V	UpdateTarget (see page 20734)	Enables or disables the action, depending on the currently active control in the form.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
R	ExecuteResult (see page 20542)	Indicates the result of executing the associated dialog.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	BeforeExecute (see page 20777)	Occurs immediately before the dialog appears.
	OnAccept (see page 20777)	This is OnAccept, a member of class TSearchReplace.
	OnCancel (see page 20777)	This is OnCancel, a member of class TSearchReplace.
	OnHint (see page 20777)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20778)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	Caption (see page 20772)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
R	Dialog (see page 20772)	Provides access the find-and-replace dialog that the action executes.
	Enabled (see page 20773)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20773)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20774)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20774)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20775)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20775)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 20775)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20776)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 20776)	Specifies the Visible property for client controls and menu items.

152.1.30.2 TSearchReplace Methods

The methods of the TSearchReplace class are listed here.

Protected Methods

	Name	Description
	GetDialogClass (see page 20771)	This is GetDialogClass, a member of class TSearchReplace.

Public Methods

	Name	Description
	ExecuteTarget (see page 20771)	Launches the associated dialog and assigns an event handler to replace found text.

152.1.30.2.1 TSearchReplace.ExecuteTarget Method

Launches the associated dialog and assigns an event handler to replace found text.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget first launches the search-and-replace dialog specified by Dialog (see page 20772). This is a modeless dialog, so the result of the dialog's Execute method simply indicates whether the dialog successfully appeared or was brought into focus. This result is set as the value of the ExecuteResult (see page 20542) property, and an OnAccept (see page 20777) event occurs if the dialog was brought into focus, or an OnCancel (see page 20777) event occurs if the dialog failed to appear.

Finally, ExecuteTarget sets the OnReplace event handler of the search-and-replace dialog to a private method that performs the replacement specified by the dialog.

See Also

onaccept (see page 20543)

oncancel (see page 20543)

Dialog (see page 20772)

Execute (see page 11381)

ExecuteResult (see page 20542)

OnReplace (see page 11488)

152.1.30.2.2 TSearchReplace.GetDialogClass Method

Pascal

```
function GetDialogClass: TCommonDialogClass; override;
```

C++

```
virtual __fastcall TCommonDialogClass GetDialogClass();
```

Description

This is GetDialogClass, a member of class TSearchReplace.

152.1.30.3 TSearchReplace Properties

The properties of the TSearchReplace class are listed here.

Published Properties

	Name	Description
	Caption (see page 20772)	Represents the caption of client controls and menu items.
R	Dialog (see page 20772)	Provides access the find-and-replace dialog that the action executes.
	Enabled (see page 20773)	Indicates whether client controls and menu items are enabled.
	HelpContext (see page 20773)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 20774)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 20774)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 20775)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 20775)	Indicates the ImageIndex property for client controls and menu items.
	SecondaryShortCuts (see page 20775)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 20776)	Specifies the ShortCut property for client menu items.
	Visible (see page 20776)	Specifies the Visible property for client controls and menu items.

152.1.30.3.1 TSearchReplace.Caption Property

Represents the caption of client controls and menu items.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Caption holds the string that is the caption for the action when it is set. The value of Caption is propagated to client controls and menu items.

See Also

Caption (see page 5806)

Caption (see page 16136)

152.1.30.3.2 TSearchReplace.Dialog Property

Provides access the find-and-replace dialog that the action executes.

Pascal

```
property Dialog: TReplaceDialog;
```

C++

```
__property TReplaceDialog Dialog;
```

Description

Use Dialog to configure the find-and-replace dialog before the action fires or to close the modeless dialog programmatically. For example, you can set the dialog's options at design time using the Object Inspector or call the dialog's CloseDialog method to shut down the modeless find-and-replace dialog.

When using a search/replace action, you do not place a TReplaceDialog component on the form or data module at design time. Instead, you add the TSearchReplace (see page 20765) action to your action list and then use the Dialog property. The TReplaceDialog component is created by the TSearchReplace (see page 20765) constructor.

See Also

ExecuteTarget (see page 20732)

CloseDialog (see page 11381)

152.1.30.3.3 TSearchReplace.Enabled Property

Indicates whether client controls and menu items are enabled.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Enabled specifies the enabled state for the action. The value of Enabled is propagated to client controls and menu items.

See Also

Enabled (see page 5821)

Enabled (see page 16145)

152.1.30.3.4 TSearchReplace.HelpContext Property

Indicates the help context ID for client controls and menu items.

Pascal

```
property HelpContext: THelpContext;
```

C++

```
__property THelpContext HelpContext;
```

Description

HelpContext specifies the help context for the action when it is set. This value is propagated to client controls and menu items.

When a client control has focus and the user presses the F1 key, the control uses the value of HelpContext for this associated action to invoke the online help targeting a specific topic. The target topic is uniquely identified by a nonzero HelpContext value. Leave the HelpContext property of the client control at its default value of zero. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpContext is only used when the HelpType property of this action or the client control is htInteger.

See Also

HelpType (see page 312)

HelpKeyword (see page 311)

152.1.30.3.5 TSearchReplace.HelpKeyword Property

Indicates the help keyword for client controls and menu items.

Pascal

```
property HelpKeyword: string;
```

C++

```
__property AnsiString HelpKeyword;
```

Description

HelpKeyword, when set, specifies the keyword that identifies a help topic for this action. This value is propagated to the HelpKeyword property of client controls and menu items. The interpretation of HelpKeyword depends on which help system is used to display the topic. For example, when using HyperHelp (on Linux) or WinHelp (on Windows), HelpKeyword refers to an A link.

When a client control has focus and the user presses the F1 key (or the key specified by the application's HelpKey property), the control uses the value of HelpKeyword for this associated action object to invoke the online help targeting a specific topic. Leave the HelpKeyword property of the client control unassigned. This allows multiple controls (and multiple types of controls) to be associated with the same help topic through the one action object.

Note: HelpKeyword is only used when the HelpType property of this action or the client control is htKeyword.

See Also

HelpKeyword (see page 5826)

HelpContext (see page 311)

HelpType (see page 312)

HelpKey

152.1.30.3.6 TSearchReplace.HelpType Property

Indicates the mechanism for client controls and menu items to use when invoking help.

Pascal

```
property HelpType: THelpType;
```

C++

```
__property THelpType HelpType;
```

Description

HelpType, when set, indicates whether client controls and menu items should use the HelpContext or the HelpKeyword property for invoking the help system. This value is propagated to the HelpType property of client controls and menu items.

See Also

HelpType (see page 5827)

HelpType

HelpContext (see page 311)

HelpKeyword (see page 311)

152.1.30.3.7 TSearchReplace.Hint Property

Indicates the Help hint for client controls and menu items.

Pascal

```
property Hint: string;
```

C++

```
__property AnsiString Hint;
```

Description

Hint holds the string that is the hint for that action when it is set. This value is propagated to client controls and menu items.

See Also

Hint (see page 5827)

Hint (see page 16148)

152.1.30.3.8 TSearchReplace.ImageIndex Property

Indicates the ImageIndex property for client controls and menu items.

Pascal

```
property ImageIndex: TImageIndex;
```

C++

```
__property TImageIndex ImageIndex;
```

Description

ImageIndex is an index into the Images property of the action list or action manager that contains the action. It identifies an image that is associated with controls and menu items that use this action.

See Also

ImageIndex (see page 5135)

ImageIndex (see page 16148)

Images (see page 325)

152.1.30.3.9 TSearchReplace.SecondaryShortCuts Property

Specifies the short cuts (in addition to ShortCut) for triggering clients.

Pascal

```
property SecondaryShortCuts: TShortCutList;
```

C++

```
__property TShortCutList SecondaryShortCuts;
```

Description

Actions can execute in response to multiple short cut key combinations. SecondaryShortCuts lists all the short cut key combinations (other than the one specified by the ShortCut property) that can trigger the action. This lets you specify shortcuts for clients that do not have a ShortCut property or provide additional, secondary shortcuts.

When the user types one of the key combinations listed in SecondaryShortCuts, the action's Execute method is called.

See Also

ShortCut (see page 314)

Execute (see page 304)

152.1.30.3.10 TSearchReplace.ShortCut Property

Specifies the ShortCut property for client menu items.

Pascal

```
property ShortCut: TShortCut;
```

C++

```
__property TShortCut ShortCut;
```

Description

ShortCut holds the value that is the shortcut for the action when it is set. This value is propagated to client menu items.

See Also

ShortCut (see page 16152)

SecondaryShortCuts (see page 314)

152.1.30.3.11 TSearchReplace.Visible Property

Specifies the Visible property for client controls and menu items.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Visible specifies the visible state for the action. This value is propagated to client controls and menu items.

See Also

Visible (see page 16153)

Visible (see page 5847)

152.1.30.4 TSearchReplace Events

The events of the TSearchReplace class are listed here.

Published Events

	Name	Description
	BeforeExecute (see page 20777)	Occurs immediately before the dialog appears.
	OnAccept (see page 20777)	This is OnAccept, a member of class TSearchReplace.
	OnCancel (see page 20777)	This is OnCancel, a member of class TSearchReplace.
	OnHint (see page 20777)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 20778)	Occurs when the application is idle or when the action list updates.

152.1.30.4.1 TSearchReplace.BeforeExecute Event

Occurs immediately before the dialog appears.

Pascal

```
property BeforeExecute: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeExecute;
```

Description

Write a BeforeExecute event handler to initialize the dialog immediately before it executes. When the action fires, it generates a BeforeExecute event, and then executes its associated dialog.

See Also

ExecuteTarget (see page 20540)

Execute (see page 11283)

PropertyName

152.1.30.4.2 TSearchReplace.OnAccept Event

Pascal

```
property OnAccept: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnAccept;
```

Description

This is OnAccept, a member of class TSearchReplace.

152.1.30.4.3 TSearchReplace.OnCancel Event

Pascal

```
property OnCancel: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCancel;
```

Description

This is OnCancel, a member of class TSearchReplace.

152.1.30.4.4 TSearchReplace.OnHint Event

Occurs when the mouse pauses over a client control or menu item.

Pascal

```
property OnHint: THintEvent;
```

C++

```
__property THintEvent OnHint;
```

Description

Use OnHint to override the default hint that appears when the user pauses the mouse over a client control or menu item. The OnHint event handler can change the hint that appears (by changing the HintStr parameter), or display the hint in some application-specific way.

152.1.30.4.5 TSearchReplace.OnUpdate Event

Occurs when the application is idle or when the action list updates.

Pascal

```
property OnUpdate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnUpdate;
```

Description

Write an OnUpdate event handler to execute centralized code while an application is idle. For example, actions may want to update enabling and disabling, or checking and unchecking of client targets.

C++ Examples:

```
/*
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
*/
void __fastcall TForm1::Action1Update(TObject *Sender)
{
   // Indicate whether ToolBar1 is currently visible.
   TAction* pa = dynamic_cast<TAction*>(Sender);
   if (pa)
   {
     if (pa->Checked != ToolBar1->Visible)
     {
       lbOther->Items->Add("Event Action1Update: toolbar visibility changed");
     }
     pa->Checked = ToolBar1->Visible;
   }
}
```

Delphi Examples:

```
{
When the application is idle, the OnUpdate event occurs for
every action that is linked to a visible control or menu
item that is showing. This provides an opportunity for
applications to execute centralized code for enabling and
disabling, checking and unchecking, and so on. For example,
the following code illustrates the OnUpdate event handler
for an action that is "checked" when the toolbar is visible.
This example requires a TActionList (with one TAction) and a
```

```
TToolBar on a form. This example requires a TActionList
(with one TAction) and a TToolBar on a form.  Double click
on the TActionList and create an TAction named Action1.  The
TAction has an OnUpdate event handler called Action1Update.
Then set an object's (such as a button or menu item) Action
to Action1.
}
procedure TMainForm.Action1Update(Sender: TObject);
begin
  if ((Sender as TAction).Checked <> ToolBar1.Visible) then
    lbOther.Items.Add('Event Action1Update: toolbar visibility changed');
    { Indicate whether ToolBar1 is currently visible }
    (Sender as TAction).Checked := ToolBar1.Visible;
end;
```

See Also

UpdateAction (see page 2790)

152.1.31 TWindowAction Class

TWindowAction is the base class for action objects that work with MDI forms.

Class Hierarchy

Pascal

```
TWindowAction = class(TAction);
```

C++

```
class TWindowAction : public TAction;
```

File

StdActns

Description

TWindowAction implements the common behavior for actions that work on MDI forms. Each descendant class performs a specific task, such as arranging, cascading, closing, tiling, or minimizing MDI child forms. Do not use TWindowAction directly in an application. Instead, use a TWindowAction descendant such as TWindowClose (see page 20798), TWindowCascade (see page 20792), TWindowMinimizeAll (see page 20804), TWindowArrange (see page 20786), TWindowTileHorizontal (see page 20809), or TWindowTileVertical (see page 20815).

TWindowAction ensures that the action is enabled as long as the target is an MDI parent form. TWindowAction descendants override the ExecuteTarget method to execute their specific function on the targets child forms.

See Also

TWindowArrange (see page 20786)

TWindowCascade (see page 20792)

TWindowClose (see page 20798)

TWindowMinimizeAll (see page 20804)

TWindowTileHorizontal (see page 20809)

TWindowTileVertical (see page 20815)

152.1.31.1 TWindowAction Members

The following tables list the members exposed by TWindowAction.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 20784)	Creates and initializes a TAction object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 2712)	Introduces an interface for invoking an action on a target client component or control.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.

	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.31.2 TWindowAction.Create Constructor

Creates and initializes a TAction object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWindowAction(TComponent * AOwner);
```

Description

Applications do not usually create action objects explicitly. Actions are created automatically when you add them to an action manager or action list component at design time. When instantiating TAction at runtime, assign a TActionList or TActionManager component to the new action's ActionList property after calling Create.

See Also

ActionList (see page 295)

152.1.31.3 TWindowAction Methods

The methods of the TWindowAction class are listed here.

Protected Methods

	Name	Description
	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	Notification (see page 20785)	Responds when components are created or destroyed.

Public Methods

	Name	Description
	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

152.1.31.3.1 TWindowAction.GetForm Method

Pascal

```
function GetForm(Target: TObject): TForm; virtual;
```

C++

```
virtual __fastcall TForm * GetForm(TObject * Target);
```

Description

This is GetForm, a member of class TWindowAction.

152.1.31.3.2 TWindowAction.HandlesTarget Method

Indicates whether the action can execute its function.

Pascal

```
function HandlesTarget(Target: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean HandlesTarget(TObject * Target);
```

Description

Do not call the HandlesTarget method. This method is called automatically when the user invokes an object (such as a tool button or menu item) that is linked to this action. The HandlesTarget method provides the action object with an opportunity to indicate whether it is appropriate to execute at this time with the object specified by the Target parameter as a "target".

As implemented in TWindowAction (see page 20779), HandlesTarget makes sure that the target is an MDI parent form. If the target is appropriate, HandlesTarget sets the Form (see page 20786) property.

See Also

Form (see page 20786)

FormStyle (see page 13912)

152.1.31.3.3 TWindowAction.Notification Method

Responds when components are created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

TBasicAction overrides the Notification method to check whether the component that is the value of the ActionComponent property is about to be freed. If so, it sets the ActionComponent property to nil (Delphi) or NULL (C++).

See Also

ActionComponent (see page 2715)

152.1.31.3.4 TWindowAction.UpdateTarget Method

Enables or disables the action, depending on whether the target form has MDI children.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TWindowAction (see page 20779), UpdateTarget checks that the target object is an MDI parent form with an MDIChildCount property greater than 0. If so, UpdateTarget sets the Enabled property to true. Otherwise, it sets Enabled to false.

See Also

Enabled (see page 310)

MDIChildCount (see page 13921)

152.1.31.4 TWindowAction Properties

The properties of the TWindowAction class are listed here.

Public Properties

	Name	Description
	Form (see page 20786)	Provides access to the target of the action.

152.1.31.4.1 TWindowAction.Form Property

Provides access to the target of the action.

Pascal

```
property Form: TCustomForm;
```

C++

```
__property TCustomForm Form;
```

Description

Form is the MDI parent form on which the action performs its function.

152.1.32 TWindowArrange Class

TWindowArrange arranges the icons of minimized MDI child forms.

Class Hierarchy

Pascal

```
TWindowArrange = class(TWindowAction);
```

C++

```
class TWindowArrange : public TWindowAction;
```

File

StdActns

Description

Add TWindowArrange to an action list to allow users to arrange the icons that represent minimized MDI child forms. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to call the ArrangeIcons method of the MDI parent form.

TWindowArrange is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no MDI children.

See Also

TWindowClose (see page 20798)

TWindowCascade (see page 20792)

TWindowMinimizeAll (see page 20804)

TWindowTileHorizontal (see page 20809)

TWindowTileVertical (see page 20815)

TForm (see page 13992)

152.1.32.1 TWindowArrange Members

The following tables list the members exposed by TWindowArrange.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20791)	Arranges the icons of minimized MDI child forms
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.

V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.

	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.32.2 TWindowArrange Methods

The methods of the TWindowArrange class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20791)	Arranges the icons of minimized MDI child forms

152.1.32.2.1 TWindowArrange.ExecuteTarget Method

Arranges the icons of minimized MDI child forms

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active form when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then calls that form's ArrangeIcons method to arrange the icons of minimized MDI children.

See Also

Form (see page 20786)

ArrangeIcons (see page 14006)

152.1.33 TWindowCascade Class

TWindowCascade cascades the MDI child forms.

Class Hierarchy

Pascal

```
TWindowCascade = class(TWindowAction);
```

C++

```
class TWindowCascade : public TWindowAction;
```

File

StdActns

Description

Add TWindowCascade to an action list to allow users to arrange the MDI child forms in an overlapping cascade. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to call the Cascade method of the MDI parent form.

TWindowCascade is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no MDI children.

See Also

TWindowClose (see page 20798)

TWindowArrange (see page 20786)

TWindowMinimizeAll (see page 20804)

TWindowTileHorizontal (see page 20809)

TWindowTileVertical (see page 20815)

TForm (see page 13992)

152.1.33.1 TWindowCascade Members

The following tables list the members exposed by TWindowCascade.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20797)	Arranges the MDI child forms in an overlapping cascade.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.33.2 TWindowCascade Methods

The methods of the TWindowCascade class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20797)	Arranges the MDI child forms in an overlapping cascade.

152.1.33.2.1 TWindowCascade.ExecuteTarget Method

Arranges the MDI child forms in an overlapping cascade.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active form when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then calls that form's Cascade method to arrange MDI child windows.

See Also

Form (see page 20786)

Cascade (see page 14007)

152.1.34 TWindowClose Class

TWindowClose closes the active MDI child form.

Class Hierarchy

Pascal

```
TWindowClose = class(TWindowAction);
```

C++

```
class TWindowClose : public TWindowAction;
```

File

StdActns

Description

Add TWindowClose to an action list to allow users to close the active MDI child form. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to call the Close method of the active MDI child.

TWindowClose is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no active MDI child.

See Also

TWindowArrange (see page 20786)

TWindowCascade (see page 20792)

TWindowMinimizeAll (see page 20804)

TWindowTileVertical (see page 20815)

TCustomForm (see page 13849)

152.1.34.1 TWindowClose Members

The following tables list the members exposed by TWindowClose.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
V	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20803)	Closes the active MDI child.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 20803)	Enables or disables the action, depending on whether the target form an active child.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.

	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.34.2 TWindowClose Methods

The methods of the TWindowClose class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20803)	Closes the active MDI child.
	UpdateTarget (see page 20803)	Enables or disables the action, depending on whether the target form an active child.

152.1.34.2.1 TWindowClose.ExecuteTarget Method

Closes the active MDI child.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active object when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then obtains a reference to the active MDI child by reading the form's ActiveMDIChild property. It calls this child form's Close method to close the active child form.

See Also

Form (see page 20786)

ActiveMDIChild (see page 13897)

Close (see page 13867)

152.1.34.2.2 TWindowClose.UpdateTarget Method

Enables or disables the action, depending on whether the target form an active child.

Pascal

```
procedure UpdateTarget(Target: TObject); override;
```

C++

```
virtual __fastcall UpdateTarget(TObject * Target);
```

Description

Do not call the UpdateTarget method. This method is called automatically so that actions can update themselves according to current conditions.

In TWindowClose (see page 20798), UpdateTarget checks that the target object is an MDI parent form with a non-nil (Delphi) or NULL (C++) ActiveMDIChild property. If so, UpdateTarget sets the Enabled property to true. Otherwise, it sets Enabled to false.

See Also

Enabled (see page 310)

ActiveMDIChild (see page 13897)

152.1.35 TWindowMinimizeAll Class

TWindowMinimizeAll minimizes all MDI child forms.

Class Hierarchy

Pascal

```
TWindowMinimizeAll = class(TWindowAction);
```

C++

```
class TWindowMinimizeAll : public TWindowAction;
```

File

StdActns

Description

Add TWindowMinimizeAll to an action list to allow users to minimize the MDI child forms in an MDI application. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the application to iterate through the MDI child forms, setting their WindowState to wsMinimized.

TWindowMinimizeAll is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no MDI children.

See Also

TWindowClose (see page 20798)

TWindowArrange (see page 20786)

TWindowCascade (see page 20792)

TWindowTileHorizontal (see page 20809)

TWindowTileVertical (see page 20815)

TCustomForm (see page 13849)

TCustomForm (see page 13849)

152.1.35.1 TWindowMinimizeAll Members

The following tables list the members exposed by TWindowMinimizeAll.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2713)	Responds when components are created or destroyed.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
V	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 307)	Sets the value of the Name property.

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20809)	Minimizes all MDI child forms of the target MDI parent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.

	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.35.2 TWindowMinimizeAll Methods

The methods of the TWindowMinimizeAll class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20809)	Minimizes all MDI child forms of the target MDI parent.

152.1.35.2.1 TWindowMinimizeAll.ExecuteTarget Method

Minimizes all MDI child forms of the target MDI parent.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active form when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then iterates through that form's MDI children, setting each child form's WindowState to wsMinimized.

WindowState (see page 13942)

152.1.36 TWindowTileHorizontal Class

TWindowTileHorizontal arranges MDI child forms so that they are all the same size, tiled horizontally.

Class Hierarchy

Pascal

```
TWindowTileHorizontal = class(TWindowAction);
```

C++

```
class TWindowTileHorizontal : public TWindowAction;
```

File

StdActns

Description

Add TWindowTileHorizontal to an action list to allow users to tile the MDI child forms horizontally. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the MDI parent form to tile its children horizontally.

TWindowTileHorizontal is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no MDI children.

152.1.36.1 TWindowTileHorizontal Members

The following tables list the members exposed by TWindowTileHorizontal.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.

	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
V	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
V	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 292)	Destroys the instance of the contained action.
V	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
V	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
V	Execute (see page 293)	Responds when the client control "fires".
V	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	ExecuteTarget (see page 20815)	Tiles the child forms of the target MDI parent horizontally.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
V	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
V	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.36.2 TWindowTileHorizontal Methods

The methods of the TWindowTileHorizontal class are listed here.

Public Methods

	Name	Description
	ExecuteTarget (see page 20815)	Tiles the child forms of the target MDI parent horizontally.

152.1.36.2.1 TWindowTileHorizontal.ExecuteTarget Method

Tiles the child forms of the target MDI parent horizontally.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active form when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then instructs the form to tile its child forms horizontally.

See Also

Form (see page 20786)

MDIChildren (see page 13922)

152.1.37 TWindowTileVertical Class

TWindowTileVertical arranges MDI child forms so that they are all the same size, tiled vertically.

Class Hierarchy

Pascal

```
TWindowTileVertical = class(TWindowAction);
```

C++

```
class TWindowTileVertical : public TWindowAction;
```

File

StdActns

Description

Add TWindowTileVertical to an action list to allow users to tile the MDI child forms vertically. Controls (see page 5711) such as menu items and tool buttons linked to this action cause the MDI parent form to tile its children vertically.

TWindowTileVertical is designed to work with an MDI parent form as a target. It automatically disables itself if the active form is not an MDI parent or if it has no MDI children.

TWindowClose (see page 20798)

TWindowArrange (see page 20786)

TWindowCascade (see page 20792)

TWindowMinimizeAll (see page 20804)

TWindowTileVertical

TCustomForm (see page 13849)

152.1.37.1 TWindowTileVertical Members

The following tables list the members exposed by TWindowTileVertical.

Protected Events

	Name	Description
	OnChange (see page 2716)	Occurs when one of the action's properties changes.

Protected Fields

	Name	Description
	FClients (see page 2711)	This is FClients, a member of class TBasicAction.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FImage (see page 302)	This is FImage, a member of class TCustomAction.
	FMask (see page 303)	This is FMask, a member of class TCustomAction.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 303)	Copies the properties of this action to a destination object.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	Change (see page 2712)	Generates an OnChange (see page 2716) event.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetForm (see page 20784)	This is GetForm, a member of class TWindowAction.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleShortCut (see page 306)	Executes the action when the user types on of its short cuts.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2713)	Responds when components are created or destroyed.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 20785)	Responds when components are created or destroyed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 294)	This is ReadState, a member of class TContainedAction.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetHelpContext (see page 306)	This is SetHelpContext, a member of class TCustomAction.
	SetHelpKeyword (see page 306)	This is SetHelpKeyword, a member of class TCustomAction.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 307)	Sets the value of the Name property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetOnExecute (see page 2714)	Assigns an OnExecute (see page 2716) event handler.
	SetParentComponent (see page 294)	This is SetParentComponent, a member of class TContainedAction.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SavedEnabledState (see page 313)	Saves the value of the Enabled (see page 310) property when the action is suspended.

Public Events

	Name	Description
	OnExecute (see page 2716)	Occurs when the client event that is linked to it fires.
	OnHint (see page 315)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 2718)	Occurs when the application is idle or when the action list updates.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 254)	Creates and initializes a TAction (see page 249) object.
	Create (see page 301)	Instantiates and initializes a TCustomAction (see page 297) object.
	Create (see page 2710)	Instantiates and initializes a TBasicAction (see page 2707) object.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 20784)	Creates and initializes a TAction object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 292)	Destroys the instance of the contained action.
	Destroy (see page 302)	Frees an instance of TCustomAction (see page 297).
	Destroy (see page 2711)	Disposes of an instance of a TBasicAction (see page 2707) object.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoHint (see page 303)	Generates an OnHint (see page 315) event.
	Execute (see page 293)	Responds when the client control "fires".
	Execute (see page 304)	Responds when a client control "fires".
	Execute (see page 2712)	Generates an OnExecute (see page 2716) event.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	ExecuteTarget (see page 20820)	Tiles the child forms of the target MDI parent vertically.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 293)	Returns the action list or action manager that contains the action.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandlesTarget (see page 2713)	Introduces an interface for verifying that the type, and state, of a target component or control are appropriate for the action.
	HandlesTarget (see page 20785)	Indicates whether the action can execute its function.
	HasParent (see page 294)	Indicates whether the action is contained in an action list or action manager.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RegisterChanges (see page 2713)	Associates the action with an action link.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UnRegisterChanges (see page 2714)	Breaks the association between the action and the action link.
V	Update (see page 295)	Indicates whether the action updates itself.
V	Update (see page 2714)	Provides an opportunity to execute centralized code when an application is idle.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateTarget (see page 2715)	Introduces an interface for a method of notifying a client when the action updates itself.
V	UpdateTarget (see page 20785)	Enables or disables the action, depending on whether the target form has MDI children.

Public Properties

	Name	Description
	ActionComponent (see page 2715)	Indicates the client component that caused this action to execute.
	ActionList (see page 295)	Indicates the action list or action manager that contains the action.
	AutoCheck (see page 308)	Controls (see page 5711) whether the Checked (see page 308) property toggles when the action executes.
	Caption (see page 308)	Represents the caption of client controls and menu items.
	Checked (see page 308)	Indicates whether client controls and menu items appear checked.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisableIfNoHandler (see page 310)	Indicates whether client components should be disabled if no handler is found.
	Enabled (see page 310)	Indicates whether client controls and menu items are enabled.
	Form (see page 20786)	Provides access to the target of the action.
	GroupIndex (see page 311)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 311)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 311)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 312)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 312)	Indicates the Help hint for client controls and menu items.

	ImageIndex (see page 313)	Indicates the ImageIndex property for client controls and menu items.
	Index (see page 296)	Specifies the index of the action in its action list or action manager.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SecondaryShortCuts (see page 314)	Specifies the short cuts (in addition to ShortCut (see page 314)) for triggering clients.
	ShortCut (see page 314)	Specifies the ShortCut property for client menu items.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 314)	Specifies the Visible property for client controls and menu items.

Published Events

	Name	Description
	OnExecute (see page 261)	Occurs when the client event that is linked to it fires.
	OnHint (see page 263)	Occurs when the mouse pauses over a client control or menu item.
	OnUpdate (see page 263)	Occurs when the application is idle or when the action list updates.

Published Properties

	Name	Description
	AutoCheck (see page 255)	Controls whether the Checked property toggles when the action executes.
	Caption (see page 255)	Represents the caption of client controls and menu items.
	Category (see page 296)	Specifies the category under which the action appears in its action list or action manager.
	Checked (see page 256)	Indicates whether client controls and menu items appear checked.
	Enabled (see page 257)	Indicates whether client controls and menu items are enabled.
	GroupIndex (see page 257)	Indicates whether the action acts like a radio button with other actions in the same action list.
	HelpContext (see page 258)	Indicates the help context ID for client controls and menu items.
	HelpKeyword (see page 258)	Indicates the help keyword for client controls and menu items.
	HelpType (see page 259)	Indicates the mechanism for client controls and menu items to use when invoking help.
	Hint (see page 259)	Indicates the Help hint for client controls and menu items.
	ImageIndex (see page 259)	Indicates the ImageIndex property for client controls and menu items.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SecondaryShortCuts (see page 260)	Specifies the short cuts (in addition to ShortCut) for triggering clients.
	ShortCut (see page 260)	Specifies the ShortCut property for client menu items.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Visible (see page 261)	Specifies the Visible property for client controls and menu items.

152.1.37.2 TWindowTileVertical Methods

The methods of the TWindowTileVertical class are listed here.

Public Methods

	Name	Description
V	ExecuteTarget (see page 20820)	Tiles the child forms of the target MDI parent vertically.

152.1.37.2.1 TWindowTileVertical.ExecuteTarget Method

Tiles the child forms of the target MDI parent vertically.

Pascal

```
procedure ExecuteTarget(Target: TObject); override;
```

C++

```
virtual __fastcall ExecuteTarget(TObject * Target);
```

Description

Do not call the ExecuteTarget method. This method is called automatically when the action fires in response to a user action (for example, when the user selects a menu item or presses a tool button that is linked to this action).

Target is the currently active form when the action fires.

ExecuteTarget sets the Form (see page 20786) property to Target, which must be an MDI parent form. It then instructs the form to tile its child forms vertically.

152.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBrowseForFolderOption (see page 20822)	This is record StdActns.TBrowseForFolderOption.

152.2.1 StdActns.TBrowseForFolderOption Enumeration

Pascal

```
TBrowseForFolderOption = (
  bifBrowseForComputer,
  bifBrowseForPrinter,
  bifBrowseIncludeFiles,
  bifBrowseIncludeURLS,
  bifDontGoBelowDomain,
  bifEditBox,
  bifNewDialogStyle,
  bifNoNewFolderButton,
  bifNoTranslateTargets,
  bifReturnFSAncestors,
  bifReturnOnlyFSDirs,
  bifShareable,
  bifStatusText,
  bifUAHint,
  bifUseNewUI,
  bifValidate
);
```

C++

```
enum TBrowseForFolderOption {
  bifBrowseForComputer,
  bifBrowseForPrinter,
  bifBrowseIncludeFiles,
  bifBrowseIncludeURLS,
  bifDontGoBelowDomain,
  bifEditBox,
  bifNewDialogStyle,
  bifNoNewFolderButton,
  bifNoTranslateTargets,
  bifReturnFSAncestors,
  bifReturnOnlyFSDirs,
  bifShareable,
  bifStatusText,
  bifUAHint,
  bifUseNewUI,
  bifValidate
};
```

File

StdActns

Description

This is record StdActns.TBrowseForFolderOption.

152.3 Types

The following table lists types in this documentation.

Types

Name	Description
TBrowseForFolderCallbackEvent (see page 20824)	This is type StdActns.TBrowseForFolderCallbackEvent.
TBrowseOptions (see page 20824)	This is type StdActns.TBrowseOptions.
TCommonDialogClass (see page 20825)	This is type StdActns.TCommonDialogClass.

152.3.1 StdActns.TBrowseForFolderCallbackEvent Type

Pascal

```
TBrowseForFolderCallbackEvent = procedure (Sender: TBrowseForFolder; Wnd: HWND; uMsg: UINT;
lParam, lpData: LPARAM; var Result: Integer) of object;
```

C++

```
(Sender: TBrowseForFolder; Wnd: HWND; uMsg: UINT; lParam, lpData: LPARAM; var Result: Integer)
( TBrowseForFolderCallbackEvent)();
```

File

StdActns

Description

This is type StdActns.TBrowseForFolderCallbackEvent.

152.3.2 StdActns.TBrowseOptions Type

Pascal

```
TBrowseOptions = set of TBrowseForFolderOption;
```

C++

```
TBrowseForFolderOption TBrowseOptions;
```

File

StdActns

Description

This is type StdActns.TBrowseOptions.

152.3.3 StdActns.TCommonDialogClass Type

Pascal

```
TCommonDialogClass = class of TCommonDialog;
```

C++

```
TCommonDialog TCommonDialogClass;
```

File

StdActns

Description

This is type StdActns.TCommonDialogClass.

153 StdConvs Namespace

This is namespace StdConvs.

Topics

Name	Description
Functions (see page 20832)	The following table lists functions in this documentation.
Variables (see page 20834)	The following table lists variables in this documentation.
Constants (see page 20883)	The following table lists constants in this documentation.

Constants

Name	Description
CubicMetersPerAcreFoot (see page 20884)	This is constant StdConvs.CubicMetersPerAcreFoot.
CubicMetersPerAcreInch (see page 20884)	This is constant StdConvs.CubicMetersPerAcreInch.
CubicMetersPerCord (see page 20885)	This is constant StdConvs.CubicMetersPerCord.
CubicMetersPerCordFoot (see page 20885)	This is constant StdConvs.CubicMetersPerCordFoot.
CubicMetersPerCubicFoot (see page 20885)	This is constant StdConvs.CubicMetersPerCubicFoot.
CubicMetersPerCubicInch (see page 20886)	This is constant StdConvs.CubicMetersPerCubicInch.
CubicMetersPerCubicMile (see page 20886)	This is constant StdConvs.CubicMetersPerCubicMile.
CubicMetersPerCubicYard (see page 20886)	This is constant StdConvs.CubicMetersPerCubicYard.
CubicMetersPerUKBucket (see page 20887)	This is constant StdConvs.CubicMetersPerUKBucket.
CubicMetersPerUKBushel (see page 20887)	This is constant StdConvs.CubicMetersPerUKBushel.
CubicMetersPerUKGallon (see page 20887)	This is constant StdConvs.CubicMetersPerUKGallon.
CubicMetersPerUKGill (see page 20888)	This is constant StdConvs.CubicMetersPerUKGill.
CubicMetersPerUKOunce (see page 20888)	This is constant StdConvs.CubicMetersPerUKOunce.
CubicMetersPerUKPeck (see page 20888)	This is constant StdConvs.CubicMetersPerUKPeck.
CubicMetersPerUKPint (see page 20889)	This is constant StdConvs.CubicMetersPerUKPint.
CubicMetersPerUKPottle (see page 20889)	This is constant StdConvs.CubicMetersPerUKPottle.
CubicMetersPerUKQuart (see page 20889)	This is constant StdConvs.CubicMetersPerUKQuart.
CubicMetersPerUSDryBucket (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryBucket.
CubicMetersPerUSDryBushel (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryBushel.
CubicMetersPerUSDryGallon (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryGallon.
CubicMetersPerUSDryPeck (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryPeck.
CubicMetersPerUSDryPint (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryPint.
CubicMetersPerUSDryQuart (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryQuart.
CubicMetersPerUSFluidCup (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidCup.
CubicMetersPerUSFluidGallon (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidGallon.

CubicMetersPerUSFluidGill (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidGill.
CubicMetersPerUSFluidOunce (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidOunce.
CubicMetersPerUSFluidPint (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidPint.
CubicMetersPerUSFluidQuart (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidQuart.
CubicMetersPerUSFluidTablespoon (see page 20894)	This is constant StdConvs.CubicMetersPerUSFluidTablespoon.
CubicMetersPerUSFluidTeaspoon (see page 20894)	This is constant StdConvs.CubicMetersPerUSFluidTeaspoon.
GramsPerDrams (see page 20894)	This is constant StdConvs.GramsPerDrams.
GramsPerGrains (see page 20895)	This is constant StdConvs.GramsPerGrains.
GramsPerLongTons (see page 20895)	This is constant StdConvs.GramsPerLongTons.
GramsPerOunces (see page 20895)	This is constant StdConvs.GramsPerOunces.
GramsPerPound (see page 20896)	This is constant StdConvs.GramsPerPound.
GramsPerStones (see page 20896)	This is constant StdConvs.GramsPerStones.
GramsPerTons (see page 20896)	This is constant StdConvs.GramsPerTons.
MetersPerAstronomicalUnit (see page 20897)	This is constant StdConvs.MetersPerAstronomicalUnit.
MetersPerChain (see page 20897)	This is constant StdConvs.MetersPerChain.
MetersPerCubit (see page 20897)	This is constant StdConvs.MetersPerCubit.
MetersPerFathom (see page 20898)	This is constant StdConvs.MetersPerFathom.
MetersPerFoot (see page 20898)	This is constant StdConvs.MetersPerFoot.
MetersPerFurlong (see page 20898)	This is constant StdConvs.MetersPerFurlong.
MetersPerHand (see page 20899)	This is constant StdConvs.MetersPerHand.
MetersPerInch (see page 20899)	This is constant StdConvs.MetersPerInch.
MetersPerLightSecond (see page 20899)	This is constant StdConvs.MetersPerLightSecond.
MetersPerLightYear (see page 20900)	This is constant StdConvs.MetersPerLightYear.
MetersPerLink (see page 20900)	This is constant StdConvs.MetersPerLink.
MetersPerMile (see page 20900)	This is constant StdConvs.MetersPerMile.
MetersPerNauticalMiles (see page 20901)	This is constant StdConvs.MetersPerNauticalMiles.
MetersPerPace (see page 20901)	This is constant StdConvs.MetersPerPace.
MetersPerParsec (see page 20901)	This is constant StdConvs.MetersPerParsec.
MetersPerPica (see page 20902)	This is constant StdConvs.MetersPerPica.
MetersPerPoint (see page 20902)	This is constant StdConvs.MetersPerPoint.
MetersPerRod (see page 20902)	This is constant StdConvs.MetersPerRod.
MetersPerYard (see page 20903)	This is constant StdConvs.MetersPerYard.
SquareMetersPerAcre (see page 20903)	This is constant StdConvs.SquareMetersPerAcre.
SquareMetersPerSquareFoot (see page 20903)	This is constant StdConvs.SquareMetersPerSquareFoot.
SquareMetersPerSquareInch (see page 20904)	This is constant StdConvs.SquareMetersPerSquareInch.
SquareMetersPerSquareMile (see page 20904)	This is constant StdConvs.SquareMetersPerSquareMile.
SquareMetersPerSquareRod (see page 20904)	This is constant StdConvs.SquareMetersPerSquareRod.
SquareMetersPerSquareYard (see page 20905)	This is constant StdConvs.SquareMetersPerSquareYard.

Functions

	Name	Description
	CelsiusToFahrenheit (see page 20832)	Converts a temperature expressed in degrees Celsius to the corresponding temperature in degrees Fahrenheit.
	FahrenheitToCelsius (see page 20832)	Converts a temperature expressed in degrees Fahrenheit to the corresponding temperature in degrees Celsius.
	InitStdConvs (see page 20833)	Initialize conversion variables for C++ program.

Variables

Name	Description
auAcres (see page 20836)	This is variable StdConvs.auAcres.
auAres (see page 20837)	This is variable StdConvs.auAres.
auCentares (see page 20837)	This is variable StdConvs.auCentares.
auHectares (see page 20837)	This is variable StdConvs.auHectares.
auSquareCentimeters (see page 20838)	This is variable StdConvs.auSquareCentimeters.
auSquareDecameters (see page 20838)	This is variable StdConvs.auSquareDecameters.

auSquareDecimeters (see page 20838)	This is variable StdConvs.auSquareDecimeters.
auSquareFeet (see page 20839)	This is variable StdConvs.auSquareFeet.
auSquareHectometers (see page 20839)	This is variable StdConvs.auSquareHectometers.
auSquareInches (see page 20839)	This is variable StdConvs.auSquareInches.
auSquareKilometers (see page 20840)	This is variable StdConvs.auSquareKilometers.
auSquareMeters (see page 20840)	This is variable StdConvs.auSquareMeters.
auSquareMiles (see page 20840)	This is variable StdConvs.auSquareMiles.
auSquareMillimeters (see page 20841)	This is variable StdConvs.auSquareMillimeters.
auSquareRods (see page 20841)	This is variable StdConvs.auSquareRods.
auSquareYards (see page 20841)	This is variable StdConvs.auSquareYards.
cbArea (see page 20842)	This is variable StdConvs.cbArea.
cbDistance (see page 20842)	This is variable StdConvs.cbDistance.
cbMass (see page 20842)	This is variable StdConvs.cbMass.
cbTemperature (see page 20843)	This is variable StdConvs.cbTemperature.
cbTime (see page 20843)	This is variable StdConvs.cbTime.
cbVolume (see page 20843)	This is variable StdConvs.cbVolume.
duAngstroms (see page 20844)	This is variable StdConvs.duAngstroms.
duAstronomicalUnits (see page 20844)	This is variable StdConvs.duAstronomicalUnits.
duCentimeters (see page 20844)	This is variable StdConvs.duCentimeters.
duChains (see page 20845)	This is variable StdConvs.duChains.
duCubits (see page 20845)	This is variable StdConvs.duCubits.
duDecameters (see page 20845)	This is variable StdConvs.duDecameters.
duDecimeters (see page 20846)	This is variable StdConvs.duDecimeters.
duFathoms (see page 20846)	This is variable StdConvs.duFathoms.
duFeet (see page 20846)	This is variable StdConvs.duFeet.
duFurlongs (see page 20847)	This is variable StdConvs.duFurlongs.
duGigameters (see page 20847)	This is variable StdConvs.duGigameters.
duHands (see page 20847)	This is variable StdConvs.duHands.
duHectometers (see page 20848)	This is variable StdConvs.duHectometers.
duInches (see page 20848)	This is variable StdConvs.duInches.
duKilometers (see page 20848)	This is variable StdConvs.duKilometers.
duLightYears (see page 20849)	This is variable StdConvs.duLightYears.
duLinks (see page 20849)	This is variable StdConvs.duLinks.
duMegameters (see page 20849)	This is variable StdConvs.duMegameters.
duMeters (see page 20850)	This is variable StdConvs.duMeters.
duMicromicrons (see page 20850)	This is variable StdConvs.duMicromicrons.
duMicrons (see page 20850)	This is variable StdConvs.duMicrons.
duMiles (see page 20851)	This is variable StdConvs.duMiles.
duMillimeters (see page 20851)	This is variable StdConvs.duMillimeters.
duMillimicrons (see page 20851)	This is variable StdConvs.duMillimicrons.
duNauticalMiles (see page 20852)	This is variable StdConvs.duNauticalMiles.
duPaces (see page 20852)	This is variable StdConvs.duPaces.
duParsecs (see page 20852)	This is variable StdConvs.duParsecs.
duPicas (see page 20853)	This is variable StdConvs.duPicas.
duPoints (see page 20853)	This is variable StdConvs.duPoints.
duRods (see page 20853)	This is variable StdConvs.duRods.
duYards (see page 20854)	This is variable StdConvs.duYards.
muCentigrams (see page 20854)	This is variable StdConvs.muCentigrams.
muDecagrams (see page 20854)	This is variable StdConvs.muDecagrams.
muDecigrams (see page 20855)	This is variable StdConvs.muDecigrams.
muDrams (see page 20855)	This is variable StdConvs.muDrams.
muGrains (see page 20855)	This is variable StdConvs.muGrains.
muGrams (see page 20856)	This is variable StdConvs.muGrams.
muHectograms (see page 20856)	This is variable StdConvs.muHectograms.

muKilograms (see page 20856)	This is variable StdConvs.muKilograms.
muLongTons (see page 20857)	This is variable StdConvs.muLongTons.
muMetricTons (see page 20857)	This is variable StdConvs.muMetricTons.
muMicrograms (see page 20857)	This is variable StdConvs.muMicrograms.
muMilligrams (see page 20858)	This is variable StdConvs.muMilligrams.
muNanograms (see page 20858)	This is variable StdConvs.muNanograms.
muOunces (see page 20858)	This is variable StdConvs.muOunces.
muPounds (see page 20859)	This is variable StdConvs.muPounds.
muStones (see page 20859)	This is variable StdConvs.muStones.
muTons (see page 20859)	This is variable StdConvs.muTons.
tuCelsius (see page 20860)	This is variable StdConvs.tuCelsius.
tuCenturies (see page 20860)	This is variable StdConvs.tuCenturies.
tuDateTime (see page 20860)	This is variable StdConvs.tuDateTime.
tuDays (see page 20861)	This is variable StdConvs.tuDays.
tuDecades (see page 20861)	This is variable StdConvs.tuDecades.
tuFahrenheit (see page 20861)	This is variable StdConvs.tuFahrenheit.
tuFortnights (see page 20862)	This is variable StdConvs.tuFortnights.
tuHours (see page 20862)	This is variable StdConvs.tuHours.
tuJulianDate (see page 20862)	This is variable StdConvs.tuJulianDate.
tuKelvin (see page 20863)	This is variable StdConvs.tuKelvin.
tuMillennia (see page 20863)	This is variable StdConvs.tuMillennia.
tuMilliSeconds (see page 20863)	This is variable StdConvs.tuMilliSeconds.
tuMinutes (see page 20864)	This is variable StdConvs.tuMinutes.
tuModifiedJulianDate (see page 20864)	This is variable StdConvs.tuModifiedJulianDate.
tuMonths (see page 20864)	This is variable StdConvs.tuMonths.
tuRankine (see page 20865)	This is variable StdConvs.tuRankine.
tuReaumur (see page 20865)	This is variable StdConvs.tuReaumur.
tuSeconds (see page 20865)	This is variable StdConvs.tuSeconds.
tuWeeks (see page 20866)	This is variable StdConvs.tuWeeks.
tuYears (see page 20866)	This is variable StdConvs.tuYears.
vuAcreFeet (see page 20866)	This is variable StdConvs.vuAcreFeet.
vuAcreInches (see page 20867)	This is variable StdConvs.vuAcreInches.
vuCentiLiters (see page 20867)	This is variable StdConvs.vuCentiLiters.
vuCordFeet (see page 20867)	This is variable StdConvs.vuCordFeet.
vuCords (see page 20868)	This is variable StdConvs.vuCords.
vuCubicCentimeters (see page 20868)	This is variable StdConvs.vuCubicCentimeters.
vuCubicDecameters (see page 20868)	This is variable StdConvs.vuCubicDecameters.
vuCubicDecimeters (see page 20869)	This is variable StdConvs.vuCubicDecimeters.
vuCubicFeet (see page 20869)	This is variable StdConvs.vuCubicFeet.
vuCubicHectometers (see page 20869)	This is variable StdConvs.vuCubicHectometers.
vuCubicInches (see page 20870)	This is variable StdConvs.vuCubicInches.
vuCubicKilometers (see page 20870)	This is variable StdConvs.vuCubicKilometers.
vuCubicMeters (see page 20870)	This is variable StdConvs.vuCubicMeters.
vuCubicMiles (see page 20871)	This is variable StdConvs.vuCubicMiles.
vuCubicMillimeters (see page 20871)	This is variable StdConvs.vuCubicMillimeters.
vuCubicYards (see page 20871)	This is variable StdConvs.vuCubicYards.
vuDecaLiters (see page 20872)	This is variable StdConvs.vuDecaLiters.
vuDecasteres (see page 20872)	This is variable StdConvs.vuDecasteres.
vuDeciLiters (see page 20872)	This is variable StdConvs.vuDeciLiters.
vuDecisteres (see page 20873)	This is variable StdConvs.vuDecisteres.
vuDryBuckets (see page 20873)	This is variable StdConvs.vuDryBuckets.
vuDryBushels (see page 20873)	This is variable StdConvs.vuDryBushels.
vuDryGallons (see page 20874)	This is variable StdConvs.vuDryGallons.
vuDryPecks (see page 20874)	This is variable StdConvs.vuDryPecks.

vuDryPints (see page 20874)	This is variable StdConvs.vuDryPints.
vuDryQuarts (see page 20875)	This is variable StdConvs.vuDryQuarts.
vuFluidCups (see page 20875)	This is variable StdConvs.vuFluidCups.
vuFluidGallons (see page 20875)	This is variable StdConvs.vuFluidGallons.
vuFluidGills (see page 20876)	This is variable StdConvs.vuFluidGills.
vuFluidOunces (see page 20876)	This is variable StdConvs.vuFluidOunces.
vuFluidPints (see page 20876)	This is variable StdConvs.vuFluidPints.
vuFluidQuarts (see page 20877)	This is variable StdConvs.vuFluidQuarts.
vuFluidTablespoons (see page 20877)	This is variable StdConvs.vuFluidTablespoons.
vuFluidTeaspoons (see page 20877)	This is variable StdConvs.vuFluidTeaspoons.
vuHectoLiters (see page 20878)	This is variable StdConvs.vuHectoLiters.
vuKiloLiters (see page 20878)	This is variable StdConvs.vuKiloLiters.
vuLiters (see page 20878)	This is variable StdConvs.vuLiters.
vuMilliLiters (see page 20879)	This is variable StdConvs.vuMilliLiters.
vuSteres (see page 20879)	This is variable StdConvs.vuSteres.
vuUKBuckets (see page 20879)	This is variable StdConvs.vuUKBuckets.
vuUKBushels (see page 20880)	This is variable StdConvs.vuUKBushels.
vuUKGallons (see page 20880)	This is variable StdConvs.vuUKGallons.
vuUKGills (see page 20880)	This is variable StdConvs.vuUKGills.
vuUKOunces (see page 20881)	This is variable StdConvs.vuUKOunces.
vuUKPecks (see page 20881)	This is variable StdConvs.vuUKPecks.
vuUKPints (see page 20881)	This is variable StdConvs.vuUKPints.
vuUKPottles (see page 20882)	This is variable StdConvs.vuUKPottles.
vuUKQuarts (see page 20882)	This is variable StdConvs.vuUKQuarts.

153.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CelsiusToFahrenheit (see page 20832)	Converts a temperature expressed in degrees Celsius to the corresponding temperature in degrees Fahrenheit.
	FahrenheitToCelsius (see page 20832)	Converts a temperature expressed in degrees Fahrenheit to the corresponding temperature in degrees Celsius.
	InitStdConvs (see page 20833)	Initialize conversion variables for C++ program.

153.1.1 StdConvs.CelsiusToFahrenheit Function

Converts a temperature expressed in degrees Celsius to the corresponding temperature in degrees Fahrenheit.

Pascal

```
function CelsiusToFahrenheit(const AValue: Double): Double;
```

C++

```
Double CelsiusToFahrenheit(const Double AValue);
```

File

StdConvs

Description

Call CelsiusToFahrenheit to convert the temperature specified by AValue, which is in degrees Celsius, to the corresponding temperature in degrees Fahrenheit.

See Also

FahrenheitToCelsius (see page 20832)

Convert

153.1.2 StdConvs.FahrenheitToCelsius Function

Converts a temperature expressed in degrees Fahrenheit to the corresponding temperature in degrees Celsius.

Pascal

```
function FahrenheitToCelsius(const AValue: Double): Double;
```

C++

```
Double FahrenheitToCelsius(const Double AValue);
```

File

StdConvs

Description

Call FahrenheitToCelsius to convert the temperature specified by AValue, which is in degrees Fahrenheit, to the corresponding temperature in degrees Celsius.

See Also

CelsiusToFahrenheit (see page 20832)

Convert

153.1.3 StdConvs.InitStdConvs Function

Initialize conversion variables for C++ program.

Pascal

```
procedure InitStdConvs;
```

C++

```
InitStdConvs();
```

File

StdConvs

Description

Insert InitStdConvs into a C++ program to ensure that StdConvs (see page 20827) global variables are properly initialized. InitStdConvs does nothing and does not need to be called. A reference to InitStdConvs in a C++ program guarantees that the linker will provide a call to the unit's initialization code, even if no other StdConvs (see page 20827) routines are present. This step is not necessary in Delphi code, which always calls the initialization code for referenced units.

See Also

FahrenheitToCelsius (see page 20832)

Convert

153.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
auAcres (see page 20836)	This is variable StdConvs.auAcres.
auAres (see page 20837)	This is variable StdConvs.auAres.
auCentares (see page 20837)	This is variable StdConvs.auCentares.
auHectares (see page 20837)	This is variable StdConvs.auHectares.
auSquareCentimeters (see page 20838)	This is variable StdConvs.auSquareCentimeters.
auSquareDecameters (see page 20838)	This is variable StdConvs.auSquareDecameters.
auSquareDecimeters (see page 20838)	This is variable StdConvs.auSquareDecimeters.
auSquareFeet (see page 20839)	This is variable StdConvs.auSquareFeet.
auSquareHectometers (see page 20839)	This is variable StdConvs.auSquareHectometers.
auSquareInches (see page 20839)	This is variable StdConvs.auSquareInches.
auSquareKilometers (see page 20840)	This is variable StdConvs.auSquareKilometers.
auSquareMeters (see page 20840)	This is variable StdConvs.auSquareMeters.
auSquareMiles (see page 20840)	This is variable StdConvs.auSquareMiles.
auSquareMillimeters (see page 20841)	This is variable StdConvs.auSquareMillimeters.
auSquareRods (see page 20841)	This is variable StdConvs.auSquareRods.
auSquareYards (see page 20841)	This is variable StdConvs.auSquareYards.
cbArea (see page 20842)	This is variable StdConvs.cbArea.
cbDistance (see page 20842)	This is variable StdConvs.cbDistance.
cbMass (see page 20842)	This is variable StdConvs.cbMass.
cbTemperature (see page 20843)	This is variable StdConvs.cbTemperature.
cbTime (see page 20843)	This is variable StdConvs.cbTime.
cbVolume (see page 20843)	This is variable StdConvs.cbVolume.
duAngstroms (see page 20844)	This is variable StdConvs.duAngstroms.
duAstronomicalUnits (see page 20844)	This is variable StdConvs.duAstronomicalUnits.
duCentimeters (see page 20844)	This is variable StdConvs.duCentimeters.
duChains (see page 20845)	This is variable StdConvs.duChains.
duCubits (see page 20845)	This is variable StdConvs.duCubits.
duDecameters (see page 20845)	This is variable StdConvs.duDecameters.
duDecimeters (see page 20846)	This is variable StdConvs.duDecimeters.
duFathoms (see page 20846)	This is variable StdConvs.duFathoms.
duFeet (see page 20846)	This is variable StdConvs.duFeet.
duFurlongs (see page 20847)	This is variable StdConvs.duFurlongs.
duGigameters (see page 20847)	This is variable StdConvs.duGigameters.
duHands (see page 20847)	This is variable StdConvs.duHands.
duHectometers (see page 20848)	This is variable StdConvs.duHectometers.
duInches (see page 20848)	This is variable StdConvs.duInches.
duKilometers (see page 20848)	This is variable StdConvs.duKilometers.
duLightYears (see page 20849)	This is variable StdConvs.duLightYears.
duLinks (see page 20849)	This is variable StdConvs.duLinks.
duMegameters (see page 20849)	This is variable StdConvs.duMegameters.
duMeters (see page 20850)	This is variable StdConvs.duMeters.
duMicromicrons (see page 20850)	This is variable StdConvs.duMicromicrons.
duMicrons (see page 20850)	This is variable StdConvs.duMicrons.
duMiles (see page 20851)	This is variable StdConvs.duMiles.

duMillimeters (see page 20851)	This is variable StdConvs.duMillimeters.
duMillimicrons (see page 20851)	This is variable StdConvs.duMillimicrons.
duNauticalMiles (see page 20852)	This is variable StdConvs.duNauticalMiles.
duPaces (see page 20852)	This is variable StdConvs.duPaces.
duParsecs (see page 20852)	This is variable StdConvs.duParsecs.
duPicas (see page 20853)	This is variable StdConvs.duPicas.
duPoints (see page 20853)	This is variable StdConvs.duPoints.
duRods (see page 20853)	This is variable StdConvs.duRods.
duYards (see page 20854)	This is variable StdConvs.duYards.
muCentigrams (see page 20854)	This is variable StdConvs.muCentigrams.
muDecagrams (see page 20854)	This is variable StdConvs.muDecagrams.
muDecigrams (see page 20855)	This is variable StdConvs.muDecigrams.
muDrams (see page 20855)	This is variable StdConvs.muDrams.
muGrains (see page 20855)	This is variable StdConvs.muGrains.
muGrams (see page 20856)	This is variable StdConvs.muGrams.
muHectograms (see page 20856)	This is variable StdConvs.muHectograms.
muKilograms (see page 20856)	This is variable StdConvs.muKilograms.
muLongTons (see page 20857)	This is variable StdConvs.muLongTons.
muMetricTons (see page 20857)	This is variable StdConvs.muMetricTons.
muMicrograms (see page 20857)	This is variable StdConvs.muMicrograms.
muMilligrams (see page 20858)	This is variable StdConvs.muMilligrams.
muNanograms (see page 20858)	This is variable StdConvs.muNanograms.
muOunces (see page 20858)	This is variable StdConvs.muOunces.
muPounds (see page 20859)	This is variable StdConvs.muPounds.
muStones (see page 20859)	This is variable StdConvs.muStones.
muTons (see page 20859)	This is variable StdConvs.muTons.
tuCelsius (see page 20860)	This is variable StdConvs.tuCelsius.
tuCenturies (see page 20860)	This is variable StdConvs.tuCenturies.
tuDateTime (see page 20860)	This is variable StdConvs.tuDateTime.
tuDays (see page 20861)	This is variable StdConvs.tuDays.
tuDecades (see page 20861)	This is variable StdConvs.tuDecades.
tuFahrenheit (see page 20861)	This is variable StdConvs.tuFahrenheit.
tuFortnights (see page 20862)	This is variable StdConvs.tuFortnights.
tuHours (see page 20862)	This is variable StdConvs.tuHours.
tuJulianDate (see page 20862)	This is variable StdConvs.tuJulianDate.
tuKelvin (see page 20863)	This is variable StdConvs.tuKelvin.
tuMillennia (see page 20863)	This is variable StdConvs.tuMillennia.
tuMilliSeconds (see page 20863)	This is variable StdConvs.tuMilliSeconds.
tuMinutes (see page 20864)	This is variable StdConvs.tuMinutes.
tuModifiedJulianDate (see page 20864)	This is variable StdConvs.tuModifiedJulianDate.
tuMonths (see page 20864)	This is variable StdConvs.tuMonths.
tuRankine (see page 20865)	This is variable StdConvs.tuRankine.
tuReaumur (see page 20865)	This is variable StdConvs.tuReaumur.
tuSeconds (see page 20865)	This is variable StdConvs.tuSeconds.
tuWeeks (see page 20866)	This is variable StdConvs.tuWeeks.
tuYears (see page 20866)	This is variable StdConvs.tuYears.
vuAcreFeet (see page 20866)	This is variable StdConvs.vuAcreFeet.
vuAcreInches (see page 20867)	This is variable StdConvs.vuAcreInches.
vuCentiLiters (see page 20867)	This is variable StdConvs.vuCentiLiters.
vuCordFeet (see page 20867)	This is variable StdConvs.vuCordFeet.
vuCords (see page 20868)	This is variable StdConvs.vuCords.
vuCubicCentimeters (see page 20868)	This is variable StdConvs.vuCubicCentimeters.
vuCubicDecameters (see page 20868)	This is variable StdConvs.vuCubicDecameters.
vuCubicDecimeters (see page 20869)	This is variable StdConvs.vuCubicDecimeters.

vuCubicFeet (see page 20869)	This is variable StdConvs.vuCubicFeet.
vuCubicHectometers (see page 20869)	This is variable StdConvs.vuCubicHectometers.
vuCubicInches (see page 20870)	This is variable StdConvs.vuCubicInches.
vuCubicKilometers (see page 20870)	This is variable StdConvs.vuCubicKilometers.
vuCubicMeters (see page 20870)	This is variable StdConvs.vuCubicMeters.
vuCubicMiles (see page 20871)	This is variable StdConvs.vuCubicMiles.
vuCubicMillimeters (see page 20871)	This is variable StdConvs.vuCubicMillimeters.
vuCubicYards (see page 20871)	This is variable StdConvs.vuCubicYards.
vuDecaLiters (see page 20872)	This is variable StdConvs.vuDecaLiters.
vuDecasteres (see page 20872)	This is variable StdConvs.vuDecasteres.
vuDeciLiters (see page 20872)	This is variable StdConvs.vuDeciLiters.
vuDecisteres (see page 20873)	This is variable StdConvs.vuDecisteres.
vuDryBuckets (see page 20873)	This is variable StdConvs.vuDryBuckets.
vuDryBushels (see page 20873)	This is variable StdConvs.vuDryBushels.
vuDryGallons (see page 20874)	This is variable StdConvs.vuDryGallons.
vuDryPecks (see page 20874)	This is variable StdConvs.vuDryPecks.
vuDryPints (see page 20874)	This is variable StdConvs.vuDryPints.
vuDryQuarts (see page 20875)	This is variable StdConvs.vuDryQuarts.
vuFluidCups (see page 20875)	This is variable StdConvs.vuFluidCups.
vuFluidGallons (see page 20875)	This is variable StdConvs.vuFluidGallons.
vuFluidGills (see page 20876)	This is variable StdConvs.vuFluidGills.
vuFluidOunces (see page 20876)	This is variable StdConvs.vuFluidOunces.
vuFluidPints (see page 20876)	This is variable StdConvs.vuFluidPints.
vuFluidQuarts (see page 20877)	This is variable StdConvs.vuFluidQuarts.
vuFluidTablespoons (see page 20877)	This is variable StdConvs.vuFluidTablespoons.
vuFluidTeaspoons (see page 20877)	This is variable StdConvs.vuFluidTeaspoons.
vuHectoLiters (see page 20878)	This is variable StdConvs.vuHectoLiters.
vuKiloLiters (see page 20878)	This is variable StdConvs.vuKiloLiters.
vuLiters (see page 20878)	This is variable StdConvs.vuLiters.
vuMilliLiters (see page 20879)	This is variable StdConvs.vuMilliLiters.
vuSteres (see page 20879)	This is variable StdConvs.vuSteres.
vuUKBuckets (see page 20879)	This is variable StdConvs.vuUKBuckets.
vuUKBushels (see page 20880)	This is variable StdConvs.vuUKBushels.
vuUKGallons (see page 20880)	This is variable StdConvs.vuUKGallons.
vuUKGills (see page 20880)	This is variable StdConvs.vuUKGills.
vuUKOunces (see page 20881)	This is variable StdConvs.vuUKOunces.
vuUKPecks (see page 20881)	This is variable StdConvs.vuUKPecks.
vuUKPints (see page 20881)	This is variable StdConvs.vuUKPints.
vuUKPottles (see page 20882)	This is variable StdConvs.vuUKPottles.
vuUKQuarts (see page 20882)	This is variable StdConvs.vuUKQuarts.

153.2.1 StdConvs.auAcres Variable

Pascal

