Description

PackVarCreation controls the way Variant Types (see page 23293) are chosen for newly-created Variants (see page 23567). If PackVarCreation is true (default), a new Variant has the smallest possible Variant Type. If PackVarCreation is false, a new Variant has the Variant Type that minimizes execution time.

171.6.11 Variants.RefAnyProc Variable

Pascal

```
RefAnyProc: TAnyProc;
```

C++

```
TAnyProc RefAnyProc;
```

File

Variants

Description

This is variable Variants.RefAnyProc.

171.6.12 Variants.VarDispProc Variable

Provides the support for IDispatch-based Automation.

Pascal

```
VarDispProc: TVarDispProc;
```

C++

```
TVarDispProc VarDispProc;
```

File

Variants

Description

In Delphi, VarDispProc points to a routine that is called to execute methods (or access properties) of an interface that is assigned to a Variant. The Variants (see page 23567) unit assigns a procedure that generates error 222 or raises an

EVariantDispatchError (see page 23575) exception. The ComObj (see page 5525) unit reassigns this variable to a procedure that generates the appropriate COM IDispatch calls.

To control how Variants (see page 23567) execute methods when they have a value that is an interface, assign your own procedure to VarDispProc.

The Linux implementation of IDispatch is currently undocumented, due to resource constraints. When that changes, decolorize and revise this topic.

172 VCLCom Namespace

This is namespace VCLCom.

Topics

Name	Description
Classes (see page 23684)	The following table lists classes in this documentation.

Classes

	Name	Description
	TComponentFactory (see page 23684)	TComponentFactory is the class factory for creating instances of components that support interfaces.

172.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TComponentFactory (see page 23684)	TComponentFactory is the class factory for creating instances of components that support interfaces.

172.1.1 TComponentFactory Class

TComponentFactory is the class factory for creating instances of components that support interfaces.

Class Hierarchy

Pascal

```
TComponentFactory = class(TAutoObjectFactory, IClassFactory);
```

C++

```
class TComponentFactory : public TAutoObjectFactory, public IClassFactory;
```

File

VCLCom

Description

TComponentFactory creates instances of component classes that implement interfaces. TComponentFactory supports the IClassFactory interface and inherits support for the IClassFactory2 interface.

Note: These components are actually created as contained objects of an automation object (aggregate).

172.1.1.1 TComponentFactory Members

The following tables list the members exposed by TComponentFactory.

Protected Methods

	Name	Description
	_AddRef (see page 5567)	This is _AddRef, a member of class TComObjectFactory.
	_Release (see page 5567)	This is _Release, a member of class TComObjectFactory.
	CreateInstance (see page 23687)	This is CreateInstance, a member of class TComponentFactory.
	CreateInstanceLic (see page 5568)	This is CreateInstanceLic, a member of class TComObjectFactory.
V	GetLicenseString (see page 5568)	This is GetLicenseString, a member of class TComObjectFactory.

	GetLicInfo (see page 5568)	This is GetLicInfo, a member of class TComObjectFactory.
V	GetProgID (see page 5569)	This is GetProgID, a member of class TComObjectFactory.
V	HasMachineLicense (see page 5569)	This is HasMachineLicense, a member of class TComObjectFactory.
	LockServer (see page 5569)	This is LockServer, a member of class TComObjectFactory.
	QueryInterface (see page 5569)	This is QueryInterface, a member of class TComObjectFactory.
	RequestLicKey (see page 5570)	This is RequestLicKey, a member of class TComObjectFactory.
V	ValidateUserLicense (see page 5571)	This is ValidateUserLicense, a member of class TComObjectFactory.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 23686)	Instantiates an instance of a TComponentFactory (see page 23684) object.
V	CreateComObject (see page 23686)	Instantiates a TComObject object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 5566)	Disposes of an instance of a class factory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetInterfaceTypeInfo (see page 5586)	Retrieves the type information for the typed COM object created by the factory.
V	GetIntfEntry (see page 5548)	Returns the entry for a specific interface implemented in a class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RegisterClassObject (see page 5569)	Registers the COM class associated with the factory object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	UpdateRegistry (see page 23687)	Registers the typed COM object class.

Public Properties

	Name	Description
R	ClassID (see page 5571)	This is ClassID, a member of class TComObjectFactory.
R	ClassInfo (see page 5587)	Specifies an interface reference that provides type information without having to load a type library.
R	ClassName (see page 5572)	Specifies the name of the class that the class factory instantiates.
R	ComClass (see page 5572)	This is ComClass, a member of class TComObjectFactory.
R	ComServer (see page 5572)	This is ComServer, a member of class TComObjectFactory.

R	Description (see page 5572)	Describes the class object.
R	DispIntfEntry (see page 5549)	Contains the entry for the dispatch interface implemented by the OLE Automation object created by the factory.
R	DispTypeInfo (see page 5549)	Returns an ITypeInfo interface reference to the type information for the dispinterface implemented by the OLE Automation object.
	ErrorIID (see page 5573)	Indicates the interface of the CoClass in which an error occurred.
R	EventIID (see page 5549)	This is EventIID, a member of class TAutoObjectFactory.
R	EventTypeInfo (see page 5550)	This is EventTypeInfo, a member of class TAutoObjectFactory.
R	Instancing (see page 5573)	Indicates the process space of COM object instances.
	LicString (see page 5573)	Contains licensing information about the object.
R	ProgID (see page 5574)	Specifies the name of the class factory.
	ShowErrors (see page 5574)	Indicates whether the COM object factory displays a message box when exceptions are raised.
	SupportsLicensing (see page 5574)	Indicates whether the object being instantiated supports licensing.
R	ThreadingModel (see page 5575)	Indicates the type of thread support provided by objects that the factory creates.

172.1.1.2 TComponentFactory.Create Constructor

Instantiates an instance of a TComponentFactory (see page 23684) object.

Pascal

```
constructor Create(ComServer: TComServerObject; ComponentClass: TComponentClass; const
ClassID: TGUID; Instancing: TClassInstancing; ThreadingModel: TThreadingModel = tmSingle);
```

C++

```
__fastcall TComponentFactory(TComServerObject ComServer, TComponentClass ComponentClass, const
TGUID ClassID, TClassInstancing Instancing, TThreadingModel ThreadingModel = tmSingle);
```

Description

Create allocates memory for a TComponentFactory (see page 23684) object, and calls the inherited Create, passing its parameters in the same order. The ComponentClass parameter is passed cast as a TAutoClass and passed to the AutoClass parameter.

Create

172.1.1.3 TComponentFactory Methods

The methods of the TComponentFactory class are listed here.

Protected Methods

	Name	Description
	CreateInstance (see page 23687)	This is CreateInstance, a member of class TComponentFactory.

Public Methods

	Name	Description
V	CreateComObject (see page 23686)	Instantiates a TComObject object.
V	UpdateRegistry (see page 23687)	Registers the typed COM object class.

172.1.1.3.1 TComponentFactory.CreateComObject Method

Instantiates a TComObject object.

Pascal

```
function CreateComObject(const Controller: IUnknown): TComObject; override;
```

C++

```
virtual __fastcall TComObject CreateComObject(const IUnknown Controller);
```

Description

CreateComObject is the method that instantiates the class type for which TComObjectFactory is the class factory. CreateComObject calls the CreateFromFactory constructor of the TComObject class to create a COM object. CreateComObject passes itself as the Factory parameter to CreateFromFactory.

CreateComClass creates a COM object based upon the value of the ComClass property. ComClass is the class identifier (CLSID) used by other applications to identify the COM class for which they request an object instance.

See Also

comclass (see page 5572)

CreateFromFactory (see page 5556)

TComObject (see page 5553)

172.1.1.3.2 TComponentFactory.CreateInstance Method

Pascal

```
function CreateInstance(const UnkOuter: IUnknown; const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const IUnknown UnkOuter, const TGUID IID,  Obj);
```

Description

This is CreateInstance, a member of class TComponentFactory.

172.1.1.3.3 TComponentFactory.UpdateRegistry Method

Registers the typed COM object class.

Pascal

```
procedure UpdateRegistry(Register: Boolean); override;
```

C++

```
virtual __fastcall UpdateRegistry(Boolean Register);
```

Description

UpdateRegistry is called for EXEs when the EXE is run, and for DLLs or EXEs when the routines are called to specifically register or unregister the server.

Constants (see page 24613)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAdapterException (see page 23696)	EAdapterException is raised by WebSnap adapter objects.
	EAdapterFieldException (see page 23698)	EAdapterFieldException is an exception class for errors by adapters using fields.
	TAbstractFieldValuesAdapter (see page 23701)	tabstractfieldvaluesadapter is the base class for adapters that have a single default field.
	TAdapter (see page 23713)	TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.
	TAdapterAction (see page 23726)	TAdapterAction is a generic adapter action that relies on event handlers.
	TAdapterActions (see page 23738)	TAdapterActions manages the list of actions that belong to an adapter.
	TAdapterApplicationField (see page 23745)	TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 24032) component.
	TAdapterApplicationTitleField (see page 23752)	TAdapterApplicationTitleField is an adapter field used to access the application title.
	TAdapterBooleanField (see page 23758)	TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.
	TAdapterDefaultActions (see page 23770)	TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.
	TAdapterDefaultFields (see page 23778)	TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.
	TAdapterEndUserDisplayNameField (see page 23787)	TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.
	TAdapterEndUserField (see page 23793)	TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.
	TAdapterEndUserLoggedInField (see page 23800)	TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.

	TAdapterError (see page 23807)	TAdapterError is the implementation of IAdapterError.
	TAdapterErrorsList (see page 23810)	TAdapterErrorsList keeps track of errors that an adapter encounters.
	TAdapterField (see page 23818)	TAdapterField is an event handler based adapter field that provides a single value.
	TAdapterFields (see page 23830)	TAdapterFields manages the list of fields that belong to an adapter.
	TAdapterFileField (see page 23837)	TAdapterFileField is an event handler based adapter field that can accept uploaded files.
	TAdapterGotoPageAction (see page 23849)	TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterHiddenField (see page 23860)	This is class WebAdapt.TAdapterHiddenField.
	TAdapterHiddenFieldsList (see page 23862)	TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.
	TAdapterImageField (see page 23869)	TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.
	TAdapterLoginField (see page 23882)	TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 24500) component.
	TAdapterMemoField (see page 23889)	TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.
	TAdapterMultiValueField (see page 23900)	TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.
	TAdapterNamedDisplayField (see page 23913)	The AdapterNamedDisplayField is a base class for adapter fields.
	TAdapterNamedField (see page 23925)	TAdapterNamedField is a based class for adapter field components.
	TAdapterNextPageAction (see page 23945)	TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterNextPageField (see page 23957)	The TAdapterNextPageField navigates to the next page of data.
	TAdapterObjectErrorsList (see page 23968)	This is class WebAdapt.TAdapterObjectErrorsList.
	TAdapterPasswordField (see page 23971)	TAdapterPasswordField is an adapter field used to access the password entered by the end-user.
	TAdapterPrevPageAction (see page 23979)	TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterSubComponent (see page 23991)	TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.
	TAdapterUpdateField (see page 24007)	TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.
	TAdapterUserNameField (see page 24024)	TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.
	TApplicationAdapter (see page 24032)	TApplicationAdapter is a container for field and action components that are available through the Application script variable.
	TBaseAdapterAction (see page 24043)	TBaseAdapterAction is a based class for adapter action components.
	TBaseAdapterErrorsList (see page 24077)	TBaseAdapterErrorsList is the base class for adapter error object managers.
	TBaseAdapterMultiValueField (see page 24086)	TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.
	TBaseEndUserAdapter (see page 24097)	TBaseEndUserAdapter contains user information.
	TBaseValuesListAdapter (see page 24120)	TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.
	TBaseValuesListField (see page 24132)	TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.
	TCustomAdapter (see page 24139)	TCustomAdapter is a base class for adapter components.
	TCustomAdapterAction (see page 24188)	TCustomAdapterAction is a base class for adapter actions.
	TCustomAdapterBooleanField (see page 24201)	tcustomadapterbooleanfield is a base class for adapter fields that provide a single Boolean value.
	TCustomAdapterField (see page 24211)	TCustomAdapterField is a base class for adapter fields that provide a single value.
	TCustomAdapterFileField (see page 24220)	TCustomAdapterFileField is a base class for adapter fields that can have associated files.
	TCustomAdapterGotoPageAction (see page 24233)	TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).
	TCustomAdapterImageField (see page 24244)	TCustomAdapterImageField is a base class for adapter fields that have an associated image file.
	TCustomAdapterMemoField (see page 24262)	TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.