```
auAcres: TConvType;
```

C++

```
TConvType auAcres;
```

File

StdConvs

Description

This is variable StdConvs.auAcres.

153.2.2 StdConvs.auAres Variable

Pascal

```
auAres: TConvType;
```

C++

```
TConvType auAres;
```

File

StdConvs

Description

This is variable StdConvs.auAres.

153.2.3 StdConvs.auCentares Variable

Pascal

```
auCentares: TConvType;
```

C++

```
TConvType auCentares;
```

File

StdConvs

Description

This is variable StdConvs.auCentares.

153.2.4 StdConvs.auHectares Variable

Pascal

```
auHectares: TConvType;
```

C++

```
TConvType auHectares;
```

File

StdConvs

Description

This is variable StdConvs.auHectares.

153.2.5 StdConvs.auSquareCentimeters Variable

Pascal

```
auSquareCentimeters: TConvType;
```

C++

```
TConvType auSquareCentimeters;
```

File

StdConvs

Description

This is variable StdConvs.auSquareCentimeters.

153.2.6 StdConvs.auSquareDecameters Variable

Pascal

```
auSquareDecameters: TConvType;
```

C++

```
TConvType auSquareDecameters;
```

File

StdConvs

Description

This is variable StdConvs.auSquareDecameters.

153.2.7 StdConvs.auSquareDecimeters Variable

Pascal

```
auSquareDecimeters: TConvType;
```

C++

```
TConvType auSquareDecimeters;
```

File

StdConvs

Description

This is variable StdConvs.auSquareDecimeters.

153.2.8 StdConvs.auSquareFeet Variable

Pascal

```
auSquareFeet: TConvType;
```

C++

```
TConvType auSquareFeet;
```

File

StdConvs

Description

This is variable StdConvs.auSquareFeet.

153.2.9 StdConvs.auSquareHectometers Variable

Pascal

```
auSquareHectometers: TConvType;
```

C++

```
TConvType auSquareHectometers;
```

File

StdConvs

Description

This is variable StdConvs.auSquareHectometers.

153.2.10 StdConvs.auSquareInches Variable

Pascal

```
auSquareInches: TConvType;
```

C++

```
TConvType auSquareInches;
```

File

StdConvs

Description

This is variable StdConvs.auSquareInches.

153.2.11 StdConvs.auSquareKilometers Variable

Pascal

```
auSquareKilometers: TConvType;
```

C++

```
TConvType auSquareKilometers;
```

File

StdConvs

Description

This is variable StdConvs.auSquareKilometers.

153.2.12 StdConvs.auSquareMeters Variable

Pascal

```
auSquareMeters: TConvType;
```

C++

```
TConvType auSquareMeters;
```

File

StdConvs

Description

This is variable StdConvs.auSquareMeters.

153.2.13 StdConvs.auSquareMiles Variable

Pascal

```
auSquareMiles: TConvType;
```

C++

```
TConvType auSquareMiles;
```

File

StdConvs

Description

This is variable StdConvs.auSquareMiles.

153.2.14 StdConvs.auSquareMillimeters Variable

Pascal

```
auSquareMillimeters: TConvType;
```

C++

```
TConvType auSquareMillimeters;
```

File

StdConvs

Description

This is variable StdConvs.auSquareMillimeters.

153.2.15 StdConvs.auSquareRods Variable

Pascal

```
auSquareRods: TConvType;
```

C++

```
TConvType auSquareRods;
```

File

StdConvs

Description

This is variable StdConvs.auSquareRods.

153.2.16 StdConvs.auSquareYards Variable

Pascal

```
auSquareYards: TConvType;
```

C++

```
TConvType auSquareYards;
```

File

StdConvs

Description

This is variable StdConvs.auSquareYards.

153.2.17 StdConvs.cbArea Variable

Pascal

```
cbArea: TConvFamily;
```

C++

```
TConvFamily cbArea;
```

File

StdConvs

Description

This is variable StdConvs.cbArea.

153.2.18 StdConvs.cbDistance Variable

Pascal

```
cbDistance: TConvFamily;
```

C++

```
TConvFamily cbDistance;
```

File

StdConvs

Description

This is variable StdConvs.cbDistance.

153.2.19 StdConvs.cbMass Variable

Pascal

```
cbMass: TConvFamily;
```

C++

```
TConvFamily cbMass;
```

File

StdConvs

Description

This is variable StdConvs.cbMass.

153.2.20 StdConvs.cbTemperature Variable

Pascal

```
cbTemperature: TConvFamily;
```

C++

```
TConvFamily cbTemperature;
```

File

StdConvs

Description

This is variable StdConvs.cbTemperature.

153.2.21 StdConvs.cbTime Variable

Pascal

```
cbTime: TConvFamily;
```

C++

```
TConvFamily cbTime;
```

File

StdConvs

Description

This is variable StdConvs.cbTime.

153.2.22 StdConvs.cbVolume Variable

Pascal

```
cbVolume: TConvFamily;
```

C++

```
TConvFamily cbVolume;
```

File

StdConvs

Description

This is variable StdConvs.cbVolume.

153.2.23 StdConvs.duAngstroms Variable

Pascal

```
duAngstroms: TConvType;
```

C++

```
TConvType duAngstroms;
```

File

StdConvs

Description

This is variable StdConvs.duAngstroms.

153.2.24 StdConvs.duAstronomicalUnits Variable

Pascal

```
duAstronomicalUnits: TConvType;
```

C++

```
TConvType duAstronomicalUnits;
```

File

StdConvs

Description

This is variable StdConvs.duAstronomicalUnits.

153.2.25 StdConvs.duCentimeters Variable

Pascal

```
duCentimeters: TConvType;
```

C++

```
TConvType duCentimeters;
```

File

StdConvs

Description

This is variable StdConvs.duCentimeters.

153.2.26 StdConvs.duChains Variable

Pascal

```
duChains: TConvType;
```

C++

```
TConvType duChains;
```

File

StdConvs

Description

This is variable StdConvs.duChains.

153.2.27 StdConvs.duCubits Variable

Pascal

```
duCubits: TConvType;
```

C++

```
TConvType duCubits;
```

File

StdConvs

Description

This is variable StdConvs.duCubits.

153.2.28 StdConvs.duDecameters Variable

Pascal

```
duDecameters: TConvType;
```

C++

```
TConvType duDecameters;
```

File

StdConvs

Description

This is variable StdConvs.duDecameters.

153.2.29 StdConvs.duDecimeters Variable

Pascal

```
duDecimeters: TConvType;
```

C++

```
TConvType duDecimeters;
```

File

StdConvs

Description

This is variable StdConvs.duDecimeters.

153.2.30 StdConvs.duFathoms Variable

Pascal

```
duFathoms: TConvType;
```

C++

```
TConvType duFathoms;
```

File

StdConvs

Description

This is variable StdConvs.duFathoms.

153.2.31 StdConvs.duFeet Variable

Pascal

```
duFeet: TConvType;
```

C++

```
TConvType duFeet;
```

File

StdConvs

Description

This is variable StdConvs.duFeet.

153.2.32 StdConvs.duFurlongs Variable

Pascal

```
duFurlongs: TConvType;
```

C++

```
TConvType duFurlongs;
```

File

StdConvs

Description

This is variable StdConvs.duFurlongs.

153.2.33 StdConvs.duGigameters Variable

Pascal

```
duGigameters: TConvType;
```

C++

```
TConvType duGigameters;
```

File

StdConvs

Description

This is variable StdConvs.duGigameters.

153.2.34 StdConvs.duHands Variable

Pascal

```
duHands: TConvType;
```

C++

```
TConvType duHands;
```

File

StdConvs

Description

This is variable StdConvs.duHands.

153.2.35 StdConvs.duHectometers Variable

Pascal

```
duHectometers: TConvType;
```

C++

```
TConvType duHectometers;
```

File

StdConvs

Description

This is variable StdConvs.duHectometers.

153.2.36 StdConvs.duInches Variable

Pascal

```
duInches: TConvType;
```

C++

```
TConvType duInches;
```

File

StdConvs

Description

This is variable StdConvs.duInches.

153.2.37 StdConvs.duKilometers Variable

Pascal

```
duKilometers: TConvType;
```

C++

```
TConvType duKilometers;
```

File

StdConvs

Description

This is variable StdConvs.duKilometers.

153.2.38 StdConvs.duLightYears Variable

Pascal

```
duLightYears: TConvType;
```

C++

```
TConvType duLightYears;
```

File

StdConvs

Description

This is variable StdConvs.duLightYears.

153.2.39 StdConvs.duLinks Variable

Pascal

```
duLinks: TConvType;
```

C++

```
TConvType duLinks;
```

File

StdConvs

Description

This is variable StdConvs.duLinks.

153.2.40 StdConvs.duMegameters Variable

Pascal

```
duMegameters: TConvType;
```

C++

```
TConvType duMegameters;
```

File

StdConvs

Description

This is variable StdConvs.duMegameters.

153.2.41 StdConvs.duMeters Variable

Pascal

```
duMeters: TConvType;
```

C++

```
TConvType duMeters;
```

File

StdConvs

Description

This is variable StdConvs.duMeters.

153.2.42 StdConvs.duMicromicrons Variable

Pascal

```
duMicromicrons: TConvType;
```

C++

```
TConvType duMicromicrons;
```

File

StdConvs

Description

This is variable StdConvs.duMicromicrons.

153.2.43 StdConvs.duMicrons Variable

Pascal

```
duMicrons: TConvType;
```

C++

```
TConvType duMicrons;
```

File

StdConvs

Description

This is variable StdConvs.duMicrons.

153.2.44 StdConvs.duMiles Variable

Pascal

```
duMiles: TConvType;
```

C++

```
TConvType duMiles;
```

File

StdConvs

Description

This is variable StdConvs.duMiles.

153.2.45 StdConvs.duMillimeters Variable

Pascal

```
duMillimeters: TConvType;
```

C++

```
TConvType duMillimeters;
```

File

StdConvs

Description

This is variable StdConvs.duMillimeters.

153.2.46 StdConvs.duMillimicrons Variable

Pascal

```
duMillimicrons: TConvType;
```

C++

```
TConvType duMillimicrons;
```

File

StdConvs

Description

This is variable StdConvs.duMillimicrons.

153.2.47 StdConvs.duNauticalMiles Variable

Pascal

```
duNauticalMiles: TConvType;
```

C++

```
TConvType duNauticalMiles;
```

File

StdConvs

Description

This is variable StdConvs.duNauticalMiles.

153.2.48 StdConvs.duPaces Variable

Pascal

```
duPaces: TConvType;
```

C++

```
TConvType duPaces;
```

File

StdConvs

Description

This is variable StdConvs.duPaces.

153.2.49 StdConvs.duParsecs Variable

Pascal

```
duParsecs: TConvType;
```

C++

```
TConvType duParsecs;
```

File

StdConvs

Description

This is variable StdConvs.duParsecs.

153.2.50 StdConvs.duPicas Variable

Pascal

```
duPicas: TConvType;
```

C++

```
TConvType duPicas;
```

File

StdConvs

Description

This is variable StdConvs.duPicas.

153.2.51 StdConvs.duPoints Variable

Pascal

```
duPoints: TConvType;
```

C++

```
TConvType duPoints;
```

File

StdConvs

Description

This is variable StdConvs.duPoints.

153.2.52 StdConvs.duRods Variable

Pascal

```
duRods: TConvType;
```

C++

```
TConvType duRods;
```

File

StdConvs

Description

This is variable StdConvs.duRods.

153.2.53 StdConvs.duYards Variable

Pascal

```
duYards: TConvType;
```

C++

```
TConvType duYards;
```

File

StdConvs

Description

This is variable StdConvs.duYards.

153.2.54 StdConvs.muCentigrams Variable

Pascal

```
muCentigrams: TConvType;
```

C++

```
TConvType muCentigrams;
```

File

StdConvs

Description

This is variable StdConvs.muCentigrams.

153.2.55 StdConvs.muDecagrams Variable

Pascal

```
muDecagrams: TConvType;
```

C++

```
TConvType muDecagrams;
```

File

StdConvs

Description

This is variable StdConvs.muDecagrams.

153.2.56 StdConvs.muDecigrams Variable

Pascal

```
muDecigrams: TConvType;
```

C++

```
TConvType muDecigrams;
```

File

StdConvs

Description

This is variable StdConvs.muDecigrams.

153.2.57 StdConvs.muDrams Variable

Pascal

```
muDrams: TConvType;
```

C++

```
TConvType muDrams;
```

File

StdConvs

Description

This is variable StdConvs.muDrams.

153.2.58 StdConvs.muGrains Variable

Pascal

```
muGrains: TConvType;
```

C++

```
TConvType muGrains;
```

File

StdConvs

Description

This is variable StdConvs.muGrains.

153.2.59 StdConvs.muGrams Variable

Pascal

```
muGrams: TConvType;
```

C++

```
TConvType muGrams;
```

File

StdConvs

Description

This is variable StdConvs.muGrams.

153.2.60 StdConvs.muHectograms Variable

Pascal

```
muHectograms: TConvType;
```

C++

```
TConvType muHectograms;
```

File

StdConvs

Description

This is variable StdConvs.muHectograms.

153.2.61 StdConvs.muKilograms Variable

Pascal

```
muKilograms: TConvType;
```

C++

```
TConvType muKilograms;
```

File

StdConvs

Description

This is variable StdConvs.muKilograms.

153.2.62 StdConvs.muLongTons Variable

Pascal

```
muLongTons: TConvType;
```

C++

```
TConvType muLongTons;
```

File

StdConvs

Description

This is variable StdConvs.muLongTons.

153.2.63 StdConvs.muMetricTons Variable

Pascal

```
muMetricTons: TConvType;
```

C++

```
TConvType muMetricTons;
```

File

StdConvs

Description

This is variable StdConvs.muMetricTons.

153.2.64 StdConvs.muMicrograms Variable

Pascal

```
muMicrograms: TConvType;
```

C++

```
TConvType muMicrograms;
```

File

StdConvs

Description

This is variable StdConvs.muMicrograms.

153.2.65 StdConvs.muMilligrams Variable

Pascal

```
muMilligrams: TConvType;
```

C++

```
TConvType muMilligrams;
```

File

StdConvs

Description

This is variable StdConvs.muMilligrams.

153.2.66 StdConvs.muNanograms Variable

Pascal

```
muNanograms: TConvType;
```

C++

```
TConvType muNanograms;
```

File

StdConvs

Description

This is variable StdConvs.muNanograms.

153.2.67 StdConvs.muOunces Variable

Pascal

```
muOunces: TConvType;
```

C++

```
TConvType muOunces;
```

File

StdConvs

Description

This is variable StdConvs.muOunces.

153.2.68 StdConvs.muPounds Variable

Pascal

```
muPounds: TConvType;
```

C++

```
TConvType muPounds;
```

File

StdConvs

Description

This is variable StdConvs.muPounds.

153.2.69 StdConvs.muStones Variable

Pascal

```
muStones: TConvType;
```

C++

```
TConvType muStones;
```

File

StdConvs

Description

This is variable StdConvs.muStones.

153.2.70 StdConvs.muTons Variable

Pascal

```
muTons: TConvType;
```

C++

```
TConvType muTons;
```

File

StdConvs

Description

This is variable StdConvs.muTons.

153.2.71 StdConvs.tuCelsius Variable

Pascal

```
tuCelsius: TConvType;
```

C++

```
TConvType tuCelsius;
```

File

StdConvs

Description

This is variable StdConvs.tuCelsius.

153.2.72 StdConvs.tuCenturies Variable

Pascal

```
tuCenturies: TConvType;
```

C++

```
TConvType tuCenturies;
```

File

StdConvs

Description

This is variable StdConvs.tuCenturies.

153.2.73 StdConvs.tuDateTime Variable

Pascal

```
tuDateTime: TConvType;
```

C++

```
TConvType tuDateTime;
```

File

StdConvs

Description

This is variable StdConvs.tuDateTime.

153.2.74 StdConvs.tuDays Variable

Pascal

```
tuDays: TConvType;
```

C++

```
TConvType tuDays;
```

File

StdConvs

Description

This is variable StdConvs.tuDays.

153.2.75 StdConvs.tuDecades Variable

Pascal

```
tuDecades: TConvType;
```

C++

```
TConvType tuDecades;
```

File

StdConvs

Description

This is variable StdConvs.tuDecades.

153.2.76 StdConvs.tuFahrenheit Variable

Pascal

```
tuFahrenheit: TConvType;
```

C++

```
TConvType tuFahrenheit;
```

File

StdConvs

Description

This is variable StdConvs.tuFahrenheit.

153.2.77 StdConvs.tuFortnights Variable

Pascal

```
tuFortnights: TConvType;
```

C++

```
TConvType tuFortnights;
```

File

StdConvs

Description

This is variable StdConvs.tuFortnights.

153.2.78 StdConvs.tuHours Variable

Pascal

```
tuHours: TConvType;
```

C++

```
TConvType tuHours;
```

File

StdConvs

Description

This is variable StdConvs.tuHours.

153.2.79 StdConvs.tuJulianDate Variable

Pascal

```
tuJulianDate: TConvType;
```

C++

```
TConvType tuJulianDate;
```

File

StdConvs

Description

This is variable StdConvs.tuJulianDate.

153.2.80 StdConvs.tuKelvin Variable

Pascal

```
tuKelvin: TConvType;
```

C++

```
TConvType tuKelvin;
```

File

StdConvs

Description

This is variable StdConvs.tuKelvin.

153.2.81 StdConvs.tuMillennia Variable

Pascal

```
tuMillennia: TConvType;
```

C++

```
TConvType tuMillennia;
```

File

StdConvs

Description

This is variable StdConvs.tuMillennia.

153.2.82 StdConvs.tuMilliSeconds Variable

Pascal

```
tuMilliSeconds: TConvType;
```

C++

```
TConvType tuMilliSeconds;
```

File

StdConvs

Description

This is variable StdConvs.tuMilliSeconds.

153.2.83 StdConvs.tuMinutes Variable

Pascal

```
tuMinutes: TConvType;
```

C++

```
TConvType tuMinutes;
```

File

StdConvs

Description

This is variable StdConvs.tuMinutes.

153.2.84 StdConvs.tuModifiedJulianDate Variable

Pascal

```
tuModifiedJulianDate: TConvType;
```

C++

```
TConvType tuModifiedJulianDate;
```

File

StdConvs

Description

This is variable StdConvs.tuModifiedJulianDate.

153.2.85 StdConvs.tuMonths Variable

Pascal

```
tuMonths: TConvType;
```

C++

```
TConvType tuMonths;
```

File

StdConvs

Description

This is variable StdConvs.tuMonths.

153.2.86 StdConvs.tuRankine Variable

Pascal

```
tuRankine: TConvType;
```

C++

```
TConvType tuRankine;
```

File

StdConvs

Description

This is variable StdConvs.tuRankine.

153.2.87 StdConvs.tuReaumur Variable

Pascal

```
tuReaumur: TConvType;
```

C++

```
TConvType tuReaumur;
```

File

StdConvs

Description

This is variable StdConvs.tuReaumur.

153.2.88 StdConvs.tuSeconds Variable

Pascal

```
tuSeconds: TConvType;
```

C++

```
TConvType tuSeconds;
```

File

StdConvs

Description

This is variable StdConvs.tuSeconds.

153.2.89 StdConvs.tuWeeks Variable

Pascal

```
tuWeeks: TConvType;
```

C++

```
TConvType tuWeeks;
```

File

StdConvs

Description

This is variable StdConvs.tuWeeks.

153.2.90 StdConvs.tuYears Variable

Pascal

```
tuYears: TConvType;
```

C++

```
TConvType tuYears;
```

File

StdConvs

Description

This is variable StdConvs.tuYears.

153.2.91 StdConvs.vuAcreFeet Variable

Pascal

```
vuAcreFeet: TConvType;
```

C++

```
TConvType vuAcreFeet;
```

File

StdConvs

Description

This is variable StdConvs.vuAcreFeet.

153.2.92 StdConvs.vuAcreInches Variable

Pascal

```
vuAcreInches: TConvType;
```

C++

```
TConvType vuAcreInches;
```

File

StdConvs

Description

This is variable StdConvs.vuAcreInches.

153.2.93 StdConvs.vuCentiLiters Variable

Pascal

```
vuCentiLiters: TConvType;
```

C++

```
TConvType vuCentiLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuCentiLiters.

153.2.94 StdConvs.vuCordFeet Variable

Pascal

```
vuCordFeet: TConvType;
```

C++

```
TConvType vuCordFeet;
```

File

StdConvs

Description

This is variable StdConvs.vuCordFeet.

153.2.95 StdConvs.vuCords Variable

Pascal

```
vuCords: TConvType;
```

C++

```
TConvType vuCords;
```

File

StdConvs

Description

This is variable StdConvs.vuCords.

153.2.96 StdConvs.vuCubicCentimeters Variable

Pascal

```
vuCubicCentimeters: TConvType;
```

C++

```
TConvType vuCubicCentimeters;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicCentimeters.

153.2.97 StdConvs.vuCubicDecameters Variable

Pascal

```
vuCubicDecameters: TConvType;
```

C++

```
TConvType vuCubicDecameters;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicDecameters.

153.2.98 StdConvs.vuCubicDecimeters Variable

Pascal

```
vuCubicDecimeters: TConvType;
```

C++

```
TConvType vuCubicDecimeters;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicDecimeters.

153.2.99 StdConvs.vuCubicFeet Variable

Pascal

```
vuCubicFeet: TConvType;
```

C++

```
TConvType vuCubicFeet;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicFeet.

153.2.100 StdConvs.vuCubicHectometers Variable

Pascal

```
vuCubicHectometers: TConvType;
```

C++

```
TConvType vuCubicHectometers;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicHectometers.

153.2.101 StdConvs.vuCubicInches Variable

Pascal

```
vuCubicInches: TConvType;
```

C++

```
TConvType vuCubicInches;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicInches.

153.2.102 StdConvs.vuCubicKilometers Variable

Pascal

```
vuCubicKilometers: TConvType;
```

C++

```
TConvType vuCubicKilometers;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicKilometers.

153.2.103 StdConvs.vuCubicMeters Variable

Pascal

```
vuCubicMeters: TConvType;
```

C++

```
TConvType vuCubicMeters;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicMeters.

153.2.104 StdConvs.vuCubicMiles Variable

Pascal

```
vuCubicMiles: TConvType;
```

C++

```
TConvType vuCubicMiles;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicMiles.

153.2.105 StdConvs.vuCubicMillimeters Variable

Pascal

```
vuCubicMillimeters: TConvType;
```

C++

```
TConvType vuCubicMillimeters;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicMillimeters.

153.2.106 StdConvs.vuCubicYards Variable

Pascal

```
vuCubicYards: TConvType;
```

C++

```
TConvType vuCubicYards;
```

File

StdConvs

Description

This is variable StdConvs.vuCubicYards.

153.2.107 StdConvs.vuDecaLiters Variable

Pascal

```
vuDecaLiters: TConvType;
```

C++

```
TConvType vuDecaLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuDecaLiters.

153.2.108 StdConvs.vuDecasteres Variable

Pascal

```
vuDecasteres: TConvType;
```

C++

```
TConvType vuDecasteres;
```

File

StdConvs

Description

This is variable StdConvs.vuDecasteres.

153.2.109 StdConvs.vuDeciLiters Variable

Pascal

```
vuDeciLiters: TConvType;
```

C++

```
TConvType vuDeciLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuDeciLiters.

153.2.110 StdConvs.vuDecisteres Variable

Pascal

```
vuDecisteres: TConvType;
```

C++

```
TConvType vuDecisteres;
```

File

StdConvs

Description

This is variable StdConvs.vuDecisteres.

153.2.111 StdConvs.vuDryBuckets Variable

Pascal

```
vuDryBuckets: TConvType;
```

C++

```
TConvType vuDryBuckets;
```

File

StdConvs

Description

This is variable StdConvs.vuDryBuckets.

153.2.112 StdConvs.vuDryBushels Variable

Pascal

```
vuDryBushels: TConvType;
```

C++

```
TConvType vuDryBushels;
```

File

StdConvs

Description

This is variable StdConvs.vuDryBushels.

153.2.113 StdConvs.vuDryGallons Variable

Pascal

```
vuDryGallons: TConvType;
```

C++

```
TConvType vuDryGallons;
```

File

StdConvs

Description

This is variable StdConvs.vuDryGallons.

153.2.114 StdConvs.vuDryPecks Variable

Pascal

```
vuDryPecks: TConvType;
```

C++

```
TConvType vuDryPecks;
```

File

StdConvs

Description

This is variable StdConvs.vuDryPecks.

153.2.115 StdConvs.vuDryPints Variable

Pascal

```
vuDryPints: TConvType;
```

C++

```
TConvType vuDryPints;
```

File

StdConvs

Description

This is variable StdConvs.vuDryPints.

153.2.116 StdConvs.vuDryQuarts Variable

Pascal

```
vuDryQuarts: TConvType;
```

C++

```
TConvType vuDryQuarts;
```

File

StdConvs

Description

This is variable StdConvs.vuDryQuarts.

153.2.117 StdConvs.vuFluidCups Variable

Pascal

```
vuFluidCups: TConvType;
```

C++

```
TConvType vuFluidCups;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidCups.

153.2.118 StdConvs.vuFluidGallons Variable

Pascal

```
vuFluidGallons: TConvType;
```

C++

```
TConvType vuFluidGallons;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidGallons.

153.2.119 StdConvs.vuFluidGills Variable

Pascal

```
vuFluidGills: TConvType;
```

C++

```
TConvType vuFluidGills;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidGills.

153.2.120 StdConvs.vuFluidOunces Variable

Pascal

```
vuFluidOunces: TConvType;
```

C++

```
TConvType vuFluidOunces;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidOunces.

153.2.121 StdConvs.vuFluidPints Variable

Pascal

```
vuFluidPints: TConvType;
```

C++

```
TConvType vuFluidPints;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidPints.

153.2.122 StdConvs.vuFluidQuarts Variable

Pascal

```
vuFluidQuarts: TConvType;
```

C++

```
TConvType vuFluidQuarts;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidQuarts.

153.2.123 StdConvs.vuFluidTablespoons Variable

Pascal

```
vuFluidTablespoons: TConvType;
```

C++

```
TConvType vuFluidTablespoons;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidTablespoons.

153.2.124 StdConvs.vuFluidTeaspoons Variable

Pascal

```
vuFluidTeaspoons: TConvType;
```

C++

```
TConvType vuFluidTeaspoons;
```

File

StdConvs

Description

This is variable StdConvs.vuFluidTeaspoons.

153.2.125 StdConvs.vuHectoLiters Variable

Pascal

```
vuHectoLiters: TConvType;
```

C++

```
TConvType vuHectoLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuHectoLiters.

153.2.126 StdConvs.vuKiloLiters Variable

Pascal

```
vuKiloLiters: TConvType;
```

C++

```
TConvType vuKiloLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuKiloLiters.

153.2.127 StdConvs.vuLiters Variable

Pascal

```
vuLiters: TConvType;
```

C++

```
TConvType vuLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuLiters.

153.2.128 StdConvs.vuMilliLiters Variable

Pascal

```
vuMilliLiters: TConvType;
```

C++

```
TConvType vuMilliLiters;
```

File

StdConvs

Description

This is variable StdConvs.vuMilliLiters.

153.2.129 StdConvs.vuSteres Variable

Pascal

```
vuSteres: TConvType;
```

C++

```
TConvType vuSteres;
```

File

StdConvs

Description

This is variable StdConvs.vuSteres.

153.2.130 StdConvs.vuUKBuckets Variable

Pascal

```
vuUKBuckets: TConvType;
```

C++

```
TConvType vuUKBuckets;
```

File

StdConvs

Description

This is variable StdConvs.vuUKBuckets.

153.2.131 StdConvs.vuUKBushels Variable

Pascal

```
vuUKBushels: TConvType;
```

C++

```
TConvType vuUKBushels;
```

File

StdConvs

Description

This is variable StdConvs.vuUKBushels.

153.2.132 StdConvs.vuUKGallons Variable

Pascal

```
vuUKGallons: TConvType;
```

C++

```
TConvType vuUKGallons;
```

File

StdConvs

Description

This is variable StdConvs.vuUKGallons.

153.2.133 StdConvs.vuUKGills Variable

Pascal

```
vuUKGills: TConvType;
```

C++

```
TConvType vuUKGills;
```

File

StdConvs

Description

This is variable StdConvs.vuUKGills.

153.2.134 StdConvs.vuUKOunces Variable

Pascal

```
vuUKOunces: TConvType;
```

C++

```
TConvType vuUKOunces;
```

File

StdConvs

Description

This is variable StdConvs.vuUKOunces.

153.2.135 StdConvs.vuUKPecks Variable

Pascal

```
vuUKPecks: TConvType;
```

C++

```
TConvType vuUKPecks;
```

File

StdConvs

Description

This is variable StdConvs.vuUKPecks.

153.2.136 StdConvs.vuUKPints Variable

Pascal

```
vuUKPints: TConvType;
```

C++

```
TConvType vuUKPints;
```

File

StdConvs

Description

This is variable StdConvs.vuUKPints.

153.2.137 StdConvs.vuUKPottles Variable

Pascal

```
vuUKPottles: TConvType;
```

C++

```
TConvType vuUKPottles;
```

File

StdConvs

Description

This is variable StdConvs.vuUKPottles.

153.2.138 StdConvs.vuUKQuarts Variable

Pascal

```
vuUKQuarts: TConvType;
```

C++

```
TConvType vuUKQuarts;
```

File

StdConvs

Description

This is variable StdConvs.vuUKQuarts.

153.3 Constants

The following table lists constants in this documentation.

Constants

Name	Description
CubicMetersPerAcreFoot (see page 20884)	This is constant StdConvs.CubicMetersPerAcreFoot.
CubicMetersPerAcreInch (see page 20884)	This is constant StdConvs.CubicMetersPerAcreInch.
CubicMetersPerCord (see page 20885)	This is constant StdConvs.CubicMetersPerCord.
CubicMetersPerCordFoot (see page 20885)	This is constant StdConvs.CubicMetersPerCordFoot.
CubicMetersPerCubicFoot (see page 20885)	This is constant StdConvs.CubicMetersPerCubicFoot.
CubicMetersPerCubicInch (see page 20886)	This is constant StdConvs.CubicMetersPerCubicInch.
CubicMetersPerCubicMile (see page 20886)	This is constant StdConvs.CubicMetersPerCubicMile.
CubicMetersPerCubicYard (see page 20886)	This is constant StdConvs.CubicMetersPerCubicYard.
CubicMetersPerUKBucket (see page 20887)	This is constant StdConvs.CubicMetersPerUKBucket.
CubicMetersPerUKBushel (see page 20887)	This is constant StdConvs.CubicMetersPerUKBushel.
CubicMetersPerUKGallon (see page 20887)	This is constant StdConvs.CubicMetersPerUKGallon.
CubicMetersPerUKGill (see page 20888)	This is constant StdConvs.CubicMetersPerUKGill.
CubicMetersPerUKOunce (see page 20888)	This is constant StdConvs.CubicMetersPerUKOunce.
CubicMetersPerUKPeck (see page 20888)	This is constant StdConvs.CubicMetersPerUKPeck.
CubicMetersPerUKPint (see page 20889)	This is constant StdConvs.CubicMetersPerUKPint.
CubicMetersPerUKPottle (see page 20889)	This is constant StdConvs.CubicMetersPerUKPottle.
CubicMetersPerUKQuart (see page 20889)	This is constant StdConvs.CubicMetersPerUKQuart.
CubicMetersPerUSDryBucket (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryBucket.
CubicMetersPerUSDryBushel (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryBushel.
CubicMetersPerUSDryGallon (see page 20890)	This is constant StdConvs.CubicMetersPerUSDryGallon.
CubicMetersPerUSDryPeck (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryPeck.
CubicMetersPerUSDryPint (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryPint.
CubicMetersPerUSDryQuart (see page 20891)	This is constant StdConvs.CubicMetersPerUSDryQuart.
CubicMetersPerUSFluidCup (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidCup.
CubicMetersPerUSFluidGallon (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidGallon.
CubicMetersPerUSFluidGill (see page 20892)	This is constant StdConvs.CubicMetersPerUSFluidGill.
CubicMetersPerUSFluidOunce (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidOunce.
CubicMetersPerUSFluidPint (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidPint.
CubicMetersPerUSFluidQuart (see page 20893)	This is constant StdConvs.CubicMetersPerUSFluidQuart.
CubicMetersPerUSFluidTablespoon (see page 20894)	This is constant StdConvs.CubicMetersPerUSFluidTablespoon.
CubicMetersPerUSFluidTeaspoon (see page 20894)	This is constant StdConvs.CubicMetersPerUSFluidTeaspoon.
GramsPerDrams (see page 20894)	This is constant StdConvs.GramsPerDrams.
GramsPerGrains (see page 20895)	This is constant StdConvs.GramsPerGrains.
GramsPerLongTons (see page 20895)	This is constant StdConvs.GramsPerLongTons.
GramsPerOunces (see page 20895)	This is constant StdConvs.GramsPerOunces.
GramsPerPound (see page 20896)	This is constant StdConvs.GramsPerPound.
GramsPerStones (see page 20896)	This is constant StdConvs.GramsPerStones.
GramsPerTons (see page 20896)	This is constant StdConvs.GramsPerTons.
MetersPerAstronomicalUnit (see page 20897)	This is constant StdConvs.MetersPerAstronomicalUnit.
MetersPerChain (see page 20897)	This is constant StdConvs.MetersPerChain.
MetersPerCubit (see page 20897)	This is constant StdConvs.MetersPerCubit.
MetersPerFathom (see page 20898)	This is constant StdConvs.MetersPerFathom.
MetersPerFoot (see page 20898)	This is constant StdConvs.MetersPerFoot.
MetersPerFurlong (see page 20898)	This is constant StdConvs.MetersPerFurlong.

MetersPerHand (see page 20899)	This is constant StdConvs.MetersPerHand.
MetersPerInch (see page 20899)	This is constant StdConvs.MetersPerInch.
MetersPerLightSecond (see page 20899)	This is constant StdConvs.MetersPerLightSecond.
MetersPerLightYear (see page 20900)	This is constant StdConvs.MetersPerLightYear.
MetersPerLink (see page 20900)	This is constant StdConvs.MetersPerLink.
MetersPerMile (see page 20900)	This is constant StdConvs.MetersPerMile.
MetersPerNauticalMiles (see page 20901)	This is constant StdConvs.MetersPerNauticalMiles.
MetersPerPace (see page 20901)	This is constant StdConvs.MetersPerPace.
MetersPerParsec (see page 20901)	This is constant StdConvs.MetersPerParsec.
MetersPerPica (see page 20902)	This is constant StdConvs.MetersPerPica.
MetersPerPoint (see page 20902)	This is constant StdConvs.MetersPerPoint.
MetersPerRod (see page 20902)	This is constant StdConvs.MetersPerRod.
MetersPerYard (see page 20903)	This is constant StdConvs.MetersPerYard.
SquareMetersPerAcre (see page 20903)	This is constant StdConvs.SquareMetersPerAcre.
SquareMetersPerSquareFoot (see page 20903)	This is constant StdConvs.SquareMetersPerSquareFoot.
SquareMetersPerSquareInch (see page 20904)	This is constant StdConvs.SquareMetersPerSquareInch.
SquareMetersPerSquareMile (see page 20904)	This is constant StdConvs.SquareMetersPerSquareMile.
SquareMetersPerSquareRod (see page 20904)	This is constant StdConvs.SquareMetersPerSquareRod.
SquareMetersPerSquareYard (see page 20905)	This is constant StdConvs.SquareMetersPerSquareYard.

153.3.1 StdConvs.CubicMetersPerAcreFoot Constant

Pascal

```
CubicMetersPerAcreFoot = SquareMetersPerAcre * MetersPerFoot;
```

C++

```
CubicMetersPerAcreFoot = SquareMetersPerAcre * MetersPerFoot;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerAcreFoot.

153.3.2 StdConvs.CubicMetersPerAcreInch Constant

Pascal

```
CubicMetersPerAcreInch = SquareMetersPerAcre * MetersPerInch;
```

C++

```
CubicMetersPerAcreInch = SquareMetersPerAcre * MetersPerInch;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerAcreInch.

153.3.3 StdConvs.CubicMetersPerCord Constant

Pascal

```
CubicMetersPerCord = CubicMetersPerCubicFoot * 128;
```

C++

```
CubicMetersPerCord = CubicMetersPerCubicFoot * 128;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCord.

153.3.4 StdConvs.CubicMetersPerCordFoot Constant

Pascal

```
CubicMetersPerCordFoot = CubicMetersPerCubicFoot * 16;
```

C++

```
CubicMetersPerCordFoot = CubicMetersPerCubicFoot * 16;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCordFoot.

153.3.5 StdConvs.CubicMetersPerCubicFoot Constant

Pascal

```
CubicMetersPerCubicFoot = MetersPerFoot * MetersPerFoot * MetersPerFoot;
```

C++

```
CubicMetersPerCubicFoot = MetersPerFoot * MetersPerFoot * MetersPerFoot;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCubicFoot.

153.3.6 StdConvs.CubicMetersPerCubicInch Constant

Pascal

```
CubicMetersPerCubicInch = MetersPerInch * MetersPerInch * MetersPerInch;
```

C++

```
CubicMetersPerCubicInch = MetersPerInch * MetersPerInch * MetersPerInch;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCubicInch.

153.3.7 StdConvs.CubicMetersPerCubicMile Constant

Pascal

```
CubicMetersPerCubicMile = MetersPerMile * MetersPerMile * MetersPerMile;
```

C++

```
CubicMetersPerCubicMile = MetersPerMile * MetersPerMile * MetersPerMile;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCubicMile.

153.3.8 StdConvs.CubicMetersPerCubicYard Constant

Pascal

```
CubicMetersPerCubicYard = MetersPerYard * MetersPerYard * MetersPerYard;
```

C++

```
CubicMetersPerCubicYard = MetersPerYard * MetersPerYard * MetersPerYard;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerCubicYard.

153.3.9 StdConvs.CubicMetersPerUKBucket Constant

Pascal

```
CubicMetersPerUKBucket = CubicMetersPerUKPeck * 2;
```

C++

```
CubicMetersPerUKBucket = CubicMetersPerUKPeck * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKBucket.

153.3.10 StdConvs.CubicMetersPerUKBushel Constant

Pascal

```
CubicMetersPerUKBushel = CubicMetersPerUKBucket * 2;
```

C++

```
CubicMetersPerUKBushel = CubicMetersPerUKBucket * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKBushel.

153.3.11 StdConvs.CubicMetersPerUKGallon Constant

Pascal

```
CubicMetersPerUKGallon = 0.00454609;
```

C++

```
CubicMetersPerUKGallon = 0.00454609;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKGallon.

153.3.12 StdConvs.CubicMetersPerUKGill Constant

Pascal

```
CubicMetersPerUKGill = CubicMetersPerUKPint / 4;
```

C++

```
CubicMetersPerUKGill = CubicMetersPerUKPint / 4;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKGill.

153.3.13 StdConvs.CubicMetersPerUKOunce Constant

Pascal

```
CubicMetersPerUKOunce = CubicMetersPerUKPint / 20;
```

C++

```
CubicMetersPerUKOunce = CubicMetersPerUKPint / 20;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKOunce.

153.3.14 StdConvs.CubicMetersPerUKPeck Constant

Pascal

```
CubicMetersPerUKPeck = CubicMetersPerUKGallon * 2;
```

C++

```
CubicMetersPerUKPeck = CubicMetersPerUKGallon * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKPeck.

153.3.15 StdConvs.CubicMetersPerUKPint Constant

Pascal

```
CubicMetersPerUKPint = CubicMetersPerUKQuart / 2;
```

C++

```
CubicMetersPerUKPint = CubicMetersPerUKQuart / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKPint.

153.3.16 StdConvs.CubicMetersPerUKPottle Constant

Pascal

```
CubicMetersPerUKPottle = CubicMetersPerUKGallon / 2;
```

C++

```
CubicMetersPerUKPottle = CubicMetersPerUKGallon / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKPottle.

153.3.17 StdConvs.CubicMetersPerUKQuart Constant

Pascal

```
CubicMetersPerUKQuart = CubicMetersPerUKPottle / 2;
```

C++

```
CubicMetersPerUKQuart = CubicMetersPerUKPottle / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUKQuart.

153.3.18 StdConvs.CubicMetersPerUSDryBucket Constant

Pascal

```
CubicMetersPerUSDryBucket = CubicMetersPerUSDryPeck * 2;
```

C++

```
CubicMetersPerUSDryBucket = CubicMetersPerUSDryPeck * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryBucket.

153.3.19 StdConvs.CubicMetersPerUSDryBushel Constant

Pascal

```
CubicMetersPerUSDryBushel = CubicMetersPerUSDryBucket * 2;
```

C++

```
CubicMetersPerUSDryBushel = CubicMetersPerUSDryBucket * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryBushel.

153.3.20 StdConvs.CubicMetersPerUSDryGallon Constant

Pascal

```
CubicMetersPerUSDryGallon = CubicMetersPerCubicInch * 268.8025;
```

C++

```
CubicMetersPerUSDryGallon = CubicMetersPerCubicInch * 268.8025;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryGallon.

153.3.21 StdConvs.CubicMetersPerUSDryPeck Constant

Pascal

```
CubicMetersPerUSDryPeck = CubicMetersPerUSDryGallon * 2;
```

C++

```
CubicMetersPerUSDryPeck = CubicMetersPerUSDryGallon * 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryPeck.

153.3.22 StdConvs.CubicMetersPerUSDryPint Constant

Pascal

```
CubicMetersPerUSDryPint = CubicMetersPerUSDryQuart / 2;
```

C++

```
CubicMetersPerUSDryPint = CubicMetersPerUSDryQuart / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryPint.

153.3.23 StdConvs.CubicMetersPerUSDryQuart Constant

Pascal

```
CubicMetersPerUSDryQuart = CubicMetersPerUSDryGallon / 4;
```

C++

```
CubicMetersPerUSDryQuart = CubicMetersPerUSDryGallon / 4;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSDryQuart.

153.3.24 StdConvs.CubicMetersPerUSFluidCup Constant

Pascal

```
CubicMetersPerUSFluidCup = CubicMetersPerUSFluidPint / 2;
```

C++

```
CubicMetersPerUSFluidCup = CubicMetersPerUSFluidPint / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidCup.

153.3.25 StdConvs.CubicMetersPerUSFluidGallon Constant

Pascal

```
CubicMetersPerUSFluidGallon = CubicMetersPerCubicInch * 231;
```

C++

```
CubicMetersPerUSFluidGallon = CubicMetersPerCubicInch * 231;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidGallon.

153.3.26 StdConvs.CubicMetersPerUSFluidGill Constant

Pascal

```
CubicMetersPerUSFluidGill = CubicMetersPerUSFluidCup / 2;
```

C++

```
CubicMetersPerUSFluidGill = CubicMetersPerUSFluidCup / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidGill.

153.3.27 StdConvs.CubicMetersPerUSFluidOunce Constant

Pascal

```
CubicMetersPerUSFluidOunce = CubicMetersPerUSFluidCup / 8;
```

C++

```
CubicMetersPerUSFluidOunce = CubicMetersPerUSFluidCup / 8;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidOunce.

153.3.28 StdConvs.CubicMetersPerUSFluidPint Constant

Pascal

```
CubicMetersPerUSFluidPint = CubicMetersPerUSFluidQuart / 2;
```

C++

```
CubicMetersPerUSFluidPint = CubicMetersPerUSFluidQuart / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidPint.

153.3.29 StdConvs.CubicMetersPerUSFluidQuart Constant

Pascal

```
CubicMetersPerUSFluidQuart = CubicMetersPerUSFluidGallon / 4;
```

C++

```
CubicMetersPerUSFluidQuart = CubicMetersPerUSFluidGallon / 4;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidQuart.

153.3.30 StdConvs.CubicMetersPerUSFluidTablespoon Constant

Pascal

```
CubicMetersPerUSFluidTablespoon = CubicMetersPerUSFluidOunce / 2;
```

C++

```
CubicMetersPerUSFluidTablespoon = CubicMetersPerUSFluidOunce / 2;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidTablespoon.

153.3.31 StdConvs.CubicMetersPerUSFluidTeaspoon Constant

Pascal

```
CubicMetersPerUSFluidTeaspoon = CubicMetersPerUSFluidOunce / 6;
```

C++

```
CubicMetersPerUSFluidTeaspoon = CubicMetersPerUSFluidOunce / 6;
```

File

StdConvs

Description

This is constant StdConvs.CubicMetersPerUSFluidTeaspoon.

153.3.32 StdConvs.GramsPerDrams Constant

Pascal

```
GramsPerDrams = GramsPerPound / 256;
```

C++

```
GramsPerDrams = GramsPerPound / 256;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerDrams.

153.3.33 StdConvs.GramsPerGrains Constant

Pascal

```
GramsPerGrains = GramsPerPound / 7000;
```

C++

```
GramsPerGrains = GramsPerPound / 7000;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerGrains.

153.3.34 StdConvs.GramsPerLongTons Constant

Pascal

```
GramsPerLongTons = GramsPerPound * 2240;
```

C++

```
GramsPerLongTons = GramsPerPound * 2240;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerLongTons.

153.3.35 StdConvs.GramsPerOunces Constant

Pascal

```
GramsPerOunces = GramsPerPound / 16;
```

C++

```
GramsPerOunces = GramsPerPound / 16;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerOunces.

153.3.36 StdConvs.GramsPerPound Constant

Pascal

```
GramsPerPound = 453.59237;
```

C++

```
GramsPerPound = 453.59237;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerPound.

153.3.37 StdConvs.GramsPerStones Constant

Pascal

```
GramsPerStones = GramsPerPound * 14;
```

C++

```
GramsPerStones = GramsPerPound * 14;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerStones.

153.3.38 StdConvs.GramsPerTons Constant

Pascal

```
GramsPerTons = GramsPerPound * 2000;
```

C++

```
GramsPerTons = GramsPerPound * 2000;
```

File

StdConvs

Description

This is constant StdConvs.GramsPerTons.

153.3.39 StdConvs.MetersPerAstronomicalUnit Constant

Pascal

```
MetersPerAstronomicalUnit = 1.49598E11;
```

C++

```
MetersPerAstronomicalUnit = 1.49598E11;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerAstronomicalUnit.

153.3.40 StdConvs.MetersPerChain Constant

Pascal

```
MetersPerChain = MetersPerRod * 4;
```

C++

```
MetersPerChain = MetersPerRod * 4;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerChain.

153.3.41 StdConvs.MetersPerCubit Constant

Pascal

```
MetersPerCubit = 0.4572;
```

C++

```
MetersPerCubit = 0.4572;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerCubit.

153.3.42 StdConvs.MetersPerFathom Constant

Pascal

```
MetersPerFathom = MetersPerFoot * 6;
```

C++

```
MetersPerFathom = MetersPerFoot * 6;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerFathom.

153.3.43 StdConvs.MetersPerFoot Constant

Pascal

```
MetersPerFoot = MetersPerInch * 12;
```

C++

```
MetersPerFoot = MetersPerInch * 12;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerFoot.

153.3.44 StdConvs.MetersPerFurlong Constant

Pascal

```
MetersPerFurlong = MetersPerYard * 220;
```

C++

```
MetersPerFurlong = MetersPerYard * 220;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerFurlong.

153.3.45 StdConvs.MetersPerHand Constant

Pascal

```
MetersPerHand = MetersPerInch * 4;
```

C++

```
MetersPerHand = MetersPerInch * 4;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerHand.

153.3.46 StdConvs.MetersPerInch Constant

Pascal

```
MetersPerInch = 0.0254;
```

C++

```
MetersPerInch = 0.0254;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerInch.

153.3.47 StdConvs.MetersPerLightSecond Constant

Pascal

```
MetersPerLightSecond = 2.99792458E8;
```

C++

```
MetersPerLightSecond = 2.99792458E8;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerLightSecond.

153.3.48 StdConvs.MetersPerLightYear Constant

Pascal

```
MetersPerLightYear = MetersPerLightSecond * 31556925.9747;
```

C++

```
MetersPerLightYear = MetersPerLightSecond * 31556925.9747;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerLightYear.

153.3.49 StdConvs.MetersPerLink Constant

Pascal

```
MetersPerLink = MetersPerChain / 100;
```

C++

```
MetersPerLink = MetersPerChain / 100;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerLink.

153.3.50 StdConvs.MetersPerMile Constant

Pascal

```
MetersPerMile = MetersPerFoot * 5280;
```

C++

```
MetersPerMile = MetersPerFoot * 5280;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerMile.

153.3.51 StdConvs.MetersPerNauticalMiles Constant

Pascal

```
MetersPerNauticalMiles = 1852;
```

C++

```
MetersPerNauticalMiles = 1852;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerNauticalMiles.

153.3.52 StdConvs.MetersPerPace Constant

Pascal

```
MetersPerPace = MetersPerInch * 30;
```

C++

```
MetersPerPace = MetersPerInch * 30;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerPace.

153.3.53 StdConvs.MetersPerParsec Constant

Pascal

```
MetersPerParsec = MetersPerAstronomicalUnit * 206264.806247096;
```

C++

```
MetersPerParsec = MetersPerAstronomicalUnit * 206264.806247096;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerParsec.

153.3.54 StdConvs.MetersPerPica Constant

Pascal

```
MetersPerPica = MetersPerPoint * 12;
```

C++

```
MetersPerPica = MetersPerPoint * 12;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerPica.

153.3.55 StdConvs.MetersPerPoint Constant

Pascal

```
MetersPerPoint = MetersPerInch * 0.013837;
```

C++

```
MetersPerPoint = MetersPerInch * 0.013837;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerPoint.

153.3.56 StdConvs.MetersPerRod Constant

Pascal

```
MetersPerRod = MetersPerFoot * 16.5;
```

C++

```
MetersPerRod = MetersPerFoot * 16.5;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerRod.

153.3.57 StdConvs.MetersPerYard Constant

Pascal

```
MetersPerYard = MetersPerFoot * 3;
```

C++

```
MetersPerYard = MetersPerFoot * 3;
```

File

StdConvs

Description

This is constant StdConvs.MetersPerYard.

153.3.58 StdConvs.SquareMetersPerAcre Constant

Pascal

```
SquareMetersPerAcre = SquareMetersPerSquareYard * 4840;
```

C++

```
SquareMetersPerAcre = SquareMetersPerSquareYard * 4840;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerAcre.

153.3.59 StdConvs.SquareMetersPerSquareFoot Constant

Pascal

```
SquareMetersPerSquareFoot = MetersPerFoot * MetersPerFoot;
```

C++

```
SquareMetersPerSquareFoot = MetersPerFoot * MetersPerFoot;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerSquareFoot.

153.3.60 StdConvs.SquareMetersPerSquareInch Constant

Pascal

```
SquareMetersPerSquareInch = MetersPerInch * MetersPerInch;
```

C++

```
SquareMetersPerSquareInch = MetersPerInch * MetersPerInch;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerSquareInch.

153.3.61 StdConvs.SquareMetersPerSquareMile Constant

Pascal

```
SquareMetersPerSquareMile = MetersPerMile * MetersPerMile;
```

C++

```
SquareMetersPerSquareMile = MetersPerMile * MetersPerMile;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerSquareMile.

153.3.62 StdConvs.SquareMetersPerSquareRod Constant

Pascal

```
SquareMetersPerSquareRod = MetersPerRod * MetersPerRod;
```

C++

```
SquareMetersPerSquareRod = MetersPerRod * MetersPerRod;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerSquareRod.

153.3.63 StdConvs.SquareMetersPerSquareYard Constant

Pascal

```
SquareMetersPerSquareYard = MetersPerYard * MetersPerYard;
```

C++

```
SquareMetersPerSquareYard = MetersPerYard * MetersPerYard;
```

File

StdConvs

Description

This is constant StdConvs.SquareMetersPerSquareYard.

154 StdCtrls Namespace

This is namespace StdCtrls.

Topics

Name	Description
Classes (see page 20909)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 21945)	The following table lists structs, records, enums in this documentation.
Types (see page 21953)	The following table lists types in this documentation.

Classes

	Name	Description
	TButton (see page 20909)	TButton is a push button control.
	TButtonActionLink (see page 20976)	TButtonActionLink is an action link designed specifically for button control clients.
	TButtonControl (see page 20981)	TButtonControl is the base class for objects that represent Windows button controls.
	TCheckBox (see page 20996)	TCheckBox represents a check box that can be on (checked) or off (unchecked)
	TComboBox (see page 21064)	TComboBox combines an edit box with a scrollable list.
	TCustomCheckBox (see page 21138)	TCustomCheckBox is the ancestor of all check-box components.
	TCustomCombo (see page 21154)	TCustomCombo is the base class for all combo boxes.
	TCustomComboBox (see page 21201)	TCustomComboBox is the base class for combobox components.
	TCustomComboBoxStrings (see page 21225)	TCustomComboBoxStrings represents the strings in the drop-down list of a combo box.
	TCustomEdit (see page 21232)	TCustomEdit is the base class from which all edit-box and memo controls are derived.
	TCustomGroupBox (see page 21275)	TCustomGroupBox is the base class for all group-box components.
	TCustomLabel (see page 21288)	TCustomLabel is the base class for non-windowed controls that display text on a form.
	TCustomListBox (see page 21308)	TCustomListBox is the base class for listbox objects that are wrappers for list box controls.
	TCustomMemo (see page 21362)	TCustomMemo is the base type for memo components, which are multiline edit boxes, including TMemo (see page 21678) and TDBMemo.
	TCustomStaticText (see page 21387)	TCustomStaticText is the base class for TStaticText (see page 21887).
	TEdit (see page 21402)	TEdit is a wrapper for a Windows single-line edit control.
	TGroupBox (see page 21474)	TGroupBox represents a Windows group box.
	TLabel (see page 21544)	TLabel is a nonwindowed control that displays text on a form.
	TListBox (see page 21598)	TListBox displays a collection of items in a scrollable list.
	TMemo (see page 21678)	TMemo is a wrapper for a Windows multiline edit control.
	TRadioButton (see page 21753)	TRadioButton is a wrapper for a system radio button.

	TScrollBar (see page 21821)	TScrollBar is a Windows scroll bar, which is used to scroll the contents of a window, form, or control.
	TStaticText (see page 21887)	TStaticText is a windowed control that displays text on a form.

Structs, Records, Enums

	Name	Description
	TCheckBoxState (see page 21945)	TCheckBoxState indicates the state of a check box control.
	TComboBoxStyle (see page 21946)	TComboBoxStyle is the type for the Style property of combo box controls that are defined in the StdCtrls unit.
	TEditCharCase (see page 21946)	TEditCharCase indicates how a control forces the case of characters, if at all.
	TEllipsisPosition (see page 21947)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	TListBoxStyle (see page 21948)	TListBoxStyle specifies the way a listbox control gets its data and how it is drawn.
	TScrollCode (see page 21949)	TScrollCode indicates what action the user performed on a scroll bar.
	TScrollStyle (see page 21950)	Identifies a set of scrollbars by their orientation.
	TSelection (see page 21950)	TSelection definese the start and position of a selection.
	TStaticBorderStyle (see page 21951)	TStaticBorderStyle determines the appearance of the border on a static text control.
	TTextLayout (see page 21951)	TTextLayout indicates where text appears within the client area of a control.

Types

Name	Description
TButtonActionLinkClass (see page 21953)	This is type StdCtrls.TButtonActionLinkClass.
TCustomComboBoxStringsClass (see page 21953)	TCustomComboBoxStringsClass describes a descendant of TCustomComboBoxStrings (see page 21225).
TDrawItemEvent (see page 21954)	TScrollEvent (see page 21957) is the type of an OnScroll event handler.
TLBFindDataEvent (see page 21954)	TLBFindDataEvent is the type of the list box OnDataFind event handler.
TLBGetDataEvent (see page 21955)	TLBGetDataEvent is the type of the list box OnData event handler.
TLBGetDataObjectEvent (see page 21955)	TLBGetDataObjectEvent is the type of the list box OnDataObject event handler.
TMeasureItemEvent (see page 21955)	TMeasureItemEvent is the type for the OnMeasureItem event handler.
TOwnerDrawState (see page 21956)	Indicates state information that can influence how an item is drawn.
TScrollEvent (see page 21957)	This is type StdCtrls.TScrollEvent.

154.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TButton (see page 20909)	TButton is a push button control.
	TButtonActionLink (see page 20976)	TButtonActionLink is an action link designed specifically for button control clients.
	TButtonControl (see page 20981)	TButtonControl is the base class for objects that represent Windows button controls.
	TCheckBox (see page 20996)	TCheckBox represents a check box that can be on (checked) or off (unchecked)
	TComboBox (see page 21064)	TComboBox combines an edit box with a scrollable list.
	TCustomCheckBox (see page 21138)	TCustomCheckBox is the ancestor of all check-box components.
	TCustomCombo (see page 21154)	TCustomCombo is the base class for all combo boxes.
	TCustomComboBox (see page 21201)	TCustomComboBox is the base class for combobox components.
	TCustomComboBoxStrings (see page 21225)	TCustomComboBoxStrings represents the strings in the drop-down list of a combo box.
	TCustomEdit (see page 21232)	TCustomEdit is the base class from which all edit-box and memo controls are derived.
	TCustomGroupBox (see page 21275)	TCustomGroupBox is the base class for all group-box components.
	TCustomLabel (see page 21288)	TCustomLabel is the base class for non-windowed controls that display text on a form.
	TCustomListBox (see page 21308)	TCustomListBox is the base class for listbox objects that are wrappers for list box controls.
	TCustomMemo (see page 21362)	TCustomMemo is the base type for memo components, which are multiline edit boxes, including TMemo (see page 21678) and TDBMemo.
	TCustomStaticText (see page 21387)	TCustomStaticText is the base class for TStaticText (see page 21887).
	TEdit (see page 21402)	TEdit is a wrapper for a Windows single-line edit control.
	TGroupBox (see page 21474)	TGroupBox represents a Windows group box.
	TLabel (see page 21544)	TLabel is a nonwindowed control that displays text on a form.
	TListBox (see page 21598)	TListBox displays a collection of items in a scrollable list.
	TMemo (see page 21678)	TMemo is a wrapper for a Windows multiline edit control.
	TRadioButton (see page 21753)	TRadioButton is a wrapper for a system radio button.
	TScrollBar (see page 21821)	TScrollBar is a Windows scroll bar, which is used to scroll the contents of a window, form, or control.
	TStaticText (see page 21887)	TStaticText is a windowed control that displays text on a form.

154.1.1 TButton Class

TButton is a push button control.

Class Hierarchy

Pascal

```
TButton = class(TButtonControl);
```

C++

```
class TButton : public TButtonControl;
```

File

StdCtrls

Description

Use TButton to put a standard push button on a form. TButton introduces several properties to control its behavior in a dialog box setting. Users choose button controls to initiate actions.

To use a button that displays a bitmap instead of a label, use TBitBtn. To use a button that can remain in a depressed position, use TSpeedButton.

Note: Since the TButton caption is always centered, changing the BiDi alignment has no effect.

TSpeedButton (see page 2335)

Button Controls

Buttons and Similar Controls

154.1.1.1 TButton Members

The following tables list the members exposed by TButton.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.

	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
V	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 20921)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 20922)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.

	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.

	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.

	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetButtonStyle (see page 20922)	This is SetButtonStyle, a member of class TButton.
	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 20994)	Handles Windows messages.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Checked (see page 20995)	Specifies whether the button control is checked.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Click (see page 20921)	Simulates a mouse click, as if the user had clicked the button.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 20920)	Creates and initializes a TButton (see page 20909) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.

	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
V	UseRightToLeftAlignment (see page 20923)	Specifies whether the control's alignment is in a right-to-left mode.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.

	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 20949)	Occurs when the user clicks the control.
	OnContextPopup (see page 20951)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 20951)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 20954)	Occurs when the user drags an object over a control.
	OnEndDock (see page 20956)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 20956)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 20957)	Occurs when a control receives the input focus.
	OnExit (see page 20960)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 20961)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 20964)	Occurs when a key is pressed.
	OnKeyUp (see page 20965)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 20967)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 20968)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 20970)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 20970)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 20971)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 20973)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 20975)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 20976)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Action (see page 20924)	Designates the action associated with the control.
	Align (see page 20924)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 20927)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 20928)	Specifies the bi-directional mode for the control.
	Cancel (see page 20929)	Determines whether the button's OnClick (see page 20949) event handler executes when the Escape key is pressed.
	Caption (see page 20929)	Specifies a text string that identifies the control to the user.
	Constraints (see page 20932)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Default (see page 20932)	Determines whether the button's OnClick (see page 20949) event handler executes when the Enter key is pressed.
	DragCursor (see page 20933)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 20934)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 20934)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 20936)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 20936)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	ModalResult (see page 20937)	Determines whether and how the button closes its (modal) parent form.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 20938)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 20938)	Determines where a control looks for its font information.
	ParentShowHint (see page 20939)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 20939)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 20944)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 20945)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 20946)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 20946)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 20948)	Specifies whether the button text wraps to fit the width of the control.

154.1.1.2 TButton.Create Constructor

Creates and initializes a TButton (see page 20909) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TButton(TComponent * AOwner);
```

Description

Use Create to programmatically instantiate a button. Buttons (see page 2289) added in the form designer are created automatically.

AOwner is the component that is responsible for freeing the button instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

154.1.1.3 TButton Methods

The methods of the TButton class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 20921)	Initializes a window-creation parameter data structure.
	CreateWnd (see page 20922)	Creates the underlying window.
	SetButtonStyle (see page 20922)	This is SetButtonStyle, a member of class TButton.

Public Methods

	Name	Description
	Click (see page 20921)	Simulates a mouse click, as if the user had clicked the button.
	UseRightToLeftAlignment (see page 20923)	Specifies whether the control's alignment is in a right-to-left mode.

154.1.1.3.1 TButton.Click Method

Simulates a mouse click, as if the user had clicked the button.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Calling Click assigns the value of the button's ModalResult (see page 20937) property to the ModalResult (see page 20937) property of its parent form, and then generates an OnClick (see page 20949) event.

See Also

ModalResult (see page 20937)

OnClick (see page 5851)

154.1.1.3.2 TButton.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

154.1.1.3.3 TButton.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams (see page 6135)

CreateWindowHandle (see page 6137)

Perform (see page 5776)

DestroyWnd (see page 6141)

154.1.1.3.4 TButton.SetButtonStyle Method

Pascal

```
procedure SetButtonStyle(ADefault: Boolean); virtual;
```

C++

```
virtual __fastcall SetButtonStyle(Boolean ADefault);
```

Description

This is SetButtonStyle, a member of class TButton.

154.1.1.3.5 TButton.UseRightToLeftAlignment Method

Specifies whether the control's alignment is in a right-to-left mode.

Pascal

```
function UseRightToLeftAlignment: Boolean; override;
```

C++

```
virtual __fastcall Boolean UseRightToLeftAlignment();
```

Description

For TButton (see page 20909), UseRightToLeftAlignment always returns false. This is because the alignment of a button should never be reversed automatically when running in Middle Eastern locales.

See Also

ModalResult (see page 20937)

OnClick (see page 5851)

154.1.1.4 TButton Properties

The properties of the TButton class are listed here.

Published Properties

	Name	Description
	Action (see page 20924)	Designates the action associated with the control.
	Align (see page 20924)	Determines how the control aligns within its container (parent control).
	Anchors (see page 20927)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 20928)	Specifies the bi-directional mode for the control.
	Cancel (see page 20929)	Determines whether the button's OnClick (see page 20949) event handler executes when the Escape key is pressed.
	Caption (see page 20929)	Specifies a text string that identifies the control to the user.
	Constraints (see page 20932)	Specifies the size constraints for the control.
	Default (see page 20932)	Determines whether the button's OnClick (see page 20949) event handler executes when the Enter key is pressed.
	DragCursor (see page 20933)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 20934)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 20934)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 20936)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 20936)	Controls the attributes of text written on or in the control.
	ModalResult (see page 20937)	Determines whether and how the button closes its (modal) parent form.
	ParentBiDiMode (see page 20938)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 20938)	Determines where a control looks for its font information.
	ParentShowHint (see page 20939)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 20939)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 20944)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 20945)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 20946)	Determines if the user can tab to a control.
	Visible (see page 20946)	Determines whether the component appears onscreen.

	WordWrap (see page 20948)	Specifies whether the button text wraps to fit the width of the control.

154.1.1.4.1 TButton.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

154.1.1.4.2 TButton.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
```

```
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;
```

```

  i: Integer;
begin
  for i := Low(TabTitles) to High(TabTitles) do
  begin
    pts[i].Free;
  end;
  PageControl1.Free;
end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

154.1.1.4.3 TButton.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

154.1.1.4.4 TButton.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.1.4.5 TButton.Cancel Property

Determines whether the button's OnClick (see page 20949) event handler executes when the Escape key is pressed.

Pascal

```
property Cancel: Boolean;
```

C++

```
__property Boolean Cancel;
```

Description

If Cancel is true, the button's OnClick (see page 20949) event handler executes when the user presses Esc. Although an application can have more than one Cancel button, the form calls the OnClick (see page 20949) event handler only for the first visible button in the tab order.

See Also

Default (see page 20932)

OnClick (see page 5851)

154.1.1.4.6 TButton.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
```

```
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

154.1.1.4.7 TButton.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.1.4.8 TButton.Default Property

Determines whether the button's OnClick (see page 20949) event handler executes when the Enter key is pressed.

Pascal

```
property Default: Boolean;
```

C++

```
__property Boolean Default;
```

Description

If Default is true, the button's OnClick (see page 20949) event handler executes when the user presses Enter.

Although an application can have more than one Default button, the form calls the OnClick (see page 20949) event handler only for the first visible button in the tab order. Moreover, any button that has focus becomes the Default button temporarily; hence, if the user selects another button before pressing Enter, the selected button's OnClick (see page 20949) event handler executes instead.

C++ Examples:

```
/*
This example uses a file list box, a directory list box, a
filter combo box, a drive combo box, a label, an edit box,
```

```
and a button on a form. When the user runs the application
and enters a path or filename in the edit box and presses
the button, all the controls update:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  FileListBox1->FileEdit = Edit1;
  FilterComboBox1->FileList = FileListBox1;
  DirectoryListBox1->FileList = FileListBox1;
  DirectoryListBox1->DirLabel = Label1;
  DriveComboBox1->DirList = DirectoryListBox1;
  Button1->Default = true;
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FileListBox1->ApplyFilePath(Edit1->Text);
}
```

Delphi Examples:

```
{
This example uses a file list box, a directory list box, a
filter combo box, a drive combo box, a label, an edit box,
and a button on a form. When the user runs the application
and enters a path or filename in the edit box and presses
the button, all the controls update:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  FileListBox1.ApplyFilePath(Edit1.Text);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  FileListBox1.FileEdit := Edit1;
  FilterComboBox1.FileList := FileListBox1;
  DirectoryListBox1.FileList := FileListBox1;
  DirectoryListBox1.DirLabel := Label1;
  DriveComboBox1.DirList := DirectoryListBox1;
  Button1.Default := True;
end;
```

See Also

Cancel (see page 20929)

OnClick (see page 5851)

154.1.1.4.9 TButton.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.1.4.10 TButton.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.1.4.11 TButton.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
```

```
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);

Arranging the Order of Persistent Columns

154.1.1.4.12 TButton.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

154.1.1.4.13 TButton.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
```

```
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

154.1.1.4.14 TButton.ModalResult Property

Determines whether and how the button closes its (modal) parent form.

Pascal

```
property ModalResult: TModalResult;
```

C++

```
__property TModalResult ModalResult;
```

Description

Setting the TButton (see page 20909) component's ModalResult property is an easy way to make clicking the button close a modal form. When a button is clicked, the ModalResult property of its parent form is set to the same value as the button's ModalResult property.

For example, if a dialog box has OK and Cancel (see page 20929) buttons, their ModalResult properties could be set at design time to mrOk and mrCancel, respectively. At runtime, clicking the OK button then changes the dialog's ModalResult property to mrOk, and clicking the Cancel (see page 20929) button changes the dialog's ModalResult property to mrCancel. Unless further processing is required, no OnClick (see page 20949) event handlers are required for the buttons.

The following constants are defined for the ModalResult property:

Constant	Value	Meaning
mrNone	0	None. Used as a default value before the user exits.
mrOk	idOK	The user exited with OK button.

mrCancel	idCancel	The user exited with the CANCEL button.
mrAbort	idAbort	The user exited with the ABORT button.
mrRetry	idRetry	The user exited with the RETRY button.
mrIgnore	idIgnore	The user exited with the IGNORE button.
mrYes	idYes	The user exited with the YES button.
mrNo	idNo	The user exited with the NO button.
mrAll	mrNo + 1	The user exited with the ALL button.
mrNoToAll	mrAll + 1	The user exited with the NO TO ALL button.
mrYesToAll	mrNoToAll + 1	The user exited with the YES TO ALL button.

154.1.1.4.15 TButton.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.1.4.16 TButton.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.1.4.17 TButton.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.1.4.18 TButton.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
```

```
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}
```

```
void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
```

```
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

154.1.1.4.19 TButton.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
```

```
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

154.1.1.4.20 TButton.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder

value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

154.1.1.4.21 TButton.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.1.4.22 TButton.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false,

the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
```

```
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;
```

154.1.1.4.23 TButton.WordWrap Property

Specifies whether the button text wraps to fit the width of the control.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the display of multiple lines of text. When WordWrap is true, text that is too wide for the control wraps at the right margin.

Set WordWrap to false to limit the text to a single line. When WordWrap is false, text that is too wide for the control appears truncated.

ClientWidth (see page 5811)

154.1.1.5 TButton Events

The events of the TButton class are listed here.

Published Events

	Name	Description
	OnClick (see page 20949)	Occurs when the user clicks the control.
	OnContextPopup (see page 20951)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 20951)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 20954)	Occurs when the user drags an object over a control.
	OnEndDock (see page 20956)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 20956)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 20957)	Occurs when a control receives the input focus.
	OnExit (see page 20960)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 20961)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 20964)	Occurs when a key is pressed.

	OnKeyUp (see page 20965)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 20967)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 20968)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 20970)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 20970)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 20971)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 20973)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 20975)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 20976)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

154.1.1.5.1 TButton.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
```

```
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.1.5.2 TButton.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

154.1.1.5.3 TButton.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y

parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
```

```
    State: TDragState; var Accept: Boolean);
  begin
    Accept := False;
    if (Source is TLabel) and (State = dsDragEnter) then
      (Source as TLabel).EndDrag(False);
  end;
  {
  This code comes from an application that contains a list box
  and three labels, each with a different font and color.  The
  DragMode property for each of the labels is dmAutomatic.
  The user can select a label and drag it to a list box and
  drop it. When the label is dropped, the items in the list
  box assume the color and font of the dropped label.
  }

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;

154.1.1.5.4 TButton.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
```

```
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

154.1.1.5.5 TButton.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

154.1.1.5.6 TButton.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.1.5.7 TButton.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
```

```
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
```

```
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.1.5.8 TButton.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
```

```
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.1.5.9 TButton.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.

154.1.1.5.10 TButton.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys

that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

154.1.1.5.11 TButton.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
```

```
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;

154.1.1.5.12 TButton.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the

OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

154.1.1.5.13 TButton.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
```

```
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

154.1.1.5.14 TButton.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.1.5.15 TButton.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.1.5.16 TButton.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
```

```
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

154.1.1.5.18 TButton.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

154.1.1.5.19 TButton.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

154.1.2 TButtonActionLink Class

TButtonActionLink is an action link designed specifically for button control clients.

Class Hierarchy

System::TObject → Classes.TBasicActionLink → ActnList.TActionLink → Controls.TControlActionLink → Controls.TWinControlActionLink → StdCtrls.TButtonActionLink

Pascal

```
TButtonActionLink = class(TWinControlActionLink);
```

C++

```
class TButtonActionLink : public TWinControlActionLink;
```

File

StdCtrls

Description

TButtonActionLink is designed to specifically link actions to button control clients. TButtonActionLink overrides methods to determine whether the action and client are linked, and to ensure that action events are appropriate for properties of button control clients.

TButtonActionLink inherits, from its ancestors, support for linking actions with the properties of components, generic controls, and windowed controls. TButtonActionLink adds support for linking the checked property to the appropriate property of a button control.

154.1.2.1 TButtonActionLink Members

The following tables list the members exposed by TButtonActionLink.

Protected Fields

	Name	Description
	FAction (see page 2722)	This is FAction, a member of class TBasicActionLink.
	FClient (see page 20979)	This is FClient, a member of class TButtonActionLink.

Protected Methods

	Name	Description
	AssignClient (see page 20980)	Assigns a client button that is linked to the associated action.
	Change (see page 2723)	This is Change, a member of class TBasicActionLink.
	DoShowHint (see page 5896)	Indicates whether the hint is shown, and modified.
	IsCaptionLinked (see page 268)	Indicates whether the Caption properties for the action and client are linked.
	IsCaptionLinked (see page 5896)	Indicates whether the caption for the action and the client are linked.
	IsCheckedLinked (see page 20980)	Indicates whether the checked state for the action and the client are linked.
	IsDropdownMenuLinked (see page 5896)	This is IsDropdownMenuLinked, a member of class TControlActionLink.
	IsEnabledLinked (see page 269)	Indicates whether the Enabled properties for the action and client are linked.
	IsEnabledLinked (see page 5897)	Indicates whether the enabled state for the action and the client are linked.
	IsEnableDropdownLinked (see page 5897)	This is IsEnableDropdownLinked, a member of class TControlActionLink.
	IsGroupIndexLinked (see page 270)	Indicates whether the GroupIndex property for the action controls client behavior.
	IsHelpContextLinked (see page 270)	Indicates whether the HelpContext properties for the action and client controls are linked.
	IsHelpContextLinked (see page 6236)	Indicates whether the Help context for the action and the client are linked.
	IsHelpLinked (see page 271)	Indicates whether the help properties for the action and client are linked.
	IsHelpLinked (see page 5897)	Indicates whether the help properties for the action and the client are linked.
	IsHintLinked (see page 271)	Indicates whether the Hint properties for the action and client are linked.
	IsHintLinked (see page 5898)	Indicates whether the Hint property for the action and the client are linked.
	IsImageIndexLinked (see page 272)	Indicates whether the image index for the action and the client are linked.
	IsOnExecuteLinked (see page 2723)	This is IsOnExecuteLinked, a member of class TBasicActionLink.

	IsOnExecuteLinked (see page 5898)	Indicates whether the OnExecute event handler for the action and the client are linked.
	IsPopupMenuLinked (see page 5898)	This is IsPopupMenuLinked, a member of class TControlActionLink.
	IsShortCutLinked (see page 272)	Indicates whether the ShortCut properties for the action and client are linked.
	IsVisibleLinked (see page 273)	Indicates whether the Visible properties for the action and client are linked.
	IsVisibleLinked (see page 5899)	Indicates whether the visible state for the action and the client are linked.
	SetAction (see page 2724)	This is SetAction, a member of class TBasicActionLink.
	SetAutoCheck (see page 274)	Introduces an interface for setting the AutoCheck property of a client.
	SetCaption (see page 274)	Introduces an interface for setting the caption on a client.
	SetCaption (see page 5899)	Sets the caption of a control if the client is linked to the action for this event.
	SetChecked (see page 20980)	Sets the checked state of a button control if the client is linked to the action for this property.
	SetDropdownMenu (see page 5899)	This is SetDropdownMenu, a member of class TControlActionLink.
	SetEnabled (see page 275)	Introduces an interface for setting the enabled state of a client.
	SetEnabled (see page 5900)	Sets the enabled state of a control if the client is linked to the action for this event.
	SetEnableDropdown (see page 5900)	This is SetEnableDropdown, a member of class TControlActionLink.
	SetGroupIndex (see page 275)	Introduces an interface for setting the GroupIndex property of a client.
	SetHelpContext (see page 276)	Introduces an interface for setting the help context of a client.
	SetHelpContext (see page 5900)	Sets the HelpContext of a control if the client is linked to the action help properties.
	SetHelpContext (see page 6237)	Sets the Help context of a windowed control if the client is linked to the action for this event.
	SetHelpKeyword (see page 276)	Introduces an interface for setting the help keyword of a client.
	SetHelpKeyword (see page 5901)	Sets the HelpKeyword of a control if the client is linked to the action help properties.
	SetHelpType (see page 277)	Introduces an interface for setting the HelpType property of a client.
	SetHelpType (see page 5901)	Sets the HelpType of a control if the client is linked to the action help properties.
	SetHint (see page 278)	Introduces an interface for setting the hint for a client.
	SetHint (see page 5901)	Sets the hint of a control if the client is linked to the action for this event.
	SetImageIndex (see page 278)	Introduces an interface for setting the image index for a client.
	SetOnExecute (see page 2724)	This is SetOnExecute, a member of class TBasicActionLink.
	SetOnExecute (see page 5902)	Sets the execution event handler for a control if the client is linked to the action for this event.
	SetPopupMenu (see page 5902)	This is SetPopupMenu, a member of class TControlActionLink.
	SetShortCut (see page 279)	Introduces an interface for setting the shortcut for a client.
	SetVisible (see page 279)	Introduces an interface for setting the visible state of a client.
	SetVisible (see page 5902)	Sets the visible state of a control if the client is linked to the action for this event.

Public Events

	Name	Description
	OnChange (see page 2725)	Occurs when an OnChange event is triggered on the action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2721)	Instantiates and initializes a TBasicActionLink (see page 2720) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 2722)	Destroys an instance of an action link object.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 2723)	Invokes the action's Execute method.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Update (see page 2724)	Invokes the action's Update method.

Public Properties

	Name	Description
	Action (see page 2725)	Indicates which action the link connects to its client.

154.1.2.2 TButtonActionLink Fields

The fields of the TButtonActionLink class are listed here.

Protected Fields

	Name	Description
	FClient (see page 20979)	This is FClient, a member of class TButtonActionLink.

154.1.2.2.1 TButtonActionLink.FClient Field

Pascal

```
FClient: TButtonControl;
```

C++

```
TButtonControl FClient;
```

Description

This is FClient, a member of class TButtonActionLink.

154.1.2.3 TButtonActionLink Methods

The methods of the TButtonActionLink class are listed here.

Protected Methods

	Name	Description
	AssignClient (see page 20980)	Assigns a client button that is linked to the associated action.
	IsCheckedLinked (see page 20980)	Indicates whether the checked state for the action and the client are linked.
	SetChecked (see page 20980)	Sets the checked state of a button control if the client is linked to the action for this property.

154.1.2.3.1 TButtonActionLink.AssignClient Method

Assigns a client button that is linked to the associated action.

Pascal

```
procedure AssignClient(AClient: TObject); override;
```

C++

```
virtual __fastcall AssignClient(TObject * AClient);
```

Description

TButtonActionLink (see page 20976) overrides AssignClient to ensure that the client for the action is a button control.

See Also

Action (see page 5797)

154.1.2.3.2 TButtonActionLink.IsCheckedLinked Method

Indicates whether the checked state for the action and the client are linked.

Pascal

```
function IsCheckedLinked: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsCheckedLinked();
```

Description

IsCheckedLinked indicates whether the Checked property is linked to the appropriate client property. IsCheckedLinked returns true if the client requests that the action control this property, false otherwise.

See Also

Checked (see page 308)

Checked (see page 20995)

SetChecked (see page 20980)

154.1.2.3.3 TButtonActionLink.SetChecked Method

Sets the checked state of a button control if the client is linked to the action for this property.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked sets the checked state of a button control, and is called only if the client is linked for this property. Value specifies whether the checked state should be set.

See Also

Checked (see page 308)

Checked (see page 20995)

IsCheckedLinked (see page 20980)

154.1.3 TButtonControl Class

TButtonControl is the base class for objects that represent Windows button controls.

Class Hierarchy

Pascal

```
TButtonControl = class(TWinControl);
```

C++

```
class TButtonControl : public TWinControl;
```

File

StdCtrls

Description

TButtonControl encapsulates behavior common to button controls, check boxes, and radio buttons. Use TButtonControl as a base class when defining a button that is a wrapper for a Windows button. Do not create instances of TButtonControl directly in an application. Instead, use a descendant of TButtonControl to put a push button, check box, or radio button on a form.

Note: Some buttons, such as TSpeedButton, are not wrappers for Windows buttons. These controls do not descend from TButtonControl.

See Also

TButton (see page 20909)

TCustomCheckBox (see page 21138)

TRadioButton (see page 21753)

TSpeedButton (see page 2335)

154.1.3.1 TButtonControl Members

The following tables list the members exposed by TButtonControl.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.

	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 20993)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.

	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.

	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.

	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 20994)	Handles Windows messages.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Checked (see page 20995)	Specifies whether the button control is checked.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.
	WordWrap (see page 20996)	Specifies whether the button text wraps to fit the width of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 20992)	Creates a button control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.

V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.3.2 TButtonControl.Create Constructor

Creates a button control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TButtonControl(TComponent * AOwner);
```

Description

AOwner is the component that is responsible for freeing the button. It becomes the value of the Owner property.

154.1.3.3 TButtonControl Methods

The methods of the TButtonControl class are listed here.

Protected Methods

	Name	Description
	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	CreateParams (see page 20993)	Initializes a window-creation parameter data structure.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
	WndProc (see page 20994)	Handles Windows messages.

154.1.3.3.1 TButtonControl.ActionChange Method

Updates the button control to reflect changes in its associated action.

Pascal

```
procedure ActionChange(Sender: TObject; CheckDefaults: Boolean); override;
```

C++

```
virtual __fastcall ActionChange(TObject * Sender, Boolean CheckDefaults);
```

Description

ActionChange is called automatically when the associated action changes. It updates the button control to reflect the action's current Checked (see page 20995) state. Then it calls the inherited method, which checks the associated properties for that client type.

The Sender parameter is the associated action. The CheckDefaults parameter specifies whether properties and event handlers should be changed if they differ from the default values. When CheckDefaults is true, properties and event handlers are only changed when the current values are the default values (that is, when the values have not been previously changed). When CheckDefaults is false, properties and event handlers are changed, regardless of their current values.

See Also

TCustomAction (see page 297)

154.1.3.3.2 TButtonControl.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

154.1.3.3.3 TButtonControl.GetActionLinkClass Method

Returns the appropriate action link class that is associated with button controls.

Pascal

```
function GetActionLinkClass: TControlActionLinkClass; override;
```

C++

```
virtual __fastcall TControlActionLinkClass GetActionLinkClass();
```

Description

GetActionLinkClass is used to get the appropriate class type for the action link used with button controls. GetActionLinkClass is used internally to create action link objects for clients when a button control has an associated action. The action link is used to link the action to the button control client. Each Action link class type is designed to link specific actions to clients based upon the types of properties the client supports. For button controls, GetActionLinkClass returns the TButtonActionLink (see page 20976) class type.

See Also

TButtonActionLink (see page 20976)

154.1.3.3.4 TButtonControl.GetChecked Method

Returns whether the button control is checked.

Pascal

```
function GetChecked: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetChecked();
```

Description

GetChecked is the read implementation of the Checked (see page 20995) property.

See Also

Checked (see page 20995)

154.1.3.3.5 TButtonControl.SetChecked Method

Sets the Checked (see page 20995) property.

Pascal

```
procedure SetChecked(Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked is the write implementer for the Checked (see page 20995) property.

See Also

Checked (see page 20995)

154.1.3.3.6 TButtonControl.WndProc Method

Handles Windows messages.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc enables button objects to receive input focus when WM_LBUTTONDOWN and WM_LBUTTONDBLCLK messages occur.

See Also

WndProc (see page 5791)

154.1.3.4 TButtonControl Properties

The properties of the TButtonControl class are listed here.

Protected Properties

	Name	Description
	Checked (see page 20995)	Specifies whether the button control is checked.

	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	WordWrap (see page 20996)	Specifies whether the button text wraps to fit the width of the control.

154.1.3.4.1 TButtonControl.Checked Property

Specifies whether the button control is checked.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to determine whether a button control is checked.

C++ Examples:

```
/*
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
*/

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->MultiLine = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->Caption = "Stack Tabs?";
  for (int i = 0; i < 20; i++)
  {
    TTabSheet *pPage = new TTabSheet(PageControl1);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
  }
}
```

Delphi Examples:

```
{
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.MultiLine := CheckBox1.Checked;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
```

```
    Checkbox1.Caption := 'Stack Tabs?';
    for i := 0 to 20 do
      with TTabSheet.Create(Self) do
      begin
        PageControl := PageControl1;
        Caption := 'Tab #' + IntToStr(i);
      end;
  end;
```

See Also

WndProc (see page 5791)

154.1.3.4.2 TButtonControl.ClicksDisabled Property

Pascal

```
property ClicksDisabled: Boolean;
```

C++

```
__property Boolean ClicksDisabled;
```

Description

This is ClicksDisabled, a member of class TButtonControl.

154.1.3.4.3 TButtonControl.WordWrap Property

Specifies whether the button text wraps to fit the width of the control.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the display of multiple lines of text. When WordWrap is true, text that is too wide for the control wraps at the right margin.

Set WordWrap to false to limit the text to a single line. When WordWrap is false, text that is too wide for the control appears truncated.

See Also

ClientWidth (see page 5811)

154.1.4 TCheckBox Class

TCheckBox represents a check box that can be on (checked) or off (unchecked)

Class Hierarchy

Pascal

```
TCheckBox = class(TCustomCheckBox);
```

C++

```
class TCheckBox : public TCustomCheckBox;
```

File

StdCtrls

Description

A TCheckBox component presents an option for the user. The user can check the box to select the option, or uncheck it to deselect the option.

See Also

TCustomCheckBox (see page 21138)

Buttons and Similar Controls

Check Boxes

154.1.4.1 TCheckBox Members

The following tables list the members exposed by TCheckBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
V	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	Click (see page 21149)	Click generates an OnClick event.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 20993)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21149)	Initializes a window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21150)	Creates a Windows control corresponding to the check box.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.

	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 20993)	Returns whether the button control is checked.
	GetChecked (see page 21150)	Returns the value of the Checked (see page 20995) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
V	SetChecked (see page 20994)	Sets the Checked (see page 20995) property.
V	SetChecked (see page 21151)	Sets the value of the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
V	Toggle (see page 21151)	Changes the state of the check box.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 20994)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 20992)	Creates a button control.
	Create (see page 21148)	Creates and initializes a TCustomCheckBox (see page 21138) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.

	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
V	GetControlsAlignment (see page 21151)	Returns the alignment of the check box caption.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 21036)	Occurs when the user clicks the control.
	OnContextPopup (see page 21038)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 21039)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21041)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21044)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21044)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21045)	Occurs when a control receives the input focus.
	OnExit (see page 21048)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21049)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21052)	Occurs when a key is pressed.
	OnKeyUp (see page 21053)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 21055)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21056)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21058)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21058)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21058)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

	OnMouseUp (see page 21061)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21063)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21064)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Action (see page 21008)	Designates the action associated with the control.
	Align (see page 21009)	Determines how the control aligns within its container (parent control).
	Alignment (see page 21012)	Determines whether the checkbox label aligns to the left or right of the tick box.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	AllowGrayed (see page 21013)	Determines whether check box can be in a "grayed" state.
	Anchors (see page 21013)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 21014)	Specifies the bi-directional mode for the control.
	Caption (see page 21014)	Specifies a text string that identifies the control to the user.
	Checked (see page 21017)	Specifies whether the button control is checked.
	Color (see page 21018)	Specifies the background color of the control.
	Constraints (see page 21019)	Specifies the size constraints for the control.
	Ctl3D (see page 21020)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 21020)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21020)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21021)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21022)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21023)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 21024)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21024)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21025)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21025)	Determines where a control looks for its font information.
	ParentShowHint (see page 21026)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21026)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21031)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	State (see page 21032)	Indicates whether the check box is selected, deselected, or grayed.
	TabOrder (see page 21033)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21034)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 21034)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 21035)	Specifies whether the button text wraps to fit the width of the control.

154.1.4.2 TCheckBox Properties

The properties of the TCheckBox class are listed here.

Published Properties

	Name	Description
	Action (see page 21008)	Designates the action associated with the control.
	Align (see page 21009)	Determines how the control aligns within its container (parent control).
	Alignment (see page 21012)	Determines whether the checkbox label aligns to the left or right of the tick box.
	AllowGrayed (see page 21013)	Determines whether check box can be in a "grayed" state.
	Anchors (see page 21013)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 21014)	Specifies the bi-directional mode for the control.
	Caption (see page 21014)	Specifies a text string that identifies the control to the user.
	Checked (see page 21017)	Specifies whether the button control is checked.
	Color (see page 21018)	Specifies the background color of the control.
	Constraints (see page 21019)	Specifies the size constraints for the control.
	Ctl3D (see page 21020)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 21020)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21020)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21021)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21022)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21023)	Controls the attributes of text written on or in the control.
	ParentBiDiMode (see page 21024)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21024)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21025)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21025)	Determines where a control looks for its font information.
	ParentShowHint (see page 21026)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21026)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21031)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	State (see page 21032)	Indicates whether the check box is selected, deselected, or grayed.
	TabOrder (see page 21033)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21034)	Determines if the user can tab to a control.
	Visible (see page 21034)	Determines whether the component appears onscreen.
	WordWrap (see page 21035)	Specifies whether the button text wraps to fit the width of the control.

154.1.4.2.1 TCheckBox.Action Property

Designates the action associated with the control.

Pascal

```
property Action: TBasicAction;
```

C++

```
__property TBasicAction Action;
```

Description

Action is the action object that is associated with the control. Actions allow an application to centralize the response to user commands. When a control is associated with an action, the action determines the appropriate properties and events of the control (such as whether the control is enabled or how it responds to an OnClick event).

To create actions at design time, place an action list component on a form or data module. Double click the action list to bring up the action list editor. Add actions in the editor using its context menu. Once the actions have been added using the action list editor, they appear in the drop-down list for the Action property in the Object Inspector.

154.1.4.2.2 TCheckBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
```

```
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)

    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var
  ProgressBar: TProgressBar;

Parent (see page 5832)

Anchors (see page 5802)

154.1.4.2.3 TCheckBox.Alignment Property

Determines whether the checkbox label aligns to the left or right of the tick box.

Pascal

```
property Alignment: TLeftRight;
```

C++

```
__property TLeftRight Alignment;
```

Description

The Alignment property is a little confusing. It implies text justification, but it is not quite that simple. The TLeftRight alignment type may have one of the following values :

Value	Meaning
taLeftJustify	The checkbox label is displayed on the left of the checkbox. The label is aligned to the left of the control, and the checkbox is aligned to the right of the control.
taRightJustify	This is the default value. The checkbox is aligned to the left of the control. The label is aligned to the right side of the checkbox : it is not aligned to the right of the control.

See Also

TLeftRight (see page 3297)

154.1.4.2.4 TCheckBox.AllowGrayed Property

Determines whether check box can be in a "grayed" state.

Pascal

```
property AllowGrayed: Boolean;
```

C++

```
__property Boolean AllowGrayed;
```

Description

If AllowGrayed is set to true, the check box has three possible states: checked, unchecked, and grayed. If AllowGrayed is set to false, the check box has only two possible states: checked and unchecked.

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

154.1.4.2.5 TCheckBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent (see page 5832)

Align (see page 5798)

154.1.4.2.6 TCheckBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.4.2.7 TCheckBox.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}
```

```
TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
```

```
      begin
        with TToolButton.Create(ToolBar) do
        begin
          Parent := ToolBar;
          Caption := ButtonCaptions[I];
          if (ButtonCaptions[I] = '|') then
            Style := tbsSeparator
          else
            Style := tbsButton;
        end;
      end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ToolBar1 := TToolBar.Create(Self);
    ToolBar1.Parent := Self;
    AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
    ToolBar1.ShowCaptions := True;
    ToolBar1.Height := 40;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I: Integer;
  begin
    for I := ToolBar1.ButtonCount - 1 downto 0 do
      ToolBar1.Buttons[I].Free;
    ToolBar1.Free;
  end;
```

154.1.4.2.8 TCheckBox.Checked Property

Specifies whether the button control is checked.

Pascal

```
property Checked: Boolean;
```

C++

```
__property Boolean Checked;
```

Description

Use Checked to determine whether a button control is checked.

C++ Examples:

```
/*
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
*/

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->MultiLine = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->Caption = "Stack Tabs?";
```

```
  for (int i = 0; i < 20; i++)
  {
    TTabSheet *pPage = new TTabSheet(PageControl1);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
  }
}
```

Delphi Examples:

```
{
This example requires a PageControl with no pages created,
and a TCheckBox. During the form create, a series of tabs
will be created on the Page Control that exceed the Page
Control's width.  When the Check Box control is clicked, the
setting of the MultiLine property is toggled, alternately
stacking the tabs vertically, or along a single line
horizontally.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.MultiLine := CheckBox1.Checked;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  Checkbox1.Caption := 'Stack Tabs?';
  for i := 0 to 20 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'Tab #' + IntToStr(i);
    end;
end;
```

See Also

WndProc (see page 5791)

154.1.4.2.9 TCheckBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
```

```
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

154.1.4.2.10 TCheckBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.4.2.11 TCheckBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

154.1.4.2.12 TCheckBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.4.2.13 TCheckBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.4.2.14 TCheckBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

154.1.4.2.15 TCheckBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls

appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

EnableControls (see page 6934)

Enabling Mouse

154.1.4.2.16 TCheckBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
```

```
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

DesktopFont (see page 5818)

ParentFont (see page 5834)

Displaying and Editing Text in a Memo Control

154.1.4.2.17 TCheckBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.4.2.18 TCheckBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.4.2.19 TCheckBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

154.1.4.2.20 TCheckBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.4.2.21 TCheckBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.4.2.22 TCheckBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
```

```
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

type
  TForm1 = class(TForm)
    AddButton: TButton;
    EditButton: TButton;
    DestroyButton: TButton;
    PopupMenu1: TPopupMenu;
```

```
      procedure AddButtonClick(Sender: TObject);
      procedure EditButtonClick(Sender: TObject);
      procedure DestroyButtonClick(Sender: TObject);
      procedure FormDestroy(Sender: TObject);
    private
      { Private declarations }
    public
      procedure PopupMenuItemsClick(Sender: TObject);

    end;

  var

154.1.4.2.23 TCheckBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

154.1.4.2.24 TCheckBox.State Property

Indicates whether the check box is selected, deselected, or grayed.

Pascal

```
property State: TCheckBoxState;
```

C++

```
__property TCheckBoxState State;
```

Description

Use State to determine whether the check box is checked (cbChecked), unchecked (cbUnchecked), or grayed (cbGrayed).

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

AllowGrayed (see page 21152)

Checked

154.1.4.2.25 TCheckBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

154.1.4.2.26 TCheckBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.4.2.27 TCheckBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
```

```
    {
      TTabSheet *pPage = new TTabSheet(this);
      pPage->PageControl = PageControl1;
      pPage->Caption = AnsiString("Page") + IntToStr(i);
      TEdit *pEdit = new TEdit(this);
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.4.2.28 TCheckBox.WordWrap Property

Specifies whether the button text wraps to fit the width of the control.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the display of multiple lines of text. When WordWrap is true, text that is too wide for the control wraps at the right margin.

Set WordWrap to false to limit the text to a single line. When WordWrap is false, text that is too wide for the control appears truncated.

See Also

ClientWidth (see page 5811)

154.1.4.3 TCheckBox Events

The events of the TCheckBox class are listed here.

Published Events

	Name	Description
	OnClick (see page 21036)	Occurs when the user clicks the control.
	OnContextPopup (see page 21038)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDragDrop (see page 21039)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21041)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21044)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21044)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21045)	Occurs when a control receives the input focus.
	OnExit (see page 21048)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21049)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21052)	Occurs when a key is pressed.
	OnKeyUp (see page 21053)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 21055)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21056)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21058)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21058)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21058)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21061)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21063)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21064)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

154.1.4.3.1 TCheckBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
```

```
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.4.3.2 TCheckBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

TPopupMenu (see page 16169)

PopupMenu (see page 5835)

AutoPopup (see page 16178)

154.1.4.3.3 TCheckBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
```

```
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
```

```
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

154.1.4.3.4 TCheckBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor

property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

154.1.4.3.5 TCheckBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

154.1.4.3.6 TCheckBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
```

```
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.4.3.7 TCheckBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter

event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
```

```
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.4.3.8 TCheckBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

OnEnter (see page 6219)

ActiveControl (see page 13896)

154.1.4.3.9 TCheckBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR

message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
```

```
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;

154.1.4.3.10 TCheckBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
```

```
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form’s color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
```

```
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;

154.1.4.3.12 TCheckBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

154.1.4.3.13 TCheckBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
```

```
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

154.1.4.3.14 TCheckBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.4.3.15 TCheckBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.4.3.16 TCheckBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

154.1.4.3.17 TCheckBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse

Responding to a Mouse-up Action

154.1.4.3.18 TCheckBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

154.1.4.3.19 TCheckBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

OnDragOver (see page 5857)

OnDragDrop (see page 5855)

154.1.5 TComboBox Class

TComboBox combines an edit box with a scrollable list.

Class Hierarchy

Pascal

```
TComboBox = class(TCustomComboBox);
```

C++

```
class TComboBox : public TCustomComboBox;
```

File

StdCtrls

Description

A TComboBox component is an edit box with a scrollable drop-down list attached to it. Users can select an item from the list or type directly into the edit box.

Note: The width of the button in a TComboBox is equal to the width that Windows uses for scrollbars. This width depends on the color scheme that the user has chosen (by right-clicking the desktop, selecting Properties, and choosing Appearance). On Windows XP, the user can specifically change the width of the scrollbar by clicking the Advanced button and selecting scrollbar as the Item. If you carefully size your combo box so all the text is visible, then a user running under a different color scheme may find that the text is obscured by the button. One solution is to set the scrollbar wide when developing the application. Most color schemes use a scrollbar that is at most 21 pixels wide.

Combo Boxes

List Controls

154.1.5.1 TComboBox Members

The following tables list the members exposed by TComboBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
V	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
V	CreateWnd (see page 21215)	Creates the Windows control that represents the combo box.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.

	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 21216)	Generates an OnDrawItem (see page 21224) event.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.

	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 21217)	Responds to WM_CHAR messages sent to the combo box.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.

	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
V	SetStyle (see page 21219)	Sets the Style (see page 21224) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WndProc (see page 21219)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
A	AddItem (see page 5940)	Adds an item to the list control.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.

	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 5940)	Deletes all of the items from the list control.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
A	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 21166)	Creates and initializes a TCustomCombo (see page 21154) instance.
V	Create (see page 21214)	Creates and initializes a TCustomComboBox (see page 21201) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21166)	Destroys the combo box and frees its memory.
V	Destroy (see page 21214)	Destroys the combo box and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.

	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
V	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.

	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 21112)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 21114)	Occurs when the user clicks the control.
	OnCloseUp (see page 21116)	Occurs when the drop-down list closes up due to some user action.

	OnContextPopup (see page 21116)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21117)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21117)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21120)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21122)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnDropDown (see page 21123)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 21124)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21124)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21125)	Occurs when a control receives the input focus.
	OnExit (see page 21128)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21129)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21132)	Occurs when a key is pressed.
	OnKeyUp (see page 21133)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 21135)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseEnter (see page 21135)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21136)	Occurs when the user moves the mouse outside of a control.
	OnSelect (see page 21136)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 21136)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21137)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 21078)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 21082)	Specifies how the control is anchored to its parent.
	AutoCloseUp (see page 21082)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoComplete (see page 21083)	Positions to matching list items as you type.
	AutoCompleteDelay (see page 21083)	Specifies the delay between a key press and an attempt to autocomplete the field.
	AutoDropDown (see page 21083)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BevelEdges (see page 21084)	Specifies which edges of the control are beveled.
	BevelInner (see page 21084)	Specifies the cut of the inner bevel.
	BevelKind (see page 21085)	Specifies the control's bevel style.
	BevelOuter (see page 21085)	Specifies the cut of the outer bevel.
	BiDiMode (see page 21085)	Specifies the bi-directional mode for the control.
	CharCase (see page 21086)	Determines the case of the text in the combo box.
	Color (see page 21086)	Specifies the background color of the control.
	Constraints (see page 21087)	Specifies the size constraints for the control.
	Ctl3D (see page 21088)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 21088)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21089)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21089)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21091)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 21091)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21091)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic

	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 21092)	Determines the behavior of the input method editor (IME).
	ImeName (see page 21093)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 21094)	Specifies the height, in pixels, of the items in the drop-down list.
	ItemIndex (see page 21094)	Specifies the index of the selected item.
	Items (see page 21095)	Provides access to the list of items (strings) in the list portion of the combo box.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxLength (see page 21097)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 21097)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21098)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21098)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21099)	Determines where a control looks for its font information.
	ParentShowHint (see page 21099)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21100)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21104)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Sorted (see page 21106)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 21107)	Determines the display style of the combo box.
	TabOrder (see page 21108)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21108)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 21109)	Contains a text string associated with the control.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 21110)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.5.2 TComboBox Properties

The properties of the TComboBox class are listed here.

Published Properties

	Name	Description
	Align (see page 21078)	Determines how the control aligns within its container (parent control).
	Anchors (see page 21082)	Specifies how the control is anchored to its parent.
	AutoCloseUp (see page 21082)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoComplete (see page 21083)	Positions to matching list items as you type.
	AutoCompleteDelay (see page 21083)	Specifies the delay between a key press and an attempt to autocomplete the field.
	AutoDropDown (see page 21083)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BevelEdges (see page 21084)	Specifies which edges of the control are beveled.
	BevelInner (see page 21084)	Specifies the cut of the inner bevel.
	BevelKind (see page 21085)	Specifies the control's bevel style.
	BevelOuter (see page 21085)	Specifies the cut of the outer bevel.
	BiDiMode (see page 21085)	Specifies the bi-directional mode for the control.

	CharCase (see page 21086)	Determines the case of the text in the combo box.
	Color (see page 21086)	Specifies the background color of the control.
	Constraints (see page 21087)	Specifies the size constraints for the control.
	Ctl3D (see page 21088)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 21088)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21089)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21089)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21091)	Specifies the maximum number of items displayed in the drop-down list.
	Enabled (see page 21091)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21091)	Controls the attributes of text written on or in the control.
	ImeMode (see page 21092)	Determines the behavior of the input method editor (IME).
	ImeName (see page 21093)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	ItemHeight (see page 21094)	Specifies the height, in pixels, of the items in the drop-down list.
	ItemIndex (see page 21094)	Specifies the index of the selected item.
	Items (see page 21095)	Provides access to the list of items (strings) in the list portion of the combo box.
	MaxLength (see page 21097)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	ParentBiDiMode (see page 21097)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21098)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21098)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21099)	Determines where a control looks for its font information.
	ParentShowHint (see page 21099)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21100)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21104)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Sorted (see page 21106)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 21107)	Determines the display style of the combo box.
	TabOrder (see page 21108)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21108)	Determines if the user can tab to a control.
	Text (see page 21109)	Contains a text string associated with the control.
	Visible (see page 21110)	Determines whether the component appears onscreen.

154.1.5.2.1 TComboBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
```

```
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;

    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this);
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}//---------------------------------------------------------------------------
void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int i=0;i<iTabTitles;i++)
        delete pts[i];
    delete ppc;
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
```

```
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.
  }

  var
    I: Integer;

    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
```

```
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

154.1.5.2.2 TComboBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

154.1.5.2.3 TComboBox.AutoCloseUp Property

Specifies whether the drop-down closes up automatically when the user selects an item.

Pascal

```
property AutoCloseUp: Boolean;
```

C++

```
__property Boolean AutoCloseUp;
```

Description

When AutoCloseUp is true, the drop-down closes up automatically when the user selects an item.

See Also

AutoDropDown (see page 21221)

154.1.5.2.4 TComboBox.AutoComplete Property

Positions to matching list items as you type.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete will position to matching list values as you type, sometimes saving you keystrokes.

As you type, the ItemIndex (see page 21094) property is updated with the list entry that matches the characters you have entered. As you type, different list enrties may match, and ItemIndex (see page 21094) is changed accordingly.

There is a delay of AutoCompleteDelay (see page 21083) milliseconds between the characters typed and the autocomplete operation.

See Also

AutoCompleteDelay (see page 21083)

154.1.5.2.5 TComboBox.AutoCompleteDelay Property

Specifies the delay between a key press and an attempt to autocomplete the field.

Pascal

```
property AutoCompleteDelay: Cardinal;
```

C++

```
__property unsigned AutoCompleteDelay;
```

Description

Specifies the delay in milliseconds between a key press and an attempt to autocomplete the field. Autocomplete will position to matching list values as you type, sometimes saving you keystrokes.

AutoCompleteDelay is only in effect when the AutoComplete (see page 21083) is true.

See Also

AutoComplete (see page 21083)

154.1.5.2.6 TComboBox.AutoDropDown Property

Specifies whether the drop-down list drops down automatically in response to user keystrokes.

Pascal

```
property AutoDropDown: Boolean;
```

C++

```
__property Boolean AutoDropDown;
```

Description

When AutoDropDown is true, the combo box automatically drops down its list when the user starts typing a string while the combo box has focus.

When AutoDropDown is false, the user must explicitly use the drop-down button to drop down the combo box list.

See Also

autocomplete (see page 21220)

OnDropDown (see page 21199)

DroppedDown (see page 21185)

154.1.5.2.7 TComboBox.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

154.1.5.2.8 TComboBox.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

154.1.5.2.9 TComboBox.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

154.1.5.2.10 TComboBox.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

154.1.5.2.11 TComboBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.5.2.12 TComboBox.CharCase Property

Determines the case of the text in the combo box.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the combo box into upper or lower case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types into the combo box. Changing the CharCase property changes the actual text, not just its appearance; case information is lost and cannot be recaptured by changing CharCase back to ecNormal.

See Also

Text (see page 5842)

154.1.5.2.13 TComboBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the

Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

154.1.5.2.14 TComboBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.5.2.15 TComboBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

154.1.5.2.16 TComboBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.5.2.17 TComboBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.5.2.18 TComboBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
```

```
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

154.1.5.2.19 TComboBox.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items property, the drop down list will display a scroll bar.

See Also

Items (see page 21187)

ItemCount (see page 21186)

154.1.5.2.20 TComboBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

154.1.5.2.21 TComboBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

154.1.5.2.22 TComboBox.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

154.1.5.2.23 TComboBox.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

154.1.5.2.24 TComboBox.ItemHeight Property

Specifies the height, in pixels, of the items in the drop-down list.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Read ItemHeight to determine the height of the items in the drop-down list.

The effect of setting ItemHeight varies, depending on the type of combo box and the style. For example, TComboBox lets you set the item height only when Style is set to csOwnerDrawFixed or csOwnerDrawVariable. If Style is csOwnerDrawVariable, ItemHeight is the default height for drawing list items, but this value can be overridden by an OnMeasureItem event handler.

TComboBoxEx does not let you change the value of ItemHeight.

Note: Combo boxes that do not support changes to ItemHeight do not raise an exception when you attempt to change ItemHeight; they simply ignore the attempt.

See Also

Items (see page 21187)

OnMeasureItem (see page 21225)

Style (see page 21224)

154.1.5.2.25 TComboBox.ItemIndex Property

Specifies the index of the selected item.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

Read ItemIndex to determine which item is selected. The first item in the list has index 0, the second item has index 1, and so on. If no item is selected, the value of ItemIndex is -1. If the list control supports multiple selected items, ItemIndex is the index of the selected item that has focus.

Set ItemIndex programmatically to select an item by passing in the index value.

Note: To implement the ItemIndex property in a TCustomListControl descendant, override the protected GetItemIndex and SetItemIndex methods.

See Also

GetItemIndex (see page 5942)

SetItemIndex (see page 5943)

154.1.5.2.26 TComboBox.Items Property

Provides access to the list of items (strings) in the list portion of the combo box.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Read Items to access the list of items that appears in the combo box. Use the methods of Items to add, insert, delete and move items. Set the value of Items to copy the items from another string list.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
```

```
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
```

```
    end;
  end;

  procedure TComboForm.ComboBox1Click(Sender: TObject);
  begin
    with ComboBox1 do
      ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

  end;
```

See Also

ItemIndex

TStrings (see page 3029)

Assign (see page 3043)

154.1.5.2.27 TComboBox.MaxLength Property

Specifies the maximum number of characters the user can type into the edit portion of the combo box.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that the user can enter into the edit portion of the combo box. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

See Also

Text (see page 5842)

154.1.5.2.28 TComboBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.5.2.29 TComboBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.5.2.30 TComboBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

154.1.5.2.31 TComboBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.5.2.32 TComboBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.5.2.33 TComboBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
```

```
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
```

```
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
```

```
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

154.1.5.2.34 TComboBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

Displaying Fly-over Help

154.1.5.2.35 TComboBox.Sorted Property

Determines whether the list portion of the combo box is alphabetized.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Set Sorted to true to sort the items in the Items list alphabetically. New items added to the list while Sorted is true are inserted in the correct alphabetical position.

When Sorted is changed from false to true, the original order of the items is lost. Setting Sorted back to false does not restore the original order.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
```

```
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ComboBox1.Sorted := True; { make sure the form names are sorted }
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Form2.Show;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Form3.Show;
end;
```

154.1.5.2.36 TComboBox.Style Property

Determines the display style of the combo box.

Pascal

```
property Style: TComboBoxStyle;
```

C++

```
__property TComboBoxStyle Style;
```

Description

Set Style to specify how the list and edit region of the combo box should appear.

When Style is csOwnerDrawFixed or csOwnerDrawVariable, the OnDrawItem event occurs when the list items need to be drawn. If Style is csOwnerDrawVariable, an OnMeasureItem event occurs as well.

Height (see page 5825)

ItemHeight

OnDrawItem (see page 21224)

OnMeasureItem (see page 21225)

154.1.5.2.37 TComboBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

154.1.5.2.38 TComboBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.5.2.39 TComboBox.Text Property

Contains a text string associated with the control.

Pascal

```
property Text: TCaption;
```

C++

```
__property TCaption Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                        //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete [] Buffer;
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
```

```
    Inc(Size);                      {Add room for null character}
    GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
    Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
    Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
    FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
  end;

  {
  Note: the same thing could be accomplished more simply as follows:
  }
  procedure TForm1.Button2Click(Sender: TObject);
  begin
    Edit2.Text := Edit1.Text;
  end;
```

See Also

Caption (see page 5806)

Lines (see page 21380)

154.1.5.2.40 TComboBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
```

```
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.5.3 TComboBox Events

The events of the TComboBox class are listed here.

Published Events

	Name	Description
	OnChange (see page 21112)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 21114)	Occurs when the user clicks the control.
	OnCloseUp (see page 21116)	Occurs when the drop-down list closes up due to some user action.

	OnContextPopup (see page 21116)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21117)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21117)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21120)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21122)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnDropDown (see page 21123)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 21124)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21124)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21125)	Occurs when a control receives the input focus.
	OnExit (see page 21128)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21129)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21132)	Occurs when a key is pressed.
	OnKeyUp (see page 21133)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 21135)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseEnter (see page 21135)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21136)	Occurs when the user moves the mouse outside of a control.
	OnSelect (see page 21136)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 21136)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21137)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

154.1.5.3.1 TComboBox.OnChange Event

Occurs when the user changes the text displayed in the edit region.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action immediately after the user edits the text in the edit region or selects an item from the list. The Text property gives the new value in the edit region.

Note: OnChange only occurs in response to user actions. Changing the Text property programmatically does not trigger an OnChange event.

C++ Examples:

```
/*
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the
ActivePage property through selection of a ComboBox item.
During the form create, the Combo Box control is loaded with
the names of each of the tabs, as well as the instance
pointers to the corresponding tab.  When the user selects
the Combo Box item, the associated TTabSheet object
contained in the Combo Box Objects array is used to set the
ActivePage property.  Select the Lines property of the
TRichEdit to enter a string.  Select the string before
```

```
justifying.
*/
void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  TComboBox *pCB = dynamic_cast<TComboBox *>(Sender);
  if (pCB)
    PageControl1->ActivePage = (TTabSheet *)(pCB->Items->Objects[pCB->ItemIndex]);
}

    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
    PageControl1->Pages[i]->Brush->Color = colorPalette[i];
    ComboBox1->Items->AddObject(PageControl1->Pages[i]->Name, PageControl1->Pages[i]);
    ComboBox1->ItemIndex = 0;
  }
}
/*
The following example assumes that a drive combo box, a file
list box, and a directory list box are on a form. Add this
code as the OnChange event handler for the drive combo box
and the OnChange event handler for the directory list box.
When the user changes the drive using the combo box, the
directory list box and file list box will update to reflect
the new drive and the current directory on that drive.  When
the user double clicks on a directory in the file list box
will update to reflect the new directory.
*/
void __fastcall TForm1::DriveComboBox1Change(TObject *Sender)
{
  DirectoryListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Directory = DirectoryListBox1->Directory;
}

void __fastcall TForm1::DirectoryListBox1Change(TObject *Sender)
{
  FileListBox1->Directory = DirectoryListBox1->Directory;
}
```

Delphi Examples:

```
{
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the

154.1.5.3.2 TComboBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).

- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
```

```
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.5.3.3 TComboBox.OnCloseUp Event

Occurs when the drop-down list closes up due to some user action.

Pascal

```
property OnCloseUp: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCloseUp;
```

Description

Write an OnCloseUp event handler to implement special processing that needs to occur when the drop-down list closes up. For example, an OnCloseUp event handler can check whether the user changed the selected item while the list was dropped down and respond accordingly.

See Also

OnDropDown (see page 21199)

DroppedDown (see page 21185)

154.1.5.3.4 TComboBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

154.1.5.3.5 TComboBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

154.1.5.3.6 TComboBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
```

```
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

154.1.5.3.7 TComboBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
```

```
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.
```

```
procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

154.1.5.3.8 TComboBox.OnDrawItem Event

Occurs when an item in an owner-draw combo box needs to be displayed.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

Write an OnDrawItem event handler to draw the items in the drop-down list of an owner-draw combo box. An OnDrawItem event handler can add graphic elements to the list items, or replace the list item text by graphics.

Draw the items on the Canvas using the coordinates provided by the Rect parameter. OnDrawItem occurs only if Style is set to csOwnerDrawFixed or csOwnerDrawVariable.

If an OnDrawItem event handler is not provided, the combo box fills the Rect parameter with the current brush and writes the text value of the item specified by the Index parameter.

See Also

Canvas

Items

OnMeasureItem (see page 21225)

Style (see page 21224)

154.1.5.3.9 TComboBox.OnDropDown Event

Occurs when the user opens the drop-down list.

Pascal

```
property OnDropDown: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDropDown;
```

Description

Write an OnDropDown event handler to implement special processing that needs to occur only when the drop-down list is activated.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
```

```
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ComboBox1.Sorted := True; { make sure the form names are sorted }
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Form2.Show;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Form3.Show;
end;
```

154.1.5.3.10 TComboBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

154.1.5.3.11 TComboBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.5.3.12 TComboBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
```

```
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
```

```
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.5.3.13 TComboBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
```

```
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.5.3.14 TComboBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
```

```
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
{
The following code aborts a print job if the user presses
Esc. Note that you should set KeyPreview to true to ensure
that the OnKeyDown event handler of Form1 is called.
}

uses Printers;

procedure TForm1.Button1Click(Sender: TObject);
var
  I, X, Y: Integer;
  Memo1 : TMemo;
  r: TRect;
begin
```

```
    Memo1 := TMemo.Create(Form1);
    Memo1.Parent := Form1;
    Memo1.Visible := True;
    Memo1.Width := 700;
    if (OpenDialog1.Execute) then
    begin
      Memo1.Lines.LoadFromFile(OpenDialog1.FileName);

      Printer.BeginDoc;
      X := 200;
      Y := 200;
      for I := 0 to 140 do
        if (not Printer.Aborted) then
        begin
          Printer.Canvas.TextOut(X, Y, Memo1.Lines[I]);
          Y := Y + 80;
          if (Y > (Printer.PageHeight - 300)) then
          begin
            Y := 200;
            Printer.NewPage;
            Sleep(1000);  // to give you time to abort!
          end;
        end;
      if (not Printer.Aborted) then Printer.EndDoc;
    end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
     KeyPreview := True;
  end;

  procedure TForm1.FormKeyDown(Sender: TObject; var Key: Word; Shift: TShiftState);
  begin
  if (Key=VK_ESCAPE) and Printer.Printing then
    begin
    Printer.Abort;
    MessageDlg('Printing aborted', mtInformation, [mbOK],0);
    end;
  end;
```

154.1.5.3.15 TComboBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an

OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

154.1.5.3.16 TComboBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
```

```
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;
```

OnKeyPress (see page 6227)

154.1.5.3.17 TComboBox.OnMeasureItem Event

Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.

Pascal

```
property OnMeasureItem: TMeasureItemEvent;
```

C++

```
__property TMeasureItemEvent OnMeasureItem;
```

Description

When Style is set to csOwnerDrawVariable, the OnMeasureItem event precedes OnDrawItem. Write an OnMeasureItem event handler to specify the height, in pixels, needed to draw an item in the drop-down list.

See Also

ItemHeight

Items

OnDrawItem (see page 21224)

Style (see page 21224)

154.1.5.3.18 TComboBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.5.3.19 TComboBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.5.3.20 TComboBox.OnSelect Event

Occurs when the user selects a string in the drop-down list.

Pascal

```
property OnSelect: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelect;
```

Description

Write an OnSelect event handler to respond when the user changes the selected item in the drop-down list. OnSelect occurs after the selection has changed and the Text property reflects the new item.

Text (see page 5842)

154.1.5.3.21 TComboBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by

dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

154.1.5.3.22 TComboBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

154.1.6 TCustomCheckBox Class

TCustomCheckBox is the ancestor of all check-box components.

Class Hierarchy

Pascal

```
TCustomCheckBox = class(TButtonControl);
```

C++

```
class TCustomCheckBox : public TButtonControl;
```

File

StdCtrls

Description

TCustomCheckBox is an abstract class from which check-box components, including TCheckBox (see page 20996) and TDBCheckBox, descend. Check boxes present the user with options that can be selected (checked) or deselected (unchecked).

See Also

TCheckBox (see page 20996)

TDBCheckBox (see page 8582)

154.1.6.1 TCustomCheckBox Members

The following tables list the members exposed by TCustomCheckBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
V	ActionChange (see page 20992)	Updates the button control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.

	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 21149)	Click generates an OnClick event.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 21149)	Initializes a window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 21150)	Creates a Windows control corresponding to the check box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus

	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetActionLinkClass (see page 20993)	Returns the appropriate action link class that is associated with button controls.
	GetChecked (see page 21150)	Returns the value of the Checked (see page 20995) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
V	SetChecked (see page 21151)	Sets the value of the Checked (see page 20995) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	Toggle (see page 21151)	Changes the state of the check box.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 20994)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21152)	This is Alignment, a member of class TCustomCheckBox.
	AllowGrayed (see page 21152)	Determines whether check box can be in a "grayed" state.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.