	TCustomAdapterMultiValueField (see page 24273)	TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.
	TCustomAdapterPageAction (see page 24286)	TCustomPagedAdapterAction (see page 24371) is a base class for adapter actions that execute the next or previous page commands.
	TCustomApplicationAdapter (see page 24296)	TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.
	TCustomApplicationAdapterAction (see page 24306)	TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 24296).
	TCustomEndUserAdapter (see page 24313)	TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomEndUserAdapterAction (see page 24326)	TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 24313).
	TCustomEndUserSessionAdapter (see page 24333)	TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomLoginFormAdapter (see page 24344)	TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.
	TCustomLoginFormAdapterAction (see page 24363)	TCustomEndUserAdapterAction (see page 24326) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 24344).
	TCustomPagedAdapter (see page 24370)	TCustomPagedAdapter is a base class for adapters that support paging.
	TCustomPagedAdapterAction (see page 24371)	TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 24403).
	TCustomStringsValuesList (see page 24378)	TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.
	TDefaultFieldsAdapter (see page 24392)	TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.
	TDefaultFieldsPagedAdapter (see page 24403)	TDefaultFieldsPagedAdapter is a base class for adapters that support paging.
	TEndUserAdapter (see page 24421)	TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TEndUserAdapterLoginFormAction (see page 24436)	TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.
	TEndUserAdapterLogoutAction (see page 24447)	TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.
	TEndUserSessionAdapter (see page 24458)	TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TFieldValuesAdapter (see page 24471)	TFieldValuesAdapter is an adapter that includes a single field value.
	TFieldValuesValueField (see page 24483)	TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 24471).
	TImplementedAdapterAction (see page 24491)	TImplementedAdapterAction is a base class for adapter actions.
	TLogicalPageList (see page 24492)	This is class WebAdapt.TLogicalPageList.
	TLoginFormAdapter (see page 24500)	TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.
	TLoginFormAdapterLoginAction (see page 24514)	TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 24500).
	TPagedAdapter (see page 24525)	TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.
	TStringsValuesList (see page 24540)	TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.
	TUpdateFileList (see page 24550)	TUpdateFileList is a container for uploaded files.
	TValuesListNameField (see page 24552)	TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.
	TValuesListValueField (see page 24558)	TValuesListValueField is an adapter field used to access the Value (see page 23945) of the current list item of a values list adapter.

Constants

Name	Description
sActionRequestLong (see page 24613)	This is constant WebAdapt.sActionRequestLong.
sCurrentPage (see page 24613)	This is constant WebAdapt.sCurrentPage.
sGotoPageAction (see page 24614)	This is constant WebAdapt.sGotoPageAction.
sImageRequest (see page 24614)	This is constant WebAdapt.sImageRequest.
sLoginPassword (see page 24614)	This is constant WebAdapt.sLoginPassword.
sLoginUserName (see page 24615)	This is constant WebAdapt.sLoginUserName.

sNextPageAction (see page 24615)	This is constant WebAdapt.sNextPageAction.
sPrevPageAction (see page 24615)	This is constant WebAdapt.sPrevPageAction.

Functions

	Name	Description
	AddDefaultActions (see page 24589)	This is function WebAdapt.AddDefaultActions.
	AddDefaultFields (see page 24589)	This is function WebAdapt.AddDefaultFields.
	FindAdapterAction (see page 24590)	This is function WebAdapt.FindAdapterAction.
	FindAdapterField (see page 24590)	This is function WebAdapt.FindAdapterField.
	FindAdapterInParent (see page 24590)	This is function WebAdapt.FindAdapterInParent.
	MakeAdapterRequestIdentifier (see page 24591)	This is function WebAdapt.MakeAdapterRequestIdentifier.
	MakeValidAdapterFieldName (see page 24591)	This is function WebAdapt.MakeValidAdapterFieldName.
	RaiseFileUploadNotSupported (see page 24591)	This is function WebAdapt.RaiseFileUploadNotSupported.
	RaiseMultipleFilesException (see page 24592)	This is function WebAdapt.RaiseMultipleFilesException.
	RaiseMultipleValuesException (see page 24592)	This is function WebAdapt.RaiseMultipleValuesException.

Interfaces

	Name	Description
	IAdapterEditor (see page 24566)	This is class WebAdapt.IAdapterEditor.
	IAdapterNotifyAdapterChange (see page 24567)	This is class WebAdapt.IAdapterNotifyAdapterChange.
	ICheckOrigValue (see page 24568)	This is class WebAdapt.ICheckOrigValue.
	ICheckValueChange (see page 24569)	This is class WebAdapt.ICheckValueChange.
	IClearAdapterValues (see page 24570)	This is class WebAdapt.IClearAdapterValues.
	ICreateActionRequestContext (see page 24571)	This is class WebAdapt.ICreateActionRequestContext.
	IEchoActionFieldValue (see page 24572)	This is class WebAdapt.IEchoActionFieldValue.
	IEchoAdapterFieldValues (see page 24574)	This is class WebAdapt.IEchoAdapterFieldValues.
	IExecuteValue (see page 24575)	IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.
	IFullyQualifyInputNames (see page 24577)	This is class WebAdapt.IFullyQualifyInputNames.
	IGetAdapterErrorsList (see page 24578)	This is class WebAdapt.IGetAdapterErrorsList.
	IGetAdapterModeNames (see page 24579)	This is class WebAdapt.IGetAdapterModeNames.
	IGetRecordKeys (see page 24580)	This is class WebAdapt.IGetRecordKeys.
	IIdentifyAdapter (see page 24581)	This is class WebAdapt.IIdentifyAdapter.
	ISetSubComponents (see page 24581)	This is class WebAdapt.ISetSubComponents.
	ISetWebFieldValue (see page 24582)	This is class WebAdapt.ISetWebFieldValue.
	IUpdateValue (see page 24583)	This is class WebAdapt.IUpdateValue.
	IValidateValue (see page 24584)	This is class WebAdapt.IValidateValue.
	IWebActionsSubcomponent (see page 24585)	This is class WebAdapt.IWebActionsSubcomponent.
	IWebFieldsSubcomponent (see page 24585)	This is class WebAdapt.IWebFieldsSubcomponent.
	IWebGetFieldPrevValue (see page 24586)	This is class WebAdapt.IWebGetFieldPrevValue.

Structs, Records, Enums

	Name	Description
	TAdapterHiddenFieldOption (see page 24593)	This is record WebAdapt.TAdapterHiddenFieldOption.
	TIteratorMethod (see page 24593)	This is record WebAdapt.TIteratorMethod.

Types

Name	Description
IActionFieldValue (see page 24596)	This is type WebAdapt.IActionFieldValue.
IActionRequest (see page 24596)	This is type WebAdapt.IActionRequest.
TAbstractWebRequestFile (see page 24596)	This is type WebAdapt.TAbstractWebRequestFile.
TActionExecuteEvent (see page 24597)	This is type WebAdapt.TActionExecuteEvent.
TActionExecuteHandledEvent (see page 24597)	This is type WebAdapt.TActionExecuteHandledEvent.
TActionGetEnabledEvent (see page 24597)	This is type WebAdapt.TActionGetEnabledEvent.
TActionGetParamsEvent (see page 24598)	This is type WebAdapt.TActionGetParamsEvent.

TActionRequestFieldsEvent (see page 24598)	This is type WebAdapt.TActionRequestFieldsEvent.
TActionRequestFieldsHandledEvent (see page 24598)	This is type WebAdapt.TActionRequestFieldsHandledEvent.
TAdapterActionExecuteEvent (see page 24599)	This is type WebAdapt.TAdapterActionExecuteEvent.
TAdapterActionExecuteHandledEvent (see page 24599)	This is type WebAdapt.TAdapterActionExecuteHandledEvent.
TAdapterActionGetParamsEvent (see page 24599)	This is type WebAdapt.TAdapterActionGetParamsEvent.
TAdapterActionsClass (see page 24600)	This is type WebAdapt.TAdapterActionsClass.
TAdapterFieldBooleanValueEvent (see page 24600)	This is type WebAdapt.TAdapterFieldBooleanValueEvent.
TAdapterFieldFileEvent (see page 24600)	This is type WebAdapt.TAdapterFieldFileEvent.
TAdapterFieldFileListEvent (see page 24601)	This is type WebAdapt.TAdapterFieldFileListEvent.
TAdapterFieldGetBooleanEvent (see page 24601)	This is type WebAdapt.TAdapterFieldGetBooleanEvent.
TAdapterFieldGetMultiValueEvent (see page 24601)	This is type WebAdapt.TAdapterFieldGetMultiValueEvent.
TAdapterFieldGetMultiValueStringEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetMultiValueStringEvent.
TAdapterFieldGetStringEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetStringEvent.
TAdapterFieldGetValueCountEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetValueCountEvent.
TAdapterFieldGetValueEvent (see page 24603)	This is type WebAdapt.TAdapterFieldGetValueEvent.
TAdapterFieldHasValueEvent (see page 24603)	This is type WebAdapt.TAdapterFieldHasValueEvent.
TAdapterFieldsClass (see page 24603)	This is type WebAdapt.TAdapterFieldsClass.
TAdapterFieldStringEvent (see page 24604)	This is type WebAdapt.TAdapterFieldStringEvent.
TAdapterFieldStringsEvent (see page 24604)	This is type WebAdapt.TAdapterFieldStringsEvent.
TAdapterFieldValidateValueEvent (see page 24604)	This is type WebAdapt.TAdapterFieldValidateValueEvent.
TAdapterFieldValueEvent (see page 24605)	This is type WebAdapt.TAdapterFieldValueEvent.
TAdapterHiddenFieldOptions (see page 24605)	This is type WebAdapt.TAdapterHiddenFieldOptions.
TEndUserGetNameEvent (see page 24605)	This is type WebAdapt.TEndUserGetNameEvent.
TEndUserGetUserIDEvent (see page 24606)	This is type WebAdapt.TEndUserGetUserIDEvent.
TEndUserHandledEvent (see page 24606)	This is type WebAdapt.TEndUserHandledEvent.
TEndUserIsLoggedInEvent (see page 24606)	This is type WebAdapt.TEndUserIsLoggedInEvent.
TEndUserRightsEvent (see page 24607)	This is type WebAdapt.TEndUserRightsEvent.
TEndUserUserIDEvent (see page 24607)	This is type WebAdapt.TEndUserUserIDEvent.
TGetEOFEvent (see page 24607)	This is type WebAdapt.TGetEOFEvent.
TGetRecordCountEvent (see page 24608)	This is type WebAdapt.TGetRecordCountEvent.
TGetRecordEvent (see page 24608)	This is type WebAdapt.TGetRecordEvent.
TGetRecordIndexEvent (see page 24608)	This is type WebAdapt.TGetRecordIndexEvent.
THandledEvent (see page 24609)	This is type WebAdapt.THandledEvent.
TImageFieldGetHREFEvent (see page 24609)	This is type WebAdapt.TImageFieldGetHREFEvent.
TImageFieldGetImageEvent (see page 24609)	This is type WebAdapt.TImageFieldGetImageEvent.
TImageFieldGetParamsEvent (see page 24610)	This is type WebAdapt.TImageFieldGetParamsEvent.
TIterateRecordsEvent (see page 24610)	This is type WebAdapt.TIterateRecordsEvent.
TLoginUserIDEvent (see page 24610)	This is type WebAdapt.TLoginUserIDEvent.
TObjectList (see page 24611)	This is type WebAdapt.TObjectList.
TValidateAdapterFieldEvent (see page 24611)	This is type WebAdapt.TValidateAdapterFieldEvent.
TWebFormGetPageNameEvent (see page 24611)	This is type WebAdapt.TWebFormGetPageNameEvent.

Variables

Name	Description
NotifyPossibleHTMLChange (see page 24612)	This is variable WebAdapt.NotifyPossibleHTMLChange.