	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Checked (see page 20995)	Specifies whether the button control is checked.
	ClicksDisabled (see page 20996)	This is ClicksDisabled, a member of class TButtonControl.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	State (see page 21153)	Indicates whether the check box is selected, deselected, or grayed.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.
	WordWrap (see page 20996)	Specifies whether the button text wraps to fit the width of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 21148)	Creates and initializes a TCustomCheckBox (see page 21138) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetControlsAlignment (see page 21151)	Returns the alignment of the check box caption.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.

	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21154)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.6.2 TCustomCheckBox.Create Constructor

Creates and initializes a TCustomCheckBox (see page 21138) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomCheckBox(TComponent * AOwner);
```

Description

Call Create to generate a check box at runtime. Check boxes placed on forms at design time, Create is called automatically.

AOwner is a component, typically the form, that is responsible for freeing the check box instance.

See Also

Owner (see page 2807)

154.1.6.3 TCustomCheckBox Methods

The methods of the TCustomCheckBox class are listed here.

Protected Methods

	Name	Description
	Click (see page 21149)	Click generates an OnClick event.
	CreateParams (see page 21149)	Initializes a window-creation parameter record.
	CreateWnd (see page 21150)	Creates a Windows control corresponding to the check box.
	GetChecked (see page 21150)	Returns the value of the Checked (see page 20995) property.
	SetChecked (see page 21151)	Sets the value of the Checked (see page 20995) property.
	Toggle (see page 21151)	Changes the state of the check box.

Public Methods

	Name	Description
	GetControlsAlignment (see page 21151)	Returns the alignment of the check box caption.

154.1.6.3.1 TCustomCheckBox.Click Method

Click generates an OnClick event.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

The protected Click method is called automatically when the check box is clicked with the mouse. In addition to generating an OnClick event, it sends a message to the parent control's window to indicate that the state of the check box has changed.

See Also

OnClick (see page 5851)

Parent (see page 5832)

154.1.6.3.2 TCustomCheckBox.CreateParams Method

Initializes a window-creation parameter record.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 21150) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. CreateParams fills in the parameter record that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

In TCustomCheckBox (see page 21138), CreateParams calls the inherited method, then makes specific adjustments for check boxes.

See Also

CreateWnd (see page 6137)

CreateWindowHandle (see page 6137)

154.1.6.3.3 TCustomCheckBox.CreateWnd Method

Creates a Windows control corresponding to the check box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the check box is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. In TCustomCheckBox (see page 21138), this method calls the inherited method to generate the underlying windows control, then sends a BM_SETCHECK message to set the check state of the control.

See Also

CreateParams (see page 21149)

154.1.6.3.4 TCustomCheckBox.GetChecked Method

Returns the value of the Checked (see page 20995) property.

Pascal

```
function GetChecked: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetChecked();
```

Description

GetChecked is the protected implementation of the Checked (see page 20995) property. Override this method and the SetChecked (see page 21151) method to change the Checked (see page 20995) property in descendant classes.

See Also

Checked

SetChecked (see page 21151)

154.1.6.3.5 TCustomCheckBox.GetControlsAlignment Method

Returns the alignment of the check box caption.

Pascal

```
function GetControlsAlignment: TAlignment; override;
```

C++

```
virtual __fastcall TAlignment GetControlsAlignment();
```

Description

GetControlsAlignment indicates the alignment of the check box caption. Usually, the caption is right-justified, but if the UseRightToLeftAlignment method returns true and the check mark is on the left, then GetControlsAlignment indicates that the caption should be left-justified.

See Also

Caption (see page 5806)

alignment (see page 21152)

UseRightToLeftAlignment (see page 5790)

154.1.6.3.6 TCustomCheckBox.SetChecked Method

Sets the value of the Checked (see page 20995) property.

Pascal

```
procedure SetChecked(Value: Boolean); override;
```

C++

```
virtual __fastcall SetChecked(Boolean Value);
```

Description

SetChecked is the protected implementation of the Checked (see page 20995) property. Override this method and the GetChecked (see page 21150) method to change the Checked (see page 20995) property in descendant classes.

See Also

Checked

GetChecked (see page 21150)

154.1.6.3.7 TCustomCheckBox.Toggle Method

Changes the state of the check box.

Pascal

```
procedure Toggle; virtual;
```

C++

```
virtual __fastcall Toggle();
```

Description

Use the Toggle method to select or deselect the check box programmatically. Toggle switches among the valid check-box

states—from checked to unchecked to grayed, or from checked to unchecked.

See Also

AllowGrayed (see page 21152)

State (see page 21153)

154.1.6.4 TCustomCheckBox Properties

The properties of the TCustomCheckBox class are listed here.

Protected Properties

	Name	Description
	Alignment (see page 21152)	This is Alignment, a member of class TCustomCheckBox.
	AllowGrayed (see page 21152)	Determines whether check box can be in a "grayed" state.
	State (see page 21153)	Indicates whether the check box is selected, deselected, or grayed.

Published Properties

	Name	Description
	TabStop (see page 21154)	Determines if the user can tab to a control.

154.1.6.4.1 TCustomCheckBox.Alignment Property

Pascal

```
property Alignment: TLeftRight;
```

C++

```
__property TLeftRight Alignment;
```

Description

This is Alignment, a member of class TCustomCheckBox.

154.1.6.4.2 TCustomCheckBox.AllowGrayed Property

Determines whether check box can be in a "grayed" state.

Pascal

```
property AllowGrayed: Boolean;
```

C++

```
__property Boolean AllowGrayed;
```

Description

If AllowGrayed is set to true, the check box has three possible states: checked, unchecked, and grayed. If AllowGrayed is set to false, the check box has only two possible states: checked and unchecked.

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

See Also

Checked

State (see page 21153)

154.1.6.4.3 TCustomCheckBox.State Property

Indicates whether the check box is selected, deselected, or grayed.

Pascal

```
property State: TCheckBoxState;
```

C++

```
__property TCheckBoxState State;
```

Description

Use State to determine whether the check box is checked (cbChecked), unchecked (cbUnchecked), or grayed (cbGrayed).

C++ Examples:

```
/*
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  CheckBox1->AllowGrayed = true;
  CheckBox1->State = cbChecked;
}
```

Delphi Examples:

```
{
This example uses a check box on a form. When the
application runs, the check box is initially checked. When
the user clicks it, the check box is unchecked. Clicking it
again grays the check box.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  CheckBox1.AllowGrayed := True;
  CheckBox1.State := cbChecked;
end;
```

See Also

AllowGrayed (see page 21152)

Checked

154.1.6.4.4 TCustomCheckBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.7 TCustomCombo Class

TCustomCombo is the base class for all combo boxes.

Class Hierarchy

Pascal

```
TCustomCombo = class(TCustomListControl);
```

C++

```
class TCustomCombo : public TCustomListControl;
```

File

StdCtrls

Description

Use TCustomCombo as a base class when defining a control that represents a specialized combo box. A combo box is an edit box with a scrollable list attached to it; users can select an item from the list or type directly into the edit box. Combo boxes can present the list as a drop-down list or as a list box that is always visible.

Typically, combo box classes do not descend directly from TCustomCombo. Rather, they descend from one of TCustomCombo's descendants, TCustomComboBox (see page 21201) or TCustomComboBoxEx. Use TCustomCombo as a base class for a

simple combo box, or TCustomComboBoxEx as a base class for a combo box that supports the extended combo box features such as images on the list entries.

Do not create instances of TCustomCombo. To put a combo box in a form, use a descendant of TCustomCombo, such as TComboBox (see page 21064) or TComboBoxEx.

See Also

TComboBox (see page 21064)

TComboBoxEx (see page 3463)

TDBComboBox (see page 8657)

TColorBox (see page 12182)

TDriveComboBox (see page 13396)

TFilterComboBox (see page 13547)

TCustomComboBox (see page 21201)

TCustomComboBoxEx (see page 3678)

154.1.7.1 TCustomCombo Members

The following tables list the members exposed by TCustomCombo.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.

	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.

A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.

	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 21183)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21185)	Specifies the maximum number of items displayed in the drop-down list.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 21190)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.

	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	Create (see page 21166)	Creates and initializes a TCustomCombo (see page 21154) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 21166)	Destroys the combo box and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.

	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
V	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.

	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21196)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.7.2 TCustomCombo.Create Constructor

Creates and initializes a TCustomCombo (see page 21154) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomCombo(TComponent * AOwner);
```

Description

Call Create to generate a combo box at runtime. Combo boxes placed on forms at design time are created automatically.

AOwner is a component (typically a form) that is responsible for freeing the combo box instance.

See Also

Owner (see page 2807)

154.1.7.3 TCustomCombo.Destroy Destructor

Destroys the combo box and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomCombo();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the combo box is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

154.1.7.4 TCustomCombo Fields

The fields of the TCustomCombo class are listed here.

Protected Fields

	Name	Description
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

154.1.7.4.1 TCustomCombo.FDefEditProc Field

Pascal

```
FDefEditProc: Pointer;
```

C++

```
void * FDefEditProc;
```

Description

This is FDefEditProc, a member of class TCustomCombo.

154.1.7.4.2 TCustomCombo.FDefListProc Field

Pascal

```
FDefListProc: Pointer;
```

C++

```
void * FDefListProc;
```

Description

This is FDefListProc, a member of class TCustomCombo.

154.1.7.4.3 TCustomCombo.FDropHandle Field

Pascal

```
FDropHandle: HWnd;
```

C++

```
HWnd FDropHandle;
```

Description

This is FDropHandle, a member of class TCustomCombo.

154.1.7.4.4 TCustomCombo.FDroppingDown Field

Pascal

```
FDroppingDown: Boolean;
```

C++

```
Boolean FDroppingDown;
```

Description

This is FDroppingDown, a member of class TCustomCombo.

154.1.7.4.5 TCustomCombo.FEditHandle Field

Pascal

```
FEditHandle: HWnd;
```

C++

```
HWnd FEditHandle;
```

Description

This is FEditHandle, a member of class TCustomCombo.

154.1.7.4.6 TCustomCombo.FEditInstance Field

Pascal

```
FEditInstance: Pointer;
```

C++

```
void * FEditInstance;
```

Description

This is FEditInstance, a member of class TCustomCombo.

154.1.7.4.7 TCustomCombo.FFocusChanged Field

Pascal

```
FFocusChanged: Boolean;
```

C++

```
Boolean FFocusChanged;
```

Description

This is FFocusChanged, a member of class TCustomCombo.

154.1.7.4.8 TCustomCombo.FIsFocused Field

Pascal

```
FIsFocused: Boolean;
```

C++

```
Boolean FIsFocused;
```

Description

This is FIsFocused, a member of class TCustomCombo.

154.1.7.4.9 TCustomCombo.FListHandle Field

Pascal

```
FListHandle: HWnd;
```

C++

```
HWnd FListHandle;
```

Description

This is FListHandle, a member of class TCustomCombo.

154.1.7.4.10 TCustomCombo.FListInstance Field

Pascal

```
FListInstance: Pointer;
```

C++

```
void * FListInstance;
```

Description

This is FListInstance, a member of class TCustomCombo.

154.1.7.4.11 TCustomCombo.FSaveIndex Field

Pascal

```
FSaveIndex: Integer;
```

C++

```
int FSaveIndex;
```

Description

This is FSaveIndex, a member of class TCustomCombo.

154.1.7.5 TCustomCombo Methods

The methods of the TCustomCombo class are listed here.

Protected Methods

	Name	Description
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
V	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
V	CreateWnd (see page 21174)	Creates the Windows control that represents the combo box.
V	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
A	GetItemCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
A	GetItemHt (see page 21177)	Returns the value of the ItemHeight (see page 21186) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
A	GetItemsClass (see page 21177)	Indicates the class that implements the Items (see page 21187) property.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
V	WndProc (see page 21183)	Processes messages received by the combo box.

Public Methods

	Name	Description
V	AddItem (see page 21170)	Adds an item to the drop-down list of items.
V	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
V	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
V	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Focused (see page 21175)	Indicates whether the combo box has input focus.
V	SelectAll (see page 21180)	Selects the entire block of text in the edit box.

154.1.7.5.1 TCustomCombo.AddItem Method

Adds an item to the drop-down list of items.

Pascal

```
procedure AddItem(Item: String; AObject: TObject); override;
```

C++

```
virtual __fastcall AddItem(AnsiString Item, TObject * AObject);
```

Description

Call AddItem to add a string, with an associated object, to the drop-down list.

Item is the string to add to the drop-down list.

AObject is an object associated with that string. It can be accessed using the Objects property of the TStrings object that implements the Items (see page 21187) property.

See Also

Items (see page 21187)

Objects (see page 3077)

154.1.7.5.2 TCustomCombo.AdjustDropDown Method

Adjusts the size and position of the drop down list.

Pascal

```
procedure AdjustDropDown; virtual;
```

C++

```
virtual __fastcall AdjustDropDown();
```

Description

TCustomCombo (see page 21154) calls AdjustDropDown when it drops down the drop-down list. This method adjusts the size and position of the drop-down list to reflect the values of the ItemHeight (see page 21186) and DropDownCount (see page 21185) properties.

See Also

ItemHeight (see page 21186)

DroppedDown (see page 21185)

DropDownCount (see page 21185)

154.1.7.5.3 TCustomCombo.Change Method

Generates an OnChange (see page 21197) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Change is called automatically in response to notifications that the text has changed. It responds by generating an OnChange (see page 21197) event. Override this method to add additional processing when the text changes, or to block the OnChange (see page 21197) event.

See Also

OnChange (see page 21197)

Changed (see page 5742)

154.1.7.5.4 TCustomCombo.Clear Method

Deletes all text from the edit box and all items from the Items (see page 21187) list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call Clear to empty the combo box at runtime.

See Also

Items (see page 21187)

Text (see page 5842)

154.1.7.5.5 TCustomCombo.ClearSelection Method

Deselects any selected items in the drop-down list.

Pascal

```
procedure ClearSelection; override;
```

C++

```
virtual __fastcall ClearSelection();
```

Description

ClearSelection checks whether an item in the drop-down list is currently selected. If so, it deselects the item (sets ItemIndex to –1), and changes the Text property to an empty string.

See Also

ItemIndex

Text (see page 5842)

154.1.7.5.6 TCustomCombo.CloseUp Method

Generates an OnCloseUp (see page 21199) event.

Pascal

```
procedure CloseUp; dynamic;
```

C++

```
__fastcall CloseUp();
```

Description

CloseUp is called automatically when the DroppedDown (see page 21185) property changes to false. It generates an OnCloseUp (see page 21199) event.

Override CloseUp to implement additional class-specific responses when the drop-down list closes up or to suppress the event.

See Also

DroppedDown (see page 21185)

OnCloseUp (see page 21199)

154.1.7.5.7 TCustomCombo.ComboWndProc Method

Responds to Windows messages sent to the edit control or drop-down list.

Pascal

```
procedure ComboWndProc(var Message: TMessage; ComboWnd: HWnd; ComboProc: Pointer); virtual;
```

C++

```
virtual __fastcall ComboWndProc(TMessage Message, HWnd ComboWnd, void * ComboProc);
```

Description

ComboWndProc handles the common processing of Windows messages sent to the edit region or list portion of the combo box. It is called by the EditWndProc (see page 21175) and ListWndProc (see page 21178) methods to take care of all processing that is not specific to the edit region or drop-down list.

The Message parameter describes the Windows message. The ComboWnd parameter is the windows handle for the edit region or list. The ComboProc parameter is a pointer to the default window procedure for the window that received the message. ComboWndProc provides default responses to focus events, mouse events, and key strokes.

Override ComboWndProc to change the way the combo box responds to Windows messages. When overriding ComboWndProc, be sure to call the parent class's method to process all unhandled messages.

Note: Do not confuse ComboWndProc with the WndProc (see page 21183) method. ComboWndProc responds to messages that are sent to the edit region or drop-down list. WndProc (see page 21183) responds to messages sent to the combo box itself.

See Also

WndProc (see page 21183)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

154.1.7.5.8 TCustomCombo.CopySelection Method

Copies the selected item in the drop-down list to another list control.

Pascal

```
procedure CopySelection(Destination: TCustomListControl); override;
```

C++

```
virtual __fastcall CopySelection(TCustomListControl Destination);
```

Description

CopySelection checks whether an item is selected in the drop-down list, and if so, adds it to the control specified by Destination, along with its associated object.

See Also

Items (see page 21187)

ItemIndex

154.1.7.5.9 TCustomCombo.CreateWnd Method

Creates the Windows control that represents the combo box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateHandle method calls CreateWnd to handle the particulars of creating the combo box window. TCustomCombo (see page 21154) overrides the inherited method to ensure that the newly-created window and the TCustomCombo (see page 21154) properties correctly reflect each other.

The Windows control for the combo box can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. Thus, CreateWnd may be called more than once during the lifetime of the TCustomCombo (see page 21154) instance.

See Also

CreateHandle (see page 6135)

154.1.7.5.10 TCustomCombo.DeleteSelected Method

Deletes the selected item from the drop-down list.

Pascal

```
procedure DeleteSelected; override;
```

C++

```
virtual __fastcall DeleteSelected();
```

Description

DeleteSelected deletes the item specified by the ItemIndex property from the drop-down list.

See Also

ItemIndex

Items (see page 21187)

154.1.7.5.11 TCustomCombo.DestroyWindowHandle Method

Destroys all of the windows controls that implement the combo box.

Pascal

```
procedure DestroyWindowHandle; override;
```

C++

```
virtual __fastcall DestroyWindowHandle();
```

Description

The DestroyWnd method calls DestroyWindowHandle to release the underlying Windows control. TCustomCombo (see page 21154) overrides the inherited method to reset the EditHandle (see page 21185) and ListHandle (see page 21189) properties once the underlying Windows controls are gone.

See Also

DestroyWnd (see page 6141)

EditHandle (see page 21185)

ListHandle (see page 21189)

154.1.7.5.12 TCustomCombo.DropDown Method

Generates an OnDropDown (see page 21199) event.

Pascal

```
procedure DropDown; dynamic;
```

C++

```
__fastcall DropDown();
```

Description

DropDown is called automatically when the DroppedDown (see page 21185) property changes to true. It responds by generating an OnDropDown (see page 21199) event. To perform additional processing or block the OnDropDown (see page 21199) event, override DropDown.

See Also

OnDropDown (see page 21199)

DroppedDown (see page 21185)

154.1.7.5.13 TCustomCombo.EditWndProc Method

Responds to Windows messages that are sent to the edit control portion of the combo box.

Pascal

```
procedure EditWndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall EditWndProc(TMessage Message);
```

Description

A combo box is composed of several windows: the combo box itself, the edit control, and the drop-down list. EditWndProc is the window procedure for the edit control portion of the combo box.

See Also

EditHandle (see page 21185)

WndProc (see page 21183)

ListWndProc (see page 21178)

ComboWndProc (see page 21173)

154.1.7.5.14 TCustomCombo.Focused Method

Indicates whether the combo box has input focus.

Pascal

```
function Focused: Boolean; override;
```

C++

```
virtual __fastcall Boolean Focused();
```

Description

Call Focused to determine whether the combo box is currently the recipient of keyboard input. When Focused returns true, the combo box is the active control and keystroke messages are sent to it. When Focused is false, the combo box is not active (although it may be selected).

See Also

ActiveControl (see page 13896)

154.1.7.5.15 TCustomCombo.GetCount Method

Returns the value of the ItemCount (see page 21186) property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount returns the number of items in the drop-down list.

See Also

ItemCount (see page 21186)

154.1.7.5.16 TCustomCombo.GetDroppedDown Method

Returns the value of the DroppedDown (see page 21185) property.

Pascal

```
function GetDroppedDown: Boolean;
```

C++

```
__fastcall Boolean GetDroppedDown();
```

Description

GetDroppedDown is the read implementation of the DroppedDown (see page 21185) property. It returns true if the drop-down list is showing.

See Also

DroppedDown (see page 21185)

154.1.7.5.17 TCustomCombo.GetItemCount Method

Returns the value of the ItemCount (see page 21186) property.

Pascal

```
function GetItemCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetItemCount() = 0;
```

Description

GetItemCount is the protected read access method for the ItemCount (see page 21186) property. In TCustomCombo (see page 21154), this method is abstract (pure virtual), meaning it has no implementation. Descendant classes override this method to return the number of items in the drop-down list.

See Also

ItemCount (see page 21186)

154.1.7.5.18 TCustomCombo.GetItemHt Method

Returns the value of the ItemHeight (see page 21186) property.

Pascal

```
function GetItemHt: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetItemHt() = 0;
```

Description

GetItemHt is the protected read access method for the ItemHeight (see page 21186) property. In TCustomCombo (see page 21154), this method is abstract (pure virtual), meaning it has no implementation. Descendant classes override this method to return the height of items in the drop-down list.

See Also

ItemHeight (see page 21186)

154.1.7.5.19 TCustomCombo.GetItemIndex Method

Returns the value of the ItemIndex property.

Pascal

```
function GetItemIndex: Integer; override;
```

C++

```
virtual __fastcall int GetItemIndex();
```

Description

GetItemIndex is the read implementation of the ItemIndex property. It returns the index of the selected item in the drop-down list. The first item in the list has index 0, the second item has index 1, and so on. If no item is selected, the value of ItemIndex is -1.

See Also

ItemIndex

154.1.7.5.20 TCustomCombo.GetItemsClass Method

Indicates the class that implements the Items (see page 21187) property.

Pascal

```
function GetItemsClass: TCustomComboBoxStringsClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomComboBoxStringsClass GetItemsClass() = 0;
```

Description

TCustomCombo (see page 21154) uses GetItemsClass internally to determine what class to instantiate when it implements the Items (see page 21187) property.

In TCustomCombo (see page 21154), GetItemsClass is abstract pure virtual, meaning it has no implementation. TCustomCombo (see page 21154) descendants override this method to indicate a TCustomComboBoxStrings (see page 21225) descendant that implements the Items (see page 21187) property.

See Also

Items (see page 21187)

154.1.7.5.21 TCustomCombo.GetSelLength Method

Returns the value of the SelLength (see page 21190) property.

Pascal

```
function GetSelLength: Integer;
```

C++

```
__fastcall int GetSelLength();
```

Description

GetSelLength is the read implementation of the SelLength (see page 21190) property. It returns the number of selected characters.

See Also

SelLength (see page 21190)

154.1.7.5.22 TCustomCombo.GetSelStart Method

Returns the value of the SelStart (see page 21193) property.

Pascal

```
function GetSelStart: Integer;
```

C++

```
__fastcall int GetSelStart();
```

Description

GetSelStart is the read implementation of the SelStart (see page 21193) property. It returns the position of the first selected character, or the position of the cursor if no characters are selected.

See Also

SelStart (see page 21193)

154.1.7.5.23 TCustomCombo.ListWndProc Method

Responds to Windows messages that are sent to the drop-down list portion of the combo box.

Pascal

```
procedure ListWndProc(var Message: TMessage);
```

C++

```
__fastcall ListWndProc(TMessage Message);
```

Description

A combo box is composed of several windows: the combo box itself, the edit control, and the drop-down list. ListWndProc is the window procedure for the drop-down list.

See Also

ListHandle (see page 21189)

WndProc (see page 21183)

EditWndProc (see page 21175)

ComboWndProc (see page 21173)

154.1.7.5.24 TCustomCombo.Loaded Method

Initializes the combo box after its form is loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The component streaming system calls this method after it loads the combo box's form from a stream.

TCustomCombo (see page 21154) overrides the inherited method to select the item specified by the ItemIndex property once the form is fully loaded.

See Also

Loaded (see page 2782)

ItemIndex

154.1.7.5.25 TCustomCombo.Select Method

Generates an OnSelect (see page 21201) event.

Pascal

```
procedure Select; dynamic;
```

C++

```
__fastcall Select();
```

Description

Select is called automatically when the selected item in the drop-down list changes. It responds by generating an OnSelect (see page 21201) event. To perform additional processing or block the OnSelect (see page 21201) event, override Select.

See Also

OnSelect (see page 21201)

ItemIndex

154.1.7.5.26 TCustomCombo.SelectAll Method

Selects the entire block of text in the edit box.

Pascal

```
procedure SelectAll; override;
```

C++

```
virtual __fastcall SelectAll();
```

Description

Use SelectAll to select the entire block of text in the edit box. To select only part of the text, use the SelStart (see page 21193) and SelLength (see page 21190) properties.

See Also

SelStart (see page 21193)

SelLength (see page 21190)

154.1.7.5.27 TCustomCombo.SetDropDownCount Method

Sets the value of the DropDownCount (see page 21185) property.

Pascal

```
procedure SetDropDownCount(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetDropDownCount(const int Value);
```

Description

SetDropDownCount is the protected write implementation of the DropDownCount (see page 21185) property.

See Also

DropDownCount (see page 21185)

154.1.7.5.28 TCustomCombo.SetDroppedDown Method

Sets the value of the DroppedDown (see page 21185) property.

Pascal

```
procedure SetDroppedDown(Value: Boolean);
```

C++

```
__fastcall SetDroppedDown(Boolean Value);
```

Description

SetDroppedDown is the protected write implementation of the DroppedDown (see page 21185) property.

See Also

DroppedDown (see page 21185)

154.1.7.5.29 TCustomCombo.SetItemHeight Method

Sets the value of the ItemHeight (see page 21186) property.

Pascal

```
procedure SetItemHeight(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetItemHeight(int Value);
```

Description

SetItemHeight is the protected write implementation of the ItemHeight (see page 21186) property. Although SetItemHeight never raises an exception, in some cases it does not change the value of the ItemHeight (see page 21186) property. ItemHeight (see page 21186) can only be changed for some TCustomCombo (see page 21154) descendants, and then only under specific circumstances.

For example, TComboBoxEx never allows the ItemHeight (see page 21186) property to change.

See Also

ItemHeight (see page 21186)

154.1.7.5.30 TCustomCombo.SetItemIndex Method

Sets the value of the ItemIndex property.

Pascal

```
procedure SetItemIndex(const Value: Integer); override;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

SetItemIndex is the protected write implementation of the ItemIndex property. It selects an item in the drop-down list.

Value is the item to select, where 0 indicates the first item, 1 indicates the second item, and so on. A negative Value causes all items to be unselected.

See Also

ItemIndex

154.1.7.5.31 TCustomCombo.SetItems Method

Sets the value of the Items (see page 21187) property.

Pascal

```
procedure SetItems(const Value: TStrings); virtual;
```

C++

```
virtual __fastcall SetItems(const TStrings Value);
```

Description

SetItems is the protected write implementation for the Items (see page 21187) property. It copies the strings (and possibly their associated objects) from Value to the Items (see page 21187) property.

See Also

Items (see page 21187)

Assign (see page 3043)

154.1.7.5.32 TCustomCombo.SetMaxLength Method

Sets the value of the MaxLength (see page 21189) property.

Pascal

```
procedure SetMaxLength(Value: Integer);
```

C++

```
__fastcall SetMaxLength(int Value);
```

Description

SetMaxLength is the protected write implementation of the MaxLength (see page 21189) property.

See Also

MaxLength (see page 21189)

154.1.7.5.33 TCustomCombo.SetSelLength Method

Sets the value of the SelLength (see page 21190) property.

Pascal

```
procedure SetSelLength(Value: Integer);
```

C++

```
__fastcall SetSelLength(int Value);
```

Description

SetSelLength is the protected write implementation of the SelLength (see page 21190) property.

See Also

SelLength (see page 21190)

154.1.7.5.34 TCustomCombo.SetSelStart Method

Sets the value of the SelStart (see page 21193) property.

Pascal

```
procedure SetSelStart(Value: Integer);
```

C++

```
__fastcall SetSelStart(int Value);
```

Description

SetSelStart is the protected write implementation of the SelStart (see page 21193) property.

See Also

SelStart (see page 21193)

154.1.7.5.35 TCustomCombo.WndProc Method

Processes messages received by the combo box.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method to received Windows messages that are sent to the combo box. Messages (see page 16211) sent to the child windows of the combo box (for the edit region and the list portion) go to the EditWndProc (see page 21175) or ListWndProc (see page 21178) method instead. WndProc handles messages about changes to the system colors defined in the Windows control panel, and closes up the drop-down list when the Enter key or the Escape key is pressed. All other messages are passed to Dispatch for default processing.

See Also

ComboWndProc (see page 21173)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

154.1.7.6 TCustomCombo Properties

The properties of the TCustomCombo class are listed here.

Protected Properties

	Name	Description
	DropDownCount (see page 21185)	Specifies the maximum number of items displayed in the drop-down list.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	ParentColor (see page 21190)	Determines where a control looks for its color information.

Public Properties

	Name	Description
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	TabStop (see page 21196)	Determines if the user can tab to a control.

154.1.7.6.1 TCustomCombo.Canvas Property

Provides access to the drawing surface of the combo box.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use Canvas as the drawing surface when customizing the way the combo box paints itself. For example, when using a TCustomCombo (see page 21154) descendant that allows applications to draw combo box items in an OnDrawItem even, the OnDrawItem event handler uses Canvas for painting the customized items.

C++ Examples:

```
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TComboBox *myComboBox;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TComboBox")
  {
    myComboBox = (TComboBox *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myComboBox->Canvas->MoveTo(myComboBox->ClientRect.Left, myComboBox->ClientRect.Top);
    myComboBox->Canvas->LineTo(myComboBox->ClientRect.Right, myComboBox->ClientRect.Bottom);
    myComboBox = NULL;
  }
}
```

Delphi Examples:

```
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TComboBox) then
  begin
    myComboBox:= (ListBox1.Items.Objects[Index] as TComboBox);
    with myComboBox.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myComboBox.Canvas.MoveTo(Left, Top);
      myComboBox.Canvas.LineTo(Right, Bottom);
    end;
  myComboBox:= nil;
  end;
```

See Also

OnDrawItem (see page 21224)

154.1.7.6.2 TCustomCombo.DropDownCount Property

Specifies the maximum number of items displayed in the drop-down list.

Pascal

```
property DropDownCount: Integer;
```

C++

```
__property int DropDownCount;
```

Description

By default, the drop-down list is long enough to contain eight items without requiring the user to scroll to see them all. To make the drop-down list smaller or larger, specify a number larger or smaller than eight as the DropDownCount value.

If the DropDownCount value is larger than the number of items in the Items (see page 21187) property, the drop-down list will be just large enough to hold all the possible choices and no more. If the DropDownCount value is smaller then the number of item in the Items (see page 21187) property, the drop down list will display a scroll bar.

See Also

Items (see page 21187)

ItemCount (see page 21186)

154.1.7.6.3 TCustomCombo.DroppedDown Property

Indicates whether the drop-down list is currently displayed.

Pascal

```
property DroppedDown: Boolean;
```

C++

```
__property Boolean DroppedDown;
```

Description

Read DroppedDown to determine whether the drop-down list is visible. Set DropDown (see page 21175) to drop the list down or close it up. DroppedDown is true when the drop-down list is open, and false when it is closed.

See Also

OnDropDown (see page 21199)

AutoDropDown (see page 21221)

154.1.7.6.4 TCustomCombo.EditHandle Property

Returns the window handle for the edit portion of the combo box.

Pascal

```
property EditHandle: HWnd;
```

C++

```
__property HWnd EditHandle;
```

Description

A combo box is composed of several windows: the combo box itself, the edit control, and the drop-down list. EditHandle is the

window handle of the edit control portion. (The Handle property and the ListHandle (see page 21189) property give the handles for the combo box itself and the drop-down list, respectively.)

Use EditHandle when making Windows API calls addressed to the edit portion of the combo box.

See Also

Handle (see page 6207)

ListHandle (see page 21189)

154.1.7.6.5 TCustomCombo.ItemCount Property

Specifies the number of items in the drop-down list.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

Read ItemCount to get the number of items in the drop-down list. ItemCount is the number of all items, not just those that are visible at one time.

See Also

Items (see page 21187)

DropDownCount (see page 21185)

154.1.7.6.6 TCustomCombo.ItemHeight Property

Specifies the height, in pixels, of the items in the drop-down list.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Read ItemHeight to determine the height of the items in the drop-down list.

The effect of setting ItemHeight varies, depending on the type of combo box and the style. For example, TComboBox (see page 21064) lets you set the item height only when Style is set to csOwnerDrawFixed or csOwnerDrawVariable. If Style is csOwnerDrawVariable, ItemHeight is the default height for drawing list items, but this value can be overridden by an OnMeasureItem event handler.

TComboBoxEx does not let you change the value of ItemHeight.

Note: Combo boxes that do not support changes to ItemHeight do not raise an exception when you attempt to change ItemHeight; they simply ignore the attempt.

See Also

Items (see page 21187)

OnMeasureItem (see page 21225)

Style (see page 21224)

154.1.7.6.7 TCustomCombo.Items Property

Provides access to the list of items (strings) in the list portion of the combo box.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Read Items to access the list of items that appears in the combo box. Use the methods of Items to add, insert, delete and move items. Set the value of Items to copy the items from another string list.

C++ Examples:

```
/*
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TListItem *Item;
  TListColumn *Column;
  const char imagenames[3][20] = {"C++ Image", "Borland Image", "Delphi Image"};
  const char Col2Array[3][40] = {"Documentation for the C++ icon.", "Borland icon.", "Delphi
icon."};
  // Create a ListView item for each image in the ImageList
  ListView1->SmallImages = ImageList1;
  ListView1->LargeImages = ImageList1;
  for (int i = 0; i < ImageList1->Count; i++)
  {
    Item = ListView1->Items->Add();
    Item->Caption = imagenames[i];
    Item->ImageIndex = i;
    Item->SubItems->Add(Col2Array[i]);
  }
  // Create two columns to show during viewing as vsReport
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 1";
  Column->Width = 200;
  Column = ListView1->Columns->Add();
  Column->Caption = "Column 2";
  Column->Width = 200;
  // Add View styles and constants to the Combo Box
  ComboBox1->Items->AddObject("vsIcon", (TObject *)vsIcon);
  ComboBox1->Items->AddObject("vsList", (TObject *)vsList);
  ComboBox1->Items->AddObject("vsReport", (TObject *)vsReport);
  ComboBox1->Items->AddObject("vsSmallIcon", (TObject *)vsSmallIcon);
  // Display first item in the Combo Box
```

```
  ComboBox1->ItemIndex = 0;
}

void __fastcall TForm1::ComboBox1Click(TObject *Sender)
{
  ListView1->ViewStyle = (TViewStyle) ComboBox1->Items->Objects[ComboBox1->ItemIndex];
}
```

Delphi Examples:

```
{
This example requires a TListView, a TImageList and a
TComboBox. You will need to double click the image list and
add several images to the image list prior to running the
project. You can use *.bmp or *.ico files from the
\Images\Icons directory. During the form's OnCreate event
handler, items for the List View control are created for
each image in the Image List and the ImageIndex is assigned
the number of the image within the ImageList. Two columns are
created so that when ViewStyle is vsReport, you will have
columns to view.  Also within the form's OnCreate event
handler assign the ComboBox each of the four TViewStyle
constants to the Items' Objects property. You could also
simply code this within a series of OnClick event handlers
as, for instance, ListView1.->ViewStyle := vsIcon.
}

procedure TComboForm.FormCreate(Sender: TObject);
var
  I: Integer;
  ListItem: TListItem;
  NewColumn: TListColumn;
begin
  Col2Array[0]:= 'Documentation for Image0.';
  Col2Array[1]:= 'Documentation for Image1.';
  Col2Array[2]:= 'Documentation for Image2.';
  // Create a ListView item for each image in the ImageList
  with ListView1 do
  begin
    SmallImages := ImageList1;
    LargeImages := ImageList1;
    for I := 0 to ImageList1.Count - 1 do
    begin
      ListItem := Items.Add;
      Listitem.Caption := 'Image' + IntToStr(I);
      ListItem.ImageIndex := I;
      Listitem.SubItems.Add(Col2Array[I]);
    end;
    // Create two columns to show during viewing as vsReport
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 1';
    NewColumn.Width := 200;
    NewColumn := Columns.Add;
    NewColumn.Caption := 'Column 2';
    NewColumn.Width := 200;
    // Add View styles and constants to the Combo Box
    ComboBox1.Items.AddObject('vsIcon', TObject(vsIcon));
    ComboBox1.Items.AddObject('vsList', TObject(vsList));
    ComboBox1.Items.AddObject('vsReport', TObject(vsReport));
    ComboBox1.Items.AddObject(
      'vsSmallIcon', TObject(vsSmallIcon));
    // Display first item in the Combo Box
    ComboBox1.ItemIndex := 0;
  end;
end;

procedure TComboForm.ComboBox1Click(Sender: TObject);
```

```
begin
  with ComboBox1 do
    ListView1.ViewStyle := TViewStyle(Items.Objects[ItemIndex]);

end;
```

154.1.7.6.8 TCustomCombo.ListHandle Property

Provides access to the window handle of the list of items in the combo box.

Pascal

```
property ListHandle: HWnd;
```

C++

```
__property HWnd ListHandle;
```

Description

A combo box is composed of several windows: the combo box itself, the edit control, and the drop-down list. ListHandle is the window handle of the drop-down list. (The Handle property and the EditHandle (see page 21185) property give the handles for the combo box itself and the edit portion, respectively.)

Use ListHandle when making Windows API calls addressed to the list portion of the combo box.

Note: ListHandle is only available when the combo box has a "simple" style (an edit box with a fixed list below rather than a drop-down list).

See Also

Handle (see page 6207)

EditHandle (see page 21185)

154.1.7.6.9 TCustomCombo.MaxLength Property

Specifies the maximum number of characters the user can type into the edit portion of the combo box.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that the user can enter into the edit portion of the combo box. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that

may be entered into an edit control.

See Also

Text (see page 5842)

154.1.7.6.10 TCustomCombo.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.7.6.11 TCustomCombo.SelLength Property

Specifies the length, in characters, of the selected text in the edit portion of the combo box.

Pascal

```
property SelLength: Integer;
```

C++

```
__property int SelLength;
```

Description

The selected portion of the text in the edit region of the combo box is the string of SelLength characters that starts at the character specified by the SelStart (see page 21193) property. The selected text appears highlighted in the edit region of the combo box.

To select a section of text in the edit region, first set the SelStart (see page 21193) property to position the cursor, and then set SelLength to the number of characters that should be selected. The SelText property is the substring that is selected.

Note: The SelLength property is only valid when the combo box has focus. When the combo box does not have focus, reading SelLength always yields a value of 0, and setting it has no effect.

C++ Examples:

```
/*
The following example shows how to complete partial strings
typed into a combo box. The code represents the OnKeyPress
event handler of the combo box, which performs most of the
default keystroke handling before finding a matching list
item and updating the text.
Note:   This OnKeyPress event handler does not deal with the
case when the user types the Delete key. That case must be
caught in the OnKeyDown event handler instead.
*/
void __fastcall TForm1::ComboBox1KeyPress(TObject *Sender, char &Key)
{
  // first, process the keystroke to obtain the current string
  // This code requires all items in list to be uppercase
  if (Key >= 'a' && Key <= 'z')
    Key -= 32; // Force Uppercase only!
  TComboBox *pCB = (TComboBox *)Sender;
  AnsiString TmpStr;
  bool BackSpace = (Key == (char)VK_BACK);
  if (BackSpace && pCB->SelLength)
    TmpStr = pCB->Text.SubString(1,pCB->SelStart)+
             pCB->Text.SubString(pCB->SelLength+pCB->SelStart+1,255);
  else if (BackSpace) // SelLength == 0
    TmpStr = pCB->Text.SubString(1,pCB->SelStart-1)+
             pCB->Text.SubString(pCB->SelStart+1,255);
  else //Key is a visible character
    TmpStr = pCB->Text.SubString(1,pCB->SelStart)+ Key +
             pCB->Text.SubString(pCB->SelLength+pCB->SelStart+1,255);
  if (TmpStr.IsEmpty())
    return;
  // set SelSt to the current insertion point
  int SelSt = pCB->SelStart;
  if (BackSpace && SelSt > 0)
    SelSt--;
  else if (!BackSpace)
    SelSt++;

Text (see page 5842)

154.1.7.6.12 TCustomCombo.SelStart Property

Specifies the position of the first selected character in the edit portion of the combo box.

Pascal

```
property SelStart: Integer;
```

C++

```
__property int SelStart;
```

Description

Read SelStart to determine where the selection starts in the Text property. The first character is designated with 0, the second with 1, and so on. When SelLength (see page 21190) is 0, SelStart is the position of the cursor.

Set SelStart to position the cursor in the edit region of the combo box. Setting SelStart to 0 positions the cursor before the first character, setting SelStart to 1 positions the cursor before the second character, and so on.

Note: Setting SelStart changes the SelLength (see page 21190) property to 0. When using SelStart and SelLength (see page 21190) to programmatically select a portion of the text in the edit region, set SelStart before setting SelLength (see page 21190).

Note: The SelStart property is only valid when the combo box has focus. When the combo box does not have focus, reading SelStart always yields a value of 0, and setting it has no effect.

C++ Examples:

```
/*
The following example shows how to complete partial strings
```

```
typed into a combo box. The code represents the OnKeyPress
event handler of the combo box, which performs most of the
default keystroke handling before finding a matching list
item and updating the text.

SelText (see page 21222)

Text (see page 5842)

154.1.7.6.13 TCustomCombo.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.7.7 TCustomCombo Events

The events of the TCustomCombo class are listed here.

Protected Events

	Name	Description
	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.

154.1.7.7.1 TCustomCombo.OnChange Event

Occurs when the user changes the text displayed in the edit region.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action immediately after the user edits the text in the edit region or selects an item from the list. The Text property gives the new value in the edit region.

Note: OnChange only occurs in response to user actions. Changing the Text property programmatically does not trigger an OnChange event.

C++ Examples:

```
/*
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the
ActivePage property through selection of a ComboBox item.
During the form create, the Combo Box control is loaded with
the names of each of the tabs, as well as the instance
pointers to the corresponding tab.  When the user selects
the Combo Box item, the associated TTabSheet object
contained in the Combo Box Objects array is used to set the
ActivePage property.  Select the Lines property of the
TRichEdit to enter a string.  Select the string before
justifying.
*/
void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  TComboBox *pCB = dynamic_cast<TComboBox *>(Sender);
  if (pCB)
    PageControl1->ActivePage = (TTabSheet *)(pCB->Items->Objects[pCB->ItemIndex]);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const TColor colorPalette[12] = {
    clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
    clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};
  for (int i = 0; i < PageControl1->PageCount; i++)
  {
    PageControl1->Pages[i]->Brush->Color = colorPalette[i];
    ComboBox1->Items->AddObject(PageControl1->Pages[i]->Name, PageControl1->Pages[i]);
    ComboBox1->ItemIndex = 0;
  }
}
/*
The following example assumes that a drive combo box, a file
list box, and a directory list box are on a form. Add this
code as the OnChange event handler for the drive combo box
and the OnChange event handler for the directory list box.
When the user changes the drive using the combo box, the
directory list box and file list box will update to reflect
the new drive and the current directory on that drive.  When
```

```
the user double clicks on a directory in the file list box
will update to reflect the new directory.
*/
void __fastcall TForm1::DriveComboBox1Change(TObject *Sender)
{
  DirectoryListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Drive = DriveComboBox1->Drive;
  FileListBox1->Directory = DirectoryListBox1->Directory;
}

void __fastcall TForm1::DirectoryListBox1Change(TObject *Sender)
{
  FileListBox1->Directory = DirectoryListBox1->Directory;
}
```

Delphi Examples:

```
{
This example requires a TPageControl already on the form.
Also, you must add pages to the TPageControl by right
clicking and selecting New Page.
The example code will allow the user to select the
ActivePage property through selection of a ComboBox item.
During the form create, the Combo Box control is loaded with
the names of each of the tabs, as well as the instance
pointers to the corresponding tab.  When the user selects
the Combo Box item, the associated TTabSheet object
contained in the Combo Box Objects array is used to set the
ActivePage property.  Select the Lines property of the
TRichEdit to enter a string.  Select the string before
justifying.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to PageControl1.PageCount - 1 do
    ComboBox1.Items.AddObject(PageControl1.Pages[i].Name,
      PageControl1.Pages[i]);
  ComboBox1.ItemIndex := 0;
end;

procedure TForm1.ComboBox1Change(Sender: TObject);
begin
  if (Sender is TComboBox) then
    with (Sender as TComboBox) do
      PageControl1.ActivePage := TTabSheet(Items.Objects[ItemIndex]);
end;
{
The following example assumes that a drive combo box, a file
list box, and a directory list box are on a form. Add this
code as the OnChange event handler for the drive combo box
and the OnChange event handler for the directory list box.
When the user changes the drive using the combo box, the
directory list box and file list box will update to reflect
the new drive and the current directory on that drive.  When
the user double clicks on a directory in the file list box
will update to reflect the new directory.
}
procedure TForm1.DirectoryListBox1Change(Sender: TObject);
begin
  FileListBox1.Directory := DirectoryListBox1.Directory;
end;

procedure TForm1.DriveComboBox1Change(Sender: TObject);
begin
  DirectoryListBox1.Drive := DriveComboBox1.Drive;
```

```
    FileListBox1.Drive := DriveComboBox1.Drive;
    FileListBox1.Directory := DirectoryListBox1.Directory;
  end;
```

OnCloseUp (see page 21199)

154.1.7.7.2 TCustomCombo.OnCloseUp Event

Occurs when the drop-down list closes up due to some user action.

Pascal

```
property OnCloseUp: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnCloseUp;
```

Description

Write an OnCloseUp event handler to implement special processing that needs to occur when the drop-down list closes up. For example, an OnCloseUp event handler can check whether the user changed the selected item while the list was dropped down and respond accordingly.

See Also

OnDropDown (see page 21199)

DroppedDown (see page 21185)

154.1.7.7.3 TCustomCombo.OnDropDown Event

Occurs when the user opens the drop-down list.

Pascal

```
property OnDropDown: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDropDown;
```

Description

Write an OnDropDown event handler to implement special processing that needs to occur only when the drop-down list is activated.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
```

```
    {
      if (((TForm1 *)Screen->CustomForms[i])->Visible)
        ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
    }
    ComboBox1->Items->EndUpdate(); //reenable painting
  }

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    ComboBox1->Sorted = True; // make sure the form names are sorted
  }

  void __fastcall TForm1::Button1Click(TObject *Sender)
  {
    Form2->Show();
  }

  void __fastcall TForm1::Button2Click(TObject *Sender)
  {
    Form3->Show();
  }
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

154.1.7.7.4 TCustomCombo.OnSelect Event

Occurs when the user selects a string in the drop-down list.

Pascal

```
property OnSelect: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnSelect;
```

Description

Write an OnSelect event handler to respond when the user changes the selected item in the drop-down list. OnSelect occurs after the selection has changed and the Text property reflects the new item.

154.1.8 TCustomComboBox Class

TCustomComboBox is the base class for combobox components.

Class Hierarchy

Pascal

```
TCustomComboBox = class(TCustomCombo);
```

C++

```
class TCustomComboBox : public TCustomCombo;
```

File

StdCtrls

Description

Use TCustomComboBox as a base class when defining a control that represents a specialized Windows combo box. A combo box is an edit box with a scrollable list attached to it; users can select an item from the list or type directly into the edit box. Combo boxes can present the list as a drop-down list or as a list box that is always visible.

Note: To create a combo box class that uses the extended combo box features such as images associated with entries, do not use TCustomComboBox. Instead, use the TCustomComboBoxEx class instead.

Do not create instances of TCustomComboBox. To put a combo box in a form, use a descendant of TCustomComboBox, such as TComboBox (see page 21064).

154.1.8.1 TCustomComboBox Members

The following tables list the members exposed by TCustomComboBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21197)	Occurs when the user changes the text displayed in the edit region.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnCloseUp (see page 21199)	Occurs when the drop-down list closes up due to some user action.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21224)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnDropDown (see page 21199)	Occurs when the user opens the drop-down list.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMeasureItem (see page 21225)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnSelect (see page 21201)	Occurs when the user selects a string in the drop-down list.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDefEditProc (see page 21167)	This is FDefEditProc, a member of class TCustomCombo.
	FDefListProc (see page 21167)	This is FDefListProc, a member of class TCustomCombo.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FDropHandle (see page 21168)	This is FDropHandle, a member of class TCustomCombo.
	FDroppingDown (see page 21168)	This is FDroppingDown, a member of class TCustomCombo.
	FEditHandle (see page 21168)	This is FEditHandle, a member of class TCustomCombo.
	FEditInstance (see page 21168)	This is FEditInstance, a member of class TCustomCombo.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FFocusChanged (see page 21168)	This is FFocusChanged, a member of class TCustomCombo.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FIsFocused (see page 21169)	This is FIsFocused, a member of class TCustomCombo.
	FListHandle (see page 21169)	This is FListHandle, a member of class TCustomCombo.
	FListInstance (see page 21169)	This is FListInstance, a member of class TCustomCombo.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.
	FSaveIndex (see page 21169)	This is FSaveIndex, a member of class TCustomCombo.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustDropDown (see page 21171)	Adjusts the size and position of the drop down list.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21171)	Generates an OnChange (see page 21197) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	CloseUp (see page 21172)	Generates an OnCloseUp (see page 21199) event.
	ComboWndProc (see page 21173)	Responds to Windows messages sent to the edit control or drop-down list.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 21215)	Creates the Windows control that represents the combo box.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWindowHandle (see page 21174)	Destroys all of the windows controls that implement the combo box.
	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus

	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 21216)	Generates an OnDrawItem (see page 21224) event.
	DropDown (see page 21175)	Generates an OnDropDown (see page 21199) event.
V	EditWndProc (see page 21175)	Responds to Windows messages that are sent to the edit control portion of the combo box.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21176)	Returns the value of the ItemCount (see page 21186) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetDroppedDown (see page 21176)	Returns the value of the DroppedDown (see page 21185) property.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
V	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21177)	Returns the value of the ItemIndex property.
V	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
V	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21178)	Returns the value of the SelLength (see page 21190) property.
	GetSelStart (see page 21178)	Returns the value of the SelStart (see page 21193) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyPress (see page 21217)	Responds to WM_CHAR messages sent to the combo box.
	KeyUp (see page 6164)	Respond to released key.
	ListWndProc (see page 21178)	Responds to Windows messages that are sent to the drop-down list portion of the combo box.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	Loaded (see page 21179)	Initializes the combo box after its form is loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.

	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	Select (see page 21179)	Generates an OnSelect (see page 21201) event.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetDropDownCount (see page 21180)	Sets the value of the DropDownCount (see page 21185) property.
	SetDroppedDown (see page 21180)	Sets the value of the DroppedDown (see page 21185) property.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetItemHeight (see page 21181)	Sets the value of the ItemHeight (see page 21186) property.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21181)	Sets the value of the ItemIndex property.
V	SetItems (see page 21181)	Sets the value of the Items (see page 21187) property.
	SetMaxLength (see page 21182)	Sets the value of the MaxLength (see page 21189) property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21182)	Sets the value of the SelLength (see page 21190) property.
	SetSelStart (see page 21182)	Sets the value of the SelStart (see page 21193) property.
V	SetStyle (see page 21219)	Sets the Style (see page 21224) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 21219)	Processes messages received by the combo box.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownCount (see page 21185)	Specifies the maximum number of items displayed in the drop-down list.
R	EditHandle (see page 21185)	Returns the window handle for the edit portion of the combo box.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
R	ItemCount (see page 21186)	Specifies the number of items in the drop-down list.
	ItemHeight (see page 21186)	Specifies the height, in pixels, of the items in the drop-down list.
R	ListHandle (see page 21189)	Provides access to the window handle of the list of items in the combo box.
	MaxLength (see page 21189)	Specifies the maximum number of characters the user can type into the edit portion of the combo box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21190)	Determines where a control looks for its color information.

	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21222)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 21224)	Determines the display style of the combo box.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddItem (see page 5940)	Adds an item to the list control.
	AddItem (see page 21170)	Adds an item to the drop-down list of items.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 5940)	Deletes all of the items from the list control.
	Clear (see page 21172)	Deletes all text from the edit box and all items from the Items (see page 21187) list.
	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
	ClearSelection (see page 21172)	Deselects any selected items in the drop-down list.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
	CopySelection (see page 21173)	Copies the selected item in the drop-down list to another list control.
	Create (see page 21214)	Creates and initializes a TCustomComboBox (see page 21201) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.

V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21174)	Deletes the selected item from the drop-down list.
V	Destroy (see page 21214)	Destroys the combo box and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
V	Focused (see page 21175)	Indicates whether the combo box has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	MoveSelection (see page 5942)	Moves all selected items to another list control.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 5943)	Selects all items or all text in the selected item.
	SelectAll (see page 21180)	Selects the entire block of text in the edit box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetDesignVisible (see page 6178)	Makes a control visible at design time.
	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Update (see page 5789)	Processes any pending paint messages immediately.
	Update (see page 6183)	Forces the control to update.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoCloseUp (see page 21220)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoComplete (see page 21220)	Positions to matching list items as you type.
	AutoCompleteDelay (see page 21220)	Specifies the delay between a key press and an attempt to autocomplete the field.
	AutoDropDown (see page 21221)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21184)	Provides access to the drawing surface of the combo box.
	CharCase (see page 21221)	Determines the case of the text in the combo box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DroppedDown (see page 21185)	Indicates whether the drop-down list is currently displayed.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21187)	Provides access to the list of items (strings) in the list portion of the combo box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21190)	Specifies the length, in characters, of the selected text in the edit portion of the combo box.
	SelStart (see page 21193)	Specifies the position of the first selected character in the edit portion of the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TabStop (see page 21196)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.8.2 TCustomComboBox.Create Constructor

Creates and initializes a TCustomComboBox (see page 21201) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomComboBox(TComponent * AOwner);
```

Description

Call Create to generate a combo box at runtime. Combo boxes placed on forms at design time are created automatically.

AOwner is a component, typically the form, that is responsible for freeing the combo box instance.

See Also

Owner (see page 2807)

154.1.8.3 TCustomComboBox.Destroy Destructor

Destroys the combo box and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomComboBox();
```

Description

Do not call Destroy directly in an application. Call Free instead. Free verifies that the combo box is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

154.1.8.4 TCustomComboBox Methods

The methods of the TCustomComboBox class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 21215)	Initializes the window-creation parameter record.
	CreateWnd (see page 21215)	Creates the Windows control that represents the combo box.
	DestroyWnd (see page 21215)	Destroys the Windows control that represents the combo box.
	DrawItem (see page 21216)	Generates an OnDrawItem (see page 21224) event.
	GetItemCount (see page 21216)	Returns the number of items in the Items (see page 21187) property list.
	GetItemHt (see page 21216)	Returns the value of the ItemHeight (see page 21186) property.
	GetItemsClass (see page 21217)	Returns the class used to implement the Items (see page 21187) property.
	GetSelText (see page 21217)	Returns the value of the SelText (see page 21222) property.
	KeyPress (see page 21217)	Responds to WM_CHAR messages sent to the combo box.
	MeasureItem (see page 21218)	Generates an OnMeasureItem (see page 21225) event.

	SelectItem (see page 21218)	Selects a specified item from the drop-down list.
V	SetStyle (see page 21219)	Sets the Style (see page 21224) property.
V	WndProc (see page 21219)	Processes messages received by the combo box.

154.1.8.4.1 TCustomComboBox.CreateParams Method

Initializes the window-creation parameter record.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 21215) method calls CreateParams to initialize the parameters it uses to create the window for the combo box. CreateParams overrides the inherited method to implement the Style (see page 21224) property.

See Also

CreateWnd (see page 21215)

Style (see page 21224)

154.1.8.4.2 TCustomComboBox.CreateWnd Method

Creates the Windows control that represents the combo box.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

The CreateHandle method calls CreateWnd to handle the particulars of creating the combo box window. TCustomCombo overrides the inherited method to ensure that the newly-created window and the TCustomCombo properties correctly reflect each other.

The Windows control for the combo box can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. Thus, CreateWnd may be called more than once during the lifetime of the TCustomCombo instance.

See Also

CreateHandle (see page 6135)

154.1.8.4.3 TCustomComboBox.DestroyWnd Method

Destroys the Windows control that represents the combo box.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

The Windows control for the combo box can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. TCustomComboBox (see page 21201) calls DestroyWnd to destroy this Windows control when necessary.

DestroyWnd saves the contents of Items (see page 21187) list before calling the inherited DestroyWnd method. The saved list is used if the window is recreated.

See Also

CreateWnd (see page 21215)

154.1.8.4.4 TCustomComboBox.DrawItem Method

Generates an OnDrawItem (see page 21224) event.

Pascal

```
procedure DrawItem(Index: Integer; Rect: TRect; State: TOwnerDrawState); virtual;
```

C++

```
virtual __fastcall DrawItem(int Index, TRect Rect, TOwnerDrawState State);
```

Description

When Style (see page 21224) is csOwnerDrawFixed or csOwnerDrawVariable, DrawItem is called whenever an item in the list needs to be drawn. If an OnDrawItem (see page 21224) event handler is assigned, DrawItem generates an OnDrawItem (see page 21224) event, passing the Index, Rect, and State parameters to the event handler. Otherwise, OnDrawItem (see page 21224) fills the rectangle passed in Rect and draws any text associated with the indexed item, ignoring the State parameter.

Override DrawItem to provide class-specific drawing code for the items in the list.

See Also

OnDrawItem (see page 21224)

Style (see page 21224)

154.1.8.4.5 TCustomComboBox.GetItemCount Method

Returns the number of items in the Items (see page 21187) property list.

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

GetItemCount is used internally to quickly determine the number of items in the drop-down list of the combo box.

See Also

Items (see page 21187)

154.1.8.4.6 TCustomComboBox.GetItemHt Method

Returns the value of the ItemHeight (see page 21186) property.

Pascal

```
function GetItemHt: Integer; override;
```

C++

```
virtual __fastcall int GetItemHt();
```

Description

GetItemHt is the protected read implementation of the ItemHeight (see page 21186) property.

See Also

ItemHeight

154.1.8.4.7 TCustomComboBox.GetItemsClass Method

Returns the class used to implement the Items (see page 21187) property.

Pascal

```
function GetItemsClass: TCustomComboBoxStringsClass; override;
```

C++

```
virtual __fastcall TCustomComboBoxStringsClass GetItemsClass();
```

Description

Combo box controls use GetItemsClass internally to determine what class to use when implementing the Items (see page 21187) property. This allows the TCustomCombo (see page 21154) base class to implement the Items (see page 21187) property for both TCustomComboBox (see page 21201) descendants and TCustomComboBoxEx descendants.

See Also

Items (see page 21187)

154.1.8.4.8 TCustomComboBox.GetSelText Method

Returns the value of the SelText (see page 21222) property.

Pascal

```
function GetSelText: string;
```

C++

```
__fastcall AnsiString GetSelText();
```

Description

GetSelText is the protected read implementation of the SelText (see page 21222) property.

See Also

SelText (see page 21222)

154.1.8.4.9 TCustomComboBox.KeyPress Method

Responds to WM_CHAR messages sent to the combo box.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress processes standard keystroke messages for the combo box control. If the KeyPress method does not handle the keystroke, it calls the inherited method, which generates an OnKeyPress event.

Key is the character represented by the key that was pressed. If the KeyPress method changes Key to 0, no further processing occurs for the keystroke.

See Also

KeyDown (see page 6163)

KeyUp (see page 6164)

OnKeyPress (see page 6227)

154.1.8.4.10 TCustomComboBox.MeasureItem Method

Generates an OnMeasureItem (see page 21225) event.

Pascal

```
procedure MeasureItem(Index: Integer; var Height: Integer); virtual;
```

C++

```
virtual __fastcall MeasureItem(int Index, int Height);
```

Description

MeasureItem is the protected implementation method for the OnMeasureItem (see page 21225) event. Override MeasureItem to provide class-specific code to specify the size of list items when Style (see page 21224) is csOwnerDrawVariable.

See Also

OnMeasureItem (see page 21225)

Style (see page 21224)

154.1.8.4.11 TCustomComboBox.SelectItem Method

Selects a specified item from the drop-down list.

Pascal

```
function SelectItem(const AnItem: String): Boolean;
```

C++

```
__fastcall Boolean SelectItem(const AnsiString AnItem);
```

Description

SelectItem selects the first item in the drop-down list that matches the string specified by AnItem. If the list does not contain a string that matches AnItem, SelectItem does nothing.

See Also

Items (see page 21187)

ItemIndex

154.1.8.4.12 TCustomComboBox.SetStyle Method

Sets the Style (see page 21224) property.

Pascal

```
procedure SetStyle(Value: TComboBoxStyle); virtual;
```

C++

```
virtual __fastcall SetStyle(TComboBoxStyle Value);
```

Description

SetStyle is the protected implementation method for the Style (see page 21224) property. Override SetStyle to change the implementation of the Style (see page 21224) property.

See Also

Style (see page 21224)

154.1.8.4.13 TCustomComboBox.WndProc Method

Processes messages received by the combo box.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc is the first method to received Windows messages that are sent to the combo box. Messages (see page 16211) sent to the child windows of the combo box (for the edit region and the list portion) go to the EditWndProc (see page 21175) or ListWndProc (see page 21178) method instead. WndProc handles messages about changes to the system colors defined in the Windows control panel, and closes up the drop-down list when the Enter key or the Escape key is pressed. All other messages are passed to Dispatch for default processing.

See Also

ComboWndProc (see page 21173)

Dispatch

WndProc (see page 6187)

EditWndProc (see page 21175)

ListWndProc (see page 21178)

154.1.8.5 TCustomComboBox Properties

The properties of the TCustomComboBox class are listed here.

Protected Properties

	Name	Description
	Sorted (see page 21222)	Determines whether the list portion of the combo box is alphabetized.
	Style (see page 21224)	Determines the display style of the combo box.

Public Properties

	Name	Description
	AutoCloseUp (see page 21220)	Specifies whether the drop-down closes up automatically when the user selects an item.
	AutoComplete (see page 21220)	Positions to matching list items as you type.
	AutoCompleteDelay (see page 21220)	Specifies the delay between a key press and an attempt to autocomplete the field.
	AutoDropDown (see page 21221)	Specifies whether the drop-down list drops down automatically in response to user keystrokes.
	CharCase (see page 21221)	Determines the case of the text in the combo box.
	SelText (see page 21222)	Represents the selected text in the edit region.

154.1.8.5.1 TCustomComboBox.AutoCloseUp Property

Specifies whether the drop-down closes up automatically when the user selects an item.

Pascal

```
property AutoCloseUp: Boolean;
```

C++

```
__property Boolean AutoCloseUp;
```

Description

When AutoCloseUp is true, the drop-down closes up automatically when the user selects an item.

See Also

AutoDropDown (see page 21221)

154.1.8.5.2 TCustomComboBox.AutoComplete Property

Positions to matching list items as you type.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

AutoComplete will position to matching list values as you type, saving you keystrokes.

As you type, the ItemIndex property is updated with the list entry that matches the characters you have entered. As you type, different list entries may match, and ItemIndex changes accordingly.

There is a delay of AutoCompleteDelay (see page 21220) milliseconds between the characters typed and the autocomplete operation.

See Also

AutoCompleteDelay (see page 21220)

154.1.8.5.3 TCustomComboBox.AutoCompleteDelay Property

Specifies the delay between a key press and an attempt to autocomplete the field.

Pascal

```
property AutoCompleteDelay: Cardinal;
```

C++

```
__property unsigned AutoCompleteDelay;
```

Description

Specifies the delay in milliseconds between a key press and an attempt to autocomplete the field. Autocomplete will position to matching list values as you type, sometimes saving you keystrokes.

AutoCompleteDelay is only in effect when the AutoComplete (see page 21220) is true.

See Also

AutoComplete (see page 21220)

154.1.8.5.4 TCustomComboBox.AutoDropDown Property

Specifies whether the drop-down list drops down automatically in response to user keystrokes.

Pascal

```
property AutoDropDown: Boolean;
```

C++

```
__property Boolean AutoDropDown;
```

Description

When AutoDropDown is true, the combo box automatically drops down its list when the user starts typing a string while the combo box has focus.

When AutoDropDown is false, the user must explicitly use the drop-down button to drop down the combo box list.

See Also

autocomplete (see page 21220)

OnDropDown (see page 21199)

DroppedDown (see page 21185)

154.1.8.5.5 TCustomComboBox.CharCase Property

Determines the case of the text in the combo box.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the combo box into upper or lower case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types into the combo box. Changing the CharCase property changes the actual text, not just its appearance; case information is lost and cannot be recaptured by changing CharCase back to ecNormal.

See Also

Text (see page 5842)

154.1.8.5.6 TCustomComboBox.SelText Property

Represents the selected text in the edit region.

Pascal

```
property SelText: string;
```

C++

```
__property AnsiString SelText;
```

Description

Read SelText to obtain the text that is selected in the edit region of the combo box. When the combo box is the active control, SelText appears highlighted. Set SelText to replace the current selection with a different substring. If no text is selected when a value is assigned to SelText, the SelText string is inserted in the text at the cursor.

Note: The SelText property is only valid when the combo box has focus. When the combo box does not have focus, reading SelText always yields an empty string and setting it inserts the text at the cursor rather than replacing the selected text.

See Also

SelLength (see page 21190)

SelStart (see page 21193)

154.1.8.5.7 TCustomComboBox.Sorted Property

Determines whether the list portion of the combo box is alphabetized.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Set Sorted to true to sort the items in the Items (see page 21187) list alphabetically. New items added to the list while Sorted is true are inserted in the correct alphabetical position.

When Sorted is changed from false to true, the original order of the items is lost. Setting Sorted back to false does not restore the original order.

C++ Examples:

```
/*
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
*/
#include "Unit2.h"
#include "Unit3.h"

void __fastcall TForm1::ComboBox1DropDown(TObject *Sender)
{
  ComboBox1->Items->BeginUpdate(); // prevent repaints until done
```

```
  ComboBox1->Items->Clear(); // empty the list of any old values
  for (int i = 0; i < Screen->CustomFormCount; i++)
  {
    if (((TForm1 *)Screen->CustomForms[i])->Visible)
      ComboBox1->Items->Add(Screen->CustomForms[i]->Caption);  // add form names
  }
  ComboBox1->Items->EndUpdate(); //reenable painting
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ComboBox1->Sorted = True; // make sure the form names are sorted
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Form2->Show();
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Form3->Show();
}
```

Delphi Examples:

```
{
This example fills the list of a combo box with the set of
open forms when the user drops down the list. The list is
regenerated every time the list is dropped down, so if the
application opens or closes forms, the combo box stays current.
}
procedure TForm1.ComboBox1DropDown(Sender: TObject);
var
  I: Integer;
begin
  with ComboBox1 do
  begin
    Items.BeginUpdate; { prevent repaints until done }
    Items.Clear; { empty the list of any old values }
    for I := 0 to Screen.CustomFormCount - 1 do
    begin
      if (Screen.CustomForms[I].Visible) then
        Items.Add(Screen.CustomForms[I].Caption); { add form name }
    end;
    Items.EndUpdate; {reenable painting }
  end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ComboBox1.Sorted := True; { make sure the form names are sorted }
end;

procedure TForm1.Button1Click(Sender: TObject);
begin
  Form2.Show;
end;

procedure TForm1.Button2Click(Sender: TObject);
begin
  Form3.Show;
end;
```

Using TDBListBox and TDBComboBox

154.1.8.5.8 TCustomComboBox.Style Property

Determines the display style of the combo box.

Pascal

```
property Style: TComboBoxStyle;
```

C++

```
__property TComboBoxStyle Style;
```

Description

Set Style to specify how the list and edit region of the combo box should appear.

When Style is csOwnerDrawFixed or csOwnerDrawVariable, the OnDrawItem (see page 21224) event occurs when the list items need to be drawn. If Style is csOwnerDrawVariable, an OnMeasureItem (see page 21225) event occurs as well.

See Also

Height (see page 5825)

ItemHeight

OnDrawItem (see page 21224)

OnMeasureItem (see page 21225)

154.1.8.6 TCustomComboBox Events

The events of the TCustomComboBox class are listed here.

Protected Events

	Name	Description
	OnDrawItem (see page 21224)	Occurs when an item in an owner-draw combo box needs to be displayed.
	OnMeasureItem (see page 21225)	Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.

154.1.8.6.1 TCustomComboBox.OnDrawItem Event

Occurs when an item in an owner-draw combo box needs to be displayed.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

Write an OnDrawItem event handler to draw the items in the drop-down list of an owner-draw combo box. An OnDrawItem event handler can add graphic elements to the list items, or replace the list item text by graphics.

Draw the items on the Canvas (see page 21184) using the coordinates provided by the Rect parameter. OnDrawItem occurs only if Style (see page 21224) is set to csOwnerDrawFixed or csOwnerDrawVariable.

If an OnDrawItem event handler is not provided, the combo box fills the Rect parameter with the current brush and writes the text value of the item specified by the Index parameter.

Canvas

Items

OnMeasureItem (see page 21225)

Style (see page 21224)

154.1.8.6.2 TCustomComboBox.OnMeasureItem Event

Occurs when an item in a csOwnerDrawVariable combo box needs to be redisplayed.

Pascal

```
property OnMeasureItem: TMeasureItemEvent;
```

C++

```
__property TMeasureItemEvent OnMeasureItem;
```

Description

When Style (see page 21224) is set to csOwnerDrawVariable, the OnMeasureItem event precedes OnDrawItem (see page 21224). Write an OnMeasureItem event handler to specify the height, in pixels, needed to draw an item in the drop-down list.

154.1.9 TCustomComboBoxStrings Class

TCustomComboBoxStrings represents the strings in the drop-down list of a combo box.

Class Hierarchy

Pascal

```
TCustomComboBoxStrings = class(TStrings);
```

C++

```
class TCustomComboBoxStrings : public TStrings;
```

File

StdCtrls

Description

TCustomComboBoxStrings is the base class for objects that represent the items in the drop-down list of a combo box. Each type of combo box (TComboBox (see page 21064) or TComboBoxEx) uses its own TCustomComboBoxStrings descendant to manage the list of items.

Do not create instances of TCustomComboBoxStrings. This class is designed to work only with a combo box. TCustomCombo

(see page 21154) creates the TCustomComboBoxStrings descendant it uses to implement its Items property.

See Also

TCustomCombo (see page 21154)

TComboBox (see page 21064)

TComboBoxEx (see page 3463)

154.1.9.1 TCustomComboBoxStrings Members

The following tables list the members exposed by TCustomComboBoxStrings.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 3048)	Compares two strings.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 3049)	Reads and writes the Strings (see page 3080) property as if it were published.
	Error (see page 3052)	This is the overview for the Error method overload.
	ExtractName (see page 3053)	Returns the name portion of a string that is a name value pair.
V	Get (see page 21229)	Returns a string given its index.
V	GetCapacity (see page 3054)	Returns the currently allocated size of the list of strings.
V	GetCount (see page 21230)	Returns the number of strings in the list
V	GetObject (see page 21230)	Returns the object associated with the item at a specified index.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetTextStr (see page 3056)	Returns the value of the Text (see page 3084) property.
V	Put (see page 3064)	Changes the value of the string with a specified index.
V	PutObject (see page 21231)	Changes the object associated with the string at a specified index.
V	SetCapacity (see page 3068)	Changes the amount of memory allocated to hold strings in the list.
V	SetTextStr (see page 3069)	Sets the Text (see page 3084) property.
V	SetUpdateState (see page 21231)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	ComboBox (see page 21232)	Identifies the combo box whose items this object represents.
R	UpdateCount (see page 3085)	Indicates the number of calls to BeginUpdate (see page 3045) that have not been matched by a call to EndUpdate (see page 3050).

Public Methods

	Name	Description
V	Add (see page 3033)	Adds a string at the end of the list.
V	AddObject (see page 3036)	Adds a string to the list, and associates an object with the string.
V	AddStrings (see page 3039)	Adds a group of strings to the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 3041)	Adds a string to the list.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 3043)	Sets the strings in the list, and possibly associated objects, from a source object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 3045)	Enables the TStrings (see page 3029) object to track when the list of strings is changing.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21228)	Deletes all the strings from the list.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 21229)	Removes the item specified by the Index parameter.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 3032)	Destroys the TPersistent instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 3050)	Enables the TStrings (see page 3029) object to keep track of when the list of strings has finished changing.
	Equals (see page 3051)	Compares the list of strings to the list from another TStrings (see page 3029) object and returns true if the two lists match.
V	Exchange (see page 3053)	Swaps the position of two strings in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 3054)	Returns a TStrings (see page 3029) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetText (see page 3055)	Allocates a text buffer and fills it with the value of the Text (see page 3084) property.
V	IndexOf (see page 21230)	Returns the position of a string in the list.
V	IndexOfName (see page 3057)	Returns the position of the first name-value pair with the specified name.
V	IndexOfObject (see page 3059)	Returns the index of the first string in the list associated with a given object.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
A	Insert (see page 3059)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
V	InsertObject (see page 3060)	Inserts a string into the list at the specified position, and associates it with an object.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	LoadFromFile (see page 3061)	Fills the list with the lines of text in a specified file.
V	LoadFromStream (see page 3062)	Fills the list with lines of text read from a stream.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 3063)	Changes the position of a string in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SaveToFile (see page 3065)	Saves the strings in the list to the specified file.
V	SaveToStream (see page 3067)	Writes the value of the Text (see page 3084) property to a stream object.
V	SetText (see page 3068)	Sets the Text (see page 3084) property.

Public Properties

	Name	Description
	Capacity (see page 3070)	Indicates the number of strings the TStrings (see page 3029) object can hold.

	CommaText (see page 3070)	Lists the strings in the TStrings (see page 3029) object in system data format (SDF).
R	Count (see page 3071)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 3074)	Represents all the strings in the TStrings (see page 3029) object as a single delimited string.
	Delimiter (see page 3074)	Specifies the delimiter used by the DelimitedText (see page 3074) property.
	LineBreak (see page 3075)	Defines the line break character(s).
R	Names (see page 3075)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 3077)	Indicates the character used to separate names from values.
	Objects (see page 3077)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 3080) property.
	QuoteChar (see page 3080)	Specifies the quote character used by the DelimitedText (see page 3074) property.
	StrictDelimiter (see page 3080)	Determines how the Delimiter (see page 3074) property is used.
	Strings (see page 3080)	References the strings in the list by their positions.
	StringsAdapter (see page 3084)	Implements an IStringsAdapter (see page 3208) interface for the TStrings (see page 3029) object.
	Text (see page 3084)	Lists the strings in the TStrings (see page 3029) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 3085)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 3086)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

154.1.9.2 TCustomComboBoxStrings Methods

The methods of the TCustomComboBoxStrings class are listed here.

Protected Methods

	Name	Description
V	Get (see page 21229)	Returns a string given its index.
V	GetCount (see page 21230)	Returns the number of strings in the list
V	GetObject (see page 21230)	Returns the object associated with the item at a specified index.
V	PutObject (see page 21231)	Changes the object associated with the string at a specified index.
V	SetUpdateState (see page 21231)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
V	Clear (see page 21228)	Deletes all the strings from the list.
V	Delete (see page 21229)	Removes the item specified by the Index parameter.
V	IndexOf (see page 21230)	Returns the position of a string in the list.

154.1.9.2.1 TCustomComboBoxStrings.Clear Method

Deletes all the strings from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call clear to empty the drop-down list of the combo box. All references to associated objects are also removed. However, the objects themselves are not freed.

See Also

Delete (see page 21229)

Objects

Strings

154.1.9.2.2 TCustomComboBoxStrings.Delete Method

Removes the item specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a single item from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string in the drop-down list, where 0 is the first string, 1 is the second string, and so on.

See Also

Add (see page 3033)

AddObject (see page 3036)

Clear (see page 21228)

IndexOf (see page 21230)

InsertObject (see page 3060)

Objects

Strings

154.1.9.2.3 TCustomComboBoxStrings.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString Get(int Index);
```

Description

Get is the protected read implementation of the Strings property. It fetches the specified string from the combo box identified by the ComboBox (see page 21232) property.

Index identifies the string to return, where 0 is the index of the first string, 1 is the index of the second string, and so on.

See Also

Strings

IndexOf (see page 21230)

ComboBox (see page 21232)

154.1.9.2.4 TCustomComboBoxStrings.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property. It fetches the number of items from the combo box identified by the ComboBox (see page 21232) property.

See Also

Count

ComboBox (see page 21232)

154.1.9.2.5 TCustomComboBoxStrings.GetObject Method

Returns the object associated with the item at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects property. It fetches the associated object for the identified item from the combo box identified by the ComboBox (see page 21232) property.

Index is the index of the item with which the object is associated.

See Also

Objects

ComboBox (see page 21232)

154.1.9.2.6 TCustomComboBoxStrings.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: string): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const AnsiString S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. The string must be an exact match (S can't be the prefix of a string in the combo box).

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second

string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

See Also

IndexOfName (see page 3057)

IndexOfObject (see page 3059)

Strings

154.1.9.2.7 TCustomComboBoxStrings.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); override;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects property. It associates the object specified by AObject with the item identified by Index.

Index identifies an item in the drop-down list of the combo box, where 0 is the index of the first item, 1 is the index of the second item, and so on.

AObject is the object to associated with the specified item.

See Also

Objects

154.1.9.2.8 TCustomComboBoxStrings.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); override;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate method is first called and the TCustomComboBoxStrings (see page 21225) object is not already in the middle of an update, SetUpdateState is called with Updating set to true. When the EndUpdate method is called and it cancels out the last unmatched call to BeginUpdate, SetUpdateState is called with Updating set to false.

SetUpdateState refreshes the combo box when Updating is false, so that the combo box reflects the new set of strings.

See Also

BeginUpdate (see page 3045)

EndUpdate (see page 3050)

154.1.9.3 TCustomComboBoxStrings Properties

The properties of the TCustomComboBoxStrings class are listed here.

Protected Properties

	Name	Description
	ComboBox (see page 21232)	Identifies the combo box whose items this object represents.

154.1.9.3.1 TCustomComboBoxStrings.ComboBox Property

Identifies the combo box whose items this object represents.

Pascal

```
property ComboBox: TCustomCombo;
```

C++

```
__property TCustomCombo ComboBox;
```

Description

TCustomComboBoxStrings (see page 21225) uses ComboBox internally so that the strings in the list and the items in the drop-down list of the combo box remain synchronized.

See Also

Items (see page 21187)

154.1.10 TCustomEdit Class

TCustomEdit is the base class from which all edit-box and memo controls are derived.

Class Hierarchy

Pascal

```
TCustomEdit = class(TWinControl);
```

C++

```
class TCustomEdit : public TWinControl;
```

File

StdCtrls

Description

TCustomEdit encapsulates the behavior common to all components for editing text by introducing methods and properties that provide:

Basic text editing functions such as selecting text, modifying selected text, and case conversions.

Ability to respond to changes in the contents of the text.

Access control of the text for making it read-only or introducing a password character to hide the actual value.

Do not create instances of TCustomEdit. Use TCustomEdit as a base class when declaring control objects that permit the user to enter or modify text. Properties and methods of TCustomEdit provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TCustomMaskEdit (see page 15798)

TCustomMemo (see page 21362)

TEdit (see page 21402)

154.1.10.1 TCustomEdit Members

The following tables list the members exposed by TCustomEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.

	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.

	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
V	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
V	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.

	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
V	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
V	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.

	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.

	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaxLength (see page 21263)	Specifies the maximum number of characters the user can enter into the edit control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 21264)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.

	Create (see page 21244)	Creates an instance of TCustomEdit (see page 21232).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.

	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.

V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 21273)	Contains a text string associated with the control.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21273)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.10.2 TCustomEdit.Create Constructor

Creates an instance of TCustomEdit (see page 21232).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomEdit(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomEdit (see page 21232).

AOwner is another component, typically the form, that is responsible for freeing the edit control. It becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before performing any additional initialization.

See Also

Owner (see page 2807)

154.1.10.3 TCustomEdit Methods

The methods of the TCustomEdit class are listed here.

Protected Methods

	Name	Description
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
V	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
V	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
V	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
V	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
V	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
V	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
V	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
V	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.

Public Methods

	Name	Description
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.

	SelectAll (see page 21255)	Selects all text in the edit control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	Undo (see page 21259)	Backs out all changes in the undo buffer.

154.1.10.3.1 TCustomEdit.Change Method

Generates an OnChange (see page 21275) event.

Pascal

```
procedure Change; dynamic;
```

C++

```
__fastcall Change();
```

Description

Applications do not call the Change method directly. It is triggered automatically by Windows events. Change is exposed as a protected method so that derived classes can make additional responses when the text changes beyond invoking the OnChange (see page 21275) event handler. If Derived classes that override the Change method do not call the inherited method, the OnChange (see page 21275) event handler will not be called.

See Also

Handle

OnChange (see page 21275)

Text (see page 5842)

154.1.10.3.2 TCustomEdit.Clear Method

Deletes all text from the edit control.

Pascal

```
procedure Clear; virtual;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to replace the Text (see page 21273) property with an empty string. Clear removes all text, not just the selected text. To remove just the selected text, use ClearSelection (see page 21245).

See Also

ClearSelection (see page 21245)

Text (see page 5842)

154.1.10.3.3 TCustomEdit.ClearSelection Method

Removes the selected text from the edit control.

Pascal

```
procedure ClearSelection;
```

C++

```
__fastcall ClearSelection();
```

Description

Use ClearSelection to delete the selected text from the edit control. If no text is selected, ClearSelection does nothing. If all of the text is selected, ClearSelection clears all text, like the Clear (see page 21245) method.

Note: Calling ClearSelection does the same thing as sending the edit control a WM_CLEAR message.

See Also

Clear (see page 21245)

CutToClipboard (see page 21249)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.10.3.4 TCustomEdit.ClearUndo Method

Clears the undo buffer so that no changes to the text can be backed out.

Pascal

```
procedure ClearUndo;
```

C++

```
__fastcall ClearUndo();
```

Description

Use ClearUndo to commit changes to the Text (see page 21273) property. After calling ClearUndo, the CanUndo (see page 21262) property is false and the Undo (see page 21259) method does nothing.

See Also

Undo (see page 21259)

CanUndo (see page 21262)

Text (see page 5842)

154.1.10.3.5 TCustomEdit.CopyToClipboard Method

Copies the selected text in the edit control to the Clipboard in CF_TEXT format.

Pascal

```
procedure CopyToClipboard;
```

C++

```
__fastcall CopyToClipboard();
```

Description

Use CopyToClipboard to replace the contents of the Clipboard with the selected text. CopyToClipboard does not clear the Clipboard if no text is selected. If no text is selected, CopyToClipboard does nothing.

Note: Calling CopyToClipboard does the same thing as sending the edit control a WM_COPY message.

C++ Examples:

```
/*
```

```
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, the first
line of text is copied from the rich edit control and pasted
into the edit box.  Note that only the text is pasted. If
the rich edit control includes any formatting information
that is not pasted into the edit control.  If the
destination were a rich edit control, the formatting
information would be copied as well.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->SelectAll();
  RichEdit1->CopyToClipboard();
  Edit1->Clear();
  Edit1->PasteFromClipboard();
  RichEdit1->SetFocus();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("..\\overview.rtf");
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, the first
line of text is copied from the rich edit control and pasted
into the edit box.  Note that only the text is pasted. If
the rich edit control includes any formatting information
that is not pasted into the edit control.  If the
destination were a rich edit control, the formatting
information would be copied as well.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  RichEdit1.SelectAll;
  RichEdit1.CopyToClipboard;
  Edit1.Clear;
  Edit1.PasteFromClipboard;
  RichEdit1.SetFocus;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  // you may need to change this path to suit your environment
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := False;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
end;
```

See Also

CutToClipboard (see page 21249)

GetSelTextBuf (see page 21253)

PasteFromClipboard (see page 21254)

SelText (see page 21272)

Displaying and Editing Text in a Memo Control

154.1.10.3.6 TCustomEdit.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 21248) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle (see page 21248). TCustomEdit (see page 21232) overrides the inherited method to specify a scrollable single-line edit control that reflects the current values of the BorderStyle (see page 21261), HideSelection (see page 21262), PasswordChar (see page 21265), and ReadOnly (see page 21265) properties.

See Also

BorderStyle (see page 21261)

CreateWindowHandle (see page 21248)

CreateWnd (see page 21248)

HideSelection (see page 21262)

PasswordChar (see page 21265)

ReadOnly (see page 21265)

154.1.10.3.7 TCustomEdit.CreateWindowHandle Method

Creates a Windows control to represent the control.

Pascal

```
procedure CreateWindowHandle(const Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateWindowHandle(const TCreateParams Params);
```

Description

CreateWindowHandle calls the inherited CreateWindowHandle method after working around a Win95 bug involving setting the read-only style on machines with Far East locales.

See Also

CreateParams (see page 21248)

CreateWnd (see page 21248)

DestroyWnd (see page 21251)

CreateWindowHandle (see page 6137)

154.1.10.3.8 TCustomEdit.CreateWnd Method

Creates a Windows control corresponding to the edit control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called when the edit control is created, and whenever a change to the edit control requires the window to be recreated. After calling the inherited method, CreateWnd sends the newly created window messages to enforce the MaxLength (see page 21263) and PasswordChar (see page 21265) properties.

See Also

CreateParams (see page 21248)

CreateWindowHandle (see page 6137)

DestroyWnd (see page 21251)

MaxLength (see page 21263)

PasswordChar (see page 21265)

CreateWnd (see page 6137)

154.1.10.3.9 TCustomEdit.CutToClipboard Method

Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.

Pascal

```
procedure CutToClipboard;
```

C++

```
__fastcall CutToClipboard();
```

Description

Use CutToClipboard to replace the contents of the Clipboard with the selected text while clearing the selected text. If no text is selected, CutToClipboard does nothing.

Note: Calling CopyToClipboard (see page 21246) does the same thing as sending the edit control a WM_CUT message.

C++ Examples:

```
/*
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, text is
cut from the rich edit control and pasted into the edit box.
Note that only the text is pasted. If the rich edit control
includes any formatting information that is not pasted into
the edit control.  If the destination where a rich edit
control, the formatting information would be copied as well.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // ensure that all the text is cut, not just the current selection
  RichEdit1->SelectAll();
  RichEdit1->CutToClipboard();
  Edit1->Clear();
  Edit1->PasteFromClipboard();
```

```
  RichEdit1->SetFocus();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const AnsiString Path = "../overview.rtf";
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile(Path);
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, text is
cut from the rich edit control and pasted into the edit box.
Note that only the text is pasted. If the rich edit control
includes any formatting information that is not pasted into
the edit control.  If the destination where a rich edit
control, the formatting information would be copied as well.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  RichEdit1.SelectAll;  { ensure that all the text is cut, not just the current selection }
  RichEdit1.CutToClipboard;
  Edit1.Clear;
  Edit1.PasteFromClipboard;
  RichEdit1.SetFocus;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := False;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
end;
```

Displaying and Editing Text in a Memo Control

154.1.10.3.10 TCustomEdit.DefaultHandler Method

Provides message handling for all messages that the control does not fully process itself.

Pascal

```
procedure DefaultHandler(var Message); override;
```

C++

```
virtual __fastcall DefaultHandler( Message);
```

Description

Override DefaultHandler to change the default message handling for the edit control. The Message parameter can be cast to a TMessage type, to obtain the WParam, LParam, and Result of the message. If the Result of the message is non-zero, the message has already been handled. Set the Result field to a non-zero value to prevent further processing of the message by the inherited method.

Note: In Delphi, calling inherited in a message-handling method results in a call to the ancestor's DefaultHandler method if that ancestor does not specify a handler for the message being handled.

See Also

WindowProc (see page 5872)

DefWndProc (see page 6199)

TMessage

154.1.10.3.11 TCustomEdit.DestroyWnd Method

Destroys the Windows control that corresponds to the edit control.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

The Windows control for the edit box can be temporarily destroyed and recreated in order to set properties that require changing the window creation parameters. When this happens, DestroyWnd is called.

Before the window is destroyed, DestroyWnd saves a copy of any properties that are needed to recreate the window after it is destroyed.

See Also

CreateWnd (see page 21248)

154.1.10.3.12 TCustomEdit.DoSetMaxLength Method

Sets the MaxLength (see page 21263) property.

Pascal

```
procedure DoSetMaxLength(Value: Integer); virtual;
```

C++

```
virtual __fastcall DoSetMaxLength(int Value);
```

Description

DoSetMaxLength is the property access function for the MaxLength (see page 21263) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the MaxLength (see page 21263) property.

DoSetMaxLength sends an EM_LIMITTEXT message to the window of the edit control.

See Also

MaxLength (see page 21263)

154.1.10.3.13 TCustomEdit.GetSelLength Method

Returns the SelLength (see page 21265) property.

Pascal

```
function GetSelLength: Integer; virtual;
```

C++

```
virtual __fastcall int GetSelLength();
```

Description

GetSelLength is the property access function for the SelLength (see page 21265) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the SelLength (see page 21265) property.

GetSelLength sends an EM_GETSEL message to the window of the edit control and returns the difference between the starting position and the ending position.

See Also

SelLength (see page 21265)

SetSelLength (see page 21257)

154.1.10.3.14 TCustomEdit.GetSelStart Method

Returns the SelStart (see page 21269) property.

Pascal

```
function GetSelStart: Integer; virtual;
```

C++

```
virtual __fastcall int GetSelStart();
```

Description

GetSelStart is the property access method for the SelStart (see page 21269) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the SelStart (see page 21269) property.

GetSelStart sends an EM_GETSEL message to the window of the edit control and returns the starting position.

See Also

SelStart (see page 21269)

SetSelStart (see page 21257)

154.1.10.3.15 TCustomEdit.GetSelText Method

Returns the SelText (see page 21272) property.

Pascal

```
function GetSelText: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetSelText();
```

Description

GetSelText is the property access method for the SelText (see page 21272) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the SelText (see page 21272) property.

See Also

SelText (see page 21272)

154.1.10.3.16 TCustomEdit.GetSelTextBuf Method

Copies the selected text into a buffer and returns the number of characters copied.

Pascal

```
function GetSelTextBuf(Buffer: PChar; BufSize: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetSelTextBuf(const char * Buffer, int BufSize);
```

Description

Use GetSelTextBuf to copy the selected text into a character buffer. If there is no selection, the buffer receives an empty string. If the selection contains more than (BufSize - 1) characters, only the first (BufSize - 1) characters are copied. GetSelTextBuf returns the number of characters that were actually copied into the buffer.

C++ Examples:

```
/*
This example copies selected text from one text edit to
another.  This example requires two text edits and two buttons.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->SelLength; //Get length of selected text in Edit1
  Size++;                      //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetSelTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete Buffer;
}
//---------------------------------------------------------------------------
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->SelText;
}
```

Delphi Examples:

```
{
This example copies selected text from one text edit to
another.  This example requires two text edits and two buttons.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Integer;
begin
  Size := Edit1.SelLength; {Get length of selected text in Edit1}
  Inc(Size); {Add room for null character}
  GetMem(Buffer, Size); {Creates Buffer dynamic variable}
```

```
  Edit1.GetSelTextBuf(Buffer,Size); {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);{Converts Buffer into Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.SelText;
end;
```

See Also

CopyToClipboard (see page 21246)

SelLength (see page 21265)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.10.3.17 TCustomEdit.PasteFromClipboard Method

Pastes the contents of the Clipboard into edit control, replacing the current selection.

Pascal

```
procedure PasteFromClipboard;
```

C++

```
__fastcall PasteFromClipboard();
```

Description

Use PasteFromClipboard to replace the selected text with the contents of the Clipboard, or, if no text is selected, to insert the contents of the Clipboard at the cursor. If the Clipboard is empty, or if it does not contain anything in CF_TEXT format, PasteFromClipboard does nothing.

Note: Calling PasteFromClipboard does the same thing as sending the edit control a WM_PASTE message.

C++ Examples:

```
/*
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, the first
line of text is copied from the rich edit control and pasted
into the edit box.  Note that only the text is pasted. If
the rich edit control includes any formatting information
that is not pasted into the edit control.  If the
destination were a rich edit control, the formatting
information would be copied as well.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->SelectAll();
  RichEdit1->CopyToClipboard();
  Edit1->Clear();
  Edit1->PasteFromClipboard();
  RichEdit1->SetFocus();
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("..\\overview.rtf");
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, the first
line of text is copied from the rich edit control and pasted
into the edit box.  Note that only the text is pasted. If
the rich edit control includes any formatting information
that is not pasted into the edit control.  If the
destination were a rich edit control, the formatting
information would be copied as well.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  RichEdit1.SelectAll;
  RichEdit1.CopyToClipboard;
  Edit1.Clear;
  Edit1.PasteFromClipboard;
  RichEdit1.SetFocus;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  // you may need to change this path to suit your environment
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := False;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
end;
```

Displaying and Editing Text in a Memo Control

154.1.10.3.18 TCustomEdit.SelectAll Method

Selects all text in the edit control.

Pascal

```
procedure SelectAll;
```

C++

```
__fastcall SelectAll();
```

Description

Use SelectAll to select all text in the edit control. To select only part of the text, use the SelStart (see page 21269) and SelLength (see page 21265) properties.

C++ Examples:

```
/*
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, text is
cut from the rich edit control and pasted into the edit box.
Note that only the text is pasted. If the rich edit control
includes any formatting information that is not pasted into
the edit control.  If the destination where a rich edit
control, the formatting information would be copied as well.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  // ensure that all the text is cut, not just the current selection
  RichEdit1->SelectAll();
  RichEdit1->CutToClipboard();
  Edit1->Clear();
  Edit1->PasteFromClipboard();
  RichEdit1->SetFocus();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const AnsiString Path = "../overview.rtf";
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile(Path);
  RichEdit1->ScrollBars = ssVertical;
}
```

Delphi Examples:

```
{
This example uses an edit box, a rich edit control, and a
button on a form. When the user clicks the button, text is
cut from the rich edit control and pasted into the edit box.
Note that only the text is pasted. If the rich edit control
includes any formatting information that is not pasted into
the edit control.  If the destination where a rich edit
control, the formatting information would be copied as well.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  RichEdit1.SelectAll;  { ensure that all the text is cut, not just the current selection }
  RichEdit1.CutToClipboard;
  Edit1.Clear;
  Edit1.PasteFromClipboard;
  RichEdit1.SetFocus;
end;

procedure TForm1.FormCreate(Sender: TObject);
const
  Path = 'OverView.RTF';
begin
  RichEdit1.PlainText := False;
  RichEdit1.Lines.LoadFromFile(Path);
  RichEdit1.ScrollBars := ssVertical;
end;
```

See Also

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

Text (see page 5842)

154.1.10.3.19 TCustomEdit.SetAutoSize Method

Sets the AutoSize (see page 21260) property.

Pascal

```
procedure SetAutoSize(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSize(Boolean Value);
```

Description

SetAutoSize is the protected write implementation of the AutoSize (see page 21260) property.

TCustomEdit (see page 21232) overrides the inherited method to update the height of the edit control to reflect the current font when the value of AutoSize (see page 21260) changes to true.

See Also

AutoSize (see page 21260)

154.1.10.3.20 TCustomEdit.SetSelLength Method

Sets the SelLength (see page 21265) property.

Pascal

```
procedure SetSelLength(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetSelLength(int Value);
```

Description

SetSelLength is the property access method for the SelLength (see page 21265) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the SelLength (see page 21265) property.

SetSelLength sends an EM_SETSEL message to the window of the edit control, specifying a selection that begins at SelStart (see page 21269) and ends at SelStart (see page 21269) + Value.

See Also

GetSelLength (see page 21252)

SelLength (see page 21265)

SelStart (see page 21269)

154.1.10.3.21 TCustomEdit.SetSelStart Method

Sets the SelStart (see page 21269) property.

Pascal

```
procedure SetSelStart(Value: Integer); virtual;
```

C++

```
virtual __fastcall SetSelStart(int Value);
```

Description

SetSelStart is the property access method for the SelStart (see page 21269) property. It is exposed as a protected method so that descendants of TCustomEdit (see page 21232) can customize the implementation of the SelStart (see page 21269) property.

SetSelLength (see page 21257) sends an EM_SETSEL message to the window of the edit control to position the cursor on the position indicated by Value.

See Also

GetSelStart (see page 21252)

SelStart (see page 21269)

154.1.10.3.22 TCustomEdit.SetSelTextBuf Method

Replaces the selected text with a null-terminated string.

Pascal

```
procedure SetSelTextBuf(Buffer: PChar);
```

C++

```
__fastcall SetSelTextBuf(const char * Buffer);
```

Description

Use SetSelTextBuf to replace the current selection by the contents of the null-terminated string pointed to by Buffer. If no text is selected, the contents of Buffer are inserted at the cursor. SetSelTextBuf does the same thing as setting the SelText (see page 21272) property, except that it takes a pointer to a char type rather than a string.

C++ Examples:

```
/*
This example inserts the contents of temp_string at the
current location of the cursor.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
   const AnsiString Path = "../readme.txt";
   Memo1->Lines->LoadFromFile(Path);
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  char * temp_string = "I am now here";
  Memo1->SetSelTextBuf(temp_string);
}
```

Delphi Examples:

```
{
This example inserts the contents of temp_string at the
current location of the cursor.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  temp_string: array[0..15] of Char;
begin
  temp_string := 'I am now here';
  Memo1.SetSelTextBuf(temp_string);
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
const Path = 'readme.txt';
begin
  Memo1.Lines.LoadFromFile(Path);
end;
```

See Also

GetSelTextBuf (see page 21253)

PasteFromClipboard (see page 21254)

SelText (see page 21272)

SetTextBuf (see page 5787)

154.1.10.3.23 TCustomEdit.Undo Method

Backs out all changes in the undo buffer.

Pascal

```
procedure Undo;
```

C++

```
__fastcall Undo();
```

Description

Call Undo to cancel all changes made to the Text (see page 21273) property since the last call to the ClearUndo (see page 21246) method. If ClearUndo (see page 21246) was never called, Undo rolls back all changes.

To determine whether there are any changes in the undo buffer, check the CanUndo (see page 21262) property.

See Also

ClearUndo (see page 21246)

CanUndo (see page 21262)

Text (see page 5842)

154.1.10.4 TCustomEdit Properties

The properties of the TCustomEdit class are listed here.

Protected Properties

	Name	Description
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	MaxLength (see page 21263)	Specifies the maximum number of characters the user can enter into the edit control.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentColor (see page 21264)	Determines where a control looks for its color information.

	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.

Public Properties

	Name	Description
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	Text (see page 21273)	Contains a text string associated with the control.

Published Properties

	Name	Description
	TabStop (see page 21273)	Determines if the user can tab to a control.

154.1.10.4.1 TCustomEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect: Boolean;
```

C++

```
__property Boolean AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll (see page 21255)

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.10.4.2 TCustomEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

See Also

BorderStyle (see page 21261)

ClientHeight (see page 5808)

ControlStyle (see page 5814)

Height (see page 5825)

154.1.10.4.3 TCustomEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

154.1.10.4.4 TCustomEdit.CanUndo Property

Indicates whether the edit control contains changes that can be backed out.

Pascal

```
property CanUndo: Boolean;
```

C++

```
__property Boolean CanUndo;
```

Description

Read CanUndo to determine whether the user has made any changes to the text that can be undone by calling the Undo (see page 21259) method. This is useful when enabling or disabling menu items that correspond to these commands.

See Also

Undo (see page 21259)

ClearUndo (see page 21246)

Text (see page 5842)

154.1.10.4.5 TCustomEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

See Also

Text (see page 5842)

154.1.10.4.6 TCustomEdit.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected portion of the text even when the edit control does not have focus. Set HideSelection to true to show the selection only when the edit control has focus. HideSelection does not affect the

actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many edit controls look too busy.

See Also

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.10.4.7 TCustomEdit.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

See Also

Text (see page 5842)

Displaying and Editing Text in a Memo Control

Displaying and Editing Text in a Rich Edit Memo Control

154.1.10.4.8 TCustomEdit.Modified Property

Indicates whether the user edited the text of the edit control.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Use Modified to determine whether the user changed the Text (see page 21273) property of the edit control. Modified is only reset to **False** when you assign a value to the Text (see page 21273) property. In particular, it is not reset when the control receives focus.

See Also

Change (see page 21245)

OnChange (see page 21275)

SetTextBuf (see page 5787)

Text (see page 5842)

154.1.10.4.9 TCustomEdit.OEMConvert Property

Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.

Pascal

```
property OEMConvert: Boolean;
```

C++

```
__property Boolean OEMConvert;
```

Description

To ensure that any characters typed in the edit control can be unambiguously converted to the OEM character set, set OEMConvert to true. This causes all characters to be converted from ANSI to OEM and then back to ANSI as they are typed. Set OEMConvert to false to avoid the overhead of this conversion when it does not matter whether the text can be unambiguously mapped to an OEM string.

OEMConvert is most useful for edit controls used to enter file names when the application does not use Unicode file names.

See Also

Text (see page 5842)

154.1.10.4.10 TCustomEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.10.4.11 TCustomEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar: Char;
```

C++

```
__property Char PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text (see page 21273) property reflects the actual characters that are typed.

See Also

Text (see page 5842)

154.1.10.4.12 TCustomEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

See Also

CopyToClipboard (see page 21246)

GetSelTextBuf (see page 21253)

154.1.10.4.13 TCustomEdit.SelLength Property

Specifies the number of characters (bytes) that are selected.

Pascal

```
property SelLength: Integer;
```

C++

```
__property int SelLength;
```

Description

Read SelLength to determine the length, in bytes, of the selected text. This is the same as the number of characters, unless you are using a multi-byte character set. Set SelLength to change the selection to consist of the first SelLength bytes starting at SelStart (see page 21269).

Note: Setting SelLength to a value greater than the number of characters from SelStart (see page 21269) to the end of the text results in the selection of all characters from SelStart (see page 21269) to the end of the text. Reading SelLength immediately after setting it to a value greater than the number of available characters returns the number of characters actually selected, not the value that was just set.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FindDialog1->Position = Point(RichEdit1->Left + RichEdit1->Width, RichEdit1->Top);
  FindDialog1->Execute();
}

void __fastcall TForm1::FindDialog1Find(TObject *Sender)
{
  int FoundAt, StartPos, ToEnd;
  TSearchTypes mySearchTypes;
  // begin the search after the current selection
  // if there is one
  // otherwise, begin at the start of the text
  if (FindDialog1->Options.Contains(frMatchCase))
    mySearchTypes << stMatchCase;
  if (FindDialog1->Options.Contains(frWholeWord))
    mySearchTypes << stWholeWord;
  if (RichEdit1->SelLength)
    StartPos = RichEdit1->SelStart + RichEdit1->SelLength;
  else
    StartPos = 0;
  // ToEnd is the length from StartPos
  // to the end of the text in the rich edit control
  ToEnd = RichEdit1->Text.Length() - StartPos;
  FoundAt = RichEdit1->FindText(FindDialog1->FindText, StartPos, ToEnd, mySearchTypes);
  if (FoundAt != -1)
  {
    RichEdit1->SetFocus();
    RichEdit1->SelStart = FoundAt;
    RichEdit1->SelLength = FindDialog1->FindText.Length();
  }
  else Beep();
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RichEdit1->PlainText = False;
  RichEdit1->Lines->LoadFromFile("../Overview.RTF");  // starts in Debug
  RichEdit1->ScrollBars = ssVertical;
}
/*
The following OnFind event handler searches a memo component
```

```
for the text specified in the FindText property of a find
dialog component. If found, the first occurrence of the text
in Memo1 is selected. The code uses the Pos function to
compare strings, and stores the number of characters to skip
when determining the selection position in the SkipChars
variable. Because there is no handling of case, whole word,
or search direction in this algorithm, it is assumed that
the Options property of FindDialog1 is set to
[frHideMatchCase, frHideWholeWord, frHideUpDown].
*/

SelStart (see page 21269)

SelText (see page 21272)

154.1.10.4.14 TCustomEdit.SelStart Property

Specifies the position of the first selected character in the text.

Pascal

```
property SelStart: Integer;
```

C++

```
__property int SelStart;
```

Description

Read SelStart to determine the position of the first selected character, where 0 indicates the first character. If there is no selected text, SelStart indicates the position of the cursor. Set SelStart to remove the current selection and position the cursor just before the indicated character.

To select a particular range of the text, first set SelStart to position the cursor, and then set SelLength (see page 21265) to extend the selection.

C++ Examples:

```
/*
This example requires a TRichEdit, a TButton, and a
TFindDialog.  Clicking the button click will display a Find
Dialog to the right of the edit control.  Filling in the
"Find what" text and pressing the Find Next button will
select the first matching string in the Rich Edit control
that follows the previous selection.
*/

SelLength (see page 21265)

SelText (see page 21272)

154.1.10.4.15 TCustomEdit.SelText Property

Specifies the selected portion of the edit control's text.

Pascal

```
property SelText: string;
```

C++

```
__property AnsiString SelText;
```

Description

Read SelText to determine the value of the selected text. Set SelText to replace the selected text with a new string. If there is no selection, but the edit control has focus, set SelText to insert a new string into the text at the cursor.

C++ Examples:

```
/*
This example copies selected text from one text edit to
another.  This example requires two text edits and two buttons.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->SelLength; //Get length of selected text in Edit1
  Size++;                      //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetSelTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete Buffer;
}
//---------------------------------------------------------------------------
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->SelText;
}
```

Delphi Examples:

```
{
This example copies selected text from one text edit to
another.  This example requires two text edits and two buttons.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Integer;
begin
  Size := Edit1.SelLength; {Get length of selected text in Edit1}
  Inc(Size); {Add room for null character}
  GetMem(Buffer, Size); {Creates Buffer dynamic variable}
  Edit1.GetSelTextBuf(Buffer,Size); {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);{Converts Buffer into Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
```

```
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.SelText;
end;
```

Text (see page 5842)

154.1.10.4.16 TCustomEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.10.4.17 TCustomEdit.Text Property

Contains a text string associated with the control.

Pascal

```
property Text: TCaption;
```

C++

```
__property TCaption Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                        //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete [] Buffer;
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
  Inc(Size);                      {Add room for null character}
  GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
  Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.Text;
end;
```

154.1.10.5 TCustomEdit Events

The events of the TCustomEdit class are listed here.

Protected Events

	Name	Description
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.

154.1.10.5.1 TCustomEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified (see page 21263) property to see if a change actually occurred. The Text (see page 21273) property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

154.1.11 TCustomGroupBox Class

TCustomGroupBox is the base class for all group-box components.

Class Hierarchy

Pascal

```
TCustomGroupBox = class(TCustomControl);
```

C++

```
class TCustomGroupBox : public TCustomControl;
```

File

StdCtrls

Description

Group boxes are visual components that act as containers for sets of related controls, such as radio buttons. Group boxes may also contain other group boxes. TCustomGroupBox is the class from which all group-box components—including TGroupBox (

see page 21474), TRadioGroup, and TDBRadioGroup—descend.

See Also

TCustomGroupBox

TDBRadioGroup (see page 9283)

TRadioGroup (see page 13115)

TGroupBox (see page 21474)

TCustomControl (see page 5908)

TWidgetControl

154.1.11.1 TCustomGroupBox Members

The following tables list the members exposed by TCustomGroupBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 21287)	Adjusts the ClientRect property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.

	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 21287)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 21287)	Renders the onscreen image of the group box.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.

	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.

	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.

	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 21286)	Creates and initializes a TCustomGroupBox (see page 21275) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.

	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.11.2 TCustomGroupBox.Create Constructor

Creates and initializes a TCustomGroupBox (see page 21275) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomGroupBox(TComponent * AOwner);
```

Description

Call Create to instantiate a group box at runtime. Group boxes placed on forms at design time are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the group box. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

154.1.11.3 TCustomGroupBox Methods

The methods of the TCustomGroupBox class are listed here.

Protected Methods

	Name	Description
V	AdjustClientRect (see page 21287)	Adjusts the ClientRect property for idiosyncrasies of the window.
V	CreateParams (see page 21287)	Initializes a window-creation parameter record passed in the Params parameter.
V	Paint (see page 21287)	Renders the onscreen image of the group box.

154.1.11.3.1 TCustomGroupBox.AdjustClientRect Method

Adjusts the ClientRect property for idiosyncrasies of the window.

Pascal

```
procedure AdjustClientRect(var Rect: TRect); override;
```

C++

```
virtual __fastcall AdjustClientRect(TRect Rect);
```

Description

AdjustClientRect is called internally when the group box needs accurate information on where to place child controls within the client area. It indents the client rectangle slightly so that child controls are not placed on the frame (or caption) of the group box.

See Also

ClientRect

Caption (see page 5806)

154.1.11.3.2 TCustomGroupBox.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a group box creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

Specify the parameter record as the value of the Params parameter. The TCreateParams type is a data structure holding information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TCustomGroupBox (see page 21275) adjusts the window style by turning off the CS_HREDRAW and CS_VREDRAW flags.

See Also

CreateWnd (see page 6137)

CreateWindowHandle (see page 6137)

154.1.11.3.3 TCustomGroupBox.Paint Method

Renders the onscreen image of the group box.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint draws a border around the group box and fills in the caption.

154.1.12 TCustomLabel Class

TCustomLabel is the base class for non-windowed controls that display text on a form.

Class Hierarchy

Pascal

```
TCustomLabel = class(TGraphicControl);
```

C++

```
class TCustomLabel : public TGraphicControl;
```

File

StdCtrls

Description

Use TCustomLabel as a base class when defining objects that display text that users can't edit. TCustomLabel introduces several new properties and methods to control the appearance of the text.

TCustomLabel is not a descendant of TWinControl, so it does not have its own window and can't receive direct input from the keyboard. To define an object that responds to direct keyboard input in addition to displaying text, use TCustomStaticText (see page 21387) as a base class.

Do not create instances of TCustomLabel. To put a label on a form, use a TLabel (see page 21544) object.

See Also

TCustomStaticText (see page 21387)

TLabel (see page 21544)

154.1.12.1 TCustomLabel Members

The following tables list the members exposed by TCustomLabel.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.

	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustBounds (see page 21296)	Resizes the label when the text changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.

	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDrawText (see page 21296)	Renders the text in the client area.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLabelText (see page 21297)	Returns the value of the Caption (see page 21303) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 21297)	Adjusts the size of the label when it is first loaded. .
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 21298)	Responds to notifications when objects are about to be created or destroyed.

	Paint (see page 21298)	Draws the image of the label.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 21298)	Sets the AutoSize (see page 21299) property.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21299)	Controls (see page 5711) the horizontal placement of the text within the label.
	AutoSize (see page 21299)	Determines whether the size of the label automatically resizes to accommodate the text.
	Color (see page 5812)	Specifies the background color of the control.

	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EllipsisPosition (see page 21305)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	FocusControl (see page 21306)	Designates a windowed control associated with the label.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	Layout (see page 21306)	Specifies the vertical placement of the text within the label.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShowAccelChar (see page 21306)	Determines how an ampersand in the label text is displayed.
	Text (see page 5842)	Contains a text string associated with the control.
	Transparent (see page 21307)	Specifies whether controls that sit below the label on a form can be seen through the label.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.
	WordWrap (see page 21308)	Specifies whether the label text wraps when it is too long for the width of the label.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	Create (see page 21295)	Creates and initializes an instance of TCustomLabel (see page 21288).
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).

	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Canvas (see page 21300)	Provides the drawing surface used by the graphic control.
	Caption (see page 21303)	Specifies a text string that identifies the control to the user.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.12.2 TCustomLabel.Create Constructor

Creates and initializes an instance of TCustomLabel (see page 21288).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomLabel(TComponent * AOwner);
```

Description

Call Create to create an instance of TCustomLabel (see page 21288) at runtime. Labels placed on forms at design time are created automatically.

AOwner is a component, typically the form, that is responsible for freeing the label.

See Also

Owner (see page 2807)

154.1.12.3 TCustomLabel Methods

The methods of the TCustomLabel class are listed here.

Protected Methods

	Name	Description
	AdjustBounds (see page 21296)	Resizes the label when the text changes.
	DoDrawText (see page 21296)	Renders the text in the client area.
V	GetLabelText (see page 21297)	Returns the value of the Caption (see page 21303) property.
V	Loaded (see page 21297)	Adjusts the size of the label when it is first loaded. .
V	Notification (see page 21298)	Responds to notifications when objects are about to be created or destroyed.
V	Paint (see page 21298)	Draws the image of the label.
V	SetAutoSize (see page 21298)	Sets the AutoSize (see page 21299) property.

154.1.12.3.1 TCustomLabel.AdjustBounds Method

Resizes the label when the text changes.

Pascal

```
procedure AdjustBounds; dynamic;
```

C++

```
__fastcall AdjustBounds();
```

Description

When the text in the label or the font changes, AdjustBounds is implicitly called. It redraws the text in the client area, and then resizes the label if the AutoSize (see page 21299) property is true.

When WordWrap (see page 21308) is true, the width of the label is fixed. If AutoSize (see page 21299) is also true, changes to the text cause the label to change in height. When AutoSize (see page 21299) is true and WordWrap (see page 21308) is false, the height of the label is determined by the font, and changes to the text cause the label to change in width.

Override AdjustBounds to make additional adjustments when the text changes.

See Also

DoDrawText (see page 21296)

AutoSize (see page 21299)

154.1.12.3.2 TCustomLabel.DoDrawText Method

Renders the text in the client area.

Pascal

```
procedure DoDrawText(var Rect: TRect; Flags: Longint); dynamic;
```

C++

```
__fastcall DoDrawText(TRect Rect, Longint Flags);
```

Description

When the label needs to draw itself, DoDrawText is implicitly called. DoDrawText uses the Windows API function, DrawText, to render the caption in the client area.

The first parameter, Rect, specifies the boundaries of the text within the client area. The second parameter, Flags, specifies how the text is aligned within those boundaries, how tab characters are handled, etc. See the Microsoft Windows API DrawText function for all the possible values of Flags.

Override DoDrawText to render text differently.

Caption (see page 5806)

AdjustBounds (see page 21296)

154.1.12.3.3 TCustomLabel.GetLabelText Method

Returns the value of the Caption (see page 21303) property.

Pascal

```
function GetLabelText: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetLabelText();
```

Description

Call GetLabelText to obtain the string that appears as the text of the label.

See Also

Caption (see page 5806)

154.1.12.3.4 TCustomLabel.Loaded Method

Adjusts the size of the label when it is first loaded. .

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

The protected Loaded method is called immediately after a saved version of the form that contains the label is loaded into memory. TCustomLabel (see page 21288) uses this method to adjust the size of the label to the text it contains if the AutoSize (see page 21299) property is true.

See Also

AutoSize (see page 21299)

154.1.12.3.5 TCustomLabel.Notification Method

Responds to notifications when objects are about to be created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are created or destroyed. After calling the inherited method, Notification checks whether the windowed control specified by the FocusControl (see page 21306) property is about to be destroyed. If the windowed control is going away, Notification sets the FocusControl (see page 21306) property to nil (Delphi) or NULL (C++).

See Also

FocusControl (see page 21306)

154.1.12.3.6 TCustomLabel.Paint Method

Draws the image of the label.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

Paint is called automatically when the label receives a WM_PAINT message from its Parent. Paint writes the text returned by the GetLabelText (see page 21297) method.

See Also

GetLabelText (see page 21297)

154.1.12.3.7 TCustomLabel.SetAutoSize Method

Sets the AutoSize (see page 21299) property.

Pascal

```
procedure SetAutoSize(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSize(Boolean Value);
```

Description

SetAutoSize is the protected access method for the AutoSize (see page 21299) property. It is exposed as a protected method so descendants can override it to change the implementation of the AutoSize (see page 21299) property.

See Also

AutoSize (see page 21299)

154.1.12.4 TCustomLabel Properties

The properties of the TCustomLabel class are listed here.

Protected Properties

	Name	Description
	Alignment (see page 21299)	Controls (see page 5711) the horizontal placement of the text within the label.
	AutoSize (see page 21299)	Determines whether the size of the label automatically resizes to accommodate the text.
	EllipsisPosition (see page 21305)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	FocusControl (see page 21306)	Designates a windowed control associated with the label.
	Layout (see page 21306)	Specifies the vertical placement of the text within the label.
	ShowAccelChar (see page 21306)	Determines how an ampersand in the label text is displayed.
	Transparent (see page 21307)	Specifies whether controls that sit below the label on a form can be seen through the label.
	WordWrap (see page 21308)	Specifies whether the label text wraps when it is too long for the width of the label.

Public Properties

	Name	Description
	Canvas (see page 21300)	Provides the drawing surface used by the graphic control.
	Caption (see page 21303)	Specifies a text string that identifies the control to the user.

154.1.12.4.1 TCustomLabel.Alignment Property

Controls (see page 5711) the horizontal placement of the text within the label.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Set Alignment to specify how the text of the label is justified within the ClientRect of the label control.

The effect of the Alignment property is more obvious if the WordWrap (see page 21308) property is true and the label includes more than one line of text.

See Also

ClientRect (see page 5810)

GetLabelText (see page 21297)

Layout (see page 21306)

WordWrap (see page 21308)

154.1.12.4.2 TCustomLabel.AutoSize Property

Determines whether the size of the label automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to make the label adjust its size automatically so the client area accommodates the height and width of the text. When AutoSize is false, the label is fixed in size. When AutoSize is true, the size of the label readjusts whenever the text changes. The size of the label is also readjusts when the Font property changes.