173.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAdapterException (see page 23696)	EAdapterException is raised by WebSnap adapter objects.
	EAdapterFieldException (see page 23698)	EAdapterFieldException is an exception class for errors by adapters using fields.
	TAbstractFieldValuesAdapter (see page 23701)	tabstractfieldvaluesadapter is the base class for adapters that have a single default field.
	TAdapter (see page 23713)	TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.
	TAdapterAction (see page 23726)	TAdapterAction is a generic adapter action that relies on event handlers.
	TAdapterActions (see page 23738)	TAdapterActions manages the list of actions that belong to an adapter.
	TAdapterApplicationField (see page 23745)	TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 24032) component.
	TAdapterApplicationTitleField (see page 23752)	TAdapterApplicationTitleField is an adapter field used to access the application title.
	TAdapterBooleanField (see page 23758)	TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.
	TAdapterDefaultActions (see page 23770)	TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.
	TAdapterDefaultFields (see page 23778)	TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.
	TAdapterEndUserDisplayNameField (see page 23787)	TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.
	TAdapterEndUserField (see page 23793)	TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.
	TAdapterEndUserLoggedInField (see page 23800)	TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.
	TAdapterError (see page 23807)	TAdapterError is the implementation of IAdapterError.
	TAdapterErrorsList (see page 23810)	TAdapterErrorsList keeps track of errors that an adapter encounters.
	TAdapterField (see page 23818)	TAdapterField is an event handler based adapter field that provides a single value.
	TAdapterFields (see page 23830)	TAdapterFields manages the list of fields that belong to an adapter.
	TAdapterFileField (see page 23837)	TAdapterFileField is an event handler based adapter field that can accept uploaded files.
	TAdapterGotoPageAction (see page 23849)	TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterHiddenField (see page 23860)	This is class WebAdapt.TAdapterHiddenField.
	TAdapterHiddenFieldsList (see page 23862)	TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.
	TAdapterImageField (see page 23869)	TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.
	TAdapterLoginField (see page 23882)	TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 24500) component.
	TAdapterMemoField (see page 23889)	TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.
	TAdapterMultiValueField (see page 23900)	TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.
	TAdapterNamedDisplayField (see page 23913)	The AdapterNamedDisplayField is a base class for adapter fields.
	TAdapterNamedField (see page 23925)	TAdapterNamedField is a based class for adapter field components.
	TAdapterNextPageAction (see page 23945)	TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterNextPageField (see page 23957)	The TAdapterNextPageField navigates to the next page of data.
	TAdapterObjectErrorsList (see page 23968)	This is class WebAdapt.TAdapterObjectErrorsList.

	TAdapterPasswordField (see page 23971)	TAdapterPasswordField is an adapter field used to access the password entered by the end-user.
	TAdapterPrevPageAction (see page 23979)	TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 24403).
	TAdapterSubComponent (see page 23991)	TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.
	TAdapterUpdateField (see page 24007)	TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.
	TAdapterUserNameField (see page 24024)	TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.
	TApplicationAdapter (see page 24032)	TApplicationAdapter is a container for field and action components that are available through the Application script variable.
	TBaseAdapterAction (see page 24043)	TBaseAdapterAction is a based class for adapter action components.
	TBaseAdapterErrorsList (see page 24077)	TBaseAdapterErrorsList is the base class for adapter error object managers.
	TBaseAdapterMultiValueField (see page 24086)	TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.
	TBaseEndUserAdapter (see page 24097)	TBaseEndUserAdapter contains user information.
	TBaseValuesListAdapter (see page 24120)	TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.
	TBaseValuesListField (see page 24132)	TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.
	TCustomAdapter (see page 24139)	TCustomAdapter is a base class for adapter components.
	TCustomAdapterAction (see page 24188)	TCustomAdapterAction is a base class for adapter actions.
	TCustomAdapterBooleanField (see page 24201)	tcustomadapterbooleanfield is a base class for adapter fields that provide a single Boolean value.
	TCustomAdapterField (see page 24211)	TCustomAdapterField is a base class for adapter fields that provide a single value.
	TCustomAdapterFileField (see page 24220)	TCustomAdapterFileField is a base class for adapter fields that can have associated files.
	TCustomAdapterGotoPageAction (see page 24233)	TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).
	TCustomAdapterImageField (see page 24244)	TCustomAdapterImageField is a base class for adapter fields that have an associated image file.
	TCustomAdapterMemoField (see page 24262)	TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.
	TCustomAdapterMultiValueField (see page 24273)	TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.
	TCustomAdapterPageAction (see page 24286)	TCustomPagedAdapterAction (see page 24371) is a base class for adapter actions that execute the next or previous page commands.
	TCustomApplicationAdapter (see page 24296)	TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.
	TCustomApplicationAdapterAction (see page 24306)	TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 24296).
	TCustomEndUserAdapter (see page 24313)	TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomEndUserAdapterAction (see page 24326)	TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 24313).
	TCustomEndUserSessionAdapter (see page 24333)	TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomLoginFormAdapter (see page 24344)	TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.
	TCustomLoginFormAdapterAction (see page 24363)	TCustomEndUserAdapterAction (see page 24326) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 24344).
	TCustomPagedAdapter (see page 24370)	TCustomPagedAdapter is a base class for adapters that support paging.
	TCustomPagedAdapterAction (see page 24371)	TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 24403).
	TCustomStringsValuesList (see page 24378)	TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.
	TDefaultFieldsAdapter (see page 24392)	TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.
	TDefaultFieldsPagedAdapter (see page 24403)	TDefaultFieldsPagedAdapter is a base class for adapters that support paging.

	TEndUserAdapter (see page 24421)	TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TEndUserAdapterLoginFormAction (see page 24436)	TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.
	TEndUserAdapterLogoutAction (see page 24447)	TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.
	TEndUserSessionAdapter (see page 24458)	TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TFieldValuesAdapter (see page 24471)	TFieldValuesAdapter is an adapter that includes a single field value.
	TFieldValuesValueField (see page 24483)	TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 24471).
	TImplementedAdapterAction (see page 24491)	TImplementedAdapterAction is a base class for adapter actions.
	TLogicalPageList (see page 24492)	This is class WebAdapt.TLogicalPageList.
	TLoginFormAdapter (see page 24500)	TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.
	TLoginFormAdapterLoginAction (see page 24514)	TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 24500).
	TPagedAdapter (see page 24525)	TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.
	TStringsValuesList (see page 24540)	TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.
	TUpdateFileList (see page 24550)	TUpdateFileList is a container for uploaded files.
	TValuesListNameField (see page 24552)	TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.
	TValuesListValueField (see page 24558)	TValuesListValueField is an adapter field used to access the Value (see page 23945) of the current list item of a values list adapter.

173.1.1 EAdapterException Class

EAdapterException is raised by WebSnap adapter objects.

Class Hierarchy

System::TObject → SysUtils.Exception → HTTPApp.EWebBrokerException → WebAdapt.EAdapterException

Pascal

```
EAdapterException = class(EWebBrokerException);
```

C++

```
class EAdapterException : public EWebBrokerException;
```

File

WebAdapt

Description

EAdapterException is raised when a WebSnap adapter object encounters an error. EAdapterException provides an ID (see page 23698) property to record application-defined errors.

173.1.1.1 EAdapterException Members

The following tables list the members exposed by EAdapterException.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 22752)	Instantiates an instance of an exception with a simple message string.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateID (see page 23697)	Create exception object with error ID (see page 23698).
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	ID (see page 23698)	Application error ID.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

173.1.1.2 EAdapterException.CreateID Constructor

Create exception object with error ID (see page 23698).

Pascal

```
constructor CreateID(const AMsg: string; AID: Integer; Reserved: Integer = 0);
```

C++

```
__fastcall EAdapterException(const AnsiString AMsg, int AID, int Reserved = 0);
```

Description

CreateID creates an EAdapterException (see page 23696) object in the usual way, and also assigns AID to the ID (see page 23698) property.

Reserved is not implemented.

173.1.1.3 EAdapterException Properties

The properties of the EAdapterException class are listed here.

Public Properties

	Name	Description
	ID (see page 23698)	Application error ID.

173.1.1.3.1 EAdapterException.ID Property

Application error ID.

Pascal

```
property ID: Integer;
```

C++

```
__property int ID;
```

Description

The ID property returns an application-defined value relating to the error. To specify an ID value, create an EAdapterException (see page 23696) object using the CreateID (see page 23697) constructor (Delphi) or the constructor syntax that includes an ID as a parameter (C++). For exceptions raised by built-in WebSnap adapters, ID is always 0.

See Also

CreateID (see page 23697)

173.1.2 EAdapterFieldException Class

EAdapterFieldException is an exception class for errors by adapters using fields.

Class Hierarchy

Pascal

```
EAdapterFieldException = class(EAdapterException);
```

C++

```
class EAdapterFieldException : public EAdapterException;
```

File

WebAdapt

Description

EAdapterFieldException is raised when an adapter encounters an error using a field.

173.1.2.1 EAdapterFieldException Members

The following tables list the members exposed by EAdapterFieldException.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 23700)	Create an EAdapterFieldException (see page 23698) instance.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateID (see page 23697)	Create exception object with error ID (see page 23698).
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	FieldName (see page 23700)	FieldName contains the name of the field associated with the error.

	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	ID (see page 23698)	Application error ID.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

173.1.2.2 EAdapterFieldException.Create Constructor

Create an EAdapterFieldException (see page 23698) instance.

Pascal

```
constructor Create(const AMsg: string; const AFieldName: string; AID: Integer = 0);
```

C++

```
__fastcall EAdapterFieldException(const AnsiString AMsg, const AnsiString AFieldName, int AID
= 0);
```

Description

Create instantiates an instance of EAdapterFieldException (see page 23698).

AMsg is the string containing the runtime error message to display in the exception dialog box. AMsg can be a hard-coded string, or can be a function call that returns a string.

AFieldName and AID are assigned to the FieldName (see page 23700) and ID (see page 23698) properties.

See Also

FieldName (see page 23700)

ID (see page 23698)

173.1.2.3 EAdapterFieldException Properties

The properties of the EAdapterFieldException class are listed here.

Public Properties

	Name	Description
	FieldName (see page 23700)	FieldName contains the name of the field associated with the error.

173.1.2.3.1 EAdapterFieldException.FieldName Property

FieldName contains the name of the field associated with the error.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

```
__property AnsiString FieldName = {read=FFieldName, write=FFieldName};
property FieldName: string;
```

FieldName contains the name of the field associated with the error.

173.1.3 TAbstractFieldValuesAdapter Class

tabstractfieldvaluesadapter is the base class for adapters that have a single default field.

Class Hierarchy

Pascal

```
TAbstractFieldValuesAdapter = class(TDefaultFieldsAdapter, IFieldValuesAdapter);
```

C++

```
class TAbstractFieldValuesAdapter : public TDefaultFieldsAdapter, public IFieldValuesAdapter;
```

File

WebAdapt

Description

Derive from tabstractfieldvaluesadapter to define adapter components that automatically include a single adapter field called ‘ValueField'.

Do not use TAbstractFieldValuesAdpter directly. It includes many abstract or, in C++ parlance, pure virtual methods, which must

be implemented by a descendant class such as TFieldValuesAdapter (see page 24471).

See Also

TFieldValuesAdapter (see page 24471)

173.1.3.1 TAbstractFieldValuesAdapter Members

The following tables list the members exposed by TAbstractFieldValuesAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.

	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetField (see page 23708)	Returns the object that represents the single field of this adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
A	GetValueFieldClass (see page 23709)	Returns the class of the single adapter field this adapter includes.
	GetValueIndex (see page 23709)	Returns an index that identifies the current adapter field value.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 23710)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 23710)	Provides the underlying implementation for the EndIterator (see page 24152) method.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
A	ImplGetField (see page 23711)	Provides the underlying implementation for the GetField (see page 23708) method.
V	ImplGetFieldsList (see page 23711)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.
V	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
A	ImplGetValueIndex (see page 23711)	Provides the underlying implementation for the GetValueIndex (see page 23709) method.