When WordWrap (see page 21308) is true, the width of the label is fixed. If AutoSize is also true, changes to the text cause the label to change in height. When AutoSize is true and WordWrap (see page 21308) is false, the font determines the height of the label, and changes to the text cause the label to change in width.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
```

See Also

BoundsRect (see page 5803)

GetLabelText (see page 21297)

Font (see page 5823)

WordWrap (see page 21308)

Layout (see page 21306)

154.1.12.4.3 TCustomLabel.Canvas Property

Provides the drawing surface used by the graphic control.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Use the properties of the TCanvas object to draw or paint on the surface of the control.

Since a TGraphicControl instance does not have its own Windows screen object, it obtains its device context from its parent control.

C++ Examples:

```
/*
When you do custom drawing, such as shown in the code for
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
   PaintBox1->Canvas->Brush->Color = clRed;
   PaintBox1->Canvas->FillRect(PaintBox1->Canvas->ClipRect);
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}

/*
In order for the drawing to be persistent, you need to also
include an OnPaint event handler that tells the PaintBox how
to redraw itself when it needs to. In the code below, an
ellipse will be drawn everytime the PaintBox renders itself,
but the PaintBox will only paint the client area of the
control red after the Button is clicked. This client area
will only stay red until it is invalidated, but the ellipse
will persist. This behavior is different from the TImage
component, because the TImage component maintains an
internal bitmap that stores this drawing information for
you.
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
   PaintBox1->Canvas->Brush->Color = clBlue;
   PaintBox1->Canvas->Ellipse(0,0,100,100);
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TLabel *myLabel;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TLabel")
  {
    myLabel = (TLabel *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myLabel->Canvas->MoveTo(myLabel->ClientRect.Left, myLabel->ClientRect.Top);
    myLabel->Canvas->LineTo(myLabel->ClientRect.Right, myLabel->ClientRect.Bottom);
    myLabel = NULL;
  }
}
/*
The following code draws the graphic in Picture1 in the
```

```
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PaintBox1->Canvas->Draw(0,0, Image1->Picture->Graphic);
}
```

Delphi Examples:

```
{
When you do custom drawing, such as shown in the code for
the Button's OnClick event handler below, this drawing will
not be persistent and will be "erased" the first time the
PaintBox component needs to repaint.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   PaintBox1.Canvas.Brush.Color := clRed;
   PaintBox1.Canvas.FillRect(PaintBox1.Canvas.ClipRect);
   PaintBox1.Canvas.Brush.Color := clBlue;
   PaintBox1.Canvas.Ellipse(0,0,100,50);
end;
{
In order for the drawing to be persistent, you need to also
include an OnPaint event handler that tells the PaintBox how
to redraw itself when it needs to. In the code below, an
ellipse will be drawn everytime the PaintBox renders itself,
but the PaintBox will only paint the client area of the
control red after the Button is clicked. This client area
will only stay red until it is invalidated, but the ellipse
will persist. This behavior is different from the TImage
component, because the TImage component maintains an
internal bitmap that stores this drawing information for
you.
}
procedure TForm1.PaintBox1Paint(Sender: TObject);
begin
   PaintBox1.Canvas.Brush.Color := clBlue;
   PaintBox1.Canvas.Ellipse(0,0,100,50);
end;
{
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
}
  if (ListBox1.Items.Objects[Index] is TLabel) then
  begin
    myLabel:= (ListBox1.Items.Objects[Index] as TLabel);
    with myLabel.ClientRect do
    begin // make sure we are using the TControl's canvas and not the form's!
      myLabel.Canvas.MoveTo(Left, Top);
      myLabel.Canvas.LineTo(Right, Bottom);
    end;
  myLabel:= nil;
  end;
{
The following code draws the graphic in Picture1 in the
top-left corner PaintBox1.  Place a TPaintBox in the form
and a TImage in the form that contains a picture.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  PaintBox1.Canvas.Draw(0,0, Image1.Picture.Graphic);
end;
```

154.1.12.4.4 TCustomLabel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
```

```
      button->Parent = toolBar;
      button->Caption = captions->Strings[i];
      if (button->Caption == "|")
        button->Style = tbsSeparator;
      else
        button->Style = tbsButton;
    }
  }

  TToolBar *myToolBar;

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    myToolBar = new TToolBar(this);
    myToolBar->Parent = this;
    TStringList *captions = new TStringList();
    captions->Add("New");
    captions->Add("Save");
    captions->Add("|");
    captions->Add("Cut");
    captions->Add("Copy");
    captions->Add("Paste");
    AddButtons(myToolBar, captions);
    delete captions;
    myToolBar->ShowCaptions = True;
    myToolBar->Height = 40;
  }

  void __fastcall TForm1::FormDestroy(TObject *Sender)
  {
    for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
      delete myToolBar->Buttons[I];
    delete myToolBar;
  }
```

Delphi Examples:

```
  {
  The following code keeps the size of the label control
  constant, even though the length of the label's caption
  changes. As a result, the caption of the label is probably
  too long to display in the label when the user clicks the
  button:
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Label1.AutoSize := False;
    Label1.Caption :=
      'This string is too long as the caption of this label';
  end;
  {
  This example requires a TPageControl populated by several
  TabSheets, a TEdit and a TButton. When the button is
  clicked, the caption of the active tab changes to that of
  the TEdit.  These lines of code could also be written:
  PageControl1.ActivePage.Caption := Edit1.Text;
  This would obviate the need for a TTabSheet variable since
  PageControl1.->ActivePage is already of type TTabSheet.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    sheet: TTabSheet;
  begin
    sheet := PageControl1.ActivePage;
    sheet.Caption := Edit1.Text;
  end;
  {
```

```
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

154.1.12.4.5 TCustomLabel.EllipsisPosition Property

Specifies how ellipsis is placed in text not fitting in allocated rectangle.

Pascal

```
property EllipsisPosition: TEllipsisPosition;
```

C++

```
__property TEllipsisPosition EllipsisPosition;
```

Description

Set EllipsisPosition to determine how an ellipsis is placed in text that does not fit in its allocated rectangle. This is a TEllipsisPosition (see page 21947) constant and its value corresponds to constants specifying ellipsis placement in the **dwDTFormat** parameter of the Windows **DrawText** and **DrawTextEx** functions.

See Also

WordWrap (see page 21308)

TypeName

154.1.12.4.6 TCustomLabel.FocusControl Property

Designates a windowed control associated with the label.

Pascal

```
property FocusControl: TWinControl;
```

C++

```
__property TWinControl * FocusControl;
```

Description

Set FocusControl to the windowed control that should receive focus when the user presses the accelerator key specified by the label. Specify an accelerator key by preceding a character in the label text with an ampersand (&) and setting the ShowAccelChar (see page 21306) property to true.

See Also

ShowAccelChar (see page 21306)

GetLabelText (see page 21297)

154.1.12.4.7 TCustomLabel.Layout Property

Specifies the vertical placement of the text within the label.

Pascal

```
property Layout: TTextLayout;
```

C++

```
__property TTextLayout Layout;
```

Description

Set Layout to specify how the text of the label is placed within the ClientRect of the label control. Layout is the vertical analog to the Alignment (see page 21299) property.

See Also

Alignment (see page 21299)

ClientRect (see page 5810)

154.1.12.4.8 TCustomLabel.ShowAccelChar Property

Determines how an ampersand in the label text is displayed.

Pascal

```
property ShowAccelChar: Boolean;
```

C++

```
__property Boolean ShowAccelChar;
```

Description

Set ShowAccelChar to true to allow the label to display an underlined accelerator key value. When ShowAccelChar is true, any character preceded by an ampersand (&) appears underlined. If the FocusControl (see page 21306) property is set, the windowed control specified by the FocusControl (see page 21306) property receives input focus when the user types that underlined character. To display an ampersand when ShowAccelChar is true, use two ampersands (&&) to stand for the single

ampersand that is displayed.

Set ShowAccelChar to false to display the label text with all ampersands appearing as ampersands. When ShowAccelChar is false, the value of the FocusControl (see page 21306) property is not used.

C++ Examples:

```
/*
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Label1->ShowAccelChar = true;
  Label1->Caption = "An &Underlined character appears here";
  Label2->ShowAccelChar = false;
  Label2->Caption = "An ampersand (&) appears here";
}
```

Delphi Examples:

```
{
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Label1.ShowAccelChar := True;
  Label1.Caption := 'An &Underlined character appears here';
  Label2.ShowAccelChar := False;
  Label2.Caption := 'An ampersand (&) appears here';
end;
```

See Also

FocusControl (see page 21306)

GetLabelText (see page 21297)

154.1.12.4.9 TCustomLabel.Transparent Property

Specifies whether controls that sit below the label on a form can be seen through the label.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to prevent the label from obscuring other controls on the form. For example, if the label is used to add text to a graphic, set Transparent to true so that the label does not stand out as a separate object.

Writing text so that the background is transparent is slower than writing text when Transparent is false. If the label is not obscuring a complicated image, performance can be improved by setting the background color of the label to match the object beneath it and setting Transparent to false.

See Also

Color (see page 5812)

ParentColor (see page 5834)

154.1.12.4.10 TCustomLabel.WordWrap Property

Specifies whether the label text wraps when it is too long for the width of the label.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the label to display multiple line of text. When WordWrap is true, text that is too wide for the label control wraps at the right margin and continues in additional lines.

Set WordWrap to false to limit the label to a single line. When WordWrap is false, text that is too wide for the label appears truncated.

See Also

ClientWidth (see page 5811)

GetLabelText (see page 21297)

154.1.13 TCustomListBox Class

TCustomListBox is the base class for listbox objects that are wrappers for list box controls.

Class Hierarchy

Pascal

```
TCustomListBox = class(TCustomMultiSelectListControl);
```

C++

```
class TCustomListBox : public TCustomMultiSelectListControl;
```

File

StdCtrls

Description

TCustomListBox encapsulates behavior common to all list box controls. List box objects are used to display a scrollable list from which users can select one or more items. Use a list box control to limit the user to selecting from a list of items. Items (see page 21348) can be added at design time or at runtime.

As a wrapper for a list box TCustomListBox introduces methods for:

Displaying, sorting, selecting, manipulating, and querying items in the list.

Creating owner-draw style list boxes that can display graphical images such as icons and bitmaps.

Creating multiple-column and multiple-selection lists.

By default, TCustomListBox is a standard list box that displays items as text strings. These items are contained in a TStrings object, and the methods of the TStrings object are used to add, insert or delete a string. The following code demonstrates adding a new string to the list box:

MyListBox.Items.Add('New item'); //Delphi

MyListBox->Items (see page 21348)->Add("New item"); // C++

Descendants of TCustomListBox inherit the basic functionality of TCustomListBox. Some descendants also have specialized behavior and can be linked to file, directory, drive, or database information. Use these list boxes to easily access and list this type of information.

A combo box is a list box with an edit control and an optional drop down style for the list. Use a combo box to allow users to type their selection into an edit box or to save space on a form by having the list drop down.

For lists of items that require a matrix or expandable tree-like structure, use list views or tree views. These controls allow the grouping of items under column headings or in expandable and contractible rows.

See Also

TStrings (see page 3029)

154.1.13.1 TCustomListBox Members

The following tables list the members exposed by TCustomListBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnData (see page 21357)	Occurs when a virtual list box needs to supply the text of an item.
	OnDataFind (see page 21357)	Occurs when a virtual list box needs to identify the index of an item given its text.
	OnDataObject (see page 21358)	Occurs when a virtual list box needs to supply the object associated with an item.
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21358)	Occurs when an item in an owner-draw list box needs to be redisplayed.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.

	OnMeasureItem (see page 21360)	Occurs when the application needs to redisplay an item in a variable height owner-draw list box.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMoving (see page 21321)	This is FMoving, a member of class TCustomListBox.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.

	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 21324)	Initializes the window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 21325)	Creates a Windows control corresponding to the list box component.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DeleteString (see page 21326)	Deletes a string from the list box.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 21326)	Saves the list box items in a string list before freeing the underlying Windows control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFindData (see page 21326)	Returns the index of a string in the list box.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetData (see page 21327)	Returns a string in the list box given its index.
	DoGetDataObject (see page 21327)	Returns the object associated with an item in a virtual list box.

	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
V	DragCanceled (see page 21328)	Sends a mouse message canceling the drag-and-drop operation.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 21328)	Generates an OnDrawItem (see page 21358) event.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetCount (see page 21329)	Returns the value of the Count (see page 21346) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetItemData (see page 21329)	Returns a 32-bit value associated with the specified item in a list box.
V	GetItemIndex (see page 21329)	Returns the value of the ItemIndex property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
V	GetSelCount (see page 21330)	Returns the number of selected items.
	GetSelected (see page 21330)	Indicates whether a particular item is selected.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalGetItemData (see page 21330)	Retrieves the data associated with an item in the list box.
	InternalSetItemData (see page 21330)	Associates an integer with a specified item in the list box.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
V	KeyPress (see page 21334)	Responds when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	LoadRecreateItems (see page 21334)	This is LoadRecreateItems, a member of class TCustomListBox.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21335)	Generates an OnMeasureItem (see page 21360) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetContent (see page 21335)	Removes all of the items from a list box.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
V	SaveRecreateItems (see page 21336)	This is SaveRecreateItems, a member of class TCustomListBox.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.

	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemData (see page 21336)	Sets the 32-bit value associated with the specified item in a list box.
V	SetItemIndex (see page 21336)	Gives focus to the item with a specified index.
V	SetMultiSelect (see page 21337)	Sets the MultiSelect property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 21337)	Handles Windows messages.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21343)	Determines whether the list box has a border.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Columns (see page 21346)	Specifies the number of columns, in a multi-column list box, that are visible without having to scroll.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	ExtendedSelect (see page 21346)	This is ExtendedSelect, a member of class TCustomListBox.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IntegralHeight (see page 21347)	Determines whether the list box displays the partial items.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	ItemHeight (see page 21347)	Specifies the height in pixels of an item in an owner-draw list box.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 21350)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Sorted (see page 21353)	Specifies whether the items in a list box are arranged alphabetically.
	Style (see page 21354)	Determines whether the list box is standard or owner-draw and whether it is virtual.
	TabWidth (see page 21355)	Specifies the size of the tabs in the list box.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddItem (see page 21322)	Adds an item to the list box
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21322)	Deletes all items from the list box.
V	ClearSelection (see page 21323)	Deselects all selected items in the list box, if possible.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	CopySelection (see page 21323)	Copies the selected items to another list-type control
V	Create (see page 21320)	Instantiates a list box control.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	DeleteSelected (see page 21325)	Deletes the selected items from the list box
V	Destroy (see page 21320)	Destroys the instance of a list box control.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemAtPos (see page 21331)	Returns the index of the list box item indicated by the coordinates of a point on the control.
	ItemRect (see page 21333)	Returns the rectangle that surrounds the item specified in the Item parameter.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
V	SelectAll (see page 21336)	Selects the entire block of text in the list box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	AutoComplete (see page 21342)	Determines whether the user can give focus to items by typing in the list.
	AutoCompleteDelay (see page 21342)	Specifies the delay between a key press and an attempt to autocomplete the field.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21343)	Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.

	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Count (see page 21346)	Indicates the number of items in the list box.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	Items (see page 21348)	Contains the strings that appear in the list box.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
	MultiSelect (see page 5957)	Specifies whether the user can select more than one item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ScrollWidth (see page 21351)	Specifies the width, in pixels, by which the list box can scroll horizontally.
R	SelCount (see page 5957)	Indicates the number of selected items.
	Selected (see page 21351)	Indicates whether a particular item is selected.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TopIndex (see page 21356)	Specifies the index number of the item that appears at the top of the list box.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.

	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21355)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.13.2 TCustomListBox.Create Constructor

Instantiates a list box control.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomListBox(TComponent * AOwner);
```

Description

Call Create to instantiate a list box control at runtime. For list boxes created at design time, Create is called automatically.AOwner is the component that is responsible for freeing the list box. It becomes the value of the Owner property. If AOwner is nil, the caller is responsible for explicitly freeing the control.

See Also

Owner (see page 2807)

154.1.13.3 TCustomListBox.Destroy Destructor

Destroys the instance of a list box control.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomListBox();
```

Description

Do not call Destroy directly in an application. Instead, an application should call Free. Free checks that the list box reference is not nil before it calls Destroy.

Destroy frees the memory associated with the objects for the Canvas (see page 21343) and Items (see page 21348) properties. Then it calls the inherited destructor to destroy the list box object.

See Also

Free (see page 22300)

154.1.13.4 TCustomListBox Fields

The fields of the TCustomListBox class are listed here.

Protected Fields

	Name	Description
	FMoving (see page 21321)	This is FMoving, a member of class TCustomListBox.

154.1.13.4.1 TCustomListBox.FMoving Field

Pascal

```
FMoving: Boolean;
```

C++

```
Boolean FMoving;
```

Description

This is FMoving, a member of class TCustomListBox.

154.1.13.5 TCustomListBox Methods

The methods of the TCustomListBox class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 21324)	Initializes the window-creation parameter record passed in the Params parameter.
	CreateWnd (see page 21325)	Creates a Windows control corresponding to the list box component.
	DeleteString (see page 21326)	Deletes a string from the list box.
	DestroyWnd (see page 21326)	Saves the list box items in a string list before freeing the underlying Windows control.
	DoFindData (see page 21326)	Returns the index of a string in the list box.
	DoGetData (see page 21327)	Returns a string in the list box given its index.
	DoGetDataObject (see page 21327)	Returns the object associated with an item in a virtual list box.
	DragCanceled (see page 21328)	Sends a mouse message canceling the drag-and-drop operation.
	DrawItem (see page 21328)	Generates an OnDrawItem (see page 21358) event.
	GetCount (see page 21329)	Returns the value of the Count (see page 21346) property.
	GetItemData (see page 21329)	Returns a 32-bit value associated with the specified item in a list box.
	GetItemIndex (see page 21329)	Returns the value of the ItemIndex property.

	GetSelCount (see page 21330)	Returns the number of selected items.
	GetSelected (see page 21330)	Indicates whether a particular item is selected.
	InternalGetItemData (see page 21330)	Retrieves the data associated with an item in the list box.
	InternalSetItemData (see page 21330)	Associates an integer with a specified item in the list box.
	KeyPress (see page 21334)	Responds when the user presses a key.
	LoadRecreateItems (see page 21334)	This is LoadRecreateItems, a member of class TCustomListBox.
	MeasureItem (see page 21335)	Generates an OnMeasureItem (see page 21360) event.
	ResetContent (see page 21335)	Removes all of the items from a list box.
	SaveRecreateItems (see page 21336)	This is SaveRecreateItems, a member of class TCustomListBox.
	SetItemData (see page 21336)	Sets the 32-bit value associated with the specified item in a list box.
	SetItemIndex (see page 21336)	Gives focus to the item with a specified index.
	SetMultiSelect (see page 21337)	Sets the MultiSelect property.
	WndProc (see page 21337)	Handles Windows messages.

Public Methods

	Name	Description
	AddItem (see page 21322)	Adds an item to the list box
	Clear (see page 21322)	Deletes all items from the list box.
	ClearSelection (see page 21323)	Deselects all selected items in the list box, if possible.
	CopySelection (see page 21323)	Copies the selected items to another list-type control
	DeleteSelected (see page 21325)	Deletes the selected items from the list box
	ItemAtPos (see page 21331)	Returns the index of the list box item indicated by the coordinates of a point on the control.
	ItemRect (see page 21333)	Returns the rectangle that surrounds the item specified in the Item parameter.
	SelectAll (see page 21336)	Selects the entire block of text in the list box.

154.1.13.5.1 TCustomListBox.AddItem Method

Adds an item to the list box

Pascal

```
procedure AddItem(Item: String; AObject: TObject); override;
```

C++

```
virtual __fastcall AddItem(AnsiString Item, TObject * AObject);
```

Description

Call AddItem to add a new item to the end of the list.

Item is the text of the item to add.

AObject is the object associated with the new item.

See Also

AddObject (see page 3036)

Items (see page 21348)

154.1.13.5.2 TCustomListBox.Clear Method

Deletes all items from the list box.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Use Clear to delete all of the items in the list box at once. Although the items in a standard list box are of type TStrings, use the Clear method of the list box rather than calling the Clear method of the Items (see page 21348) property. This allows descendants of TCustomListBox (see page 21308) to perform any other necessary clean-up in the Clear method, in addition to deleting the items from the Items (see page 21348) property. Thus, applications should use

```
ListBox1.Clear;
ListBox1->Clear();
```

rather than

```
ListBox1.Items.Clear;
ListBox1->Items->Clear();
```

See Also

Clear (see page 3047)

Items (see page 21348)

154.1.13.5.3 TCustomListBox.ClearSelection Method

Deselects all selected items in the list box, if possible.

Pascal

```
procedure ClearSelection; override;
```

C++

```
virtual __fastcall ClearSelection();
```

Description

Use ClearSelection to deselect all the currently selected items in the list box. When the list box receives focus, after ClearSelection is called, the last item that was selected is the item that receives the current focus in the list box. Although this item receives focus, the item itself is not selected.

154.1.13.5.4 TCustomListBox.CopySelection Method

Copies the selected items to another list-type control

Pascal

```
procedure CopySelection(Destination: TCustomListControl); override;
```

C++

```
virtual __fastcall CopySelection(TCustomListControl Destination);
```

Description

Call CopySelection to copy all the items selected in the list box to a combo box, list view, or another list box. If the destination control is not sorted, the selected items are added to the end of its list.

Destination is the list box, combo box, or list view to which the selected items are copied.

154.1.13.5.5 TCustomListBox.CreateParams Method

Initializes the window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams is used to pass information, in its Params parameter, to CreateWindowHandle when the list box control is created.

TCustomListBox (see page 21308) overrides CreateParams to customize the representation of the window. It uses information from the list box Columns (see page 21346), ExtendedSelect (see page 21346), IntegralHeight (see page 21347), MultiSelect, Sorted (see page 21353) and Style (see page 21354) properties and sets WS_HSCROLL, WS_VSCROLL, LBS_HASSTRINGS and LBS_NOTIFY Windows styles for creation of the list box.

When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

See Also

Columns (see page 21346)

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

extendedselect (see page 21346)

IntegralHeight (see page 21347)

MultiSelect

Sorted (see page 21353)

Style (see page 21354)

154.1.13.5.6 TCustomListBox.CreateWnd Method

Creates a Windows control corresponding to the list box component.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the list box must be displayed. CreateWnd calls the inherited CreateWnd method, which calls

CreateParams (see page 21324) to initialize the window-creation parameters.

CreateWindowHandle to create the window handle for the control.

CreateWnd additionally sets up the list box position, tabs, items, and columns.

See Also

Columns (see page 21346)

154.1.13.5.7 TCustomListBox.DeleteSelected Method

Deletes the selected items from the list box

Pascal

```
procedure DeleteSelected; override;
```

C++

```
virtual __fastcall DeleteSelected();
```

Description

Call DeleteSelected to delete the selected items from the list box.

See Also

ClearSelection (see page 5940)

MoveSelection (see page 5942)

CopySelection (see page 21323)

extendedselect (see page 21346)

ItemIndex

154.1.13.5.8 TCustomListBox.DeleteString Method

Deletes a string from the list box.

Pascal

```
procedure DeleteString(Index: Integer); dynamic;
```

C++

```
__fastcall DeleteString(int Index);
```

Description

DeleteString deletes the string, specified by the Index parameter, from the list box control.

154.1.13.5.9 TCustomListBox.DestroyWnd Method

Saves the list box items in a string list before freeing the underlying Windows control.

Pascal

```
procedure DestroyWnd; override;
```

C++

```
virtual __fastcall DestroyWnd();
```

Description

DestroyWnd saves the list box text string items in the Items (see page 21348) property to internal storage in a TStringList object that it creates. It then calls the inherited DestroyWnd method to destroy the windowed control's window handle and free associated device contexts.

See Also

DestroyWnd (see page 6141)

Items (see page 21348)

TStringList (see page 3006)

154.1.13.5.10 TCustomListBox.DoFindData Method

Returns the index of a string in the list box.

Pascal

```
function DoFindData(const Data: String): Integer;
```

C++

```
__fastcall int DoFindData(const AnsiString Data);
```

Description

This protected method is called automatically when the list box needs to indicate the index for an item.

If the list box is virtual (that is, if the value of the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw), DoFindData generates an OnDataFind (see page 21357) event so that the index can be provided dynamically. If the list box is not virtual (any other Style (see page 21354)), DoFindData locates the specified string from the Items (see page 21348) property and returns its index.

Data is the text of the item to locate.

See Also

OnDataFind (see page 21357)

Style (see page 21354)

Items (see page 21348)

154.1.13.5.11 TCustomListBox.DoGetData Method

Returns a string in the list box given its index.

Pascal

```
function DoGetData(const Index: Integer): String;
```

C++

```
__fastcall AnsiString DoGetData(const int Index);
```

Description

This protected method is called automatically when a virtual list box needs to supply the text of an item. DoGetData is never called unless the list box is virtual (that is, unless the value of the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw).

DoGetData generates an OnData (see page 21357) event and returns the string that is supplied dynamically by the event handler.

See Also

OnData (see page 21357)

Style (see page 21354)

Items (see page 21348)

154.1.13.5.12 TCustomListBox.DoGetDataObject Method

Returns the object associated with an item in a virtual list box.

Pascal

```
function DoGetDataObject(const Index: Integer): TObject;
```

C++

```
__fastcall TObject * DoGetDataObject(const int Index);
```

Description

This protected method is called automatically when a virtual list box needs to supply the object associated with an item. DoGetDataObject is never called unless the list box is virtual (that is, unless the value of the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw).

DoGetDataObject generates an OnDataObject (see page 21358) event and returns the object that is supplied dynamically by the event handler.

See Also

OnDataObject (see page 21358)

Style (see page 21354)

Items (see page 21348)

154.1.13.5.13 TCustomListBox.DragCanceled Method

Sends a mouse message canceling the drag-and-drop operation.

Pascal

```
procedure DragCanceled; override;
```

C++

```
virtual __fastcall DragCanceled();
```

Description

DragCanceled is called in response to the cancellation of a drag-and-drop operation that had started. Users can cancel the operation by dropping the item over a component that does not accept the item, or by pressing Esc while dragging.

The OnEndDrag event occurs after the call to DragCanceled.

See Also

OnEndDrag (see page 5860)

154.1.13.5.14 TCustomListBox.DrawItem Method

Generates an OnDrawItem (see page 21358) event.

Pascal

```
procedure DrawItem(Index: Integer; Rect: TRect; State: TOwnerDrawState); virtual;
```

C++

```
virtual __fastcall DrawItem(int Index, TRect Rect, TOwnerDrawState State);
```

Description

DrawItem is called whenever a visual aspect of an owner-draw list box changes. The list box calls DrawItem for each visible item in its list, passing the index of the item in the Index parameter.

By default, the DrawItem method for a list box calls any event handler attached to the component's OnDrawItem (see page 21358) event. If there is no handler attached, DrawItem fills the rectangle passed in Rect and draws any text associated with the indexed item. The default drawing ignores the State parameter, although State is passed along to attached event handlers.

See Also

ItemHeight (see page 21347)

MeasureItem (see page 21335)

OnDrawItem (see page 21358)

OnMeasureItem (see page 21360)

Style (see page 21354)

154.1.13.5.15 TCustomListBox.GetCount Method

Returns the value of the Count (see page 21346) property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count (see page 21346) property.

See Also

Count (see page 21346)

154.1.13.5.16 TCustomListBox.GetItemData Method

Returns a 32-bit value associated with the specified item in a list box.

Pascal

```
function GetItemData(Index: Integer): LongInt; dynamic;
```

C++

```
__fastcall LongInt GetItemData(int Index);
```

Description

GetItemData retrieves the data associated with a particular item in the list box. This value can be displayed as that list box item, or can be a value (such as a pointer) associated with the list box item.

See Also

SetItemData (see page 21336)

154.1.13.5.17 TCustomListBox.GetItemIndex Method

Returns the value of the ItemIndex property.

Pascal

```
function GetItemIndex: Integer; override;
```

C++

```
virtual __fastcall int GetItemIndex();
```

Description

GetItemIndex is the protected read implementation of the ItemIndex property. It returns the index of the first selected item in the list box.

The first item in the list has index 0, the second item has index 1, and so on. If no item is selected, the value of ItemIndex is -1.

See Also

ItemIndex

154.1.13.5.18 TCustomListBox.GetSelCount Method

Returns the number of selected items.

Pascal

```
function GetSelCount: Integer; override;
```

C++

```
virtual __fastcall int GetSelCount();
```

Description

GetSelCount is the protected read implementation of the SelCount property.

See Also

SelCount

154.1.13.5.19 TCustomListBox.GetSelected Method

Indicates whether a particular item is selected.

Pascal

```
function GetSelected(Index: Integer): Boolean;
```

C++

```
__fastcall Boolean GetSelected(int Index);
```

Description

GetSelected is the protected read implementation of the Selected (see page 21351) property. It returns true if the item specified by Index is selected, false if it is not.

154.1.13.5.20 TCustomListBox.InternalGetItemData Method

Retrieves the data associated with an item in the list box.

Pascal

```
function InternalGetItemData(Index: Integer): Longint; dynamic;
```

C++

```
__fastcall Longint InternalGetItemData(int Index);
```

Description

InternalGetItemData is the low-level protected method for fetching the data associated with an item in the list box. It retrieves a reference pointer to the object associated with the specified item, as an integer.

Index is the index of the item whose data is to be fetched.

See Also

GetItemData (see page 21329)

154.1.13.5.21 TCustomListBox.InternalSetItemData Method

Associates an integer with a specified item in the list box.

Pascal

```
procedure InternalSetItemData(Index: Integer; AData: Longint); dynamic;
```

C++

```
__fastcall InternalSetItemData(int Index, Longint AData);
```

Description

InternalSetItemData is the low-level protected method for associating data with an item in the list box. It associates the item that has the index specified by Index with the integer specified by AData.

See Also

SetItemData (see page 21336)

154.1.13.5.22 TCustomListBox.ItemAtPos Method

Returns the index of the list box item indicated by the coordinates of a point on the control.

Pascal

```
function ItemAtPos(Pos: TPoint; Existing: Boolean): Integer;
```

C++

```
__fastcall int ItemAtPos(TPoint Pos, Boolean Existing);
```

Description

Use ItemAtPos to detect if an item exists at a particular point in the control.

The Pos parameter is the point in the control in window coordinates. If Pos is beyond the last item in the list box, the value of the Existing variable determines the returned value. If Existing is set to true, ItemAtPos returns -1, indicating that no item exists at that point. If Existing is set to false, ItemAtPos returns the index of the last item in the list box plus one.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
                                  Components[i]->Name,
                                  (TObject *)Components[i]);
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  if (Button == mbRight)
  {
```

```
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = (TControl *)ListBox1->Items->Objects[Index];
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
         break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
  APoint.X := X;
  APoint.Y := Y;
  Index := ListBox1.ItemAtPos(APoint, True);
  if (ListBox1.Items.Objects[Index] is TControl) then
  begin
    TheObject :=
      (ListBox1.Items.Objects[Index] as TControl);
    StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                             IntToStr(TheObject.Left) + ', ' +
```

```
                                IntToStr(TheObject.Top) + ') ';
    end
    else
      Beep;
    end;
  end;
```

See Also

ItemIndex

Items (see page 21348)

154.1.13.5.23 TCustomListBox.ItemRect Method

Returns the rectangle that surrounds the item specified in the Item parameter.

Pascal

```
function ItemRect(Index: Integer): TRect;
```

C++

```
__fastcall TRect ItemRect(int Index);
```

Description

Use ItemRect to get the coordinates of a particular item in the list box. For example, ItemRect is used internally by the ItemAtPos (see page 21331) method.

The Item parameter is the ItemIndex of the item whose position is queried.

C++ Examples:

```
/*
This example uses a list box on a form. When the user clicks
one of the items in the list box, a beep occurs if the mouse
is in the first half of the item. A similar technique can be
used to detect "hot" regions in an owner-draw list box:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Hello");
  ListBox1->Items->Add("New");
  ListBox1->Items->Add("World");
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  TRect ItemBounds;
  if (Button == mbLeft)
  {
    ItemBounds = ListBox1->ItemRect(ListBox1->ItemIndex);
    if (Y > ItemBounds.Top &&
        Y < ItemBounds.Bottom &&
        X > ItemBounds.Left &&
        X < (ItemBounds.Left + ItemBounds.Right)/2)
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
This example uses a list box on a form. When the user clicks
one of the items in the list box, a beep occurs if the mouse
```

```
is in the first half of the item. A similar technique can be
used to detect "hot" regions in an owner-draw list box:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  with ListBox1 do
  begin
    Items.Add('Hello');
    Items.Add('New');
    Items.Add('World');
  end;
end;

procedure TForm1.ListBox1MouseUp (Sender: TObject; Button: TMouseButton; Shift: TShiftState;
X, Y: Integer);
var
  ListBoxItem: TRect;
begin
  if Button = mbLeft then
  begin
    ListBoxItem := ListBox1.ItemRect(ListBox1.ItemIndex);
    if (Y > ListBoxItem.Top) and
       (Y < ListBoxItem.Bottom) and
       (X > ListBoxItem.Left) and
       (X < (ListBoxItem.Left + ListBoxItem.Right) div 2) then
      Beep;
  end;
 end;
```

See Also

ItemAtPos (see page 21331)

ItemIndex

154.1.13.5.24 TCustomListBox.KeyPress Method

Responds when the user presses a key.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically when the list box receives a key-press message (WM_CHAR). It generates an OnKeyPress event, and then, if the AutoComplete (see page 21342) property is true, updates ItemIndex to reflect the next character that the user typed.

The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

See Also

OnKeyPress (see page 6227)

154.1.13.5.25 TCustomListBox.LoadRecreateItems Method

Pascal

```
procedure LoadRecreateItems(RecreateItems: TStrings); virtual;
```

C++

```
virtual __fastcall LoadRecreateItems(TStrings RecreateItems);
```

Description

This is LoadRecreateItems, a member of class TCustomListBox.

154.1.13.5.26 TCustomListBox.MeasureItem Method

Generates an OnMeasureItem (see page 21360) event.

Pascal

```
procedure MeasureItem(Index: Integer; var Height: Integer); virtual;
```

C++

```
virtual __fastcall MeasureItem(int Index, int Height);
```

Description

MeasureItem is called whenever a visual aspect of a variable owner-draw list box changes and the value of the Style (see page 21354) property is csOwnerDrawVariable.

Before drawing its items, a variable owner-draw list box calls MeasureItem once for each visible item, passing the index of the item to measure, and the default height of the item. Since Height is passed by reference (a var parameter), MeasureItem can increase or reduce the height of each item as needed.

By default, the MeasureItem method does nothing except call any event handler attached to the OnMeasureItem (see page 21360) event. Override MeasureItem to change or add functionality to the default behavior.

See Also

DrawItem (see page 21328)

ItemHeight (see page 21347)

ItemIndex

OnDrawItem (see page 21358)

OnMeasureItem (see page 21360)

Style (see page 21354)

154.1.13.5.27 TCustomListBox.ResetContent Method

Removes all of the items from a list box.

Pascal

```
procedure ResetContent; dynamic;
```

C++

```
__fastcall ResetContent();
```

Description

ResetContent is used to remove the items from the list box. ResetContent is used, for example, by the Clear (see page 21322) method.

See Also

Clear (see page 21322)

154.1.13.5.28 TCustomListBox.SaveRecreateItems Method

Pascal

```
procedure SaveRecreateItems(RecreateItems: TStrings); virtual;
```

C++

```
virtual __fastcall SaveRecreateItems(TStrings RecreateItems);
```

Description

This is SaveRecreateItems, a member of class TCustomListBox.

154.1.13.5.29 TCustomListBox.SelectAll Method

Selects the entire block of text in the list box.

Pascal

```
procedure SelectAll; override;
```

C++

```
virtual __fastcall SelectAll();
```

Description

Use SelectAll to select the entire block of text in the list box. To select only part of the text, use the SelStart and SelLength properties.

154.1.13.5.30 TCustomListBox.SetItemData Method

Sets the 32-bit value associated with the specified item in a list box.

Pascal

```
procedure SetItemData(Index: Integer; AData: LongInt); dynamic;
```

C++

```
__fastcall SetItemData(int Index, LongInt AData);
```

Description

Use SetItemData to set the data associated with a particular item in a list box. This value can be displayed as that list box item, or it can be a value (such as a pointer) represented by the list box item.

See Also

GetItemData (see page 21329)

154.1.13.5.31 TCustomListBox.SetItemIndex Method

Gives focus to the item with a specified index.

Pascal

```
procedure SetItemIndex(const Value: Integer); override;
```

C++

```
virtual __fastcall SetItemIndex(const int Value);
```

Description

SetItemIndex is the protected write implementation for the ItemIndex property. Value is the index of the item that should receive focus.

See Also

ItemIndex

154.1.13.5.32 TCustomListBox.SetMultiSelect Method

Sets the MultiSelect property.

Pascal

```
procedure SetMultiSelect(Value: Boolean); override;
```

C++

```
virtual __fastcall SetMultiSelect(Boolean Value);
```

Description

SetMultiSelect is the protected write implementation for the MultiSelect property. Value is true if the list box should allow more than one item to be selected, false if only one item can be selected at a time.

See Also

MultiSelect

154.1.13.5.33 TCustomListBox.WndProc Method

Handles Windows messages.

Pascal

```
procedure WndProc(var Message: TMessage); override;
```

C++

```
virtual __fastcall WndProc(TMessage Message);
```

Description

WndProc overrides the inherited WndProc to provide specialized responses to messages that allows the list box to handle auto drag mode itself. Then it calls the inherited WndProc to handle all other messages.

When overriding the WndProc method, be sure to call the inherited WndProc at the end to dispatch any other messages.

C++ Examples:

```
/*
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
*/
class TMyListBoxDescendant : public TListBox
{
__published:    // IDE-managed Components
    void __fastcall SubClassWndProc(Messages::TMessage &Message);
    void __fastcall ToggleSubClass(bool On);
    void __fastcall OnDrawItemProc(
      TWinControl *Control, int Index, const TRect &Rect,
```

```
      TOwnerDrawState State);
private:    // User declarations
public:     // User declarations
    __fastcall TMyListBoxDescendant(TComponent* Owner);
};

TForm1 *Form1;
TMyListBoxDescendant *MyListBoxDescendant1;
Graphics::TBitmap *bitmap0;

const WM_STYLEMESSAGE = WM_USER + 2000;

__fastcall TForm1::TForm1(TComponent* Owner)
    : TForm(Owner)
{
}

__fastcall TMyListBoxDescendant::TMyListBoxDescendant(TComponent* Owner)
    : TListBox(Owner)
{
}

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbOwnerDrawFixed),
    0);
}

void __fastcall TForm1::Button2Click(TObject *Sender)
{
  PostMessage(
    MyListBoxDescendant1->Handle,
    WM_STYLEMESSAGE,
    Integer(lbStandard),
    0);
}

void __fastcall TForm1::SubClassRadioGroup1Click(TObject *Sender)
{
  MyListBoxDescendant1->ToggleSubClass(SubClassRadioGroup1->ItemIndex == 0);
}

void __fastcall TMyListBoxDescendant::SubClassWndProc(Messages::TMessage &Message)
{
  if (Message.Msg == WM_STYLEMESSAGE)
    Style = (TListBoxStyle)Message.WParam;
  else
    WndProc(Message);
}

void __fastcall TMyListBoxDescendant::ToggleSubClass(bool On)
{
  if (On)
    WindowProc = SubClassWndProc;
  else
    WindowProc = WndProc;
}

}
```

Delphi Examples:

```
{
This example shows how to use the WndProc method and the
WindowProc property to subclass a custom control's window
procedure.  This example subclasses the window procedure of
a TListBox descendant to respond to a user-defined message
called WM_STYLEMESSAGE. The subclassed window procedure can
be turned on or off by pressing a radio button.
}

type

154.1.13.6 TCustomListBox Properties

The properties of the TCustomListBox class are listed here.

Protected Properties

	Name	Description
	BorderStyle (see page 21343)	Determines whether the list box has a border.
	Columns (see page 21346)	Specifies the number of columns, in a multi-column list box, that are visible without having to scroll.
	ExtendedSelect (see page 21346)	This is ExtendedSelect, a member of class TCustomListBox.
	IntegralHeight (see page 21347)	Determines whether the list box displays the partial items.
	ItemHeight (see page 21347)	Specifies the height in pixels of an item in an owner-draw list box.
	ParentColor (see page 21350)	Determines where a control looks for its color information.
	Sorted (see page 21353)	Specifies whether the items in a list box are arranged alphabetically.

	Style (see page 21354)	Determines whether the list box is standard or owner-draw and whether it is virtual.
	TabWidth (see page 21355)	Specifies the size of the tabs in the list box.

Public Properties

	Name	Description
	AutoComplete (see page 21342)	Determines whether the user can give focus to items by typing in the list.
	AutoCompleteDelay (see page 21342)	Specifies the delay between a key press and an attempt to autocomplete the field.
R	Canvas (see page 21343)	Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.
	Count (see page 21346)	Indicates the number of items in the list box.
	Items (see page 21348)	Contains the strings that appear in the list box.
	ScrollWidth (see page 21351)	Specifies the width, in pixels, by which the list box can scroll horizontally.
	Selected (see page 21351)	Indicates whether a particular item is selected.
	TopIndex (see page 21356)	Specifies the index number of the item that appears at the top of the list box.

Published Properties

	Name	Description
	TabStop (see page 21355)	Determines if the user can tab to a control.

154.1.13.6.1 TCustomListBox.AutoComplete Property

Determines whether the user can give focus to items by typing in the list.

Pascal

```
property AutoComplete: Boolean;
```

C++

```
__property Boolean AutoComplete;
```

Description

Use AutoComplete to specify whether the list box automatically updates the ItemIndex property in response to user keystrokes. When AutoComplete is true, the item with focus changes to the first item that begins with the sequence of characters that the user typed. As the user types more characters, ItemIndex may change to a later item because the string to match becomes longer.

See Also

ItemIndex

154.1.13.6.2 TCustomListBox.AutoCompleteDelay Property

Specifies the delay between a key press and an attempt to autocomplete the field.

Pascal

```
property AutoCompleteDelay: Cardinal;
```

C++

```
__property unsigned AutoCompleteDelay;
```

Description

Specifies the delay in milliseconds between a key press and an attempt to autocomplete the field. Autocomplete will position to matching list values as you type, sometimes saving you keystrokes.

AutoCompleteDelay is only in effect when the AutoComplete (see page 21342) is true.

See Also

AutoComplete (see page 21342)

154.1.13.6.3 TCustomListBox.BorderStyle Property

Determines whether the list box has a border.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to change the appearance of the outer boundary of the list box control. A list box can have a single border (bsSingle) or no visible border (bsNone).

See Also

Ctl3D (see page 6198)

154.1.13.6.4 TCustomListBox.Canvas Property

Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.

Pascal

```
property Canvas: TCanvas;
```

C++

```
__property TCanvas Canvas;
```

Description

Canvas is only useful for applications that control the drawing of list box items, that is, for owner-draw list boxes. Canvas is used to draw graphical images that can be used as items in a list box.

By default a TControlCanvas object is created for the Canvas property in the list box constructor. To create an owner-draw list box that uses a canvas, set the Style (see page 21354) property accordingly.

C++ Examples:

```
/*
Here is a typical handler for an OnDrawItem event. In the
example, a list box with the lbOwnerDrawFixed style draws a
bitmap to the left of each string.
Select the TListBox and set the ItemHeight property to 32.
Select the ImageList and set the Layout Height and Width to
32.  Double click on the ImageList to load the images.  Be
sure to load in the correct order, logo2, Sunflower,
butterfly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  MyList = new TStringList;
  bitmap0 = new Graphics::TBitmap;
  bitmap1 = new Graphics::TBitmap;
  bitmap2 = new Graphics::TBitmap;
//  MyList->Add("Animal");
```

```
//  MyList->Add("Flowers");
//  MyList->Add("Butterfly");
//  ListBox1.Items->AddStrings(MyList);

  ImageList1->GetBitmap(0, bitmap0);
  ListBox1->Items->AddObject("Flowers", bitmap0);
  ImageList1->GetBitmap(1, bitmap1);
  ListBox1->Items->AddObject("Animal", bitmap1);
  ImageList1->GetBitmap(2, bitmap2);
  ListBox1->Items->AddObject("Butterfly", bitmap2);
}

void __fastcall TForm1::ListBox1DrawItem(TWinControl *Control, int Index,
      TRect &Rect, TOwnerDrawState State)
{
  Graphics::TBitmap *pBitmap; // temporary variable for item's bitmap
  int     Offset = 2;   // default text offset width
  // note that we draw on the listbox's canvas, not on the form
  TCanvas *pCanvas = ((TListBox *)Control)->Canvas;
  pCanvas->FillRect(Rect); // clear the rectangle
  pBitmap = (Graphics::TBitmap *)((TListBox *)Control)->Items->Objects[Index];
  if (pBitmap)
  {
    pCanvas->BrushCopy(Bounds(Rect.Left + Offset, Rect.Top, pBitmap->Width, pBitmap->Height),
pBitmap, Bounds(0, 0, pBitmap->Width, pBitmap->Height), clRed); // render bitmap
    Offset += pBitmap->Width + 4;   // add four pixels between bitmap and text
  }
  // display the text
  pCanvas->TextOut(Rect.Left + Offset, Rect.Top, ((TListBox *)Control)->Items->Strings[Index]);
}
/*
The following code uses ClientRect to find and draw a line
from the top left to the bottom right of the current
control.  Select a TControl in the ListBox list.  This
example assumes that the current object is a descendent of
TControl and has a public Canvas property.
*/
{
  TPoint APoint = Point(X, Y);
  int Index = ListBox1->ItemAtPos(APoint, True);
  TListBox *myListBox;
  TClass ClassRef = ListBox1->Items->Objects[Index]->ClassType();
  if (String(ClassRef->ClassName()) == "TListBox")
  {
    myListBox = (TListBox *)ListBox1->Items->Objects[Index];
    // make sure we are using the TControls canvas and not the from's!
    myListBox->Canvas->MoveTo(myListBox->ClientRect.Left, myListBox->ClientRect.Top);
    myListBox->Canvas->LineTo(myListBox->ClientRect.Right, myListBox->ClientRect.Bottom);
    myListBox = NULL;
  }
}
```

Delphi Examples:

```
{
Here is a typical handler for an OnDrawItem event. In the
example, a list box with the lbOwnerDrawFixed style draws a
bitmap to the left of each string.
Select the TListBox and set the ItemHeight property to 32.
Select the ImageList and set the Layout Height and Width to
32.  Double click on the ImageList to load the images.  Be
sure to load in the correct order, logo2, Sunflower,
butterfly.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  MyList := TStringList.Create;
```

```
    bitmap0 := TBitmap.Create;
    bitmap1 := TBitmap.Create;
    bitmap2 := TBitmap.Create;
  //  MyList.Add('Animal');
  //  MyList.Add('Flowers');
  //  MyList.Add('Butterfly');
  //  ListBox1.Items.AddStrings(MyList);

    ImageList1.GetBitmap(0, bitmap0);
    ListBox1.Items.AddObject('Flowers', bitmap0);
    ImageList1.GetBitmap(1, bitmap1);
    ListBox1.Items.AddObject('Animal', bitmap1);
    ImageList1.GetBitmap(2, bitmap2);
    ListBox1.Items.AddObject('Butterfly', bitmap2);
  end;

  procedure TForm1.ListBox1DrawItem(Control: TWinControl; Index: Integer; Rect:TRect; State:
  TOwnerDrawState);
  var
    Bitmap: TBitmap;      { temporary variable for the item’s bitmap }
    Offset: Integer;      { text offset width }
  begin
    Bitmap := TBitmap.Create;
    with (Control as TListBox).Canvas do  { draw on control canvas, not on the form }
    begin
      FillRect(Rect);       { clear the rectangle }
      Offset := 2;          { provide default offset }
      Bitmap := TBitmap((Control as TListBox).Items.Objects[Index]);  { get the bitmap }
      if Bitmap <> nil then
      begin
        BrushCopy(
          Bounds(Rect.Left + Offset, Rect.Top, Bitmap.Width, Bitmap.Height),
          Bitmap,
          Bounds(0, 0, Bitmap.Width, Bitmap.Height),
          clRed);  {render bitmap}
        Offset := Bitmap.width + 6;    { add four pixels between bitmap and text}
      end;
      TextOut(Rect.Left + Offset, Rect.Top, (Control as TListBox).Items[Index])  { display the
  text }
    end;
  end;
  {
  The following code uses ClientRect to find and draw a line
  from the top left to the bottom right of the current
  control.  Select a TControl in the ListBox list.  This
  example assumes that the current object is a descendent of
  TControl and has a public Canvas property.
  }
    if (ListBox1.Items.Objects[Index] is TListBox) then
    begin
      myListBox:= (ListBox1.Items.Objects[Index] as TListBox);
      with myListBox.ClientRect do
      begin // make sure we are using the TControl's canvas and not the form's!
        myListBox.Canvas.MoveTo(Left, Top);
        myListBox.Canvas.LineTo(Right, Bottom);
      end;
    myListBox:= nil;
    end;
```

See Also

ItemHeight (see page 21347)

OnDrawItem (see page 21358)

Style (see page 21354)

TCanvas (see page 14441)

TControlCanvas (see page 5903)

154.1.13.6.5 TCustomListBox.Columns Property

Specifies the number of columns, in a multi-column list box, that are visible without having to scroll.

Pascal

```
property Columns: Integer;
```

C++

```
__property int Columns;
```

Description

Use Columns to specify the number of columns, in a multi-column list box, that are visible without having to use the horizontal scroll bar.

Multi-column list boxes have a horizontal scroll bar that allows users to view multiple columns as they wrap. The default value for Columns is 0, meaning that the list box is not multi-column. That is, users can scroll only vertically and the list of items will not wrap.

For Columns values greater than 0, multiple columns accommodate the items as they wrap beyond the bottom of the list box. The Columns property specifies the number of columns that are visible without having to horizontally scroll the list box.

The width of each column depends upon both the Width property and the number of Columns.

See Also

ItemHeight (see page 21347)

Width (see page 5849)

154.1.13.6.6 TCustomListBox.Count Property

Indicates the number of items in the list box.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count to determine the number of items in the list box. You can only set Count when the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw, in which case you must set this property.

See Also

Style (see page 21354)

154.1.13.6.7 TCustomListBox.ExtendedSelect Property

Pascal

```
property ExtendedSelect: Boolean;
```

C++

```
__property Boolean ExtendedSelect;
```

Description

This is ExtendedSelect, a member of class TCustomListBox.

154.1.13.6.8 TCustomListBox.IntegralHeight Property

Determines whether the list box displays the partial items.

Pascal

```
property IntegralHeight: Boolean;
```

C++

```
__property Boolean IntegralHeight;
```

Description

IntegralHeight controls the height of the list box itself.

When IntegralHeight is true, and the Style (see page 21354) property is lsOwnerDrawFixed, the list box height will always be a multiple of the ItemHeight (see page 21347) property value. In this case, items will never be partially displayed.

If IntegralHeight is false, the list box height can be set to any value, but the last item may not be fully displayed.

If the Style (see page 21354) property value of the list box is lbOwnerDrawVariable, setting the IntegralHeight property to true has no effect.

See Also

ItemHeight (see page 21347)

Items (see page 21348)

Style (see page 21354)

Using TDBListBox and TDBComboBox

154.1.13.6.9 TCustomListBox.ItemHeight Property

Specifies the height in pixels of an item in an owner-draw list box.

Pascal

```
property ItemHeight: Integer;
```

C++

```
__property int ItemHeight;
```

Description

Use ItemHeight to control the height of an item in a list box when the Style (see page 21354) property is lbOwnerDrawFixed. The ItemHeight property can also affect the height of the list box itself. When the IntegralHeight (see page 21347) property is true, the height of the list box is always an increment of the ItemHeight value.

If the Style (see page 21354) property is lbStandard or lbOwnerDrawVariable, the value of ItemHeight is ignored.

See Also

DrawItem (see page 21328)

IntegralHeight (see page 21347)

Items (see page 21348)

MeasureItem (see page 21335)

OnDrawItem (see page 21358)

OnMeasureItem (see page 21360)

Style (see page 21354)

Using TDBListBox and TDBComboBox

154.1.13.6.10 TCustomListBox.Items Property

Contains the strings that appear in the list box.

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

Use Items to add, insert, delete and move items. By default, the items in a list box are of type TStrings. Use this item type to access its methods or properties to manipulate the items in the list.

For example, the following code adds the text in the edit box to the list box as an item:

```
ListBox1.Items.Add(Edit1.Text); {Delphi }
ListBox1->Items->Add(Edit1->Text); // C++
```

C++ Examples:

```
/*
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Continue will continue listing
file sizes in a multiple selection that includes the deleted
file.  Break will stop.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
*/

        Reset(F, 1);
        ListBox1.Items.Add(
          FileListBox1.Items.Strings[i] + ': ' + IntToStr(FileSize(F)));
        CloseFile(F);
      end;
    finally
    { do something here }
    end;
  end;
end;
{
This example uses a list box and a button on a form. Use the
Items property editor in the Object Inspector to enter a
list of strings in the list box. When the application runs
and the button is clicked, the strings in the list box
become uppercase.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to ListBox1.Items.Count -1 do
    ListBox1.Items[I] := SysUtils.UpperCase(ListBox1.Items[I]);
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  Listbox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');

154.1.13.6.11 TCustomListBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the

form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.13.6.12 TCustomListBox.ScrollWidth Property

Specifies the width, in pixels, by which the list box can scroll horizontally.

Pascal

```
property ScrollWidth: Integer;
```

C++

```
__property int ScrollWidth;
```

Description

Use ScrollWidth to get or set the logical width of the list box. When ScrollWidth is greater than the client width of the list box, the list box gets a horizontal scroll bar. When ScrollWidth is less than or equal to ClientWidth, the horizontal scroll bar disappears.

See Also

Columns (see page 21346)

ClientWidth (see page 5811)

154.1.13.6.13 TCustomListBox.Selected Property

Indicates whether a particular item is selected.

Pascal

```
property Selected [Index: Integer]: Boolean;
```

C++

```
__property Boolean Selected[int Index];
```

Description

Use Selected to query the state of a particular item in the list box. If the item specified by the Index parameter is selected in the list box, the value of the Selected property is true. If the specified item is not selected, Selected is false. Set Selected to change the currently selected item.

The Index parameter is the item referenced by its position in the list box, with the first item having an Index value of 0.

An item is selected when the user highlights it. More than one item in the list box can be selected by setting the MultiSelect property to true. In this case, the Selected item is the one that has focus when the list box has input focus.

C++ Examples:

```
/*
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
```

```
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Continue will continue listing
file sizes in a multiple selection that includes the deleted
file.  Break will stop.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
*/
#include <stdio.h>     // for FILE, fopen, fstat, fileno, fread and fclose
#include <sys\stat.h>  // for fstat and the stat struct

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < FileListBox1->Items->Count; i++)
  {
    if (FileListBox1->Selected[i])
    {
      if (!FileExists(FileListBox1->Items->Strings[i]))
      {
        MessageBeep(0);
        if (Application->MessageBox(
          AnsiString("File " + FileListBox1->Items->Strings[i] + "not found").c_str(),
          NULL,
          MB_OKCANCEL) == IDCANCEL)
          break;
        else
          continue;
      }
      FILE *F = fopen(FileListBox1->Items->Strings[i].c_str(),"r");
      struct stat statbuf;
      fstat(fileno(F), &statbuf);
      ListBox1->Items->Add(
          FileListBox1->Items->Strings[i] + ": " + IntToStr(statbuf.st_size));
      fclose(F);
    }
  }
}
```

Delphi Examples:

```
{
This example uses a file listbox and a regular listbox on a
form. The following routine scans through the files listed
in the file listbox and lists the sizes of any selected
files to the regular list box.  To exercise the error
condition create a file in the Debug directory, start this
application and then delete the file.  Now try to list the
size of the deleted file.  Set the MultiSelect and
ExtendedSelect properties on the FileListBox.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  F: File;
  i, filehandle: Integer;
begin
  for i := 0 to (FileListBox1.Items.Count - 1) do begin
  try
    if FileListBox1.Selected[i] then
    begin
      if not FileExists(FileListBox1.Items.Strings[i]) then
      begin
        MessageDlg('File: ' + FileListBox1.Items.Strings[i] +
                   ' not found', mtError, [mbOk], 0);
        Continue;
      end;
      filehandle:=  FileOpen(FileListBox1.Items.Strings[i], 1);
      if (filehandle = -1) then
```

```
        begin
          MessageDlg('File: ' + FileListBox1.Items.Strings[i] +
                     ' cannot be opened with access mode 1.', mtError, [mbOk], 0);
          Continue;
        end
        else
          FileClose(filehandle);

        AssignFile(F, FileListBox1.Items.Strings[i]);
        Reset(F, 1);
        ListBox1.Items.Add(
          FileListBox1.Items.Strings[i] + ': ' + IntToStr(FileSize(F)));
        CloseFile(F);
      end;
    finally
    { do something here }
    end;
  end;

154.1.13.6.14 TCustomListBox.Sorted Property

Specifies whether the items in a list box are arranged alphabetically.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Use Sorted to sort the items by setting its value to true. If Sorted is false, the items are unsorted. When Sorted is true, items are automatically added or inserted into the list box in alphabetical order.

Note: Sorted has no effect if Listbox's style is lbVirtual or lbVirtualOwnerDraw

C++ Examples:

```
/*
This example uses an edit box, a list box, and two buttons
on a form. The buttons are named Add and Sort. When the user
clicks the Add button, the text in the edit box is added to
the list in the list box. Before the user clicks the sort
button, any new items are added to the end of the list.
After the user clicks the Sort button, the list in the list
box is sorted and remains sorted, even if additional strings
are added.  If the user clicks the sort button again, the
list box remains sorted, but any new strings are again added
to the end of the list.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
```

```
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");
}

void __fastcall TForm1::AddClick(TObject *Sender)
{
  ListBox1->Items->Add(Edit1->Text);
}

void __fastcall TForm1::SortClick(TObject *Sender)
{
  ListBox1->Sorted = True;
}
```

Delphi Examples:

```
{
This example uses an edit box, a list box, and two buttons
on a form. The buttons are named Add and Sort. When the user
clicks the Add button, the text in the edit box is added to
the list in the list box. Before the user clicks the sort
button, any new items are added to the end of the list.
After the user clicks the Sort button, the list in the list
box is sorted and remains sorted, even if additional strings
are added.  If the user clicks the sort button again, the
list box remains sorted, but any new strings are again added
to the end of the list.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

procedure TForm1.AddClick(Sender: TObject);
begin
  ListBox1.Items.Add(Edit1.Text);
end;

procedure TForm1.SortClick(Sender: TObject);
begin
  ListBox1.Sorted := True;
end;
```

See Also

Items (see page 21348)

Style (see page 21354)

154.1.13.6.15 TCustomListBox.Style Property

Determines whether the list box is standard or owner-draw and whether it is virtual.

Pascal

```
property Style: TListBoxStyle;
```

C++

```
__property TListBoxStyle Style;
```

Description

Use Style to specify whether the list box is a standard list box that displays text strings, or an owner-draw list box that can display graphical images. Owner-draw list boxes let you display items in some nonstandard way. In this case, you must write the code to paint items in the list box.

In addition, Style controls whether the list box is virtual, which means that items are supplied dynamically using event handlers. By default, Style is lbStandard, meaning that the list box is not virtual and it displays each item as a string.

OnDataObject (see page 21358)

154.1.13.6.16 TCustomListBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.13.6.17 TCustomListBox.TabWidth Property

Specifies the size of the tabs in the list box.

Pascal

```
property TabWidth: Integer;
```

C++

```
__property int TabWidth;
```

Description

Set TabWidth to control the number of dialog base units displayed for each tab character that appears in the strings of a list box.

If TabWidth is set to 0, which is the default setting, the tabs default to the width specified by Windows, which is two dialog base units.

154.1.13.6.18 TCustomListBox.TopIndex Property

Specifies the index number of the item that appears at the top of the list box.

Pascal

```
property TopIndex: Integer;
```

C++

```
__property int TopIndex;
```

Description

Use TopIndex property to find or set the first item displayed at the top of the list box. TopIndex can be used, for example, to change the topmost item to a different item in the list.

C++ Examples:

```
/*
The following example uses a list box containing a list of
strings, a button, and an edit box on a form. When the user
runs the application and clicks the button, the third item
in the list becomes the first item, and the index value of
that item appears in the edit box. The index value displayed
is 2, indicating the third item in the list (the first item
in the list has an index value of 0):
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  ListBox1->TopIndex = 2;
  Edit1->Text = IntToStr(ListBox1->TopIndex);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int Number = 1; Number <= 20; Number++)
    ListBox1->Items->Add("Item " + IntToStr(Number));
}
```

Delphi Examples:

```
{
The following example uses a list box containing a list of
strings, a button, and an edit box on a form. When the user
runs the application and clicks the button, the third item
in the list becomes the first item, and the index value of
that item appears in the edit box. The index value displayed
is 2, indicating the third item in the list (the first item
in the list has an index value of 0):
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  ListBox1.TopIndex := 2;
  Edit1.Text := IntToStr(ListBox1.TopIndex);
end;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  Number: Integer;
begin
  for Number := 1 to 20 do
    ListBox1.Items.Add('Item ' + IntToStr(Number));
end;
```

154.1.13.7 TCustomListBox Events

The events of the TCustomListBox class are listed here.

Protected Events

	Name	Description
	OnData (see page 21357)	Occurs when a virtual list box needs to supply the text of an item.
	OnDataFind (see page 21357)	Occurs when a virtual list box needs to identify the index of an item given its text.
	OnDataObject (see page 21358)	Occurs when a virtual list box needs to supply the object associated with an item.
	OnDrawItem (see page 21358)	Occurs when an item in an owner-draw list box needs to be redisplayed.
	OnMeasureItem (see page 21360)	Occurs when the application needs to redisplay an item in a variable height owner-draw list box.

154.1.13.7.1 TCustomListBox.OnData Event

Occurs when a virtual list box needs to supply the text of an item.

Pascal

```
property OnData: TLBGetDataEvent;
```

C++

```
__property TLBGetDataEvent OnData;
```

Description

You must supply an OnData event handler to dynamically supply the items in the list box when the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw.

See Also

OnDataFind (see page 21357)

OnDataObject (see page 21358)

Style (see page 21354)

Count (see page 21346)

154.1.13.7.2 TCustomListBox.OnDataFind Event

Occurs when a virtual list box needs to identify the index of an item given its text.

Pascal

```
property OnDataFind: TLBFindDataEvent;
```

C++

```
__property TLBFindDataEvent OnDataFind;
```

Description

You must supply an OnDataFind event handler to dynamically provide the mapping from list item to index when the Style (see page 21354) property is lbVirtual or lbVirtualOwnerDraw.

See Also

OnData (see page 21357)

OnDataObject (see page 21358)

Style (see page 21354)

Count (see page 21346)

154.1.13.7.3 TCustomListBox.OnDataObject Event

Occurs when a virtual list box needs to supply the object associated with an item.

Pascal

```
property OnDataObject: TLBGetDataObjectEvent;
```

C++

```
__property TLBGetDataObjectEvent OnDataObject;
```

Description

Supply an OnDataObject event handler to dynamically provide objects associated with the items in a virtual list box.

See Also

OnData (see page 21357)

OnDataFind (see page 21357)

Style (see page 21354)

Count (see page 21346)

154.1.13.7.4 TCustomListBox.OnDrawItem Event

Occurs when an item in an owner-draw list box needs to be redisplayed.

Pascal

```
property OnDrawItem: TDrawItemEvent;
```

C++

```
__property TDrawItemEvent OnDrawItem;
```

Description

Use OnDrawItem to write a handler for drawing of the items in list boxes with the Style (see page 21354) values lbOwnerDrawFixed, lbOwnerDrawVariable, or lbVirtualOwnerDraw. OnDrawItem occurs when the list box needs to display an item. OnDrawItem occurs only for owner-draw list boxes.

The size of the rectangle that contains the item is determined either by the ItemHeight (see page 21347) property for fixed

owner-draw list boxes or by the response to the OnMeasureItem (see page 21360) event for variable owner-draw list boxes.

C++ Examples:

```
/*
Here is a typical handler for an OnDrawItem event. In the
example, a list box with the lbOwnerDrawFixed style draws a
bitmap to the left of each string.
Select the TListBox and set the ItemHeight property to 32.
Select the ImageList and set the Layout Height and Width to
32.  Double click on the ImageList to load the images.  Be
sure to load in the correct order, logo2, Sunflower,
butterfly.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  MyList = new TStringList;
  bitmap0 = new Graphics::TBitmap;
  bitmap1 = new Graphics::TBitmap;
  bitmap2 = new Graphics::TBitmap;
//  MyList->Add("Animal");
//  MyList->Add("Flowers");
//  MyList->Add("Butterfly");
//  ListBox1.Items->AddStrings(MyList);

  ImageList1->GetBitmap(0, bitmap0);
  ListBox1->Items->AddObject("Flowers", bitmap0);
  ImageList1->GetBitmap(1, bitmap1);
  ListBox1->Items->AddObject("Animal", bitmap1);
  ImageList1->GetBitmap(2, bitmap2);
  ListBox1->Items->AddObject("Butterfly", bitmap2);
}

void __fastcall TForm1::ListBox1DrawItem(TWinControl *Control, int Index,
      TRect &Rect, TOwnerDrawState State)
{
  Graphics::TBitmap *pBitmap; // temporary variable for item's bitmap
  int     Offset = 2;   // default text offset width
  // note that we draw on the listbox's canvas, not on the form
  TCanvas *pCanvas = ((TListBox *)Control)->Canvas;
  pCanvas->FillRect(Rect); // clear the rectangle
  pBitmap = (Graphics::TBitmap *)((TListBox *)Control)->Items->Objects[Index];
  if (pBitmap)
  {
    pCanvas->BrushCopy(Bounds(Rect.Left + Offset, Rect.Top, pBitmap->Width, pBitmap->Height),
pBitmap, Bounds(0, 0, pBitmap->Width, pBitmap->Height), clRed); // render bitmap
    Offset += pBitmap->Width + 4;   // add four pixels between bitmap and text
  }
  // display the text
  pCanvas->TextOut(Rect.Left + Offset, Rect.Top, ((TListBox *)Control)->Items->Strings[Index]);
}
```

Delphi Examples:

```
{
Here is a typical handler for an OnDrawItem event. In the
example, a list box with the lbOwnerDrawFixed style draws a
bitmap to the left of each string.
Select the TListBox and set the ItemHeight property to 32.
Select the ImageList and set the Layout Height and Width to
32.  Double click on the ImageList to load the images.  Be
sure to load in the correct order, logo2, Sunflower,
butterfly.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  MyList := TStringList.Create;
```

```
    bitmap0 := TBitmap.Create;
    bitmap1 := TBitmap.Create;
    bitmap2 := TBitmap.Create;
  //  MyList.Add('Animal');
  //  MyList.Add('Flowers');
  //  MyList.Add('Butterfly');
  //  ListBox1.Items.AddStrings(MyList);

    ImageList1.GetBitmap(0, bitmap0);
    ListBox1.Items.AddObject('Flowers', bitmap0);
    ImageList1.GetBitmap(1, bitmap1);
    ListBox1.Items.AddObject('Animal', bitmap1);
    ImageList1.GetBitmap(2, bitmap2);
    ListBox1.Items.AddObject('Butterfly', bitmap2);
  end;

  procedure TForm1.ListBox1DrawItem(Control: TWinControl; Index: Integer; Rect:TRect; State:
  TOwnerDrawState);
  var
    Bitmap: TBitmap;      { temporary variable for the item's bitmap }
    Offset: Integer;      { text offset width }
  begin
    Bitmap := TBitmap.Create;
    with (Control as TListBox).Canvas do  { draw on control canvas, not on the form }
    begin
      FillRect(Rect);       { clear the rectangle }
      Offset := 2;          { provide default offset }
      Bitmap := TBitmap((Control as TListBox).Items.Objects[Index]);  { get the bitmap }
      if Bitmap <> nil then
      begin
        BrushCopy(
          Bounds(Rect.Left + Offset, Rect.Top, Bitmap.Width, Bitmap.Height),
          Bitmap,
          Bounds(0, 0, Bitmap.Width, Bitmap.Height),
          clRed);  {render bitmap}
        Offset := Bitmap.width + 6;    { add four pixels between bitmap and text}
      end;
      TextOut(Rect.Left + Offset, Rect.Top, (Control as TListBox).Items[Index])  { display the
  text }
    end;
  end;
```

See Also

DrawItem (see page 21328)

MeasureItem (see page 21335)

OnMeasureItem (see page 21360)

Style (see page 21354)

154.1.13.7.5 TCustomListBox.OnMeasureItem Event

Occurs when the application needs to redisplay an item in a variable height owner-draw list box.

Pascal

```
property OnMeasureItem: TMeasureItemEvent;
```

C++

```
__property TMeasureItemEvent OnMeasureItem;
```

Description

Use OnMeasureItem to write a handler to measure items to be drawn in a list box with a Style (see page 21354) property value of lbOwnerDrawVariable.

OnMeasureItem is of type TMeasureItemEvent (see page 21955) which contains three parameters describing the item to measure:

Control, specifying the control containing the item.

Index, specifying the index of the item in the control.

Height, specifying the height of the item.

The Index parameter identifies the position of the item in the list box.

The Height parameter should specify the height in pixels that the given item will occupy in the control. The Height parameter is passed by reference (a var parameter), which initially contains the default height of the item or the height of the item text in the control's font. The handler can set Height to a value appropriate to the contents of the item, such as the height of a graphical image to be displayed within the item.

After the OnMeasureItem event occurs, the OnDrawItem (see page 21358) event occurs, rendering the item with the measured size.

C++ Examples:

```
/*
Here is a typical handler for an OnMeasureItem event. The
example assumes that a variable owner-draw list box already
has bitmaps associated with each of its strings. It sets the
height of the item to the height of the associated bitmap if
that height is greater than the default height
(ListBox1.ItemHeight).  Note that TWinControl can also be
used in place of TWidgetControl on Windows.
*/
void __fastcall TForm1::ListBox1MeasureItem(TWinControl *Control, int Index,
      int &Height)
{
  Graphics::TBitmap *bitmap = (Graphics::TBitmap *)((TListBox
*)Control)->Items->Objects[Index];
  if (bitmap && bitmap->Height > Height)
    Height = bitmap->Height;
}

void __fastcall TForm1::ListBox1DrawItem(TWinControl *Control, int Index,
      TRect &Rect, TOwnerDrawState State)
{
  Graphics::TBitmap *pBitmap; // temporary variable for item's bitmap
  int     Offset = 2;   // default text offset width
  // note that we draw on the listbox's canvas, not on the form
  TCanvas *pCanvas = ((TListBox *)Control)->Canvas;
  pCanvas->FillRect(Rect); // clear the rectangle
  pBitmap = (Graphics::TBitmap *)((TListBox *)Control)->Items->Objects[Index];
  if (pBitmap)
  {
    pCanvas->BrushCopy(Bounds(Rect.Left + Offset, Rect.Top, pBitmap->Width, pBitmap->Height),
pBitmap, Bounds(0, 0, pBitmap->Width, pBitmap->Height), clRed); // render bitmap
    Offset += pBitmap->Width + 4;   // add four pixels between bitmap and text
  }
  // display the text
  pCanvas->TextOut(Rect.Left + Offset, Rect.Top, ((TListBox *)Control)->Items->Strings[Index]);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
```

```
  Graphics::TBitmap *bitmap0 = new Graphics::TBitmap;
  Graphics::TBitmap *bitmap1 = new Graphics::TBitmap;
  Graphics::TBitmap *bitmap2 = new Graphics::TBitmap;
  bitmap0->LoadFromFile("../littleB_64.bmp");
//  ImageList1->GetBitmap(0, bitmap0);
  ListBox1->Items->AddObject("Butterfly", bitmap0);
  ImageList1->GetBitmap(3, bitmap1);
  ListBox1->Items->AddObject("Animal", bitmap1); // no bitmap, see if it leaves this height at
64.
  ImageList1->GetBitmap(4, bitmap2);
  ListBox1->Items->AddObject("Sunflower", bitmap2); // no bitmap, see if it leaves this height
at 64.

}
```

StdCtrls

Description

TCustomMemo introduces new properties and methods to expand the capabilities of TCustomEdit (see page 21232) for handling multiline edit boxes.

Do not create instances of TCustomMemo. Use TCustomMemo as a base class when declaring control objects that implement a multiline edit control. Properties and methods of TCustomMemo provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

154.1.14.1 TCustomMemo Members

The following tables list the members exposed by TCustomMemo.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnChange (see page 21275)	Occurs when the text for the edit control may have changed.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.

	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 21375)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 21376)	Creates a window based on the window-creation parameter record.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.

	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetCaretPos (see page 21376)	Returns the value of the CaretPos (see page 21380) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 21377)	Ensures that return characters are not entered into the text when WantReturns (see page 21384) is false.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 21377)	Initializes the memo control when it is first loaded into memory.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.

	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAlignment (see page 21377)	Sets the Alignment (see page 21379) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetCaretPos (see page 21378)	Sets the CaretPos (see page 21380) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetLines (see page 21378)	Sets the Lines (see page 21380) property.
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetScrollBars (see page 21378)	Sets the ScrollBars (see page 21381) property.
	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetWordWrap (see page 21379)	Sets the WordWrap (see page 21384) property.

	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21379)	Determines how the text is aligned within the memo control.
	AutoSelect (see page 21260)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	AutoSize (see page 21260)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21261)	Determines whether the edit control has a single line border around the client area.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	CharCase (see page 21262)	Determines the case of the text within the edit control.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.

	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	HideSelection (see page 21262)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MaxLength (see page 21263)	Specifies the maximum number of characters the user can enter into the edit control.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	OEMConvert (see page 21264)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentColor (see page 21264)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PasswordChar (see page 21265)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ScrollBars (see page 21381)	Determines whether the memo control has scroll bars.
	Text (see page 5842)	Contains a text string associated with the control.
	WantReturns (see page 21384)	Determines whether the user can insert return characters into the text.
	WantTabs (see page 21384)	Determines whether the user can insert tab characters into the text.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.
	WordWrap (see page 21384)	Determines whether the edit control inserts soft carriage returns so text wraps at the right margin.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 21374)	Creates and initializes an instance of TCustomMemo (see page 21362).
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 21374)	Destroys an instance of TCustomMemo (see page 21362).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetControlsAlignment (see page 21376)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Invalidate (see page 5770)	Completely repaint control.
	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.

	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	CaretPos (see page 21380)	Indicates the position of the caret in the client area of the memo.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	Lines (see page 21380)	Contains the individual lines of text in the memo control.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ReadOnly (see page 21265)	Determines whether the user can change the text of the edit control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	Text (see page 21273)	Contains a text string associated with the control.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.

	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	TabStop (see page 21273)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.14.2 TCustomMemo.Create Constructor

Creates and initializes an instance of TCustomMemo (see page 21362).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomMemo(TComponent * AOwner);
```

Description

Call Create to instantiate a TCustomMemo (see page 21362) object.

AOwner is the component, typically the form, that is responsible for freeing the memo object. This becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before making any additional initializations.

See Also

Owner (see page 2807)

154.1.14.3 TCustomMemo.Destroy Destructor

Destroys an instance of TCustomMemo (see page 21362).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomMemo();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free checks that the TCustomMemo (see page 21362) reference is not nil, and only then calls Destroy.

Destroy frees the TStrings object that implements the Lines (see page 21380) property before calling the inherited destructor.

See Also

Free (see page 22300)

Lines (see page 21380)

TStrings (see page 3029)

154.1.14.4 TCustomMemo Methods

The methods of the TCustomMemo class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 21375)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateWindowHandle (see page 21376)	Creates a window based on the window-creation parameter record.
	GetCaretPos (see page 21376)	Returns the value of the CaretPos (see page 21380) property.
	KeyPress (see page 21377)	Ensures that return characters are not entered into the text when WantReturns (see page 21384) is false.
	Loaded (see page 21377)	Initializes the memo control when it is first loaded into memory.
	SetAlignment (see page 21377)	Sets the Alignment (see page 21379) property.
	SetCaretPos (see page 21378)	Sets the CaretPos (see page 21380) property.
	SetLines (see page 21378)	Sets the Lines (see page 21380) property.
	SetScrollBars (see page 21378)	Sets the ScrollBars (see page 21381) property.
	SetWordWrap (see page 21379)	Sets the WordWrap (see page 21384) property.

Public Methods

	Name	Description
	GetControlsAlignment (see page 21376)	Indicates how text is aligned within the control.

154.1.14.4.1 TCustomMemo.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd (see page 21248) method calls CreateParams to initialize the parameters it passes to CreateWindowHandle (see page 21376). TCustomMemo (see page 21362) overrides the inherited method to specify a scrollable multiline edit control. The Params parameter is updated to reflect the current values of the Alignment (see page 21379), ScrollBars (see page 21381), and WordWrap (see page 21384) properties, in addition to the BorderStyle (see page 21261), HideSelection (see page 21262), PasswordChar (see page 21265), and ReadOnly (see page 21265) properties that the inherited method specifies.

154.1.14.4.2 TCustomMemo.CreateWindowHandle Method

Creates a window based on the window-creation parameter record.

Pascal

```
procedure CreateWindowHandle(const Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateWindowHandle(const TCreateParams Params);
```

Description

The CreateWnd (see page 21248) method calls CreateWindowHandle to create the edit control window once it has been specified in the window-creation parameters. CreateWindowHandle creates the window by calling the CreateWindowEx API function, passing parameters from the record passed in the Params parameter. CreateWindowHandle overrides the inherited method to interpret the Caption in Params as the initial text rather than as the window caption.

See Also

CreateParams (see page 21375)

CreateWnd (see page 21248)

154.1.14.4.3 TCustomMemo.GetCaretPos Method

Returns the value of the CaretPos (see page 21380) property.

Pascal

```
function GetCaretPos: TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetCaretPos();
```

Description

CaretPos (see page 21380) represents the coordinates of the cursor. GetCaretPos is the protected implementation of the CaretPos (see page 21380) property. Override this method to change the way the caret position is computed.

See Also

CaretPos (see page 21380)

154.1.14.4.4 TCustomMemo.GetControlsAlignment Method

Indicates how text is aligned within the control.

Pascal

```
function GetControlsAlignment: TAlignment; override;
```

C++

```
virtual __fastcall TAlignment GetControlsAlignment();
```

Description

Use GetControlsAlignment to determine the alignment of the control. For controls that do not have an Alignment property, GetControlsAlignment returns taLeftJustify.

Note: GetControlsAlignment returns the alignment of text before it is altered by the BiDiMode property. To check if the alignment should be reversed to reflect the BiDiMode property, call UseRightToLeftAlignment.

See Also

BiDiMode (see page 5803)

Text (see page 5842)

Caption (see page 5806)

UseRightToLeftAlignment (see page 5790)

154.1.14.4.5 TCustomMemo.KeyPress Method

Ensures that return characters are not entered into the text when WantReturns (see page 21384) is false.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

KeyPress is called automatically when the user presses a key. After calling the inherited KeyPress, which calls the OnKeyPress event handler, KeyPress discards return characters when WantReturns (see page 21384) is false.

See Also

WantReturns (see page 21384)

154.1.14.4.6 TCustomMemo.Loaded Method

Initializes the memo control when it is first loaded into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Loaded overrides the inherited method so that the Modified (see page 21263) property is set to false when the form containing the memo is first loaded into memory. Derived classes can override the Loaded method to perform additional initializations after the memo's form is loaded.

See Also

Modified (see page 21263)

154.1.14.4.7 TCustomMemo.SetAlignment Method

Sets the Alignment (see page 21379) property.

Pascal

```
procedure SetAlignment(Value: TAlignment);
```

C++

```
__fastcall SetAlignment(TAlignment Value);
```

Description

SetAlignment is exposed as a protected method so derived classes can customize their implementation of the Alignment (see page 21379) property.

See Also

Alignment (see page 21379)

154.1.14.4.8 TCustomMemo.SetCaretPos Method

Sets the CaretPos (see page 21380) property.

Pascal

```
procedure SetCaretPos(const Value: TPoint); virtual;
```

C++

```
virtual __fastcall SetCaretPos(const TPoint Value);
```

Description

SetCaretPos is the property write access method for the CaretPos (see page 21380) property. The CaretPos (see page 21380) property returns the coordinates of the cursor. SetCaretPos sets the cursor position to Value.

See Also

CaretPos (see page 21380)

154.1.14.4.9 TCustomMemo.SetLines Method

Sets the Lines (see page 21380) property.

Pascal

```
procedure SetLines(Value: TStrings);
```

C++

```
__fastcall SetLines(TStrings Value);
```

Description

SetLines is the protected write implementation for the Lines (see page 21380) property.

SetLines is exposed as a protected method so derived classes can customize their implementation of the Lines (see page 21380) property.

See Also

Lines (see page 21380)

154.1.14.4.10 TCustomMemo.SetScrollBars Method

Sets the ScrollBars (see page 21381) property.

Pascal

```
procedure SetScrollBars(Value: TScrollStyle);
```

C++

```
__fastcall SetScrollBars(TScrollStyle Value);
```

Description

SetScrollBars is the property access method for the ScrollBars (see page 21381) property.

SetScrollBars is exposed as a protected method so derived classes can customize their implementation of the ScrollBars (see page 21381) property.

See Also

ScrollBars (see page 21381)

154.1.14.4.11 TCustomMemo.SetWordWrap Method

Sets the WordWrap (see page 21384) property.

Pascal

```
procedure SetWordWrap(Value: Boolean);
```

C++

```
__fastcall SetWordWrap(Boolean Value);
```

Description

SetWordWrap is the property access method for the WordWrap (see page 21384) property.

See Also

WordWrap (see page 21384)

154.1.14.5 TCustomMemo Properties

The properties of the TCustomMemo class are listed here.

Protected Properties

	Name	Description
	Alignment (see page 21379)	Determines how the text is aligned within the memo control.
	ScrollBars (see page 21381)	Determines whether the memo control has scroll bars.
	WantReturns (see page 21384)	Determines whether the user can insert return characters into the text.
	WantTabs (see page 21384)	Determines whether the user can insert tab characters into the text.
	WordWrap (see page 21384)	Determines whether the edit control inserts soft carriage returns so text wraps at the right margin.

Public Properties

	Name	Description
	CaretPos (see page 21380)	Indicates the position of the caret in the client area of the memo.
	Lines (see page 21380)	Contains the individual lines of text in the memo control.

154.1.14.5.1 TCustomMemo.Alignment Property

Determines how the text is aligned within the memo control.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Use Alignment to change the way the text is formatted by the memo control. Alignment can take one of the following values:

Value	Meaning
taLeftJustify	Align text to the left side of the control
taCenter	Center text horizontally in the control.
taRightJustify	Align text to the right side of the control.

See Also

SetAlignment (see page 21377)

Text (see page 5842)

Displaying and Editing Text in a Memo Control

154.1.14.5.2 TCustomMemo.CaretPos Property

Indicates the position of the caret in the client area of the memo.

Pascal

```
property CaretPos: TPoint;
```

C++

```
__property TPoint CaretPos;
```

Description

Use CaretPos to determine the coordinates of the cursor. CaretPos defines a location onscreen, in characters, with the origin in the top left corner of the memo. X specifies the horizontal coordinate of the point, Y specifies the vertical coordinate.

To determine the position of the caret in terms of characters of text only (rather than X/Y location), use the SelStart (see page 21269) property.

See Also

ClientRect (see page 5810)

ClientOrigin (see page 5809)

SelStart (see page 21269)

154.1.14.5.3 TCustomMemo.Lines Property

Contains the individual lines of text in the memo control.

Pascal

```
property Lines: TStrings;
```

C++

```
__property TStrings Lines;
```

Description

Use Lines to manipulate text in an memo control on a line-by-line basis. Lines is a TStrings object, so the TStrings methods may

be used for Lines to perform manipulations such as counting the lines of text, adding new lines, deleting lines, or replacing lines with new text.

To work with all the text at once, use the Text (see page 21273) property. To manipulate individual lines of text, the Lines property works better.

Note: Although Lines is implemented as a TStrings descendant, it does not implement the support for associating objects with the strings in the list.

C++ Examples:

```
/*
This example uses a button and a memo control on a form.
When the user clicks the button, the content of the specified
file is loaded into the memo, and the fifth line of the file
is written across the top of the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Memo1->Lines->LoadFromFile("../readme.txt");
  Caption = Memo1->Lines->Strings[4];
}
```

Delphi Examples:

```
{
This example uses a button and a memo control on a form.
When the user clicks the button, the content of the specified
file is loaded into the memo, and the fifth line of the file
is written across the top of the form.
}

procedure TForm1.Button1Click(Sender: TObject);
begin
  Memo1.Lines.LoadFromFile('readme.txt');
  Caption:= Memo1.Lines[4];
end;
```

See Also

TStrings (see page 3029)

SelText (see page 21272)

SetLines (see page 21378)

Text (see page 5842)

WordWrap (see page 21384)

154.1.14.5.4 TCustomMemo.ScrollBars Property

Determines whether the memo control has scroll bars.

Pascal

```
property ScrollBars: TScrollStyle;
```

C++

```
__property TScrollStyle ScrollBars;
```

Description

Use ScrollBars to give a multiline edit control horizontal or vertical scroll bars. ScrollBars can take one of the following values:

Value	Meaning
ssNone	The control has no scroll bars.
ssHorizontal	The control has a single scroll bar on the bottom edge.
ssVertical	The control has a single scroll bar on the right edge.
ssBoth	The control has a scroll bar on both the bottom and right edges.

C++ Examples:

```
/*
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->Lines->Clear();
  for (int i = 0; i < 500; i++)
  {
    RichEdit1->Text = RichEdit1->Text + AnsiString("This is sentence ") + IntToStr(i) + ".  ";
    if ((i % 2) == 0) {
      RichEdit1->Text = RichEdit1->Text + AnsiString("\n");
    }
  }
  RichEdit1->SelStart = 0; // move text cursor to top of edit
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  RichEdit1->HideScrollBars = CheckBox1->Checked;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  TScrollStyle ScrollBarA[4] = {ssBoth, ssHorizontal, ssNone, ssVertical };
  RichEdit1->ScrollBars = ScrollBarA[RadioGroup1->ItemIndex];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Caption = "Scroll Bars";
  RadioGroup1->Items->Clear();
  RadioGroup1->Items->Add("ssBoth");
  RadioGroup1->Items->Add("ssHorizontal");
  RadioGroup1->Items->Add("ssNone");
  RadioGroup1->Items->Add("ssVertical");
  CheckBox1->Caption = "Hide Scroll Bars";
  CheckBox1->Checked = true;
  Button1->Caption = "Load Text";
  RichEdit1->Text = "Just a little text.";
  RichEdit1->WordWrap = False;
}
```

Delphi Examples:

```
{
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  RichEdit1.Lines.Clear;
  for I := 0 to 500 do
  begin
    RichEdit1.Text :=
      RichEdit1.Text + 'test line ' + IntToStr(I) + ' ';
    if (i mod 4 = 0) then
      RichEdit1.Text := RichEdit1.Text + Chr(13);
  end;
  // move text cursor to top of editend;
  RichEdit1.SelStart := 0;
end;

procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  RichEdit1.HideScrollbars := CheckBox1.Checked;
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
const
  ScrollBarA: array[0..3] of TScrollStyle = (
    ssBoth,
    ssHorizontal,
    ssNone,
    ssVertical);
begin
  RichEdit1.ScrollBars :=
    ScrollBarA[RadioGroup1.ItemIndex];
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  with RadioGroup1, Items do
  begin
    Caption := 'Scroll Bars';
    Clear;
    Add('ssBoth');
    Add('ssHorizontal');
    Add('ssNone');
    Add('ssVertical');
  end;
  with CheckBox1 do
  begin
    Caption := 'HideScrollBars';
    Checked := True;
  end;
  Button1.Caption := 'Loaded';
  RichEdit1.Text := 'Just a little text.';
  RichEdit1.WordWrap := False;
end;
```

See Also

SetScrollBars (see page 21378)

WordWrap (see page 21384)

Displaying and Editing Text in a Memo Control

154.1.14.5.5 TCustomMemo.WantReturns Property

Determines whether the user can insert return characters into the text.

Pascal

```
property WantReturns: Boolean;
```

C++

```
__property Boolean WantReturns;
```

Description

Set WantReturns to true to allow users to enter return characters into the text. Set WantReturns to false to allow the form to handle return characters instead.

For example, in a form with a default button (such as an OK button) and a memo control, if WantReturns is false, pressing Enter chooses the default button. If WantReturns is true, pressing Enter inserts a return character in the text.

Note: If WantReturns is false, users can still enter return characters into the text by pressing Ctrl+Enter.

See Also

Text (see page 5842)

WantTabs (see page 21384)

WordWrap (see page 21384)

154.1.14.5.6 TCustomMemo.WantTabs Property

Determines whether the user can insert tab characters into the text.

Pascal

```
property WantTabs: Boolean;
```

C++

```
__property Boolean WantTabs;
```

Description

Set WantTabs to true to allow users to enter tab characters into the text. Set WantTabs to false if you want the tab character to select the next control on the form instead.

Note: If WantTabs is true, users can tab into the edit control, but they can't tab out.

See Also

Text (see page 5842)

WantReturns (see page 21384)

Displaying and Editing Text in a Memo Control

Displaying and Editing Text in a Rich Edit Memo Control

154.1.14.5.7 TCustomMemo.WordWrap Property

Determines whether the edit control inserts soft carriage returns so text wraps at the right margin.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to make the edit control wrap text at the right margin so it fits in the client area. The wrapping is cosmetic only. The text does not include any return characters that were not explicitly entered. Set WordWrap to false to have the edit control show a separate line only where return characters were explicitly entered into the text.

Note: There should be no use for a horizontal scroll bar if WordWrap is true.

C++ Examples:

```
/*
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  RichEdit1->Lines->Clear();
  for (int i = 0; i < 500; i++)
  {
    RichEdit1->Text = RichEdit1->Text + AnsiString("This is sentence ") + IntToStr(i) + ".  ";
    if ((i % 2) == 0) {
      RichEdit1->Text = RichEdit1->Text + AnsiString("\n");
    }
  }
  RichEdit1->SelStart = 0; // move text cursor to top of edit
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  RichEdit1->HideScrollBars = CheckBox1->Checked;
}

void __fastcall TForm1::RadioGroup1Click(TObject *Sender)
{
  TScrollStyle ScrollBarA[4] = {ssBoth, ssHorizontal, ssNone, ssVertical };
  RichEdit1->ScrollBars = ScrollBarA[RadioGroup1->ItemIndex];
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  RadioGroup1->Caption = "Scroll Bars";
  RadioGroup1->Items->Clear();
  RadioGroup1->Items->Add("ssBoth");
  RadioGroup1->Items->Add("ssHorizontal");
  RadioGroup1->Items->Add("ssNone");
  RadioGroup1->Items->Add("ssVertical");
  CheckBox1->Caption = "Hide Scroll Bars";
  CheckBox1->Checked = true;
  Button1->Caption = "Load Text";
  RichEdit1->Text = "Just a little text.";
  RichEdit1->WordWrap = False;
}
```

Delphi Examples:

```
{
This example requires: TRichEdit, TRadioGroup, TCheckBox,
TButton. Clicking the Radio Group control sets the ScrollBar
style of the RichEdit. Toggling the Check Box turns
HideScrollBars on and off.  Clicking the button loads the
Rich Edit with a large amount of contiguous text.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  RichEdit1.Lines.Clear;
  for I := 0 to 500 do
  begin
    RichEdit1.Text :=
      RichEdit1.Text + 'test line ' + IntToStr(I) + ' ';
    if (i mod 4 = 0) then
      RichEdit1.Text := RichEdit1.Text + Chr(13);
  end;
  // move text cursor to top of editend;
  RichEdit1.SelStart := 0;
end;

procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  RichEdit1.HideScrollbars := CheckBox1.Checked;
end;

procedure TForm1.RadioGroup1Click(Sender: TObject);
const
  ScrollBarA: array[0..3] of TScrollStyle = (
    ssBoth,
    ssHorizontal,
    ssNone,
    ssVertical);
begin
  RichEdit1.ScrollBars :=
    ScrollBarA[RadioGroup1.ItemIndex];
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  with RadioGroup1, Items do
  begin
    Caption := 'Scroll Bars';
    Clear;
    Add('ssBoth');
    Add('ssHorizontal');
    Add('ssNone');
    Add('ssVertical');
  end;
  with CheckBox1 do
  begin
    Caption := 'HideScrollBars';
    Checked := True;
  end;
  Button1.Caption := 'Loaded';
  RichEdit1.Text := 'Just a little text.';
  RichEdit1.WordWrap := False;
end;
```

Displaying and Editing Text in a Memo Control

154.1.15 TCustomStaticText Class

TCustomStaticText is the base class for TStaticText (see page 21887).

Class Hierarchy

Pascal

```
TCustomStaticText = class(TWinControl);
```

C++

```
class TCustomStaticText : public TWinControl;
```

File

StdCtrls

Description

TCustomStaticText is the base class for TStaticText (see page 21887), a windowed control that displays text on a form. This component functions like TLabel (see page 21544), except that it has a window handle.

TCustomStaticText cannot receive focus or contain other controls.

See Also

TLabel (see page 21544)

TStaticText (see page 21887)

154.1.15.1 TCustomStaticText Members

The following tables list the members exposed by TCustomStaticText.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnClick (see page 5851)	Occurs when the user clicks the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnContextPopup (see page 5854)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 5854)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.

	OnDragDrop (see page 5855)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 5857)	Occurs when the user drags an object over a control.
	OnEndDock (see page 5859)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 5860)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 6219)	Occurs when a control receives the input focus.
	OnExit (see page 6221)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 5861)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 5862)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 5864)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 5864)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 5865)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 5867)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnStartDock (see page 5871)	Occurs when the user begins to drag a control with a DragKind (see page 5819) of dkDock.
	OnStartDrag (see page 5871)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.

	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 21398)	Initializes a window-creation parameter data structure.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.

	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 6153)	Calls a specified method for each child of the control.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 21399)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 21399)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 21399)	This is SetAutoSize, a member of class TCustomStaticText.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	Alignment (see page 21400)	Determines how text is aligned within the component.
	AutoSize (see page 21400)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderStyle (see page 21401)	Determines the appearance of the control's border.

	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	Color (see page 5812)	Specifies the background color of the control.
	Ctl3D (see page 6198)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	DragCursor (see page 5818)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 5819)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 5819)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	FocusControl (see page 21401)	Links the component with another windowed control.
	Font (see page 5823)	Controls (see page 5711) the attributes of text written on or in the control.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 5833)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	ParentColor (see page 5834)	Determines where a control looks for its color information.
	ParentCtl3D (see page 6209)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 5834)	Determines where a control looks for its font information.
	ParentShowHint (see page 5835)	Determines where a control looks to find out if its Help Hint (see page 5827) should be shown.
	PopupMenu (see page 5835)	Identifies the pop-up menu associated with the control.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	ShowAccelChar (see page 21401)	Enables accelerator characters.
	Text (see page 5842)	Contains a text string associated with the control.
	Transparent (see page 21402)	Specifies whether the background of the image obscures objects below the image object.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
V	Create (see page 21397)	Creates and initializes a TCustomStaticText (see page 21387) instance.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.

V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	Align (see page 5798)	Determines how the control aligns within its container (parent control).
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	Anchors (see page 5802)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 5803)	Specifies the bi-directional mode for the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Constraints (see page 5812)	Specifies the size constraints for the control.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	Enabled (see page 5821)	Controls (see page 5711) whether the control responds to mouse, keyboard, and timer events.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.

R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	ShowHint (see page 5840)	Determines whether the control displays a Help Hint (see page 5827) when the mouse pointer rests momentarily on the control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TabOrder (see page 6211)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 6211)	Determines if the user can tab to a control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Visible (see page 5847)	Determines whether the component appears onscreen.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Properties

	Name	Description
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.15.2 TCustomStaticText.Create Constructor

Creates and initializes a TCustomStaticText (see page 21387) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStaticText(TComponent * AOwner);
```

Description

Create calls the inherited constructor, then initializes the TCustomStaticText (see page 21387) instance

See Also

autosize (see page 21400)

ControlStyle (see page 5814)

ShowAccelChar (see page 21401)

154.1.15.3 TCustomStaticText Methods

The methods of the TCustomStaticText class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 21398)	Initializes a window-creation parameter data structure.
	Loaded (see page 21399)	Initializes the control after it is loaded from a stream.
	Notification (see page 21399)	Responds to notifications that components are being created or destroyed.
	SetAutoSize (see page 21399)	This is SetAutoSize, a member of class TCustomStaticText.

154.1.15.3.1 TCustomStaticText.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

See Also

CreateWindowHandle (see page 6137)

CreateWnd (see page 6137)

AddBiDiModeExStyle (see page 6128)

154.1.15.3.2 TCustomStaticText.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded (see page 2782)

Action (see page 5797)

ActionChange (see page 5737)

154.1.15.3.3 TCustomStaticText.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu (see page 5835)

Notification (see page 2783)

154.1.15.3.4 TCustomStaticText.SetAutoSize Method

Pascal

```
procedure SetAutoSize(Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSize(Boolean Value);
```

Description

This is SetAutoSize, a member of class TCustomStaticText.

154.1.15.4 TCustomStaticText Properties

The properties of the TCustomStaticText class are listed here.

Protected Properties

	Name	Description
	Alignment (see page 21400)	Determines how text is aligned within the component.
	AutoSize (see page 21400)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BorderStyle (see page 21401)	Determines the appearance of the control's border.
	FocusControl (see page 21401)	Links the component with another windowed control.
	ShowAccelChar (see page 21401)	Enables accelerator characters.
	Transparent (see page 21402)	Specifies whether the background of the image obscures objects below the image object.

154.1.15.4.1 TCustomStaticText.Alignment Property

Determines how text is aligned within the component.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

The possible values of Alignment are

Value	Meaning
taLeftJustify	Text is aligned at the left of the control.
taCenter	Text is centered in the control.
taRightJustify	Text is aligned at the right of the control.

See Also

Font (see page 5823)

Caption (see page 5806)

154.1.15.4.2 TCustomStaticText.AutoSize Property

Specifies whether the control sizes itself automatically to accommodate its contents.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;
```

Description

Use AutoSize to specify whether the control sizes itself automatically. When AutoSize is true, the control resizes automatically when its contents change.

By default, AutoSize is false.

See Also

Constraints (see page 5812)

CanAutoSize (see page 5741)

154.1.15.4.3 TCustomStaticText.BorderStyle Property

Determines the appearance of the control's border.

Pascal

```
property BorderStyle: TStaticBorderStyle;
```

C++

```
__property TStaticBorderStyle BorderStyle;
```

Description

Use BorderStyle to specify the appearance of the border, if any, that appears around the text.

154.1.15.4.4 TCustomStaticText.FocusControl Property

Links the component with another windowed control.

Pascal

```
property FocusControl: TWinControl;
```

C++

```
__property TWinControl * FocusControl;
```

Description

Use the FocusControl property to link the TCustomStaticText (see page 21387) instance with another windowed control. If the text of Caption includes an accelerator key, the component specified by FocusControl receives focus when the accelerator is pressed.

See Also

Caption (see page 5806)

FocusControl (see page 21306)

TWinControl (see page 6112)

154.1.15.4.5 TCustomStaticText.ShowAccelChar Property

Enables accelerator characters.

Pascal

```
property ShowAccelChar: Boolean;
```

C++

```
__property Boolean ShowAccelChar;
```

Description

If ShowAccelChar is true, an ampersand in the component's Caption text appears as an underline and makes the character after it into an accelerator key. If ShowAccelChar is false, ampersands appear as ampersands.

See Also

Caption (see page 5806)

154.1.15.4.6 TCustomStaticText.Transparent Property

Specifies whether the background of the image obscures objects below the image object.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to allow objects behind the TCustomStaticText (see page 21387) object to show through the background of the image. Set Transparent to false to make the background of the image opaque.

154.1.16 TEdit Class

TEdit is a wrapper for a Windows single-line edit control.

Class Hierarchy

Pascal

```
TEdit = class(TCustomEdit);
```

C++

```
class TEdit : public TCustomEdit;
```

File

StdCtrls

Description

Use a TEdit object to put a standard Windows edit control on a form. Edit controls are used to retrieve text that users type. Edit controls can also display text to the user.

When only displaying text to the user, choose an edit control to allow users to select text and copy it to the Clipboard. Choose a label object if the selection capabilities of an edit control are not needed.

TEdit implements the generic behavior introduced in TCustomEdit (see page 21232). TEdit publishes many of the properties inherited from TCustomEdit (see page 21232), but does not introduce any new behavior. For specialized edit controls, use other descendant classes of TCustomEdit (see page 21232) or derive from it.

See Also

TDBEdit (see page 8735)

TDBMemo (see page 9149)

TInplaceEdit (see page 14938)

TLabel (see page 21544)

Edit Controls

154.1.16.1 TEdit Members

The following tables list the members exposed by TEdit.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Change (see page 21245)	Generates an OnChange (see page 21275) event.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21248)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWindowHandle (see page 21248)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CreateWnd (see page 21248)	Creates a Windows control corresponding to the edit control.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.

	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
V	DestroyWnd (see page 21251)	Destroys the Windows control that corresponds to the edit control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
V	DoSetMaxLength (see page 21251)	Sets the MaxLength (see page 21263) property.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.

	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSelLength (see page 21252)	Returns the SelLength (see page 21265) property.
	GetSelStart (see page 21252)	Returns the SelStart (see page 21269) property.
	GetSelText (see page 21252)	Returns the SelText (see page 21272) property.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.

	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
	SetAutoSize (see page 21257)	Sets the AutoSize (see page 21260) property.
	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDragMode (see page 5785)	Sets the drag mode for the control.
	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetName (see page 5785)	Sets the name of the control.
	SetParent (see page 5786)	Sets the parent of the control.
	SetParent (see page 6182)	Sets the parent of the control.
	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetSelLength (see page 21257)	Sets the SelLength (see page 21265) property.
	SetSelStart (see page 21257)	Sets the SelStart (see page 21269) property.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 21245)	Deletes all text from the edit control.
	ClearSelection (see page 21245)	Removes the selected text from the edit control.
	ClearUndo (see page 21246)	Clears the undo buffer so that no changes to the text can be backed out.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.

	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	CopyToClipboard (see page 21246)	Copies the selected text in the edit control to the Clipboard in CF_TEXT format.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 21244)	Creates an instance of TCustomEdit (see page 21232).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	CutToClipboard (see page 21249)	Copies the selected text to the Clipboard in CF_TEXT format and then deletes the selection.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 21250)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
V	GetSelTextBuf (see page 21253)	Copies the selected text into a buffer and returns the number of characters copied.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	PasteFromClipboard (see page 21254)	Pastes the contents of the Clipboard into edit control, replacing the current selection.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SelectAll (see page 21255)	Selects all text in the edit control.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSelTextBuf (see page 21258)	Replaces the selected text with a null-terminated string.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
	Undo (see page 21259)	Backs out all changes in the undo buffer.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	CanUndo (see page 21262)	Indicates whether the edit control contains changes that can be backed out.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.

	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
	Modified (see page 21263)	Indicates whether the user edited the text of the edit control.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
	SelLength (see page 21265)	Specifies the number of characters (bytes) that are selected.
	SelStart (see page 21269)	Specifies the position of the first selected character in the text.
	SelText (see page 21272)	Specifies the selected portion of the edit control's text.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnChange (see page 21445)	Occurs when the text for the edit control may have changed.
	OnClick (see page 21446)	Occurs when the user clicks the control.
	OnContextPopup (see page 21448)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21448)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21449)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21451)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21453)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21454)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21455)	Occurs when a control receives the input focus.
	OnExit (see page 21457)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21459)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21462)	Occurs when a key is pressed.
	OnKeyUp (see page 21463)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 21464)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21465)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21468)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21468)	Occurs when the user moves the mouse outside of a control.

	OnMouseMove (see page 21468)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21470)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21473)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21473)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 21415)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 21418)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 21419)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 21419)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 21420)	Specifies which edges of the control are beveled.
	BevelInner (see page 21421)	Specifies the cut of the inner bevel.
	BevelKind (see page 21421)	Specifies the control's bevel style.
	BevelOuter (see page 21422)	Specifies the cut of the outer bevel.
	BevelWidth (see page 21422)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 21423)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 21423)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 21423)	Determines the case of the text within the edit control.
	Color (see page 21424)	Specifies the background color of the control.
	Constraints (see page 21425)	Specifies the size constraints for the control.
	Ctl3D (see page 21425)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 21426)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21426)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21426)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21428)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21428)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	HideSelection (see page 21429)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	ImeMode (see page 21430)	Determines the behavior of the input method editor (IME).
	ImeName (see page 21430)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	MaxLength (see page 21431)	Specifies the maximum number of characters the user can enter into the edit control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OEMConvert (see page 21432)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBiDiMode (see page 21432)	Specifies whether the control uses its parent's BiDiMode.

	ParentColor (see page 21432)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21433)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21433)	Determines where a control looks for its font information.
	ParentShowHint (see page 21434)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 21434)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 21435)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 21439)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 21440)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 21441)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21442)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Text (see page 21442)	Contains a text string associated with the control.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 21443)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.16.2 TEdit Properties

The properties of the TEdit class are listed here.

Published Properties

	Name	Description
	Align (see page 21415)	Determines how the control aligns within its container (parent control).
	Anchors (see page 21418)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 21419)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 21419)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	BevelEdges (see page 21420)	Specifies which edges of the control are beveled.
	BevelInner (see page 21421)	Specifies the cut of the inner bevel.
	BevelKind (see page 21421)	Specifies the control's bevel style.
	BevelOuter (see page 21422)	Specifies the cut of the outer bevel.
	BevelWidth (see page 21422)	Specifies the width of the inner and outer bevels.
	BiDiMode (see page 21423)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 21423)	Determines whether the edit control has a single line border around the client area.
	CharCase (see page 21423)	Determines the case of the text within the edit control.
	Color (see page 21424)	Specifies the background color of the control.
	Constraints (see page 21425)	Specifies the size constraints for the control.
	Ctl3D (see page 21425)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 21426)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21426)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21426)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21428)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21428)	Controls the attributes of text written on or in the control.
	HideSelection (see page 21429)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 21430)	Determines the behavior of the input method editor (IME).
	ImeName (see page 21430)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

	MaxLength (see page 21431)	Specifies the maximum number of characters the user can enter into the edit control.
	OEMConvert (see page 21432)	Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.
	ParentBiDiMode (see page 21432)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21432)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21433)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21433)	Determines where a control looks for its font information.
	ParentShowHint (see page 21434)	Determines where a control looks to find out if its Help Hint should be shown.
	PasswordChar (see page 21434)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 21435)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 21439)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 21440)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 21441)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21442)	Determines if the user can tab to a control.
	Text (see page 21442)	Contains a text string associated with the control.
	Visible (see page 21443)	Determines whether the component appears onscreen.

154.1.16.2.1 TEdit.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
```

```
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)

    end;
  end;
  {
  This example dynamically creates a Page Control, then a
  series of Tab Sheets on the Page Control.
  }
  var
    PageControl1: TPageControl;
    pts: array[0..3] of TTabSheet;
  const
    TabTitles: array[0..3] of ShortString = ('Customer', 'Orders', 'Items', 'Parts' );

  procedure TForm1.FormCreate(Sender: TObject);
  const
    colorpalette: Array[0..11] of TColor = (
      clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia, clTeal,
      clNavy, clMaroon, clLime, clOlive, clPurple);
  var
    i: Integer;
  begin
    PageControl1 := TPageControl.Create(Self);
    PageControl1.Parent := Self;
    PageControl1.Align := alClient;
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i]:= TTabSheet.Create(PageControl1);
      with pts[i] do
      begin
        PageControl := PageControl1;
        Name := 'ts' + TabTitles[i];
        Caption := TabTitles[i];
        Brush.Color := colorPalette[i];
     end;
    end;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    i: Integer;
  begin
    for i := Low(TabTitles) to High(TabTitles) do
    begin
      pts[i].Free;
    end;
    PageControl1.Free;
  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

154.1.16.2.2 TEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

154.1.16.2.3 TEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect: Boolean;
```

C++

```
__property Boolean AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll (see page 21255)

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.16.2.4 TEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;__property Boolean AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

ControlStyle (see page 5814)

Height (see page 5825)

154.1.16.2.5 TEdit.BevelEdges Property

Specifies which edges of the control are beveled.

Pascal

```
property BevelEdges: TBevelEdges;
```

C++

```
__property TBevelEdges BevelEdges;
```

Description

Use BevelEdges to get or set which edges of the control are beveled. The BevelInner, BevelOuter, and BevelKind properties determine the appearance of the specified edges.

See Also

BevelInner (see page 6193)

BevelOuter (see page 6194)

BevelKind (see page 6193)

154.1.16.2.6 TEdit.BevelInner Property

Specifies the cut of the inner bevel.

Pascal

```
property BevelInner: TBevelCut;
```

C++

```
__property TBevelCut BevelInner;
```

Description

Use BevelInner to specify whether the inner bevel has a raised, lowered, or flat look.

The inner bevel appears immediately inside the outer bevel. If there is no outer bevel (BevelOuter is bvNone), the inner bevel appears immediately inside the border.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelKind (see page 6193)

BevelWidth (see page 6194)

BorderWidth (see page 6195)

154.1.16.2.7 TEdit.BevelKind Property

Specifies the control's bevel style.

Pascal

```
property BevelKind: TBevelKind;
```

C++

```
__property TBevelKind BevelKind;
```

Description

Use BevelKind to modify the appearance of a bevel. BevelKind influences how sharply the bevel stands out.

BevelKind, in combination with BevelWidth and the cut of the bevel specified by BevelInner or BevelOuter, can create a variety of effects. Experiment with various combinations to get the look you want.

See Also

BevelEdges (see page 6192)

BevelOuter (see page 6194)

BevelInner (see page 6193)

BevelWidth (see page 6194)

154.1.16.2.8 TEdit.BevelOuter Property

Specifies the cut of the outer bevel.

Pascal

```
property BevelOuter: TBevelCut;
```

C++

```
__property TBevelCut BevelOuter;
```

Description

Use BevelInner to specify whether the outer bevel has a raised, lowered, or flat look.

The outer bevel appears immediately inside the border and outside the inner bevel.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelWidth (see page 6194)

154.1.16.2.9 TEdit.BevelWidth Property

Specifies the width of the inner and outer bevels.

Pascal

```
property BevelWidth: TBevelWidth;
```

C++

```
__property TBevelWidth BevelWidth;
```

Description

Use BevelWidth to specify the width, in pixels, of the inner and outer bevels.

See Also

BevelEdges (see page 6192)

BevelInner (see page 6193)

BevelKind (see page 6193)

BevelOuter (see page 6194)

154.1.16.2.10 TEdit.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

See Also

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.16.2.11 TEdit.BorderStyle Property

Determines whether the edit control has a single line border around the client area.

Pascal

```
property BorderStyle: TBorderStyle;
```

C++

```
__property TBorderStyle BorderStyle;
```

Description

Use BorderStyle to affect the sharpness with which the client area of the edit control stands out. BorderStyle can have a value of either bsSingle or bsNone. If BorderStyle is bsSingle, the edit control has a single-line border around the client area. If BorderStyle is bsNone, there will be no border.

154.1.16.2.12 TEdit.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase: TEditCharCase;
```

C++

```
__property TEditCharCase CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

See Also

Text (see page 5842)

154.1.16.2.13 TEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

154.1.16.2.14 TEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.16.2.15 TEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BevelOuter (see page 6194)

BorderWidth (see page 6195)

154.1.16.2.16 TEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.16.2.17 TEdit.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.16.2.18 TEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime

by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
```

```
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

154.1.16.2.19 TEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

See Also

Visible (see page 5847)

DisableControls (see page 6925)

EnableControls (see page 6934)

Enabling Mouse

154.1.16.2.20 TEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

154.1.16.2.21 TEdit.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection: Boolean;
```

C++

```
__property Boolean HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected portion of the text even when the edit control does not have focus. Set HideSelection to true to show the selection only when the edit control has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many edit controls look too busy.

SelLength (see page 21265)

SelStart (see page 21269)

SelText (see page 21272)

SetSelTextBuf (see page 21258)

154.1.16.2.22 TEdit.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode: TImeMode;
```

C++

```
__property TImeMode ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

See Also

ImeName (see page 6208)

ResetIme (see page 6174)

ResetImeComposition (see page 6175)

SetIme (see page 6181)

SetImeCompositionWindow (see page 6181)

154.1.16.2.23 TEdit.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName: TImeName;
```

C++

```
__property TImeName ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

See Also

ImeMode (see page 6207)

ResetIme (see page 6174)

SetIme (see page 6181)

DefaultIme (see page 14216)

Imes (see page 14227)

154.1.16.2.24 TEdit.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

See Also

Text (see page 5842)

Displaying and Editing Text in a Memo Control

Displaying and Editing Text in a Rich Edit Memo Control

154.1.16.2.25 TEdit.OEMConvert Property

Determines whether characters typed in the edit control are converted from ANSI to OEM and then back to ANSI.

Pascal

```
property OEMConvert: Boolean;
```

C++

```
__property Boolean OEMConvert;
```

Description

To ensure that any characters typed in the edit control can be unambiguously converted to the OEM character set, set OEMConvert to true. This causes all characters to be converted from ANSI to OEM and then back to ANSI as they are typed. Set OEMConvert to false to avoid the overhead of this conversion when it does not matter whether the text can be unambiguously mapped to an OEM string.

OEMConvert is most useful for edit controls used to enter file names when the application does not use Unicode file names.

See Also

Text (see page 5842)

154.1.16.2.26 TEdit.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.16.2.27 TEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.16.2.28 TEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

154.1.16.2.29 TEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.16.2.30 TEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.16.2.31 TEdit.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar: Char;
```

C++

```
__property Char PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

See Also

Text (see page 5842)

154.1.16.2.32 TEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
```

```
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->CutToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Paste1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))
        ((TEdit *)pComponent)->PasteFromClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }
  /*
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  */
  void __fastcall TForm1::AddButtonClick(TObject *Sender)
  {
      const int num_items = 4;
      for (int index = 0; index < num_items; ++index)
      {
          TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
          PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
          NewItem->Caption = "Menu Item " + IntToStr(index);
          NewItem->Tag = index;
          NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
          TNotifyEvent();
      }
  }

  void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
  {
      TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
      if (ClickedItem)
      {
          switch (ClickedItem->Tag)
          {
              case 0:
              {
                  ShowMessage("first item clicked");
                  break;
              }
              case 1:
              {
                  ShowMessage("second item clicked");
                  break;
              }
              case 2:
              {
```

```
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
```

```
      Edit1.CutToClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.CutToClipboard
    else
      Beep;
  end;

  procedure TForm1.Paste1Click(Sender: TObject);
  begin
    if PopupMenu1.PopupComponent = Edit1 then
      Edit1.PasteFromClipboard
    else if PopupMenu1.PopupComponent = Edit2 then
      Edit2.PasteFromClipboard
    else
      Beep;
  end;
  {
  This example demonstrates how to add and delete menu items
  to a popup menu at runtime and assign an event handler to
  the OnClick event.  Place a TPopupMenu and three buttons on
  the form named "AddButton", "EditButton",  and
  "DestroyButton" and add OnClick events to all three buttons.
  Put the TPopupMenu in the PopupMenu property of the form.
  Place the PopupMenuItemsClick procedure in the TForm1 type
  declaration so that it can be used as the method call for
  the menu item OnClick event.
  }

  type
    TForm1 = class(TForm)

154.1.16.2.33 TEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

See Also

CopyToClipboard (see page 21246)

GetSelTextBuf (see page 21253)

154.1.16.2.34 TEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
```

```
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

154.1.16.2.35 TEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore

cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

154.1.16.2.36 TEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.16.2.37 TEdit.Text Property

Contains a text string associated with the control.

Pascal

```
property Text: TCaption;
```

C++

```
__property TCaption Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
```

```
  Size++;                       //Add room for null character
  char *Buffer = new char[Size];  //Creates Buffer dynamic variable
  Edit1->GetTextBuf(Buffer,Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer;
  delete [] Buffer;
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
  Inc(Size);                      {Add room for null character}
  GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
  Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.Text;
end;
```

See Also

Caption (see page 5806)

Lines (see page 21380)

154.1.16.2.38 TEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
```

```
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.16.3 TEdit Events

The events of the TEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 21445)	Occurs when the text for the edit control may have changed.
	OnClick (see page 21446)	Occurs when the user clicks the control.
	OnContextPopup (see page 21448)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21448)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21449)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21451)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21453)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21454)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21455)	Occurs when a control receives the input focus.
	OnExit (see page 21457)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 21459)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 21462)	Occurs when a key is pressed.
	OnKeyUp (see page 21463)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 21464)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21465)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21468)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21468)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21468)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21470)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21473)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21473)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

154.1.16.3.1 TEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

See Also

Change (see page 21245)

Text (see page 5842)

154.1.16.3.2 TEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
```

```
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.16.3.3 TEdit.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 16178)

154.1.16.3.4 TEdit.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

154.1.16.3.5 TEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
```

```
      end;
    end;
  end;
```

154.1.16.3.6 TEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
```

```
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
```

```
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

154.1.16.3.7 TEdit.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

154.1.16.3.8 TEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.16.3.9 TEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
```

```
    ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------

154.1.16.3.10 TEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
```

```
begin
  Memo1.Color := clWindow;
end;
```

154.1.16.3.11 TEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
```

```
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form’s color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);

154.1.16.3.12 TEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress: TKeyPressEvent;
```

C++

```
__property TKeyPressEvent OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

154.1.16.3.13 TEdit.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp: TKeyEvent;
```

C++

```
__property TKeyEvent OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
}
var

154.1.16.3.14 TEdit.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

154.1.16.3.15 TEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form’s unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {

154.1.16.3.16 TEdit.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.16.3.17 TEdit.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.16.3.18 TEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
```

```
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  */
  int StartX, StartY; // Declare at the top of the form's unit
  // Use this code as the OnMouseDown event handler of the form:
  void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
  int X, int Y)
  {
    StartX = X;
    StartY = Y;
  }

  // Use this code as the OnMouseUp event handler of the form:
  void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
  int X, int Y)
  {
    Form1->Canvas->Rectangle(StartX, StartY, X, Y);
    StatusBar1->Panels->Items[0]->Text = "";
    StatusBar1->Panels->Items[1]->Text = "";
    StatusBar1->Panels->Items[2]->Text = "";
    StatusBar1->Panels->Items[3]->Text = "";
  }

  // Use this code as the OnMouseMove event handler of the form:
  void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
  {
    if (Shift.Contains(ssLeft)) // make sure button is down
    {
      if (Y > StartY)
      {
        StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
        StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
      }
      else
      {
        StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
        StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
      }
      if (X > StartX)
      {
        StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
        StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
      }
      else
      {
        StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
        StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
      }
    }
  }
```

Delphi Examples:

  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;

154.1.16.3.19 TEdit.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
      end;
  end;
end;

154.1.16.3.20 TEdit.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

154.1.16.3.21 TEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

154.1.17 TGroupBox Class

TGroupBox represents a Windows group box.

Class Hierarchy

Pascal

```
TGroupBox = class(TCustomGroupBox);
```

C++

```
class TGroupBox : public TCustomGroupBox;
```

File

StdCtrls

Description

The TGroupBox component represents a standard Windows group box, used to group related controls on a form. When another control component is placed within a group box, the group box becomes the parent of that component.

Grouping Controls

154.1.17.1 TGroupBox Members

The following tables list the members exposed by TGroupBox.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnKeyDown (see page 6225)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 6227)	Occurs when a key is pressed.
	OnKeyUp (see page 6228)	Occurs when the user releases a key that has been pressed.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
V	AdjustClientRect (see page 21287)	Adjusts the ClientRect property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanAutoSize (see page 6131)	Indicates how the control can be resized.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
V	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
V	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
V	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
V	CreateHandle (see page 6135)	Creates underlying screen object.
V	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
V	CreateParams (see page 21287)	Initializes a window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
V	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
V	CreateWnd (see page 6137)	Creates the underlying window.
V	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
V	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
V	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
V	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
V	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
V	DestroyWnd (see page 6141)	Destroys the control's window.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
V	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.
	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.

	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..

	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
V	Paint (see page 5920)	Renders the image of a custom control.
V	Paint (see page 21287)	Renders the onscreen image of the group box.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 5920)	Renders the image of the control on a specified device context.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.

V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WndProc (see page 6187)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BevelEdges (see page 6192)	Specifies which edges of the control are beveled.
	BevelInner (see page 6193)	Specifies the cut of the inner bevel.
	BevelKind (see page 6193)	Specifies the control's bevel style.
	BevelOuter (see page 6194)	Specifies the cut of the outer bevel.
	BevelWidth (see page 6194)	Specifies the width of the inner and outer bevels.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
R	Canvas (see page 5921)	Specifies the TCanvas object that presents a drawing surface for the control.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	ImeMode (see page 6207)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6208)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 5731)	Creates an instance of TControl (see page 5724).
	Create (see page 5918)	Creates an instance of TCustomControl (see page 5908).
	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
	Create (see page 21286)	Creates and initializes a TCustomGroupBox (see page 21275) instance.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
	Destroy (see page 5919)	Destroys an instance of TCustomControl (see page 5908).
	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.

	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.
R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 21511)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 21512)	Occurs when an object with custom alignment is aligned.
	OnClick (see page 21513)	Occurs when the user clicks the control.
	OnContextPopup (see page 21514)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21515)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 21515)	Occurs when another control is docked to the control.
	OnDockOver (see page 21517)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 21520)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21522)	Occurs when the user drags an object over a control.

	OnEndDock (see page 21524)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21525)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21526)	Occurs when a control receives the input focus.
	OnExit (see page 21528)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 21530)	Returns the control's docking information.
	OnMouseActivate (see page 21532)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21533)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21535)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21535)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21535)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21538)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21540)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21541)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 21541)	Occurs when the application tries to undock a control that is docked to the windowed control.

Published Properties

	Name	Description
	Align (see page 21485)	Determines how the control aligns within its container (parent control).
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 21489)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 21490)	Specifies the bi-directional mode for the control.
	Caption (see page 21490)	Specifies a text string that identifies the control to the user.
	Color (see page 21493)	Specifies the background color of the control.
	Constraints (see page 21493)	Specifies the size constraints for the control.
	Ctl3D (see page 21494)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DockSite (see page 21495)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 21496)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21496)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21496)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21498)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21498)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Padding (see page 21499)	Specifies the padding of a control.
	ParentBackground (see page 21500)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 21500)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21500)	Determines where a control looks for its color information.

	ParentCtl3D (see page 21501)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21501)	Determines where a control looks for its font information.
	ParentShowHint (see page 21502)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21502)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21507)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 21508)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21509)	Determines if the user can tab to a control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Visible (see page 21509)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.

154.1.17.2 TGroupBox Properties

The properties of the TGroupBox class are listed here.

Published Properties

	Name	Description
	Align (see page 21485)	Determines how the control aligns within its container (parent control).
	Anchors (see page 21489)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 21490)	Specifies the bi-directional mode for the control.
	Caption (see page 21490)	Specifies a text string that identifies the control to the user.
	Color (see page 21493)	Specifies the background color of the control.
	Constraints (see page 21493)	Specifies the size constraints for the control.
	Ctl3D (see page 21494)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DockSite (see page 21495)	Specifies whether the control can be the target of drag-and-dock operations.
	DragCursor (see page 21496)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21496)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21496)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 21498)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 21498)	Controls the attributes of text written on or in the control.
	Padding (see page 21499)	Specifies the padding of a control.
	ParentBackground (see page 21500)	Determines whether control uses parent's theme background.
	ParentBiDiMode (see page 21500)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21500)	Determines where a control looks for its color information.
	ParentCtl3D (see page 21501)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 21501)	Determines where a control looks for its font information.
	ParentShowHint (see page 21502)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21502)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 21507)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 21508)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 21509)	Determines if the user can tab to a control.
	Visible (see page 21509)	Determines whether the component appears onscreen.

154.1.17.2.1 TGroupBox.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;
```

```
  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>

  end;
```

See Also

Parent (see page 5832)

Anchors (see page 5802)

154.1.17.2.2 TGroupBox.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

154.1.17.2.3 TGroupBox.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.17.2.4 TGroupBox.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
```

```
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this);
  myToolBar->Parent = this;
  TStringList *captions = new TStringList();
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions);
  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}

void __fastcall TForm1::FormDestroy(TObject *Sender)
{
  for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
    delete myToolBar->Buttons[I];
  delete myToolBar;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
```

```
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

154.1.17.2.5 TGroupBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor (see page 5834)

154.1.17.2.6 TGroupBox.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.17.2.7 TGroupBox.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D: Boolean;
```

C++

```
__property Boolean Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

See Also

ParentCtl3D (see page 6209)

BevelKind (see page 6193)

BevelInner (see page 6193)

BorderWidth (see page 6195)

154.1.17.2.8 TGroupBox.DockSite Property

Specifies whether the control can be the target of drag-and-dock operations.