	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 23712)	Provides the underlying implementation for the NextIteration (see page 24173) method.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 23712)	Provides the underlying implementation for the StartIterator (see page 24176) method.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.

	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.

	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.3.2 TAbstractFieldValuesAdapter Methods

The methods of the TAbstractFieldValuesAdapter class are listed here.

Protected Methods

	Name	Description
	GetField (see page 23708)	Returns the object that represents the single field of this adapter.
A	GetValueFieldClass (see page 23709)	Returns the class of the single adapter field this adapter includes.
	GetValueIndex (see page 23709)	Returns an index that identifies the current adapter field value.
V	ImplCanAddFieldClass (see page 23710)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
V	ImplEndIterator (see page 23710)	Provides the underlying implementation for the EndIterator (see page 24152) method.
A	ImplGetField (see page 23711)	Provides the underlying implementation for the GetField (see page 23708) method.
V	ImplGetFieldsList (see page 23711)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.
A	ImplGetValueIndex (see page 23711)	Provides the underlying implementation for the GetValueIndex (see page 23709) method.
V	ImplNextIteration (see page 23712)	Provides the underlying implementation for the NextIteration (see page 24173) method.
V	ImplStartIterator (see page 23712)	Provides the underlying implementation for the StartIterator (see page 24176) method.

173.1.3.2.1 TAbstractFieldValuesAdapter.GetField Method

Returns the object that represents the single field of this adapter.

Pascal

```
function GetField: TObject;
```

C++

```
__fastcall TObject * GetField();
```

Description

Call GetField to access the single field for this adapter. GetField returns an adapter field that is an instance of the class that the GetValueFieldClass (see page 23709) method returns.

GetField calls the abstract or, in C++ terminology, pure virtual ImplGetField (see page 23711) method to obtain the adapter field instance it returns. Descendant classes override ImplGetField (see page 23711) to provide the underlying implementation

for GetField.

See Also

ImplGetField (see page 23711)

GetValueFieldClass (see page 23709)

173.1.3.2.2 TAbstractFieldValuesAdapter.GetValueFieldClass Method

Returns the class of the single adapter field this adapter includes.

Pascal

```
function GetValueFieldClass: TComponentClass; virtual; abstract;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass() = 0;
```

Description

GetValueFieldClass returns the class reference for the type of the single adapter field that the GetField (see page 23708) method returns. The return value must be a descendant of TComponent and is typically a descendant of TAdapterNamedField (see page 23925).

In TAbstractFieldValuesAdapter (see page 23701), GetValueFieldClass is abstract or, in C++ terminology, pure virtual. Descendant classes must override this method to indicate the type of field this adapter includes.

See Also

GetField (see page 23708)

TAdapterNamedField (see page 23925)

173.1.3.2.3 TAbstractFieldValuesAdapter.GetValueIndex Method

Returns an index that identifies the current adapter field value.

Pascal

```
function GetValueIndex: Integer;
```

C++

```
__fastcall int GetValueIndex();
```

Description

Although this adapter only includes a single adapter field, that field may have several values (for example, if it represents a column in a table). When the field has several values, GetValueIndex is the index of the current value. This index may be the same as the value that the GetIteratorIndex (see page 24160) method returns if the application is using the adapter's iteration support. However, TAbstractFieldValuesAdapter (see page 23701) introduces GetValueIndex as a separate method for descendants that support multiple values that change using some other mechanism.

GetValueIndex calls the abstract or, in C++ terminology, pure virtual ImplGetValueIndex (see page 23711) method to obtain the index of the current value. Descendant classes override ImplGetValueIndex (see page 23711) to provide the underlying implementation for GetValueIndex.

See Also

ImplGetValueIndex (see page 23711)

GetIteratorIndex (see page 24160)

173.1.3.2.4 TAbstractFieldValuesAdapter.ImplCanAddFieldClass Method

Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddFieldClass (see page 24150) method calls ImplCanAddFieldClass to determine whether this adapter can include a field that is an instance of a specified class. This allows the adapter editor to indicate the available fields at design time.

AParent is an instance of this adapter class to which the field is to be added.

AClass is the class of the object that represents the adapter field.

ImplCanAddFieldClass returns true if AClass is the same as (or a descendant of) the class that the GetValueFieldClass (see page 23709) method returns, indicating that this is the only child field this adapter supports. It returns false for any other class.

See Also

CanAddFieldClass (see page 24150)

GetValueFieldClass (see page 23709)

173.1.3.2.5 TAbstractFieldValuesAdapter.ImplEndIterator Method

Provides the underlying implementation for the EndIterator (see page 24152) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

The EndIterator (see page 24152) method calls ImplEndIterator to stop the process of iterating through the adapter's field's possible values.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way.

ImplEndIterator raises an exception, because this method should never be called at the TAbstractFieldValuesAdapter (see page 23701) level: The TAbstractFieldValuesAdapter (see page 23701) ImplStartIterator (see page 23712) method returns false, indicating that this adapter does not support iteration.

Descendant classes that implement support for iterating over field values override this method to end that iteration process.

See Also

EndIterator (see page 24152)

ImplStartIterator (see page 23712)

ImplNextIteration (see page 23712)

173.1.3.2.6 TAbstractFieldValuesAdapter.ImplGetField Method

Provides the underlying implementation for the GetField (see page 23708) method.

Pascal

```
function ImplGetField: TObject; virtual; abstract;
```

C++

```
virtual __fastcall TObject * ImplGetField() = 0;
```

Description

The GetField (see page 23708) method calls ImplGetField to obtain the object that represents this adapter's single field. Unlike the GetField (see page 23708) method, ImplGetField is virtual, so that descendant classes can override it to provide a class-specific mechanism for obtaining the adapter field object.

In TAbstractFieldValuesAdapter (see page 23701), ImplGetField is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the GetField (see page 23708) method.

See Also

GetField (see page 23708)

173.1.3.2.7 TAbstractFieldValuesAdapter.ImplGetFieldsList Method

Provides the underlying implementation for the GetFieldsList (see page 24159) method.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The GetFieldsList (see page 24159) method calls ImplGetFieldsList to fill a string list with a list of all fields that the adapter includes. Each entry in the list is the name of one of the adapter's field, and has an associated object that is the class of the object that represents that adapter field. GetFieldsList (see page 24159) is part of the design-time support for editing adapters.

AList is an existing string list to fill with entries for all of the fields this adapter can include.

In TAbstractFieldValuesAdapter (see page 23701), ImplGetFieldsList clears AList and inserts a single entry for a field named 'ValueField'. It associates the class that the GetValueFieldClass (see page 23709) method returns with this field name.

See Also

GetValueFieldClass (see page 23709)

GetFieldsList (see page 24159)

173.1.3.2.8 TAbstractFieldValuesAdapter.ImplGetValueIndex Method

Provides the underlying implementation for the GetValueIndex (see page 23709) method.

Pascal

```
function ImplGetValueIndex: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int ImplGetValueIndex() = 0;
```

Description

The GetValueIndex (see page 23709) method calls ImplGetValueIndex to obtain the index of current value of this adapter's single field. Unlike the GetValueIndex (see page 23709) method, ImplGetValueIndex is virtual, so that descendant classes can override it to provide a class-specific mechanism for obtaining this index.

In TAbstractFieldValuesAdapter (see page 23701), ImplGetValueIndex is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the GetValueIndex (see page 23709) method.

See Also

GetValueIndex (see page 23709)

173.1.3.2.9 TAbstractFieldValuesAdapter.ImplNextIteration Method

Provides the underlying implementation for the NextIteration (see page 24173) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

The NextIteration (see page 24173) method calls ImplNextIteration when iterating over field values to determine whether there is another field value after the current one and if so, to change the current value to the next one.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. On entry, this value is typically the same as the value returned by the last call to NextIteration (see page 24173) or to StartIterator (see page 24176).

In TAbstractFieldValuesAdapter (see page 23701), ImplNextIteration always returns false, because TAbstractFieldValuesAdapter (see page 23701) does not implement support for iteration. Descendant classes that support iterating over field values override this method to check whether their is a next value and if so, move to it.

See Also

NextIteration (see page 24173)

ImplStartIterator (see page 23712)

ImplEndIterator (see page 23710)

173.1.3.2.10 TAbstractFieldValuesAdapter.ImplStartIterator Method

Provides the underlying implementation for the StartIterator (see page 24176) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

The StartIterator (see page 24176) method calls ImplStartIterator to start the process of iterating through the adapter's field's possible values. The return value indicates whether the adapter's field has any values over which to iterate.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way. Depending on the adapter, it may be supplied by the caller, or created by the ImplStartIterator method.

In TAbstractFieldValuesAdapter (see page 23701), ImplNextIteration (see page 23712) always returns false, because TAbstractFieldValuesAdapter (see page 23701) does not implement support for obtaining any field values. Descendant classes that override this method to check whether they can move to the first value in the field's set of values. If so, they move to the first value and return true. Otherwise they return false.

See Also

StartIterator (see page 24176)

ImplEndIterator (see page 23710)

ImplNextIteration (see page 23712)

173.1.4 TAdapter Class

TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.

Class Hierarchy

Pascal

```
TAdapter = class(TCustomAdapter);
```

C++

```
class TAdapter : public TCustomAdapter;
```

File

WebAdapt

Description

Use TAdapter to define a custom interface to application logic. Adapters contain field components and action components that represent data items and commands, respectively. Server-side script statements access the value of Adapter fields and the parameters of Adapter actions in order to build HTML forms and tables. Server-side script can be written by hand or automatically generated by the TAdapterPageProducer component. When an HTML form containing Adapter commands is submitted, the TAdapterDispatcher may automatically call an Adapter action component to execute the command. When an HTTP request for an adapter image field is received the TAdapterDispatcher may automatically call an Adapter field to retrieve the image.

For each field component added to TAdapter, you must implement an event handler to retrieve the data. For each action component added to TAdapter, you must implement an event handler to execute the command. Other adapter components,

such as TDataSetAdapter and TLoginFormAdapter (see page 24500), have built in fields and actions that do not require events.

173.1.4.1 TAdapter Members

The following tables list the members exposed by TAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.

	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.

	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 23722)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 23723)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 23723)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 23723)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 23724)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 23724)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 23725)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 23725)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 23725)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 23726)	Occurs when the adapter needs to iterate over its data records.

Published Properties

	Name	Description
	Actions (see page 23721)	Actions is the container for adapter actions components.
	Data (see page 23721)	Data is the container for adapter field components.
	ModifyAccess (see page 23721)	This is ModifyAccess, a member of class TAdapter.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 23722)	Identifies the rights required to view this adapter's fields.

173.1.4.2 TAdapter Properties

The properties of the TAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 23721)	Actions is the container for adapter actions components.
	Data (see page 23721)	Data is the container for adapter field components.
	ModifyAccess (see page 23721)	This is ModifyAccess, a member of class TAdapter.
	ViewAccess (see page 23722)	Identifies the rights required to view this adapter's fields.

173.1.4.2.1 TAdapter.Actions Property

Actions is the container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterActions (see page 23738)

173.1.4.2.2 TAdapter.Data Property

Data is the container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterFields (see page 23830)

173.1.4.2.3 TAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TAdapter.

173.1.4.2.4 TAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

implhasviewaccess (see page 24169)

173.1.4.3 TAdapter Events

The events of the TAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 23722)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 23723)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 23723)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 23723)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 23724)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 23724)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 23725)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 23725)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 23725)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 23726)	Occurs when the adapter needs to iterate over its data records.

173.1.4.3.1 TAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter

action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.4.3.2 TAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.4.3.3 TAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnBeforeUpdateFields (see page 24187)

Errors (see page 24182)

173.1.4.3.4 TAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 24178)

OnBeforeValidateFields (see page 24187)

Errors (see page 24182)

173.1.4.3.5 TAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.4.3.6 TAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.4.3.7 TAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

173.1.4.3.8 TAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 24178)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

173.1.4.3.9 TAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.4.3.10 TAdapter.OnIterateRecords Event

Occurs when the adapter needs to iterate over its data records.

Pascal

```
property OnIterateRecords: TIterateRecordsEvent;
```

C++

```
__property TIterateRecordsEvent OnIterateRecords;
```

Description

Implement this event when the adapter supports multiple data records. This event handler is called when server-side script iterates over the records in adapter, such as when generating an HTML table displaying all records. The event handler must update an iteration pointer or cursor that adapter fields are also aware of. Adapter fields must use this iteration pointer when called to retrieve their value.

See Also

IIteratorSupport (see page 19722)

173.1.5 TAdapterAction Class

TAdapterAction is a generic adapter action that relies on event handlers.

Class Hierarchy

Pascal

```
TAdapterAction = class(TCustomAdapterAction);
```

C++

```
class TAdapterAction : public TCustomAdapterAction;
```

File

WebAdapt

Description

TAdapterAction publishes the properties in TCustomAdapterAction (see page 24188). TCustomAdapterAction (see page 24188) calls event handlers to retrieve the adapter action's parameters, get the state of the action, and execute the adapter action. Add TAdapterAction to TAdapter (see page 23713) or other adapter components types when you need an adapter action that will be controlled by event handlers. Other adapter action components declare events but also have built-in logic to work with a particular type of adapter. For example, TAdapterNextPageAction (see page 23945) has built-in logic to take the end user to the next page provided by TPagedAdapter (see page 24525). TAdapterAction, on the other hand, does not have this sort of built-in logic.

See Also

TAdapterActions (see page 23738)

TAdapter (see page 23713)

TAdapterDispatcher (see page 24840)

173.1.5.1 TAdapterAction Members

The following tables list the members exposed by TAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.

V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 23735)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23735)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23736)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23736)	Called before the adapter action response is generated.
	OnExecute (see page 23737)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 23737)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 23737)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	ActionName (see page 23733)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 23734)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23734)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 23734)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.5.2 TAdapterAction Properties

The properties of the TAdapterAction class are listed here.

Published Properties

	Name	Description
	ActionName (see page 23733)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 23734)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23734)	Defines the rights required to execute this action.
	RedirectOptions (see page 23734)	Indicates whether to perform an HTTP redirect after successfully executing this action.

173.1.5.2.1 TAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;__property AnsiString ActionName;__property AnsiString
ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

ImplGetActionName (see page 24195)

ImplSetActionName (see page 24197)

173.1.5.2.2 TAdapterAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.5.2.3 TAdapterAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

173.1.5.2.4 TAdapterAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

173.1.5.3 TAdapterAction Events

The events of the TAdapterAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 23735)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23735)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23736)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23736)	Called before the adapter action response is generated.
	OnExecute (see page 23737)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 23737)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 23737)	Specifies name/value pairs needed to execute this adapter action.

173.1.5.3.1 TAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.5.3.2 TAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by

DoAfterGetExecuteActionReponse.

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.5.3.3 TAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.5.3.4 TAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.5.3.5 TAdapterAction.OnExecute Event

Called to execute this action using parameters passed in the HTTP request.

Pascal

```
property OnExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnExecute;
```

Description

Implement this event handler to execute this adapter action. Params contains the name/value pairs that were passed in the HTTP request. OnExecute is called by ImplExecuteActionRequest.

See Also

ImplExecuteActionRequest (see page 24195)

OnGetParams (see page 24077)

173.1.5.3.6 TAdapterAction.OnGetEnabled Event

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
property OnGetEnabled: TActionGetEnabledEvent;
```

C++

```
__property TActionGetEnabledEvent OnGetEnabled;
```

Description

ImplWebEnabled calls the OnGetEnabled event handler. Set the Enabled parameter to false to indicate that this adapter action should not be enabled.

See Also

ImplWebEnabled (see page 24197)

173.1.5.3.7 TAdapterAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.6 TAdapterActions Class

TAdapterActions manages the list of actions that belong to an adapter.

Class Hierarchy

Pascal

```
TAdapterActions = class(TAdapterSubComponent, IWebActionsSubcomponent);
```

C++

```
class TAdapterActions : public TAdapterSubComponent, public IWebActionsSubcomponent;
```

File

WebAdapt

Description

TAdapterActions is the type of the Actions property on an adapter component. It manages a list that contains all the actions that belong to the adapter. The action objects (TBaseAdapterAction (see page 24043) descendants) are available using the WebActions (see page 23745) property. TAdapterActions also includes support for associating the actions with variable names so that server-side script can execute the actions.

TAdapterActions represents the list of explicitly assigned actions. Adapters that include a set of default actions use a TAdapterDefaultActions (see page 23770) object instead.

See Also

TCustomAdapter (see page 24139)

TAdapterFields (see page 23830)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

TBaseAdapterAction (see page 24043)

173.1.6.1 TAdapterActions Members

The following tables list the members exposed by TAdapterActions.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdapterCanAddClass (see page 23742)	Indicates whether the associated adapter supports a specified class of action component.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24755)	Executes a callback for each child Web item.
	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 23999)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
V	GetDefaultWebComponents (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 24001)	Returns the value of the VariablesInUse (see page 24007) property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 23743)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 23744)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
V	Notification (see page 2783)	Forwards notification messages to all owned components.

	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 24004)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetDefaultWebComponents (see page 24757)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetWebParent (see page 23744)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24755)	Frees an instance of TWebContainerComponent (see page 24751).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24000)	Returns the associated adapter.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebActions (see page 23745)	Lists the action components that this object manages.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.6.2 TAdapterActions Methods

The methods of the TAdapterActions class are listed here.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 23742)	Indicates whether the associated adapter supports a specified class of action component.
V	ImplCanAddClass (see page 23743)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetWebComponentNodeName (see page 23744)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
V	SetWebParent (see page 23744)	Introduces a method to associate this component with an adapter.

173.1.6.2.1 TAdapterActions.AdapterCanAddClass Method

Indicates whether the associated adapter supports a specified class of action component.

Pascal

```
function AdapterCanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean AdapterCanAddClass(TComponent * AParent, TClass AClass);
```

Description

TAdapterActions (see page 23738) uses this method internally as part of its implementation for the CanAddClass (see page 23996) method. This allows the TAdapterActions (see page 23738) object to indicate, at design time, which types of action components are valid as components in the WebActions (see page 23745) property list.

AParent is the instance of TAdapterActions (see page 23738) to which the child actions are to be added.

AClass describes the class of the child component to be added to AParent.

AdapterCanAddClass returns true if the adapter recognizes and supports AClass as a child action, false otherwise.

AdapterCanAddClass calls the CanAddActionClass method of its associated adapter to determine whether it accepts the specified action class.

See Also

WebActions (see page 23745)

Adapter (see page 24006)

ImplCanAddClass (see page 23743)

CanAddActionClass (see page 24150)

173.1.6.2.2 TAdapterActions.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 23996) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 23996) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterActions (see page 23738) object to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterActions (see page 23738) object can include a child of type AClass, false otherwise.

ImplCanAddClass returns true if one of the following two conditions is met:

AClass is an adapter action class that the associated adapter recognizes and accepts.

AClass is a custom adapter action (a descendant of TCustomAdapterAction (see page 24188) that is not a descendant of TImplementedAdapterAction (see page 24491)).

See Also

CanAddClass (see page 23996)

AdapterCanAddClass (see page 23742)

TCustomAdapterAction (see page 24188)

TImplementedAdapterAction (see page 24491)

173.1.6.2.3 TAdapterActions.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.

Pascal

```
function ImplGetWebComponentNodeName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 24001) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the string 'Actions'.

See Also

GetWebComponentNodeName (see page 24001)

173.1.6.2.4 TAdapterActions.SetWebParent Method

Introduces a method to associate this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); override;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

TAdapterSubComponent introduces SetWebParent as a virtual method for setting the read-only Adapter property.

Value is the adapter component that acts as a parent to this collection.

In TAdapterSubComponent, SetWebParent does nothing. Descendant classes override this method to set the Adapter property and populate the list with actions or fields appropriate to that adapter.

See Also

Adapter (see page 24006)

173.1.6.3 TAdapterActions Properties

The properties of the TAdapterActions class are listed here.

Public Properties

	Name	Description
R	WebActions (see page 23745)	Lists the action components that this object manages.

173.1.6.3.1 TAdapterActions.WebActions Property

Lists the action components that this object manages.

Pascal

```
property WebActions: TWebComponentList;
```

C++

```
__property TWebComponentList WebActions;
```

Description

Read WebActions to access the list of action components. Each component in this list is a descendant of TBaseAdapterAction (see page 24043).

See Also

TBaseAdapterAction (see page 24043)

173.1.7 TAdapterApplicationField Class

TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 24032) component.

Class Hierarchy

Pascal

```
TAdapterApplicationField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterApplicationField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterApplicationField implements functionality useful to an adapter field that can be a child of TApplicationAdapter (see page 24032).

See Also

TApplicationAdapter (see page 24032)

TAdapterNamedDisplayField (see page 23913)

TAdapterApplicationTitleField (see page 23752)

173.1.7.1 TAdapterApplicationField Members

The following tables list the members exposed by TAdapterApplicationField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.

	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23751)	Returns the parent adapter of this adapter field.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.7.2 TAdapterApplicationField Properties

The properties of the TAdapterApplicationField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 23751)	Returns the parent adapter of this adapter field.

173.1.7.2.1 TAdapterApplicationField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TCustomApplicationAdapter;
```

C++

```
__property TCustomApplicationAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter.

See Also

TCustomApplicationAdapter (see page 24296)

173.1.8 TAdapterApplicationTitleField Class

TAdapterApplicationTitleField is an adapter field used to access the application title.

Class Hierarchy

Pascal

```
TAdapterApplicationTitleField = class(TAdapterApplicationField);
```

C++

```
class TAdapterApplicationTitleField : public TAdapterApplicationField;
```

File

WebAdapt

Description

TAdapterApplicationTitleField is added to TApplicationAdapter (see page 24032).

See Also

TAdapterApplicationField (see page 23745)

TApplicationAdapter (see page 24032)

TCustomApplicationAdapter (see page 24296)

173.1.8.1 TAdapterApplicationTitleField Members

The following tables list the members exposed by TAdapterApplicationTitleField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23758)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23758)	Returns the value associated with this adapter field.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23751)	Returns the parent adapter of this adapter field.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.8.2 TAdapterApplicationTitleField Methods

The methods of the TAdapterApplicationTitleField class are listed here.

Protected Methods

	Name	Description
	GetDefaultFieldName (see page 23758)	Returns the name used to access this adapter field with server-side script.
	ImplGetValue (see page 23758)	Returns the value associated with this adapter field.

173.1.8.2.1 TAdapterApplicationTitleField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'Title'. This allows server-side script to access this adapter field using the parent adapter's Title property.

173.1.8.2.2 TAdapterApplicationTitleField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the value of the parent adapter's Title property. Server-side script accesses the result of this function using the DisplayText property of this adapter field. Server-side script may use this value to display the application title on a Web page.

See Also

ApplicationTitle (see page 24305)

173.1.9 TAdapterBooleanField Class

TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.

Class Hierarchy

Pascal