Pascal

```
property DockSite: Boolean;
```

C++

```
__property Boolean DockSite;
```

Description

Set DockSite to true to allow other controls to be docked to this windowed control.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
}
procedure TConjoinDockHost.FormUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if Client is TDockableForm then
    TDockableForm(Client).DockSite := True;
  if (DockClientCount = 2) and (NewTarget <> Self) then
    PostMessage(Self.Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
end;
```

154.1.17.2.9 TGroupBox.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.17.2.10 TGroupBox.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.17.2.11 TGroupBox.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

154.1.17.2.12 TGroupBox.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

154.1.17.2.13 TGroupBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

154.1.17.2.14 TGroupBox.Padding Property

Specifies the padding of a control.

Pascal

```
property Padding: TPadding;
```

C++

```
__property TPadding Padding;
```

Description

Use Padding to specify the padding of a control. This value is an instance of the class TPadding.

See Also

TPadding (see page 6103)

154.1.17.2.15 TGroupBox.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground: Boolean;
```

C++

```
__property Boolean ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

154.1.17.2.16 TGroupBox.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.17.2.17 TGroupBox.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.17.2.18 TGroupBox.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D: Boolean;
```

C++

```
__property Boolean ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D (see page 6198)

154.1.17.2.19 TGroupBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.17.2.20 TGroupBox.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

Parent (see page 5832)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.17.2.21 TGroupBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
```

```
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
```

```
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
```

```
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

154.1.17.2.22 TGroupBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
```

```
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

154.1.17.2.23 TGroupBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder: TTabOrder;
```

C++

```
__property TTabOrder TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl (see page 6149)

TabStop (see page 6211)

154.1.17.2.24 TGroupBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop: Boolean;
```

C++

```
__property Boolean TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

See Also

TabOrder (see page 6211)

154.1.17.2.25 TGroupBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
```

```
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.17.3 TGroupBox Events

The events of the TGroupBox class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 21511)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 21512)	Occurs when an object with custom alignment is aligned.
	OnClick (see page 21513)	Occurs when the user clicks the control.
	OnContextPopup (see page 21514)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21515)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDockDrop (see page 21515)	Occurs when another control is docked to the control.
	OnDockOver (see page 21517)	Occurs when another control is dragged over the control.
	OnDragDrop (see page 21520)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21522)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21524)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21525)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 21526)	Occurs when a control receives the input focus.
	OnExit (see page 21528)	Occurs when the input focus shifts away from one control to another.
	OnGetSiteInfo (see page 21530)	Returns the control's docking information.
	OnMouseActivate (see page 21532)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21533)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21535)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21535)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21535)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21538)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21540)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21541)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUnDock (see page 21541)	Occurs when the application tries to undock a control that is docked to the windowed control.

154.1.17.3.1 TGroupBox.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore: TAlignInsertBeforeEvent;
```

C++

```
__property TAlignInsertBeforeEvent OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore (see page 6137)

Align (see page 5798)

TAlignInsertBeforeEvent (see page 6293)

154.1.17.3.2 TGroupBox.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition: TAlignPositionEvent;
```

C++

```
__property TAlignPositionEvent OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.	

See Also

CustomAlignPosition (see page 6138)

Align (see page 5798)

Anchors (see page 5802)

TAlignInfo (see page 6269)

TAlignPositionEvent (see page 6293)

154.1.17.3.3 TGroupBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
```

```
      pEdit->Parent = pPage;
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.17.3.4 TGroupBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

154.1.17.3.5 TGroupBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

Responding to User Actions at Runtime

154.1.17.3.6 TGroupBox.OnDockDrop Event

Occurs when another control is docked to the control.

Pascal

```
property OnDockDrop: TDockDropEvent;
```

C++

```
__property TDockDropEvent OnDockDrop;
```

Description

Write code in the OnDockDrop event to perform actions when another control is docked on the control.

OnDockDrop can only occur if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
```

```
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

DockSite (see page 6204)

OnDockOver (see page 6216)

154.1.17.3.7 TGroupBox.OnDockOver Event

Occurs when another control is dragged over the control.

Pascal

```
property OnDockOver: TDockOverEvent;
```

C++

```
__property TDockOverEvent OnDockOver;
```

Description

Write code in the OnDockOver event to indicate whether a dockable control that is dragged over the windowed control can be accepted as a dock client. OnDockOver occurs after the TDragDockObject has been initialized by an OnGetSiteInfo event.

OnDockOver occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
```

```
      ShowMessage("GetSiteInfo CanDock went bad!");
    }
  }
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

154.1.17.3.8 TGroupBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

154.1.17.3.9 TGroupBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}
```

```
/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
```

```
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

154.1.17.3.10 TGroupBox.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

154.1.17.3.11 TGroupBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.17.3.12 TGroupBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}

void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   ((TEdit *)myActiveControl)->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    ((TRichEdit *)myActiveControl)->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
```

```
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
```

```
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.17.3.13 TGroupBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK

button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);
begin
  Memo1.Color := clYellow;
end;

procedure TForm1.Memo1Exit(Sender: TObject);
begin
  Memo1.Color := clWindow;
end;
```

154.1.17.3.14 TGroupBox.OnGetSiteInfo Event

Returns the control's docking information.

Pascal

```
property OnGetSiteInfo: TGetSiteInfoEvent;
```

C++

```
__property TGetSiteInfoEvent OnGetSiteInfo;
```

Description

Write code in the OnGetSiteInfo event handler to initialize a TDragDockObject with information about where a dragged object can be docked, if at all. OnGetSiteInfo occurs before the OnDockOver event.

OnGetSiteInfo occurs only if DockSite is true.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,
      TDragDockObject *Source, int X, int Y, TDragState State, bool &Accept)
{
  Accept = (dynamic_cast<TDockableForm*>(Source->Control) != NULL);
  if (Accept)
  {
    // Modify the DockRect to preview dock area.
    Types::TPoint TopLeft = LeftDockPanel->ClientToScreen(Point(0, 0));
    Types::TPoint BottomRight = LeftDockPanel->ClientToScreen(
      Point(this->ClientWidth/3, LeftDockPanel->Height));
    Source->DockRect = Types::TRect(TopLeft, BottomRight);
  }
}

void __fastcall TMainForm::LeftDockPanelUnDock(TObject *Sender,
      TControl *Client, TWinControl *NewTarget, bool &Allow)
{
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
```

```
    ShowDockPanel(panel, False, NULL);
}

void __fastcall TMainForm::LeftDockPanelGetSiteInfo(TObject *Sender,
      TControl *DockClient, TRect &InfluenceRect, TPoint &MousePos,
      bool &CanDock)
{
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock = DockClient->ClassNameIs("TDockableForm");
  if (!CanDock)
  {
     ShowMessage("GetSiteInfo CanDock went bad!");
  }
}
```

Delphi Examples:

```
{
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
}

procedure TMainForm.LeftDockPanelDockDrop(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer);
begin
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, True, nil);
  (Sender as TPanel).DockManager.ResetBounds(True);
  //Make DockManager repaints it's clients.
end;

procedure TMainForm.LeftDockPanelDockOver(Sender: TObject;
  Source: TDragDockObject; X, Y: Integer; State: TDragState;
  var Accept: Boolean);
var
  ARect: TRect;
begin
  Accept := Source.Control is TDockableForm;
  if Accept then
  begin
    //Modify the DockRect to preview dock area.
    ARect.TopLeft := LeftDockPanel.ClientToScreen(Point(0, 0));
    ARect.BottomRight := LeftDockPanel.ClientToScreen(
      Point(Self.ClientWidth div 3, LeftDockPanel.Height));
    Source.DockRect := ARect;
  end;
end;

procedure TMainForm.LeftDockPanelUnDock(Sender: TObject; Client: TControl;
  NewTarget: TWinControl; var Allow: Boolean);
begin
  //OnUnDock gets called BEFORE the client is undocked, in order to optionally
  //disallow the undock. DockClientCount is never 0 when called from this event.
  if (Sender as TPanel).DockClientCount = 1 then
    ShowDockPanel(Sender as TPanel, False, nil);
end;

procedure TMainForm.LeftDockPanelGetSiteInfo(Sender: TObject;
  DockClient: TControl; var InfluenceRect: TRect; MousePos: TPoint;
  var CanDock: Boolean);
begin
  //if CanDock is true, the panel will not automatically draw the preview rect.
  CanDock := DockClient is TDockableForm;
end;
```

154.1.17.3.15 TGroupBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

154.1.17.3.16 TGroupBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
```

```
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form’s canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
```

```
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

154.1.17.3.17 TGroupBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.17.3.18 TGroupBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.17.3.19 TGroupBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

154.1.17.3.20 TGroupBox.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

154.1.17.3.21 TGroupBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock (see page 5859)

TDragDockObjectEx (see page 6018)

DragKind (see page 5819)

OnDragOver (see page 5857)

154.1.17.3.22 TGroupBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

154.1.17.3.23 TGroupBox.OnUnDock Event

Occurs when the application tries to undock a control that is docked to the windowed control.

Pascal

```
property OnUnDock: TUnDockEvent;
```

C++

```
__property TUnDockEvent OnUnDock;
```

Description

Write an OnUnDock event handler to adjust the windowed control when a dock client is undocked. The OnUnDock event handler can make any necessary adjustments, or it can block the undock attempt by setting the Allow parameter to false.

C++ Examples:

```
/*
The following example is taken from the docking demo. It
shows how the OnUnDock event handler of the conjoinment
```

```
docking site re-enables docking in the control that is
undocked (if it is a dockable form). In addition, when the
next to last docked control is undocked, the conjoinment
docking site sends itself a close message so that the last
docked control is undocked to its old position and size.
*/
void __fastcall TConjoinDockHost::FormUnDock(TObject *Sender, TControl *Client,
      TWinControl *NewTarget, bool &Allow)
{
  // Only 2 dock clients means the host must be destroyed and
  // the remaining window undocked to its old position and size.
  // Recall that OnUnDock gets called before the undocking
  // actually occurs.
  if (Client->ClassNameIs("TDockableForm"))
    dynamic_cast<TDockableForm *>(Client)->DockSite = True;
  if ((DockClientCount == 2) && (NewTarget != this))        // Self?
    PostMessage(dynamic_cast<TConjoinDockHost *>(this)->Handle, WM_CLOSE, 0, 0);
  UpdateCaption(Client);
}
/*
The following example is taken from the docking demo. It
shows how set permissions to dock dockable objects onto a
docking site.
*/

void __fastcall TMainForm::LeftDockPanelDockDrop(TObject *Sender,
      TDragDockObject *Source, int X, int Y)
{
  //OnDockDrop gets called AFTER the client has actually docked,
  //so we check for DockClientCount = 1 before making the dock panel visible.
  TPanel *panel = dynamic_cast<TPanel *>(Sender);
  if (panel->DockClientCount == 1)
    ShowDockPanel(panel, True, NULL);
  panel->DockManager->ResetBounds(True);
  //Make DockManager repaints it's clients.
}

void __fastcall TMainForm::LeftDockPanelDockOver(TObject *Sender,

154.1.18 TLabel Class

TLabel is a nonwindowed control that displays text on a form.

Class Hierarchy

Pascal

```
TLabel = class(TCustomLabel);
```

C++

```
class TLabel : public TCustomLabel;
```

File

StdCtrls

Description

Use TLabel to add text that the user can't edit to a form. This text can be used to label another control, and can set focus to that control when the user types an accelerator key.

Because TLabel is not a descendant of TWinControl, it does not have its own window and can't receive direct input from the keyboard. To add an object to a form that can respond to keyboard input (other than setting focus to another object when an accelerator key is typed) in addition to displaying text, use TStaticText (see page 21887).

To add an object to a form that displays text that a user can scroll or edit, use TEdit (see page 21402).

Labels

Display Controls

154.1.18.1 TLabel Members

The following tables list the members exposed by TLabel.

Protected Events

	Name	Description
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
	AdjustBounds (see page 21296)	Resizes the label when the text changes.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.
V	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	Click (see page 5743)	Respond to user click.
V	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDrawText (see page 21296)	Renders the text in the client area.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
	GetDeviceContext (see page 5760)	Returns a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLabelText (see page 21297)	Returns the value of the Caption (see page 21303) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
	Loaded (see page 21297)	Adjusts the size of the label when it is first loaded. .
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
	Notification (see page 21298)	Responds to notifications when objects are about to be created or destroyed.

V	Paint (see page 6052)	Render control surface.
V	Paint (see page 21298)	Draws the image of the label.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	Resize (see page 5780)	Respond to control resize.
	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetAutoSize (see page 21298)	Sets the AutoSize (see page 21299) property.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
V	WndProc (see page 5791)	Provides specific message responses for the control.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
R	Canvas (see page 6053)	Provides the drawing surface used by the graphic control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.

	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6051)	Creates an instance of TGraphicControl (see page 6044).
V	Create (see page 21295)	Creates and initializes an instance of TCustomLabel (see page 21288).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6052)	Destroys an instance of TGraphicControl (see page 6044).
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EndDrag (see page 5757)	Stops a control from being dragged any further.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
	Canvas (see page 21300)	Provides the drawing surface used by the graphic control.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Parent (see page 5832)	Indicates the parent of the control.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnClick (see page 21579)	Occurs when the user clicks the control.
	OnContextPopup (see page 21581)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21582)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21582)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21584)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21587)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21587)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 21588)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21589)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21592)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21592)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21592)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21594)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21597)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21597)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Align (see page 21553)	Determines how the control aligns within its container (parent control).
	Alignment (see page 21556)	Controls the horizontal placement of the text within the label.
	AlignWithMargins (see page 5802)	Indicates whether a control should be constrained by margins.
	Anchors (see page 21557)	Specifies how the control is anchored to its parent.
	AutoSize (see page 21557)	Determines whether the size of the label automatically resizes to accommodate the text.
	BiDiMode (see page 21558)	Specifies the bi-directional mode for the control.
	Caption (see page 21559)	Specifies a text string that identifies the control to the user.
	Color (see page 21561)	Specifies the background color of the control.
	Constraints (see page 21562)	Specifies the size constraints for the control.
	Cursor (see page 5815)	Specifies the image used to represent the mouse pointer when it passes into the region covered by the control.
	DragCursor (see page 21563)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21563)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21563)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EllipsisPosition (see page 21565)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	Enabled (see page 21565)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 21566)	Designates a windowed control associated with the label.
	Font (see page 21566)	Controls the attributes of text written on or in the control.
	Height (see page 5825)	Specifies the vertical size of the control in pixels.
	HelpContext (see page 5826)	Numeric ID for control's context-sensitive help topic
	HelpKeyword (see page 5826)	Keyword for control's context-sensitive help topic
	HelpType (see page 5827)	Indicates whether the control's context sensitive help topic is identified by context ID or by keyword.
	Hint (see page 5827)	Contains the text string that can appear when the user moves the mouse over the control.
	Layout (see page 21567)	Specifies the vertical placement of the text within the label.

	Left (see page 5830)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	Margins (see page 5831)	Specifies the margins for the control.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 21567)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21568)	Determines where a control looks for its color information.
	ParentFont (see page 21568)	Determines where a control looks for its font information.
	ParentShowHint (see page 21569)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21569)	Identifies the pop-up menu associated with the control.
	ShowAccelChar (see page 21574)	Determines how an ampersand in the label text is displayed.
	ShowHint (see page 21575)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Tag (see page 2808)	Stores an integer value as part of a component.
	Top (see page 5844)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Transparent (see page 21576)	Specifies whether controls that sit below the label on a form can be seen through the label.
	Visible (see page 21577)	Determines whether the component appears onscreen.
	Width (see page 5849)	Specifies the horizontal size of the control or form in pixels.
	WordWrap (see page 21578)	Specifies whether the label text wraps when it is too long for the width of the label.

154.1.18.2 TLabel Properties

The properties of the TLabel class are listed here.

Published Properties

	Name	Description
	Align (see page 21553)	Determines how the control aligns within its container (parent control).
	Alignment (see page 21556)	Controls the horizontal placement of the text within the label.
	Anchors (see page 21557)	Specifies how the control is anchored to its parent.
	AutoSize (see page 21557)	Determines whether the size of the label automatically resizes to accommodate the text.
	BiDiMode (see page 21558)	Specifies the bi-directional mode for the control.
	Caption (see page 21559)	Specifies a text string that identifies the control to the user.
	Color (see page 21561)	Specifies the background color of the control.
	Constraints (see page 21562)	Specifies the size constraints for the control.
	DragCursor (see page 21563)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 21563)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 21563)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EllipsisPosition (see page 21565)	Specifies how ellipsis is placed in text not fitting in allocated rectangle.
	Enabled (see page 21565)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 21566)	Designates a windowed control associated with the label.
	Font (see page 21566)	Controls the attributes of text written on or in the control.
	Layout (see page 21567)	Specifies the vertical placement of the text within the label.
	ParentBiDiMode (see page 21567)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 21568)	Determines where a control looks for its color information.
	ParentFont (see page 21568)	Determines where a control looks for its font information.
	ParentShowHint (see page 21569)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 21569)	Identifies the pop-up menu associated with the control.
	ShowAccelChar (see page 21574)	Determines how an ampersand in the label text is displayed.
	ShowHint (see page 21575)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Transparent (see page 21576)	Specifies whether controls that sit below the label on a form can be seen through the label.
	Visible (see page 21577)	Determines whether the component appears onscreen.

	WordWrap (see page 21578)	Specifies whether the label text wraps when it is too long for the width of the label.

154.1.18.2.1 TLabel.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align: TAlign;
```

C++

```
__property TAlign Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form’s implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/
#include <Extctrls.hpp>
#include <Filectrl.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1);
  TFileListBox* pflb = new TFileListBox(Form1);
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;
```

```
  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>

154.1.18.2.2 TLabel.Alignment Property

Controls the horizontal placement of the text within the label.

Pascal

```
property Alignment: TAlignment;
```

C++

```
__property TAlignment Alignment;
```

Description

Set Alignment to specify how the text of the label is justified within the ClientRect of the label control.

The effect of the Alignment property is more obvious if the WordWrap property is true and the label includes more than one line of text.

See Also

ClientRect (see page 5810)

GetLabelText (see page 21297)

Layout (see page 21306)

WordWrap (see page 21308)

154.1.18.2.3 TLabel.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors: TAnchors;
```

C++

```
__property TAnchors Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent (see page 5832)

Align (see page 5798)

154.1.18.2.4 TLabel.AutoSize Property

Determines whether the size of the label automatically resizes to accommodate the text.

Pascal

```
property AutoSize: Boolean;
```

C++

```
__property Boolean AutoSize;__property Boolean AutoSize;
```

Description

Use AutoSize to make the label adjust its size automatically so the client area accommodates the height and width of the text. When AutoSize is false, the label is fixed in size. When AutoSize is true, the size of the label readjusts whenever the text changes. The size of the label is also readjusts when the Font property changes.

When WordWrap is true, the width of the label is fixed. If AutoSize is also true, changes to the text cause the label to change in height. When AutoSize is true and WordWrap is false, the font determines the height of the label, and changes to the text cause the label to change in width.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label’s caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long as the caption of this label';
end;
```

See Also

BoundsRect (see page 5803)

GetLabelText (see page 21297)

Font (see page 5823)

WordWrap (see page 21308)

Layout (see page 21306)

154.1.18.2.5 TLabel.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode: TBiDiMode;
```

C++

```
__property TBiDiMode BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

UseRightToLeftAlignment (see page 5790)

UseRightToLeftReading (see page 5790)

UseRightToLeftScrollBar (see page 5791)

Including Bi-directional Functionality in Applications

154.1.18.2.6 TLabel.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption: TCaption;
```

C++

```
__property TCaption Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long as the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);
```

```
      button->Parent = toolBar;
      button->Caption = captions->Strings[i];
      if (button->Caption == "|")
        button->Style = tbsSeparator;
      else
        button->Style = tbsButton;
    }
  }

  TToolBar *myToolBar;

  void __fastcall TForm1::FormCreate(TObject *Sender)
  {
    myToolBar = new TToolBar(this);
    myToolBar->Parent = this;
    TStringList *captions = new TStringList();
    captions->Add("New");
    captions->Add("Save");
    captions->Add("|");
    captions->Add("Cut");
    captions->Add("Copy");
    captions->Add("Paste");
    AddButtons(myToolBar, captions);
    delete captions;
    myToolBar->ShowCaptions = True;
    myToolBar->Height = 40;
  }

  void __fastcall TForm1::FormDestroy(TObject *Sender)
  {
    for (int I = myToolBar->ButtonCount - 1; I >= 0; I--)
      delete myToolBar->Buttons[I];
    delete myToolBar;
  }
```

Delphi Examples:

```
  {
  The following code keeps the size of the label control
  constant, even though the length of the label's caption
  changes. As a result, the caption of the label is probably
  too long to display in the label when the user clicks the
  button:
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    Label1.AutoSize := False;
    Label1.Caption :=
      'This string is too long as the caption of this label';
  end;
  {
  This example requires a TPageControl populated by several
  TabSheets, a TEdit and a TButton. When the button is
  clicked, the caption of the active tab changes to that of
  the TEdit.  These lines of code could also be written:
  PageControl1.ActivePage.Caption := Edit1.Text;
  This would obviate the need for a TTabSheet variable since
  PageControl1.->ActivePage is already of type TTabSheet.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    sheet: TTabSheet;
  begin
    sheet := PageControl1.ActivePage;
    sheet.Caption := Edit1.Text;
  end;
  {
```

```
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

154.1.18.2.7 TLabel.Color Property

Specifies the background color of the control.

Pascal

```
property Color: TColor;
```

C++

```
__property TColor Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
```

```
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

ParentColor (see page 5834)

154.1.18.2.8 TLabel.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints: TSizeConstraints;
```

C++

```
__property TSizeConstraints Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

See Also

AutoSize (see page 5803)

Align (see page 5798)

Anchors (see page 5802)

OnConstrainedResize (see page 5853)

OnCanResize (see page 5851)

154.1.18.2.9 TLabel.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor: TCursor;
```

C++

```
__property TCursor DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor (see page 5815)

DragKind (see page 5819)

DragMode (see page 5819)

154.1.18.2.10 TLabel.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind: TDragKind;
```

C++

```
__property TDragKind DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor (see page 5818)

DragMode (see page 5819)

154.1.18.2.11 TLabel.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode: TDragMode;
```

C++

```
__property TDragMode DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != (TObject *)TreeView1 || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == (TObject *)TreeView1);
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TTreeView;
end;
```

Arranging the Order of Persistent Columns

154.1.18.2.12 TLabel.EllipsisPosition Property

Specifies how ellipsis is placed in text not fitting in allocated rectangle.

Pascal

```
property EllipsisPosition: TEllipsisPosition;
```

C++

```
__property TEllipsisPosition EllipsisPosition;
```

Description

Set EllipsisPosition to determine how an ellipsis is placed in text that does not fit in its allocated rectangle. This is a TEllipsisPosition constant and its value corresponds to constants specifying ellipsis placement in the **dwDTFormat** parameter of the Windows **DrawText** and **DrawTextEx** functions.

See Also

WordWrap (see page 21308)

TypeName

154.1.18.2.13 TLabel.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled: Boolean;
```

C++

```
__property Boolean Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

154.1.18.2.14 TLabel.FocusControl Property

Designates a windowed control associated with the label.

Pascal

```
property FocusControl: TWinControl;
```

C++

```
__property TWinControl * FocusControl;
```

Description

Set FocusControl to the windowed control that should receive focus when the user presses the accelerator key specified by the label. Specify an accelerator key by preceding a character in the label text with an ampersand (&) and setting the ShowAccelChar property to true.

See Also

ShowAccelChar (see page 21306)

GetLabelText (see page 21297)

154.1.18.2.15 TLabel.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font: TFont;
```

C++

```
__property TFont Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
```

```
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

154.1.18.2.16 TLabel.Layout Property

Specifies the vertical placement of the text within the label.

Pascal

```
property Layout: TTextLayout;
```

C++

```
__property TTextLayout Layout;
```

Description

Set Layout to specify how the text of the label is placed within the ClientRect of the label control. Layout is the vertical analog to the Alignment property.

See Also

Alignment (see page 21299)

ClientRect (see page 5810)

154.1.18.2.17 TLabel.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode: Boolean;
```

C++

```
__property Boolean ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent (see page 5832)

BiDiMode (see page 5803)

154.1.18.2.18 TLabel.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor: Boolean;
```

C++

```
__property Boolean ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

See Also

Color (see page 5812)

Parent (see page 5832)

ParentFont (see page 5834)

ParentShowHint (see page 5835)

154.1.18.2.19 TLabel.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont: Boolean;
```

C++

```
__property Boolean ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

See Also

Font (see page 5823)

Parent (see page 5832)

ParentColor (see page 5834)

ParentShowHint (see page 5835)

154.1.18.2.20 TLabel.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint: Boolean;
```

C++

```
__property Boolean ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

See Also

Hint (see page 5827)

ParentColor (see page 5834)

ParentFont (see page 5834)

ShowHint (see page 5840)

154.1.18.2.21 TLabel.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu: TPopupMenu;
```

C++

```
__property TPopupMenu PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
  {
    if (pComponent->ClassNameIs("TEdit"))
      ((TEdit *)pComponent)->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
```

```
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
```

```
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

154.1.18.2.22 TLabel.ShowAccelChar Property

Determines how an ampersand in the label text is displayed.

Pascal

```
property ShowAccelChar: Boolean;
```

C++

```
__property Boolean ShowAccelChar;
```

Description

Set ShowAccelChar to true to allow the label to display an underlined accelerator key value. When ShowAccelChar is true, any character preceded by an ampersand (&) appears underlined. If the FocusControl property is set, the windowed control specified by the FocusControl property receives input focus when the user types that underlined character. To display an ampersand when ShowAccelChar is true, use two ampersands (&&) to stand for the single ampersand that is displayed.

Set ShowAccelChar to false to display the label text with all ampersands appearing as ampersands. When ShowAccelChar is false, the value of the FocusControl property is not used.

C++ Examples:

```
/*
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Label1->ShowAccelChar = true;
  Label1->Caption = "An &Underlined character appears here";
  Label2->ShowAccelChar = false;
```

```
  Label2->Caption = "An ampersand (&) appears here";
}
```

Delphi Examples:

```
{
This example uses two labels on a form. The first label has
a caption with an accelerator character in it. The second
label also includes an ampersand, but it does not appear as
an accelerator character.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  Label1.ShowAccelChar := True;
  Label1.Caption := 'An &Underlined character appears here';
  Label2.ShowAccelChar := False;
  Label2.Caption := 'An ampersand (&) appears here';
end;
```

FocusControl (see page 21306)

GetLabelText (see page 21297)

154.1.18.2.23 TLabel.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint: Boolean;
```

C++

```
__property Boolean ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
```

```
    char index[3];
    for(int i = 1; i <= 10; i++)
    {
      strcpy(string, "Item");
      itoa(i, index, 10);
      strcat(string, index);
      ListBox1->Items->Add(string);
    }
    ListBox1->Hint = "Select an item";
    ListBox1->ShowHint = true;
    Application->ShowHint = true;
  }
  /*
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  */
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}
```

154.1.18.2.24 TLabel.Transparent Property

Specifies whether controls that sit below the label on a form can be seen through the label.

Pascal

```
property Transparent: Boolean;
```

C++

```
__property Boolean Transparent;
```

Description

Set Transparent to true to prevent the label from obscuring other controls on the form. For example, if the label is used to add text to a graphic, set Transparent to true so that the label does not stand out as a separate object.

Writing text so that the background is transparent is slower than writing text when Transparent is false. If the label is not obscuring a complicated image, performance can be improved by setting the background color of the label to match the object beneath it and setting Transparent to false.

See Also

Color (see page 5812)

ParentColor (see page 5834)

154.1.18.2.25 TLabel.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible: Boolean;
```

C++

```
__property Boolean Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
```

```
      pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
      pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
    }
    PageControl1Change(Sender);
  }
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.18.2.26 TLabel.WordWrap Property

Specifies whether the label text wraps when it is too long for the width of the label.

Pascal

```
property WordWrap: Boolean;
```

C++

```
__property Boolean WordWrap;
```

Description

Set WordWrap to true to allow the label to display multiple line of text. When WordWrap is true, text that is too wide for the label control wraps at the right margin and continues in additional lines.

Set WordWrap to false to limit the label to a single line. When WordWrap is false, text that is too wide for the label appears truncated.

154.1.18.3 TLabel Events

The events of the TLabel class are listed here.

Published Events

	Name	Description
	OnClick (see page 21579)	Occurs when the user clicks the control.
	OnContextPopup (see page 21581)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 21582)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21582)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21584)	Occurs when the user drags an object over a control.
	OnEndDock (see page 21587)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 21587)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnMouseActivate (see page 21588)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 21589)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 21592)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 21592)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 21592)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 21594)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 21597)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 21597)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

154.1.18.3.1 TLabel.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an

OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this);
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this);
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
```

```
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

154.1.18.3.2 TLabel.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup: TContextPopupEvent;
```

C++

```
__property TContextPopupEvent OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the

default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 16178)

154.1.18.3.3 TLabel.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick (see page 5851)

Responding to User Actions at Runtime

154.1.18.3.4 TLabel.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop: TDragDropEvent;
```

C++

```
__property TDragDropEvent OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
```

```
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}
procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
```

```
  The user can select a label and drag it to a list box and
  drop it. When the label is dropped, the items in the list
  box assume the color and font of the dropped label.
  }

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ListBox1.Items.Add('Not');
    ListBox1.Items.Add('In');
    ListBox1.Items.Add('Alphabetical');
    ListBox1.Items.Add('Order');
  end;

  // This OnDragOver event handler permits the list box to
  // accept a dropped label:

  procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TLabel;
  end;

  // This OnDragDrop event handler implements the drop behavior.

  procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
  begin
    if (Sender is TListBox) and (Source is TLabel) then
    begin
      with Sender as TListBox do
      begin
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

154.1.18.3.5 TLabel.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver: TDragOverEvent;
```

C++

```
__property TDragOverEvent OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = (TListBox *)Sender;
    DestList->Font = ((TLabel *)Source)->Font;
    DestList->Color = ((TLabel *)Source)->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
```

```
dragging of the label as soon as the user drags the label
onto the panel:

154.1.18.3.6 TLabel.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

See Also

DragKind (see page 5819)

OnDragOver (see page 5857)

OnDockDrop (see page 6214)

OnStartDock (see page 5871)

154.1.18.3.7 TLabel.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag: TEndDragEvent;
```

C++

```
__property TEndDragEvent OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
```

```
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = ((TLabel *)Sender)->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

154.1.18.3.8 TLabel.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate: TMouseActivateEvent;
```

C++

```
__property TMouseActivateEvent OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
```

```
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

154.1.18.3.9 TLabel.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled

before running this example).  When the user presses a mouse
```

```
  button, moves the mouse, and releases the mouse button, a
  rectangle is drawn on the form. When the mouse button is
  released, the rectangle appears on the form's canvas. Its
  top-left and bottom-right corners are defined by the
  location of the mouse pointer when the user pressed and
  released the mouse button.  While the user drags the mouse,
  the location of the top, left, bottom, and right sides of
  the rectangle are displayed in the status bar.
  }
  procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
  Y: Integer);
  begin
    StartX := X;
    StartY := Y;
  end;

  procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
  Integer);
  begin
    Form1.Canvas.Rectangle(StartX, StartY, X, Y);
    StatusBar1.Panels[0].Text := '';
    StatusBar1.Panels[1].Text := '';
    StatusBar1.Panels[2].Text := '';
    StatusBar1.Panels[3].Text := '';
  end;

  procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
  begin
    if ssLeft in Shift then { make sure button is down }
    begin
      if Y > StartY then
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

154.1.18.3.10 TLabel.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

154.1.18.3.11 TLabel.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

154.1.18.3.12 TLabel.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove: TMouseMoveEvent;
```

C++

```
__property TMouseMoveEvent OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

154.1.18.3.13 TLabel.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp: TMouseEvent;
```

C++

```
__property TMouseEvent OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

154.1.18.3.14 TLabel.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock: TStartDockEvent;
```

C++

```
__property TStartDockEvent OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

154.1.18.3.15 TLabel.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag: TStartDragEvent;
```

C++

```
__property TStartDragEvent OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

154.1.19 TListBox Class

TListBox displays a collection of items in a scrollable list.

Class Hierarchy

Pascal

```
TListBox = class(TCustomListBox);
```

C++

```
class TListBox : public TCustomListBox;
```

File

StdCtrls

Description

Use TListBox to display a scrollable list of items that users can select, add, or delete. TListBox is a wrapper for the Windows listbox control. For specialized list boxes, use other descendant classes of TCustomListBox (see page 21308) or derive your own class from TCustomListBox (see page 21308).

TListBox implements the generic behavior introduced in TCustomListBox (see page 21308). TListBox publishes many of the properties inherited from TCustomListBox (see page 21308), but does not introduce any new behavior.

154.1.19.1 TListBox Members

The following tables list the members exposed by TListBox.

Protected Events

	Name	Description
	OnAlignInsertBefore (see page 6213)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 6214)	Occurs when an object with custom alignment is aligned.
	OnCanResize (see page 5851)	Occurs when an attempt is made to resize the control.
	OnConstrainedResize (see page 5853)	Adjust resize constraints.
	OnDockDrop (see page 6214)	Occurs when another control is docked to the control.
	OnDockOver (see page 6216)	Occurs when another control is dragged over the control.
	OnGetSiteInfo (see page 6223)	Returns the control's docking information.
	OnMouseWheel (see page 5869)	Occurs when the mouse wheel is rotated.
	OnMouseWheelDown (see page 5869)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 5870)	Occurs when the mouse wheel is rotated upward.
	OnResize (see page 5870)	Occurs immediately after the control is resized.
	OnUnDock (see page 6230)	Occurs when the application tries to undock a control that is docked to the windowed control.

Protected Fields

	Name	Description
	FAnchorMove (see page 5733)	This is FAnchorMove, a member of class TControl.
	FAnchorOrigin (see page 5734)	This is FAnchorOrigin, a member of class TControl.
	FAnchorRules (see page 5734)	This is FAnchorRules, a member of class TControl.
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FDesignSize (see page 6124)	This is FDesignSize, a member of class TWinControl.
	FDoubleBuffered (see page 6124)	This is FDoubleBuffered, a member of class TWinControl.
	FExplicitHeight (see page 5734)	This is FExplicitHeight, a member of class TControl.
	FExplicitLeft (see page 5734)	This is FExplicitLeft, a member of class TControl.
	FExplicitTop (see page 5734)	This is FExplicitTop, a member of class TControl.
	FExplicitWidth (see page 5735)	This is FExplicitWidth, a member of class TControl.
	FInImeComposition (see page 6125)	This is FInImeComposition, a member of class TWinControl.
	FMoving (see page 21321)	This is FMoving, a member of class TCustomListBox.
	FMultiSelect (see page 5956)	This is FMultiSelect, a member of class TCustomMultiSelectListControl.
	FOriginalParentSize (see page 5735)	This is FOriginalParentSize, a member of class TControl.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActionChange (see page 5737)	Responds when the action associated with the control changes.
V	ActionChange (see page 6127)	Updates the control to reflect changes in its associated action.
	AddBiDiModeExStyle (see page 6128)	Sets control's window style according to its bi-directional support.
V	AdjustClientRect (see page 6128)	Provides the interface that adjusts the ClientRect (see page 5810) property for idiosyncrasies of the window.
	AdjustSize (see page 5738)	Sets the size of the control as determined by the AutoSize (see page 5803) property.
V	AdjustSize (see page 6129)	Adjusts the control's size according to its contents and constraints.
V	AlignControls (see page 6129)	Aligns any controls for which the control is the parent within a specified area of the control.
	ArrangeControl (see page 6130)	This is ArrangeControl, a member of class TWinControl.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	AssignTo (see page 5739)	Overrides the inherited AssignTo function to enable assignments to TAction objects.
V	AssignTo (see page 6130)	Copies the properties of the windowed control to another object.
	BeginAutoDrag (see page 5739)	Begin Automatic Drag.
	CalcCursorPos (see page 5741)	This is CalcCursorPos, a member of class TControl.
V	CanAutoSize (see page 5741)	Indicates whether the control can resize itself automatically to accommodate its contents.

	CanAutoSize (see page 6131)	Indicates how the control can be resized.
	CanResize (see page 5742)	OnCanResize (see page 5851) event dispatcher.
	CanResize (see page 6132)	Indicates how the control can respond to a resize attempt.
	Changed (see page 5742)	Sends a CM_CHANGED (see page 6330) message to the control.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	ChangeScale (see page 5743)	Rescaling event dispatcher.
	ChangeScale (see page 6132)	Resize (see page 5780) and reposition children and self.
	Click (see page 5743)	Respond to user click.
	ConstrainedResize (see page 5746)	Notify control of resize with constraints.
	ConstrainedResize (see page 6133)	Generates an OnConstrainedResize (see page 5853) event.
	ControlsAligned (see page 6134)	This is ControlsAligned, a member of class TWinControl.
	CreateDockManager (see page 6134)	Creates the dock manager for the control.
	CreateHandle (see page 6135)	Creates underlying screen object.
	CreateParams (see page 6135)	Initializes a window-creation parameter data structure.
	CreateParams (see page 21324)	Initializes the window-creation parameter record passed in the Params parameter.
	CreateSubClass (see page 6136)	Creates a windowed control derived from an existing Windows window class.
	CreateWindowHandle (see page 6137)	Creates a Windows control to represent the control.
	CreateWnd (see page 6137)	Creates the underlying window.
	CreateWnd (see page 21325)	Creates a Windows control corresponding to the list box component.
	CustomAlignInsertBefore (see page 6137)	Returns placement order of custom-aligned child control.
	CustomAlignPosition (see page 6138)	Returns aligned position of custom-aligned child control.
	DblClick (see page 5747)	OnDblClick (see page 5854) event dispatcher.
	DefaultDockImage (see page 5747)	Handles the painting and erasing of a dock image.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DefineProperties (see page 5748)	Provides methods to read and write the IsControl (see page 5829) property to a stream such as a form file.
	DefineProperties (see page 6139)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DeleteString (see page 21326)	Deletes a string from the list box.
	DesignWndProc (see page 5749)	This is DesignWndProc, a member of class TControl.
	DestroyHandle (see page 6140)	Destroys the control's window without destroying the control.
	DestroyWindowHandle (see page 6140)	Destroys the window created in the CreateWindowHandle (see page 6137) method.
	DestroyWnd (see page 6141)	Destroys the control's window.
	DestroyWnd (see page 21326)	Saves the list box items in a string list before freeing the underlying Windows control.
	DoAddDockClient (see page 6142)	Performs actions when a control is docked to the windowed control.
	DockOver (see page 6143)	Responds when a docking client is dragged over the windowed control.
	DockReplaceDockClient (see page 6143)	This is DockReplaceDockClient, a member of class TWinControl.
	DockTrackNoTarget (see page 5749)	Handles dragging of the control over an invalid docking target.
	DoContextPopup (see page 5750)	OnContextPopup (see page 5854) event dispatcher.
	DoDock (see page 5750)	Docking event dispatcher.
	DoDockOver (see page 6143)	Generates an OnDockOver (see page 6216) event.
	DoEndDock (see page 5750)	OnEndDock (see page 5859) event dispatcher.
	DoEndDrag (see page 5751)	OnEndDrag (see page 5860) event dispatcher.
	DoEnter (see page 6144)	Respond to receiving input focus.
	DoExit (see page 6144)	Respond to losing input focus
	DoFindData (see page 21326)	Returns the index of a string in the list box.
	DoFlipChildren (see page 6145)	Flips the control's children.
	DoGetData (see page 21327)	Returns a string in the list box given its index.
	DoGetDataObject (see page 21327)	Returns the object associated with an item in a virtual list box.
	DoKeyDown (see page 6145)	Performs some preprocessing before generating an OnKeyDown (see page 6225) event.

	DoKeyPress (see page 6146)	Performs some preprocessing before generating an OnKeyPress (see page 6227) event.
	DoKeyUp (see page 6146)	Performs some preprocessing before generating an OnKeyUp (see page 6228) event.
	DoMouseWheel (see page 5751)	Processes mouse wheel motion.
	DoMouseWheelDown (see page 5752)	OnMouseWheelDown (see page 5869) event dispatcher.
	DoMouseWheelUp (see page 5752)	OnMouseWheelUp (see page 5870) event dispatcher.
	DoRemoveDockClient (see page 6147)	Responds when a control is undocked from the windowed control.
	DoStartDock (see page 5753)	OnStartDock (see page 5871) event dispatcher.
	DoStartDrag (see page 5753)	OnStartDrag (see page 5871) event dispatcher.
	DoUnDock (see page 6147)	Undocks a control that is currently docked to the windowed control.
	DragCanceled (see page 5754)	Provides the interface for a method that responds to the cancellation of a drag.
V	DragCanceled (see page 21328)	Sends a mouse message canceling the drag-and-drop operation.
	DragOver (see page 5755)	OnDragOver (see page 5857) event dispatcher.
	DrawDragDockImage (see page 5755)	Draws the dock image for the control.
V	DrawItem (see page 21328)	Generates an OnDrawItem (see page 21358) event.
	EraseDragDockImage (see page 5757)	Erases the dock image for the control.
	FindNextControl (see page 6149)	Returns the control's next child in the tab order after the specified control.
	FixupTabList (see page 6149)	Sorts the child controls by their tab order.
V	GetAction (see page 5758)	This is GetAction, a member of class TControl.
	GetActionLinkClass (see page 5758)	Returns the appropriate action link class that is associated with the control class.
V	GetActionLinkClass (see page 6152)	Returns the associated action link class.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 6153)	Calls a specified method for each child of the control.
V	GetClientOrigin (see page 5758)	Returns the screen coordinates of the top-left corner of the control's client area.
V	GetClientOrigin (see page 6153)	Returns the value of the ClientOrigin (see page 5809) property.
V	GetClientRect (see page 5759)	Returns a rectangle defining the client area of the control.
V	GetClientRect (see page 6154)	Returns the value of the ClientRect (see page 5810) property.
V	GetControlExtents (see page 6154)	Returns the smallest rectangle in which all the control's children fit.
A	GetCount (see page 5942)	Returns the number of items in the list.
V	GetCount (see page 21329)	Returns the value of the Count (see page 21346) property.
V	GetDeviceContext (see page 5760)	Returns a device context for the control.
V	GetDeviceContext (see page 6155)	Provides access to a device context for the control.
	GetDockEdge (see page 5763)	Returns the edge on which another control should be docked when it is dragged over the control.
V	GetDragImages (see page 5763)	Returns the control's image list containing the image to be displayed while dragging.
V	GetEnabled (see page 5763)	Returns the value of the Enabled (see page 5821) property.
V	GetFloating (see page 5764)	Returns the value of the Floating (see page 5823) property.
V	GetFloatingDockSiteClass (see page 5764)	Returns the class used for the control when it is floating.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetItemData (see page 21329)	Returns a 32-bit value associated with the specified item in a list box.
A	GetItemIndex (see page 5942)	Returns the value of the ItemIndex (see page 5944) property.
V	GetItemIndex (see page 21329)	Returns the value of the ItemIndex property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPalette (see page 5765)	Returns the handle to a palette for use by the control.
	GetParentHandle (see page 6157)	Returns the window handle for the window of the control's parent.
	GetPopupMenu (see page 5765)	Returns the pop-up menu associated with the control.
A	GetSelCount (see page 5956)	Returns the value of the SelCount (see page 5957) property.
V	GetSelCount (see page 21330)	Returns the number of selected items.
	GetSelected (see page 21330)	Indicates whether a particular item is selected.

	GetSiteInfo (see page 6158)	Generates an OnGetSiteInfo (see page 6223) event
	GetTopParentHandle (see page 6159)	Returns the window handle of the first window not associated with a VCL control that contains the windowed control.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalGetItemData (see page 21330)	Retrieves the data associated with an item in the list box.
	InternalSetItemData (see page 21330)	Associates an integer with a specified item in the list box.
	InvalidateDockHostSite (see page 6162)	This is InvalidateDockHostSite, a member of class TWinControl.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsControlActivateMsg (see page 6162)	This is IsControlActivateMsg, a member of class TWinControl.
	IsControlMouseMsg (see page 6162)	Indicates whether a specified mouse message is directed to one of the windowed control's child controls.
	IsQualifyingSite (see page 6163)	This is IsQualifyingSite, a member of class TWinControl.
	KeyDown (see page 6163)	Respond to key press events.
	KeyPress (see page 6163)	Respond to keyboard input.
V	KeyPress (see page 21334)	Responds when the user presses a key.
	KeyUp (see page 6164)	Respond to released key.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 5771)	Initializes the control after it is loaded from a stream.
V	LoadRecreateItems (see page 21334)	This is LoadRecreateItems, a member of class TCustomListBox.
	MainWndProc (see page 6165)	Receives Windows messages for the control.
V	MeasureItem (see page 21335)	Generates an OnMeasureItem (see page 21360) event.
	MouseActivate (see page 5773)	This is MouseActivate, a member of class TControl.
	MouseDown (see page 5773)	OnMouseDown (see page 5862) event dispatcher.
	MouseMove (see page 5773)	Respond to mouse moving over control area..
	MouseUp (see page 5774)	OnMouseUp (see page 5867) event dispatcher.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 5775)	Responds to notifications that components are being created or destroyed.
V	Notification (see page 6165)	Responds to notifications that components are being created or destroyed.
	NotifyControls (see page 6165)	Sends a message to all the child controls.
	PaintControls (see page 6166)	Paints each of the child controls in a windowed control using the specified device context.
	PaintHandler (see page 6166)	Responds to WM_PAINT messages.
V	PaintWindow (see page 6169)	Renders the image of a windowed control.
	PaletteChanged (see page 5775)	Responds to changes in the system's palette by realizing the control's palette.
V	PaletteChanged (see page 6170)	Responds to changes in the system's palette by realizing the control's palette and the palette for each child control.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PositionDockRect (see page 5777)	Positions the docking rectangle according to the current drag-and-dock state.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 5778)	Prepares the control for having its properties assigned values read from a stream.
V	ReadState (see page 6171)	Prepares the control for having its properties assigned values from a stream.
	RecreateWnd (see page 6171)	Recreate underlying Windows screen object.
	ReloadDockedControl (see page 6172)	Reloads a docked control.
	RemoveWindowProps (see page 6174)	This is RemoveWindowProps, a member of class TWinControl.
V	RequestAlign (see page 5780)	Instructs the parent of a control to reposition the control, enforcing its Align (see page 5798) property.
	ResetContent (see page 21335)	Removes all of the items from a list box.
	ResetIme (see page 6174)	Restores the input method editor (IME) that was active when the application started.
	ResetImeComposition (see page 6175)	Directs the composition window of the input method editor (IME) to perform a specific action.
	Resize (see page 5780)	Respond to control resize.
V	SaveRecreateItems (see page 21336)	This is SaveRecreateItems, a member of class TCustomListBox.

	ScaleConstraints (see page 5781)	This is ScaleConstraints, a member of class TControl.
	ScaleControls (see page 6176)	Rescale child controls only.
	SelectFirst (see page 6177)	Locates first selectable child control.
	SelectNext (see page 6177)	Moves the input focus from the current child control to the next one in the tab order.
	SendCancelMode (see page 5781)	Cancels the modal state of the control.
	SendDockNotification (see page 5782)	Sends a Windows message to the control's host dock site.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetAutoSize (see page 5783)	This is SetAutoSize, a member of class TControl.
V	SetBiDiMode (see page 5783)	Sets the control's bi-directional mode.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 6178)	Changes the order in which the child component appears in the list of child components returned by the GetChildren (see page 6153) method.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
V	SetDragMode (see page 5785)	Sets the drag mode for the control.
V	SetEnabled (see page 5785)	Sets the value of the Enabled (see page 5821) property.
	SetIme (see page 6181)	Activates an input method editor (IME) using the values specified by the ImeMode (see page 6207) and ImeName (see page 6208) properties.
	SetImeCompositionWindow (see page 6181)	Sets the position and font of the composition window.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetItemData (see page 21336)	Sets the 32-bit value associated with the specified item in a list box.
A	SetItemIndex (see page 5943)	Sets the value of the ItemIndex (see page 5944) property.
V	SetItemIndex (see page 21336)	Gives focus to the item with a specified index.
A	SetMultiSelect (see page 5956)	Sets the value of the MultiSelect (see page 5957) property.
V	SetMultiSelect (see page 21337)	Sets the MultiSelect property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetName (see page 5785)	Sets the name of the control.
V	SetParent (see page 5786)	Sets the parent of the control.
V	SetParent (see page 6182)	Sets the parent of the control.
V	SetParentBackground (see page 6182)	This is SetParentBackground, a member of class TWinControl.
V	SetParentBiDiMode (see page 5786)	Specifies whether the control uses its parent's BiDiMode (see page 5803).
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 5787)	Sets the parent for the control.
	SetZOrder (see page 5788)	Repositions the control in its parent's control list, thereby changing position onscreen.
V	SetZOrder (see page 6182)	Moves the control to the top or bottom of the parent control's (or screen's) list of TWinControl (see page 6112) controls.
V	ShowControl (see page 6183)	Ensures that a specified child control is visible.
	UpdateBounds (see page 6185)	This is UpdateBounds, a member of class TWinControl.
	UpdateBoundsRect (see page 5789)	Changes the Top (see page 5844), Left (see page 5830), Width (see page 5849), and Height (see page 5825) properties of the control, but doesn't update its screen image and bypasses all resize events.
V	UpdateControlOriginalParentSize (see page 6186)	This is UpdateControlOriginalParentSize, a member of class TWinControl.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateExplicitBounds (see page 5789)	This is UpdateExplicitBounds, a member of class TControl.
	UpdateRecreatingFlag (see page 6186)	This is UpdateRecreatingFlag, a member of class TWinControl.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateUIState (see page 6186)	Updates form User Interface State as needed
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	VisibleChanging (see page 5791)	Provides the interface for a method that responds to changes in the control's visibility.
	WndProc (see page 5791)	Provides specific message responses for the control.
	WndProc (see page 6187)	Provides specific message responses for the control.
	WndProc (see page 21337)	Handles Windows messages.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	ActionLink (see page 5798)	Contains the action link object associated with the control.
	AutoSize (see page 5803)	Specifies whether the control sizes itself automatically to accommodate its contents.
	BorderWidth (see page 6195)	Specifies the width of the control's border.
	Caption (see page 5806)	Specifies a text string that identifies the control to the user.
	DefWndProc (see page 6199)	Specifies the default window procedure for the windowed control.
	DesktopFont (see page 5818)	Specifies whether the control uses the Windows icon font when writing text.
	IsControl (see page 5829)	Determines whether a form stores its form-specific properties to a stream.
	MouseCapture (see page 5831)	Indicates whether the control has "captured" mouse events.
	ParentBackground (see page 6209)	Determines whether control uses parent's theme background.
	ScalingFlags (see page 5840)	Reflects which attributes of the control have been scaled.
	Text (see page 5842)	Contains a text string associated with the control.
	WheelAccumulator (see page 5849)	Accumulates mouse wheel rotations.
	WindowHandle (see page 6212)	Provides access to a window handle for the control.
	WindowText (see page 5850)	Contains the text string of the control.

Public Events

	Name	Description
	WindowProc (see page 5872)	Points to the window procedure that responds to messages sent to the control.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddItem (see page 5940)	Adds an item to the list control.
	AddItem (see page 21322)	Adds an item to the list box
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginDrag (see page 5740)	Starts the dragging of a control.
	BringToFront (see page 5740)	Puts the control in front of all other controls in its parent control.
	Broadcast (see page 6130)	Sends a message to each of the child controls.
	CanFocus (see page 6131)	Indicates whether a control can receive focus.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 5940)	Deletes all of the items from the list control.
	Clear (see page 21322)	Deletes all items from the list box.
	ClearSelection (see page 5940)	Removes the selection, leaving all items unselected.
	ClearSelection (see page 21323)	Deselects all selected items in the list box, if possible.

	ClientToParent (see page 5744)	Translates client coordinates to parent coordinates.
	ClientToScreen (see page 5744)	Translates a given point from client area coordinates to global screen coordinates.
	ContainsControl (see page 6133)	Indicates whether a specified control exists within the control.
	ControlAtPos (see page 6133)	Returns the child control located at a specified position within the control.
A	CopySelection (see page 5941)	Copies the selected item or items to another TCustomListControl (see page 5928) descendant.
V	CopySelection (see page 21323)	Copies the selected items to another list-type control
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 5731)	Creates an instance of TControl (see page 5724).
V	Create (see page 6123)	Creates an instance of TWinControl (see page 6112).
V	Create (see page 21320)	Instantiates a list box control.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	CreateParented (see page 6123)	Creates and initializes a control as the child of a specified non-VCL container.
	CreateParentedControl (see page 6136)	Creates and initializes a control as the child of a specified non-VCL window.
V	DefaultHandler (see page 5748)	Provides message handling for all messages that do not have specific handlers.
V	DefaultHandler (see page 6139)	Provides message handling for all messages that the control does not fully process itself.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	DeleteSelected (see page 5941)	Deletes all the selected items.
V	DeleteSelected (see page 21325)	Deletes the selected items from the list box
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 5732)	Destroys an instance of TControl (see page 5724).
V	Destroy (see page 6124)	Destroys an instance of TWinControl (see page 6112).
V	Destroy (see page 21320)	Destroys the instance of a list box control.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	DisableAlign (see page 6141)	Disables the realignment of child controls.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Dock (see page 5749)	Used internally to dock the control.
	DockDrop (see page 6142)	Generates an OnDockDrop (see page 6214) event.
	DragDrop (see page 5754)	OnDragDrop (see page 5855) event dispatcher.
	Dragging (see page 5754)	Indicates whether a control is being dragged.
	DrawTextBiDiModeFlags (see page 5756)	Returns the text flags that reflect the current setting of the BiDiMode (see page 5803) property.
	DrawTextBiDiModeFlagsReadingOnly (see page 5756)	Returns the text flag to add that indicates whether the control's text should read from right to left.
	EnableAlign (see page 6148)	Decrements the reference count incremented by the DisableAlign (see page 6141) method, eventually realigning the child controls.
	EndDrag (see page 5757)	Stops a control from being dragged any further.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindChildControl (see page 6148)	Returns a child control given its name.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FlipChildren (see page 6150)	Reverses the positions of child controls.
	Focused (see page 6150)	Determines whether the control has input focus.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetControlsAlignment (see page 5759)	Indicates how text is aligned within the control.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 5765)	Returns the parent of the control.
	GetTabOrderList (see page 6158)	Builds a list of controls in tab order.
	GetTextBuf (see page 5766)	Retrieves the control's text, copies it into a buffer, and returns the number of characters copied.
	GetTextLen (see page 5767)	Returns the length of the control's text.
	HandleAllocated (see page 6159)	Reports whether a screen object handle exists for the control.
	HandleNeeded (see page 6160)	Creates a screen object for the control if it doesn't already exist.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 5768)	Indicates whether the control has a parent.
	Hide (see page 5769)	Makes the control invisible.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	InitiateAction (see page 5769)	Calls the action link's Update (see page 5789) method if the control is associated with an action link.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InsertControl (see page 6160)	Inserts a control into the Controls (see page 6197) array property.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	Invalidate (see page 5770)	Completely repaint control.
V	Invalidate (see page 6161)	Schedules a control repaint.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsRightToLeft (see page 5770)	Indicates whether the control should be reversed right to left.
	ItemAtPos (see page 21331)	Returns the index of the list box item indicated by the coordinates of a point on the control.
	ItemRect (see page 21333)	Returns the rectangle that surrounds the item specified in the Item parameter.
	ManualDock (see page 5771)	Docks the control.
	ManualFloat (see page 5772)	Undocks the control.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	MouseWheelHandler (see page 5774)	Dispatches messages received from a mouse wheel.
V	MoveSelection (see page 5942)	Moves all selected items to another list control.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintTo (see page 6167)	This is the overview for the PaintTo method overload.
	ParentToClient (see page 5776)	Translate parent coordinates to client coordinates.
	Perform (see page 5776)	Responds as if the control received a specified Windows message.
	PreProcessMessage (see page 6170)	This is PreProcessMessage, a member of class TWinControl.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Realign (see page 6171)	Forces the control to realign children.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 5779)	Repaints the control on the screen.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveControl (see page 6172)	Removes a specified control from the Controls (see page 6197) array.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Repaint (see page 5779)	Forces the control to repaint its image on the screen.
V	Repaint (see page 6174)	Repaints the entire control.

	ReplaceDockedControl (see page 5779)	Docks the control in the place where another control is already docked.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ScaleBy (see page 6175)	Rescale control and its children.
	ScreenToClient (see page 5781)	Converts the screen coordinates of a specified point on the screen to client coordinates.
	ScrollBy (see page 6176)	Scroll control contents.
A	SelectAll (see page 5943)	Selects all items or all text in the selected item.
V	SelectAll (see page 21336)	Selects the entire block of text in the list box.
	SendToBack (see page 5782)	Puts a windowed control behind all other windowed controls, or puts a non-windowed control behind all other non-windowed controls.
V	SetBounds (see page 5783)	Sets the Left (see page 5830), Top (see page 5844), Width (see page 5849), and Height (see page 5825) properties all at once.
V	SetBounds (see page 6178)	Sets the windowed control's boundary properties all at once.
	SetDesignVisible (see page 5784)	Makes a control visible at design time.
V	SetDesignVisible (see page 6178)	Makes a control visible at design time.
V	SetFocus (see page 6179)	Gives the input focus to the control.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetTextBuf (see page 5787)	Sets the text of the control.
	Show (see page 5788)	Makes a control visible.
V	Update (see page 5789)	Processes any pending paint messages immediately.
V	Update (see page 6183)	Forces the control to update.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateControlState (see page 6186)	Respond to state change.
	UseRightToLeftAlignment (see page 5790)	Specifies whether the control's alignment should be reversed right-to-left.
	UseRightToLeftReading (see page 5790)	Specifies whether the control is using a right-to-left reading order.
	UseRightToLeftScrollBar (see page 5791)	Specifies whether the vertical scroll bar appears on the left side of the control.

Public Properties

	Name	Description
	Action (see page 5797)	Designates the action associated with the control.
R	AlignDisabled (see page 6192)	Indicates child control realignment disabled.
	BoundsRect (see page 5803)	Specifies the bounding rectangle of the control, expressed in the coordinate system of the parent control.
R	Brush (see page 6195)	Determines the color and pattern used for painting the background of the control.
R	Canvas (see page 21343)	Provides a drawing surface when implementing a handler for the OnDrawItem (see page 21358) event of an owner-draw list box.
	ClientHeight (see page 5808)	Specifies the height of the control's client area in pixels.
R	ClientOrigin (see page 5809)	Specifies the screen coordinates (in pixels) of the top left corner of a control's client area.
R	ClientRect (see page 5810)	Specifies the size (in pixels) of a control's client area.
	ClientWidth (see page 5811)	Specifies the horizontal size of the control's client area in pixels.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	ControlCount (see page 6195)	Returns the number of child controls.
R	Controls (see page 6197)	Lists all child controls.
	ControlState (see page 5813)	Indicates the current state of a control at runtime.
	ControlStyle (see page 5814)	Determines style characteristics of the control.
	Count (see page 21346)	Indicates the number of items in the list box.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DockClientCount (see page 6199)	Specifies the number of controls that are docked on the windowed control.

R	DockClients (see page 6201)	Lists the controls that are docked to the windowed control.
	DockManager (see page 6202)	Specifies the control's docking manager interface.
	DockOrientation (see page 5818)	Specifies how the control is docked relative to other controls docked in the same parent.
	DockSite (see page 6204)	Specifies whether the control can be the target of drag-and-dock operations.
	DoubleBuffered (see page 6205)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
R	ExplicitHeight (see page 5821)	Specifies the explicit vertical size of the control in pixels.
R	ExplicitLeft (see page 5822)	Specifies the explicit horizontal pixel coordinate of the left edge of a component relative to its parent.
R	ExplicitTop (see page 5822)	Specifies the explicit vertical pixel coordinate of the top edge of a component relative to its parent.
R	ExplicitWidth (see page 5822)	Specifies the explicit horizontal size of the control in pixels.
R	Floating (see page 5823)	Indicates whether the control is floating.
	FloatingDockSiteClass (see page 5823)	Specifies the class of the temporary control that hosts the control when it is floating.
R	Handle (see page 6207)	Provides access to the underlying Windows screen object for the control.
	HostDockSite (see page 5829)	Specifies the control in which the control is docked.
	ItemIndex (see page 5944)	Specifies the index of the selected item.
	LRDockWidth (see page 5831)	Specifies the width of the control when it is docked horizontally.
R	MouseInClient (see page 6209)	This is MouseInClient, a member of class TWinControl.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Padding (see page 6209)	Specifies the padding of a control.
	Parent (see page 5832)	Indicates the parent of the control.
	ParentWindow (see page 6210)	Reference to parent's underlying control.
R	SelCount (see page 5957)	Indicates the number of selected items.
	Selected (see page 21351)	Indicates whether a particular item is selected.
R	Showing (see page 6210)	Indicates whether the control is showing on the screen.
	TBDockHeight (see page 5842)	Specifies the height of the control when it is docked vertically.
	TopIndex (see page 21356)	Specifies the index number of the item that appears at the top of the list box.
	UndockHeight (see page 5845)	Specifies the height of the control when it is floating.
	UndockWidth (see page 5846)	Specifies the width of the control when it is floating.
	UseDockManager (see page 6212)	Specifies whether the docking manager is used in drag-and-dock operations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleDockClientCount (see page 6212)	Specifies the number of visible controls that are docked on the windowed control.

Published Events

	Name	Description
	OnClick (see page 21645)	Occurs when the user clicks the control.
	OnContextPopup (see page 21647)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnData (see page 21647)	Occurs when a virtual list box needs to supply the text of an item.
	OnDataFind (see page 21648)	Occurs when a virtual list box needs to identify the index of an item given its text.
	OnDataObject (see page 21648)	Occurs when a virtual list box needs to supply the object associated with an item.
	OnDblClick (see page 21649)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 21649)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 21651)	Occurs when the user drags an object over a control.
	OnDrawItem (see page 21654)	Occurs when an item in an owner-draw list box needs to be redisplayed.
	OnEndDock (see page 21656)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