```
TAdapterBooleanField = class(TCustomAdapterBooleanField);
```

C++

```
class TAdapterBooleanField : public TCustomAdapterBooleanField;
```

File

WebAdapt

Description

TAdapterBooleanField publishes the properties in TCustomAdapterBooleanField (see page 24201). TCustomAdapterBooleanField (see page 24201) calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

Add TAdapterBooleanField to TAdapter (see page 23713) or other adapter components types when you need an adapter field that works with a Boolean value. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 23818), TAdapterMultiValueField (see page 23900),

TAdapterMemoField (see page 23889), TAdapterFileField (see page 23837) and TAdapterImageField (see page 23869).

See Also

TAdapter (see page 23713)

TAdapterField (see page 23818)

TAdapterMemoField (see page 23889)

TAdapterMultiValueField (see page 23900)

TAdapterFileField (see page 23837)

TAdapterImageField (see page 23869)

173.1.9.1 TAdapterBooleanField Members

The following tables list the members exposed by TAdapterBooleanField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValue (see page 24208)	Retrieves a Boolean value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.

	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayStyleType (see page 24208)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetInputStyleType (see page 24208)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetValue (see page 24209)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.

	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplIsEqual (see page 24209)	Indicates whether the value of this field is equal to a particular Variant value.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24209)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsEqual (see page 24210)	Indicates whether the value of this field is equal to a particular Variant value.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEqual (see page 19787)	This is IsEqual, a member of class IWebValueIsEqual.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValue (see page 23769)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23769)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 23769)	Event handler called to validate value(s) entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 23766)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23766)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23767)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23767)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23767)	Indicates whether this adapter field is read-only.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValuesList (see page 23768)	Associates a list of values with the adapter field.
	ViewAccess (see page 23768)	Identifies the rights required to view this field.

173.1.9.2 TAdapterBooleanField Properties

The properties of the TAdapterBooleanField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23766)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23766)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23767)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23767)	Identifies the rights required to update this field.
	ReadOnly (see page 23767)	Indicates whether this adapter field is read-only.
	ValuesList (see page 23768)	Associates a list of values with the adapter field.
	ViewAccess (see page 23768)	Identifies the rights required to view this field.

173.1.9.2.1 TAdapterBooleanField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.9.2.2 TAdapterBooleanField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.9.2.3 TAdapterBooleanField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.9.2.4 TAdapterBooleanField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.9.2.5 TAdapterBooleanField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.9.2.6 TAdapterBooleanField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 19740)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

173.1.9.2.7 TAdapterBooleanField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.9.3 TAdapterBooleanField Events

The events of the TAdapterBooleanField class are listed here.

Published Events

	Name	Description
	OnGetValue (see page 23769)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23769)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 23769)	Event handler called to validate value(s) entered by the end-user.

173.1.9.3.1 TAdapterBooleanField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetBooleanEvent;
```

C++

```
__property TAdapterFieldGetBooleanEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24209)

173.1.9.3.2 TAdapterBooleanField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldBooleanValueEvent;
```

C++

```
__property TAdapterFieldBooleanValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24209)

173.1.9.3.3 TAdapterBooleanField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

DoOnValidateValue (see page 24016)

IActionFieldValue (see page 920)

173.1.10 TAdapterDefaultActions Class

TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.

Class Hierarchy

Pascal

```
TAdapterDefaultActions = class(TAdapterActions, IAddFieldsEditor);
```

C++

```
class TAdapterDefaultActions : public TAdapterActions, public IAddFieldsEditor;
```

File

WebAdapt

Description

TAdapterDefaultActions is the type of the Actions property on an adapter component. It manages two lists of actions (TBaseAdapterAction (see page 24043) descendants) that belong to the adapter: the list of actions that have been explicitly added to the adapter, and the list of actions that the adapter includes by default. The explicitly added action objects are available using the WebActions (see page 23745) property. The default actions are available using the DefaultWebComponents (see page 23778) property.

See Also

TDefaultFieldsAdapter (see page 24392)

TAdapterFields (see page 23830)

TAdapterActions (see page 23738)

TAdapterDefaultFields (see page 23778)

TBaseAdapterAction (see page 24043)

173.1.10.1 TAdapterDefaultActions Members

The following tables list the members exposed by TAdapterDefaultActions.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdapterCanAddClass (see page 23742)	Indicates whether the associated adapter supports a specified class of action component.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetAddAllFieldsItem (see page 23775)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.
	GetAddFieldsDlgCaption (see page 23776)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.
	GetAddFieldsItem (see page 23776)	This is GetAddFieldsItem, a member of class TAdapterDefaultActions.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24755)	Executes a callback for each child Web item.
	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 23776)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetNewFieldPrefix (see page 23776)	This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 23777)	Returns the value of the VariablesInUse property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 23743)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplCanAddClass (see page 24002)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 23744)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.

V	ImplGetWebComponentNodeName (see page 24003)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 23777)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetWebParent (see page 23744)	Introduces a method to associate this component with an adapter.
V	SetWebParent (see page 24005)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	ClearDefaultComponents (see page 23775)	Empties the list of default actions that is the value of the DefaultWebComponents (see page 23778) property.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 23774)	Frees an instance of TAdapterDefaultActions (see page 23770).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24000)	Returns the associated adapter.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultWebComponents (see page 23778)	Lists the action components that the associated adapter includes by default.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebActions (see page 23745)	Lists the action components that this object manages.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.10.2 TAdapterDefaultActions.Destroy Destructor

Frees an instance of TAdapterDefaultActions (see page 23770).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDefaultActions();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

173.1.10.3 TAdapterDefaultActions Methods

The methods of the TAdapterDefaultActions class are listed here.

Protected Methods

	Name	Description
	GetAddAllFieldsItem (see page 23775)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.
	GetAddFieldsDlgCaption (see page 23776)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.
	GetAddFieldsItem (see page 23776)	This is GetAddFieldsItem, a member of class TAdapterDefaultActions.
V	GetDefaultWebComponents (see page 23776)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 23776)	This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.
V	GetVariablesInUse (see page 23777)	Returns the value of the VariablesInUse property.
V	SetDefaultWebComponents (see page 23777)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Public Methods

	Name	Description
V	ClearDefaultComponents (see page 23775)	Empties the list of default actions that is the value of the DefaultWebComponents (see page 23778) property.

173.1.10.3.1 TAdapterDefaultActions.ClearDefaultComponents Method

Empties the list of default actions that is the value of the DefaultWebComponents (see page 23778) property.

Pascal

```
procedure ClearDefaultComponents; virtual;
```

C++

```
virtual __fastcall ClearDefaultComponents();
```

Description

The associated adapter calls ClearDefaultComponents when it changes its set of default actions. After a call to ClearDefaultComponents, the adapter generates a new set of default components the next time the application reads the default actions.

See Also

DefaultWebComponents (see page 23778)

173.1.10.3.2 TAdapterDefaultActions.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.

173.1.10.3.3 TAdapterDefaultActions.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.

173.1.10.3.4 TAdapterDefaultActions.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TAdapterDefaultActions.

173.1.10.3.5 TAdapterDefaultActions.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 24756)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

173.1.10.3.6 TAdapterDefaultActions.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.

173.1.10.3.7 TAdapterDefaultActions.GetVariablesInUse Method

Returns the value of the VariablesInUse property.

Pascal

```
function GetVariablesInUse: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse property.

In TAdapterSubComponent, GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 24007)

GetWebComponents (see page 24756)

173.1.10.3.8 TAdapterDefaultActions.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent, SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 23999)

IsDefaultField (see page 24728)

173.1.10.4 TAdapterDefaultActions Properties

The properties of the TAdapterDefaultActions class are listed here.

Public Properties

	Name	Description
R	DefaultWebComponents (see page 23778)	Lists the action components that the associated adapter includes by default.

173.1.10.4.1 TAdapterDefaultActions.DefaultWebComponents Property

Lists the action components that the associated adapter includes by default.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Read DefaultWebComponents to access the list of action components that the adapter uses when you do not explicitly add any actions to this object. Each default action is a descendant of TAdapterNamedAction.

If you explicitly add action components to this object, the adapter uses the actions in the WebActions (see page 23745) property instead.

See Also

TBaseAdapterAction (see page 24043)

WebActions (see page 23745)

Adapter (see page 24006)

173.1.11 TAdapterDefaultFields Class

TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.

Class Hierarchy

Pascal

```
TAdapterDefaultFields = class(TAdapterFields, IAddFieldsEditor);
```

C++

```
class TAdapterDefaultFields : public TAdapterFields, public IAddFieldsEditor;
```

File

WebAdapt

Description

TAdapterDefaultFields is the type of the Data property on an adapter component. It manages two lists of fields (TAdapterNamedField (see page 23925) descendants) that belong to the adapter: the list of fields that have been explicitly added to the adapter, and the list of fields that the adapter includes by default. The explicitly added field objects are available using the WebFields (see page 23837) property. The default fields are available using the DefaultWebComponents (see page 23786) property.

See Also

TDefaultFieldsAdapter (see page 24392)

TAdapterActions (see page 23738)

TAdapterDefaultActions (see page 23770)

TAdapterFields (see page 23830)

TAdapterNamedField (see page 23925)

173.1.11.1 TAdapterDefaultFields Members

The following tables list the members exposed by TAdapterDefaultFields.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdapterCanAddClass (see page 23835)	Indicates whether the associated adapter supports a specified class of field component.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetAddAllFieldsItem (see page 23784)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.
	GetAddFieldsDlgCaption (see page 23784)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.
	GetAddFieldsItem (see page 23784)	This is GetAddFieldsItem, a member of class TAdapterDefaultFields.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24755)	Executes a callback for each child Web item.
	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 23785)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetNewFieldPrefix (see page 23785)	This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 23785)	Returns the value of the VariablesInUse property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 23836)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplCanAddClass (see page 24002)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 23836)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
V	ImplGetWebComponentNodeName (see page 24003)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 23786)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetWebParent (see page 23836)	Associates this component with an adapter.
V	SetWebParent (see page 24005)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.
	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDefaultComponents (see page 23784)	Empties the list of default fields that is the value of the DefaultWebComponents (see page 23786) property.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 23783)	Frees an instance of TAdapterDefaultFields (see page 23778).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24000)	Returns the associated adapter.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultWebComponents (see page 23786)	Lists the field components that the associated adapter includes by default.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFields (see page 23837)	Lists the field components that this object manages.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.11.2 TAdapterDefaultFields.Destroy Destructor

Frees an instance of TAdapterDefaultFields (see page 23778).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDefaultFields();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

Free (see page 22300)

173.1.11.3 TAdapterDefaultFields Methods

The methods of the TAdapterDefaultFields class are listed here.

Protected Methods

	Name	Description
	GetAddAllFieldsItem (see page 23784)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.
	GetAddFieldsDlgCaption (see page 23784)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.
	GetAddFieldsItem (see page 23784)	This is GetAddFieldsItem, a member of class TAdapterDefaultFields.
V	GetDefaultWebComponents (see page 23785)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 23785)	This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.
V	GetVariablesInUse (see page 23785)	Returns the value of the VariablesInUse property.
V	SetDefaultWebComponents (see page 23786)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Public Methods

	Name	Description
V	ClearDefaultComponents (see page 23784)	Empties the list of default fields that is the value of the DefaultWebComponents (see page 23786) property.

173.1.11.3.1 TAdapterDefaultFields.ClearDefaultComponents Method

Empties the list of default fields that is the value of the DefaultWebComponents (see page 23786) property.

Pascal

```
procedure ClearDefaultComponents; virtual;
```

C++

```
virtual __fastcall ClearDefaultComponents();
```

Description

The associated adapter calls ClearDefaultComponents when it changes its set of default fields. After a call to ClearDefaultComponents, the adapter generates a new set of default components the next time the application reads the default fields.

See Also

DefaultWebComponents (see page 23786)

173.1.11.3.2 TAdapterDefaultFields.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.

173.1.11.3.3 TAdapterDefaultFields.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.

173.1.11.3.4 TAdapterDefaultFields.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TAdapterDefaultFields.

173.1.11.3.5 TAdapterDefaultFields.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 24756)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

173.1.11.3.6 TAdapterDefaultFields.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.

173.1.11.3.7 TAdapterDefaultFields.GetVariablesInUse Method

Returns the value of the VariablesInUse property.

Pascal

```
function GetVariablesInUse: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse property.

In TAdapterSubComponent, GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 24007)

GetWebComponents (see page 24756)

173.1.11.3.8 TAdapterDefaultFields.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent, SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 23999)

IsDefaultField (see page 24728)

173.1.11.4 TAdapterDefaultFields Properties

The properties of the TAdapterDefaultFields class are listed here.

Public Properties

	Name	Description
R	DefaultWebComponents (see page 23786)	Lists the field components that the associated adapter includes by default.

173.1.11.4.1 TAdapterDefaultFields.DefaultWebComponents Property

Lists the field components that the associated adapter includes by default.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Read DefaultWebComponents to access the list of field components that the adapter uses when you do not explicitly add any field components to this object. Each default field component is a descendant of TAdapterNamedField (see page 23925).

If you explicitly add field components to this object, the adapter uses the fields in the WebFields (see page 23837) property instead.

See Also

TAdapterNamedField (see page 23925)

WebFields (see page 23837)

Adapter (see page 24006)

173.1.12 TAdapterEndUserDisplayNameField Class

TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.

Class Hierarchy

Pascal

```
TAdapterEndUserDisplayNameField = class(TAdapterEndUserField);
```

C++

```
class TAdapterEndUserDisplayNameField : public TAdapterEndUserField;
```

File

WebAdapt

Description

TAdapterEndUserDisplayNameField is added to TApplicationAdapter (see page 24032).

See Also

TAdapterEndUserField (see page 23793)

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

173.1.12.1 TAdapterEndUserDisplayNameField Members

The following tables list the members exposed by TAdapterEndUserDisplayNameField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23793)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23793)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23800)	Returns the parent adapter of this adapter field.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.12.2 TAdapterEndUserDisplayNameField Methods

The methods of the TAdapterEndUserDisplayNameField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 23793)	Returns the name used to access this adapter field with server-side script.

	ImplGetValue (see page 23793)	Returns the value associated with this adapter field.

173.1.12.2.1 TAdapterEndUserDisplayNameField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'DisplayName'. This allows server-side script to access this adapter field using the parent adapter's DisplayName property.

173.1.12.2.2 TAdapterEndUserDisplayNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetDisplayNameValue. Server-side script accesses the result of this function using the DisplayText property of this adapter field. Server-side script may use this value to display the end-user's name on a Web page.

See Also

GetDisplayNameValue (see page 24109)

173.1.13 TAdapterEndUserField Class

TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.

Class Hierarchy

Pascal

```
TAdapterEndUserField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterEndUserField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterEndUserField implements functionality useful to an adapter field that can be a child of TEndUserAdapter (see page 24421) or TEndUserSessionAdapter (see page 24458).

See Also

TAdapterNamedDisplayField (see page 23913)

TBaseEndUserAdapter (see page 24097)

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

TAdapterEndUserLoggedInField (see page 23800)

TAdapterEndUserDisplayNameField (see page 23787)

173.1.13.1 TAdapterEndUserField Members

The following tables list the members exposed by TAdapterEndUserField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.

	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23800)	Returns the parent adapter of this adapter field.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.13.2 TAdapterEndUserField Properties

The properties of the TAdapterEndUserField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 23800)	Returns the parent adapter of this adapter field.

173.1.13.2.1 TAdapterEndUserField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TBaseEndUserAdapter;
```

C++

```
__property TBaseEndUserAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter.

See Also

TBaseEndUserAdapter (see page 24097)

173.1.14 TAdapterEndUserLoggedInField Class

TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.

Class Hierarchy

Pascal

```
TAdapterEndUserLoggedInField = class(TAdapterEndUserField);
```

C++

```
class TAdapterEndUserLoggedInField : public TAdapterEndUserField;
```

File

WebAdapt

Description

TAdapterEndUserLoggedInField is added to TApplicationAdapter (see page 24032). The logged-in flag indicates whether the user is logged-in. This value may be used by server-side script to conditionally generate HTML. For example, when the end-user is logged in, a logout hyperlink is displayed. When the end-user is not logged in, a logout hyperlink is not displayed.

See Also

TApplicationAdapter (see page 24032)

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

173.1.14.1 TAdapterEndUserLoggedInField Members

The following tables list the members exposed by TAdapterEndUserLoggedInField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23807)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.

	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23807)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23800)	Returns the parent adapter of this adapter field.
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.14.2 TAdapterEndUserLoggedInField Methods

The methods of the TAdapterEndUserLoggedInField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 23807)	Returns the name used to access this adapter field with server-side script.
V	ImplGetValue (see page 23807)	Returns the value associated with this adapter field.

173.1.14.2.1 TAdapterEndUserLoggedInField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'LoggedIn'. This allows server-side script to access this adapter field using the parent adapter's LoggedIn property.

173.1.14.2.2 TAdapterEndUserLoggedInField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetLoggedInValue. Server-side script accesses the result of this function using the Value (see page 23945) property of this adapter field. This value may be used by server-side script to conditionally generate HTML. For example, when the end-user is logged in, a logout hyperlink is displayed. When the end-user is not logged in, a logout hyperlink is not displayed.

See Also

GetLoggedInValue (see page 24110)

173.1.15 TAdapterError Class

TAdapterError is the implementation of IAdapterError.

Class Hierarchy

Pascal

```
TAdapterError = class(TInterfacedObject, IAdapterError);
```

C++

```
class TAdapterError : public TInterfacedObject, public IAdapterError;
```

File

WebAdapt

Description

TAdapterError is the implementation class for IAdapterError.

See Also

IAdapterError (see page 19660)

173.1.15.1 TAdapterError Members

The following tables list the members exposed by TAdapterError.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetErrorText (see page 23810)	Returns the value of the ErrorText property.
	GetField (see page 23810)	Returns the value of the Field property.
	GetID (see page 23810)	Returns the value of the ID property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 23809)	Create instantiates an instance of TAdapterError (see page 23807). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorText (see page 19662)	Returns text describing the error.
R	Field (see page 19662)	Returns text describing the error.
R	ID (see page 19662)	Returns error ID.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

173.1.15.2 TAdapterError.Create Constructor

Create instantiates an instance of TAdapterError (see page 23807). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.

Pascal

```
constructor Create(AErrors: TAdapterErrorsList; AIndex: Integer);
```

C++

```
__fastcall TAdapterError(TAdapterErrorsList AErrors, int AIndex);
```

Description

```
constructor Create(AErrors: TAdapterErrorsListTAdapterErrorsList; AIndex: Integer); public;
```

Create instantiates an instance of TAdapterError (see page 23807). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.

AErrors is the adapter errors list object that creates this TAdapterError (see page 23807) object.

AIndex is the index of this adapter error in the list that AErrors maintains.

173.1.15.3 TAdapterError Methods

The methods of the TAdapterError class are listed here.

Protected Methods

	Name	Description
	GetErrorText (see page 23810)	Returns the value of the ErrorText property.
	GetField (see page 23810)	Returns the value of the Field property.
	GetID (see page 23810)	Returns the value of the ID property.

173.1.15.3.1 TAdapterError.GetErrorText Method

Returns the value of the ErrorText property.

Pascal

```
function GetErrorText: string;
```

C++

```
__fastcall AnsiString GetErrorText();
```

Description

GetErrorText is the read implementation of the ErrorText property.

See Also

ErrorText (see page 19662)

173.1.15.3.2 TAdapterError.GetField Method

Returns the value of the Field property.

Pascal

```
function GetField: TComponent;
```

C++

```
__fastcall TComponent * GetField();
```

Description

GetField is the read implementation of the Field property.

See Also

Field (see page 19662)

173.1.15.3.3 TAdapterError.GetID Method

Returns the value of the ID property.

Pascal

```
function GetID: integer;
```

C++

```
__fastcall int GetID();
```

Description

GetID is the read implementation of the ID property.

See Also

ID (see page 19662)

173.1.16 TAdapterErrorsList Class

TAdapterErrorsList keeps track of errors that an adapter encounters.

Class Hierarchy

Pascal

```
TAdapterErrorsList = class(TBaseAdapterErrorsList);
```

C++

```
class TAdapterErrorsList : public TBaseAdapterErrorsList;
```

File

WebAdapt

Description

TAdapterErrorsList acts as a repository for all the errors an adapter (or any of its subcomponents) encounters while processing an HTTP request message. Adapter components create an instance of this class to implement their Errors (see page 24085) property. Server-side scripts can use the Errors (see page 24085) property to access the errors in this list. The usual purpose of such a script is to display error messages to the end user.

To add new error objects to the list, call the AddError (see page 23815) method. To access the errors in the list, read its Errors (see page 24085) property. Errors (see page 24085) lists the IAdapterError interfaces of adapter error objects (TAdapterError (see page 23807)) that represent each error in the list. You can also access the individual properties of those error objects using the FieldNames (see page 23817), IDs (see page 23817), and Messages (see page 23818) properties of the TAdapterErrorsList instance.

TAdapterErrorsList implements the IAdapterErrorsList interface.

Note: Do not confuse TAdapterErrorsList with TAdapterErrorList. TAdapterErrorsList stores the errors that the WebSnap application encounters when using an adapter. TAdapterErrorList is a display component that displays the errors from a TAdapterErrorsList object.

See Also

TAdapterErrorList (see page 25145)

TCustomAdapter (see page 24139)

TAdapterError (see page 23807)

IAdapterErrors (see page 19663)

IAdapterError (see page 19660)

173.1.16.1 TAdapterErrorsList Members

The following tables list the members exposed by TAdapterErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	EndIterator (see page 24081)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 24081)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 24082)	Returns a particular error.
	GetErrorCount (see page 24082)	Return the number of errors in the errors list.
	GetObjectErrors (see page 24082)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 24082)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 23815)	This is ImplClearErrors, a member of class TAdapterErrorsList.
V	ImplDefineLabel (see page 23816)	This is ImplDefineLabel, a member of class TAdapterErrorsList.
V	ImplGetError (see page 23816)	This is ImplGetError, a member of class TAdapterErrorsList.
V	ImplGetErrorCount (see page 23816)	This is ImplGetErrorCount, a member of class TAdapterErrorsList.
V	ImplGetObjectErrors (see page 23816)	This is ImplGetObjectErrors, a member of class TAdapterErrorsList.
V	ImplHasObjectErrors (see page 23816)	This is ImplHasObjectErrors, a member of class TAdapterErrorsList.
	NextIteration (see page 24084)	Advances to the objects next item.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 24085)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddError (see page 23814)	This is the overview for the AddError method overload.
V	AddError (see page 24080)	This is the overview for the AddError method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 19664)	Clears the errors list.
	ClearErrors (see page 24080)	Clear error list.
	Create (see page 23813)	Creates and initializes an instance of TAdapterErrorsList (see page 23810).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefineLabel (see page 19664)	Associates a label with all errors associated with a particular adapter field.
	DefineLabel (see page 24081)	Define error label for field.
V	Destroy (see page 23814)	Frees an instance of TAdapterErrorsList (see page 23810).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetCurrentIntf (see page 19718)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	GetError (see page 19664)	Returns a particular error.
	GetErrorCount (see page 19665)	Return the number of errors in the errors list.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetObjectErrors (see page 19665)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 19665)	Indicates whether the errors list contains objects associated with a particular adapter field.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
	ErrorCount (see page 19666)	Returns the number of errors in the errors list.
	ErrorCount (see page 24085)	Number of error objects contained.
	Errors (see page 19666)	Returns an error from the list.
	Errors (see page 24085)	Access to error objects.
	FieldNames (see page 23817)	Lists the names of the objects that encountered the errors in the list.
	IDs (see page 23817)	Lists the error codes of the errors in the list.
	Messages (see page 23818)	Lists the error messages for the errors in the list.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

173.1.16.2 TAdapterErrorsList.Create Constructor

Creates and initializes an instance of TAdapterErrorsList (see page 23810).

Pascal

```
constructor Create(AAdapter: TObject);
```

C++

```
__fastcall TAdapterErrorsList(TObject * AAdapter);
```

Description

Typically, WebSnap applications do not create their own instances of TAdapterErrorsList (see page 23810). Adapter objects instantiate this class to implement their Errors (see page 24085) property.

AAdapter is the adapter component that uses this object to implement its Errors (see page 24085) property.

See Also

Errors (see page 24182)

173.1.16.3 TAdapterErrorsList.Destroy Destructor

Frees an instance of TAdapterErrorsList (see page 23810).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterErrorsList();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the errors list is not nil before calling Destroy.

See Also

Free (see page 22300)

173.1.16.4 TAdapterErrorsList Methods

The methods of the TAdapterErrorsList class are listed here.

Protected Methods

	Name	Description
	ImplClearErrors (see page 23815)	This is ImplClearErrors, a member of class TAdapterErrorsList.
	ImplDefineLabel (see page 23816)	This is ImplDefineLabel, a member of class TAdapterErrorsList.
	ImplGetError (see page 23816)	This is ImplGetError, a member of class TAdapterErrorsList.
	ImplGetErrorCount (see page 23816)	This is ImplGetErrorCount, a member of class TAdapterErrorsList.
	ImplGetObjectErrors (see page 23816)	This is ImplGetObjectErrors, a member of class TAdapterErrorsList.
	ImplHasObjectErrors (see page 23816)	This is ImplHasObjectErrors, a member of class TAdapterErrorsList.

Public Methods

	Name	Description
	AddError (see page 23814)	This is the overview for the AddError method overload.

173.1.16.4.1 AddError Method

This is the overview for the AddError method overload.

Overload List

	Name	Description
	TAdapterErrorsList.AddError (Exception, string) (see page 23815)	Adds an error to the list.
	TAdapterErrorsList.AddError (Exception, TObject) (see page 23815)	Adds an error to the list.
	TAdapterErrorsList.AddError (string, string, Integer) (see page 23815)	Adds an error to the list.
	TAdapterErrorsList.AddError (string, TObject, Integer) (see page 23815)	Adds an error to the list.

173.1.16.4.1.1 TAdapterErrorsList.AddError Method (Exception, TObject)

Adds an error to the list.

Pascal

```
procedure AddError(AException: Exception; const AObjectName: string = ''); override;
procedure AddError(const AMessage: string; const AObjectName: string = ''; AID: Integer = 0);
override;
procedure AddError(const AMessage: string; AObject: TObject; AID: Integer = 0); override;
procedure AddError(AException: Exception; AObject: TObject); override;
```

C++

```
virtual __fastcall AddError(Exception AException, const AnsiString AObjectName = '');
virtual __fastcall AddError(const AnsiString AMessage, const AnsiString AObjectName = '', int
AID = 0);
virtual __fastcall AddError(const AnsiString AMessage, TObject * AObject, int AID = 0);
virtual __fastcall AddError(Exception AException, TObject * AObject);
```

Description

AddError adds an error to the object's internal list. An error is described by three pieces of information:

An error message string. You can specify this string directly with the AMessage parameter, or using an Exception object (with the AException parameter). If you specify an Exception object, the object's Message property becomes the message string.

The name of an object (Variable) related to the error. You can specify this value as a string (with the AObjectName parameter) or as an object reference (with the AObject parameter). If you omit both these parameters, but supply an EAdapterFieldException (see page 23698) object as the AException parameter, TAdapterErrorsList (see page 23810) uses the FieldName property of that exception object. If you do not supply an AObject parameter, an AObjectName parameter, or an EAdapterFIeldException object as the AException parameter, TAdapterErrorsList (see page 23810) uses an empty string.

An error ID value. You can specify this value using the AID parameter. If you do not supply a value for AID but specify an EAdapterException (see page 23696) object as the AException parameter, TAdapterErrorsList (see page 23810) uses the ID property of that exception object. If you do not supply an AID parameter or an EAdapterException (see page 23696) object, TAdapterErrorsList (see page 23810) uses 0.

See Also

FieldName (see page 23700)

ID (see page 23698)

Messages (see page 23818)

FieldNames (see page 23817)

IDs (see page 23817)

173.1.16.4.2 TAdapterErrorsList.ImplClearErrors Method

Pascal

```
procedure ImplClearErrors; override;
```

C++

```
virtual __fastcall ImplClearErrors();
```

Description

This is ImplClearErrors, a member of class TAdapterErrorsList.

173.1.16.4.3 TAdapterErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); override;
```

C++

```
virtual __fastcall ImplDefineLabel(const AnsiString AName, const AnsiString ALabel);
```

Description

This is ImplDefineLabel, a member of class TAdapterErrorsList.

173.1.16.4.4 TAdapterErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; override;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TAdapterErrorsList.

173.1.16.4.5 TAdapterErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TAdapterErrorsList.

173.1.16.4.6 TAdapterErrorsList.ImplGetObjectErrors Method

Pascal

```
function ImplGetObjectErrors(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetObjectErrors(const AnsiString AName);
```

Description

This is ImplGetObjectErrors, a member of class TAdapterErrorsList.

173.1.16.4.7 TAdapterErrorsList.ImplHasObjectErrors Method

Pascal

```
function ImplHasObjectErrors(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHasObjectErrors(const AnsiString AName);
```

Description

This is ImplHasObjectErrors, a member of class TAdapterErrorsList.

173.1.16.5 TAdapterErrorsList Properties

The properties of the TAdapterErrorsList class are listed here.

Public Properties

	Name	Description
R	FieldNames (see page 23817)	Lists the names of the objects that encountered the errors in the list.
R	IDs (see page 23817)	Lists the error codes of the errors in the list.
R	Messages (see page 23818)	Lists the error messages for the errors in the list.

173.1.16.5.1 TAdapterErrorsList.FieldNames Property

Lists the names of the objects that encountered the errors in the list.

Pascal

```
property FieldNames [I: Integer]: string;
```

C++

```
__property AnsiString FieldNames[int I];
```

Description

Use FieldNames to access the name of the object associated with a specified error. FieldNames values typically reflect the name of an adapter field that was the cause of the error. However, they can be any object reference for which there is a defined Variable that can be accessed from server-side script. If there is no object associated with an error, the value of FieldNames is an empty string.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of FieldNames for an error is set by the AddError (see page 23815) method when the error is added to the list.

See Also

AddError (see page 23815)

Field (see page 19662)

FieldName (see page 23700)

173.1.16.5.2 TAdapterErrorsList.IDs Property

Lists the error codes of the errors in the list.

Pascal

```
property IDs [I: Integer]: integer;
```

C++

```
__property int IDs[int I];
```

Description

Use IDs to access the ID (error code) of a specified error in the list. If the error has no error code, the value of IDs is 0.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of IDs for an error is set by the AddError (see page 23815) method when the error is added to the list.

See Also

AddError (see page 23815)

ID (see page 19662)

ID (see page 23698)

173.1.16.5.3 TAdapterErrorsList.Messages Property

Lists the error messages for the errors in the list.

Pascal

```
property Messages [I: Integer]: string;
```

C++

```
__property AnsiString Messages[int I];
```

Description

Use Messages to access the error message for a specified error in the list.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of Messages for an error is set by the AddError (see page 23815) method when the error is added to the list.

See Also

AddError (see page 23815)

ErrorText (see page 19662)

173.1.17 TAdapterField Class

TAdapterField is an event handler based adapter field that provides a single value.

Class Hierarchy

Pascal

```
TAdapterField = class(TCustomAdapterField);
```

C++

```
class TAdapterField : public TCustomAdapterField;
```

File

WebAdapt

Description

TAdapterField publishes the properties in TCustomAdapterField (see page 24211). TCustomAdapterField (see page 24211) calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

Add TAdapterField to TAdapter (see page 23713) or other adapter components types when you need an adapter field that supports a single value using event handlers. Event handlers are used to provide the adapter field value(s), validate a value entered by the end-user, and update the adapter field with a value entered by the end-user.

There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. For example, TAdapterMultiValue field is used when the end-user can enter multiple values using a group of check boxes or a multiple selection select list. TAdapterFileField (see page 23837), TAdapterMemoField (see page 23889), TAdapterBooleanField (see page 23758) and TAdapterImageField (see page 23869) are other event driven adapter fields.

See Also

TAdapterUpdateField (see page 24007)

TCustomAdapterField (see page 24211)

TAdapter (see page 23713)

TAdapterMultiValueField (see page 23900)

TAdapterMemoField (see page 23889)

TAdapterFileField (see page 23837)

TAdapterBooleanField (see page 23758)

TAdapterImageField (see page 23869)

173.1.17.1 TAdapterField Members

The following tables list the members exposed by TAdapterField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 24218)	Validates a single value entered by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
V	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
V	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.

	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetValue (see page 24219)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24219)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.

	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Adapter (see page 23943)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetDisplayText (see page 23829)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 23829)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23829)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 23830)	Event handler called to validate value(s) entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 23826)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23826)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23826)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23827)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23827)	Indicates whether this adapter field is read-only.
	Required (see page 23827)	Indicates whether the end-user must enter a value for this adapter field.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValuesList (see page 23828)	Associates a list of values with the adapter field.
	ViewAccess (see page 23828)	Identifies the rights required to view this field.

173.1.17.2 TAdapterField Properties

The properties of the TAdapterField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23826)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23826)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23826)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23827)	Identifies the rights required to update this field.
	ReadOnly (see page 23827)	Indicates whether this adapter field is read-only.
	Required (see page 23827)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 23828)	Associates a list of values with the adapter field.
	ViewAccess (see page 23828)	Identifies the rights required to view this field.

173.1.17.2.1 TAdapterField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.17.2.2 TAdapterField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.17.2.3 TAdapterField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.17.2.4 TAdapterField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.17.2.5 TAdapterField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.17.2.6 TAdapterField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.17.2.7 TAdapterField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 19740)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

173.1.17.2.8 TAdapterField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.17.3 TAdapterField Events

The events of the TAdapterField class are listed here.

Published Events

	Name	Description
	OnGetDisplayText (see page 23829)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 23829)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23829)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 23830)	Event handler called to validate value(s) entered by the end-user.

173.1.17.3.1 TAdapterField.OnGetDisplayText Event

Event handler called to retrieve a string representation of the adapter field's value.

Pascal

```
property OnGetDisplayText: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

The OnGetDisplayText event handler is called to retrieve a string representation an adapter field's value appropriate for a read-only display. If OnGetDisplayText is nil (Delphi) or NULL (C++), then the value of the adapter field will be used (after conversion to a string).

See Also

ImplAsFormatted (see page 24018)

173.1.17.3.2 TAdapterField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetValueEvent;
```

C++

```
__property TAdapterFieldGetValueEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24219)

173.1.17.3.3 TAdapterField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldValueEvent;
```

C++

```
__property TAdapterFieldValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

173.1.17.3.4 TAdapterField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

DoOnValidateValue (see page 24016)

IActionFieldValue (see page 920)

173.1.18 TAdapterFields Class

TAdapterFields manages the list of fields that belong to an adapter.

Class Hierarchy

Pascal

```
TAdapterFields = class(TAdapterSubComponent, IWebFieldsSubcomponent);
```

C++

```
class TAdapterFields : public TAdapterSubComponent, public IWebFieldsSubcomponent;
```

File

WebAdapt

Description

TAdapterFields is the type of the Data property on an adapter component. It manages a list that contains all the fields that belong to the adapter. The field objects (TAdapterNamedField (see page 23925) descendants) are available using the WebFields (see page 23837) property. TAdapterFields also includes support for associating the fields with variable names so that server-side script can use the field values.

TAdapterFields represents the list of explicitly assigned fields. Adapters that include a set of default fields use a TAdapterDefaultFields (see page 23778) object instead.

See Also

TCustomAdapter (see page 24139)

TAdapterActions (see page 23738)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

TAdapterNamedField (see page 23925)

173.1.18.1 TAdapterFields Members

The following tables list the members exposed by TAdapterFields.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AdapterCanAddClass (see page 23835)	Indicates whether the associated adapter supports a specified class of field component.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24755)	Executes a callback for each child Web item.

	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 23999)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
V	GetDefaultWebComponents (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 24001)	Returns the value of the VariablesInUse (see page 24007) property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 23836)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 23836)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 24004)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetDefaultWebComponents (see page 24757)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetWebParent (see page 23836)	Associates this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24755)	Frees an instance of TWebContainerComponent (see page 24751).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24000)	Returns the associated adapter.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFields (see page 23837)	Lists the field components that this object manages.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.18.2 TAdapterFields Methods

The methods of the TAdapterFields class are listed here.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 23835)	Indicates whether the associated adapter supports a specified class of field component.
V	ImplCanAddClass (see page 23836)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetWebComponentNodeName (see page 23836)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
V	SetWebParent (see page 23836)	Associates this component with an adapter.

173.1.18.2.1 TAdapterFields.AdapterCanAddClass Method

Indicates whether the associated adapter supports a specified class of field component.

Pascal

```
function AdapterCanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean AdapterCanAddClass(TComponent * AParent, TClass AClass);
```

Description

TAdapterActions (see page 23738) uses this method internally as part of its implementation for the CanAddClass (see page 23996) method. This allows the TAdapterFields (see page 23830) object to indicate, at design time, which types of components are valid as members of the WebFields (see page 23837) property list.

AParent is the instance of TAdapterFields (see page 23830) to which the child fields are to be added.

AClass describes the class of the child component to be added to AParent.

AdapterCanAddClass returns true if the adapter recognizes and supports AClass as a child field, false otherwise.

AdapterCanAddClass calls the CanAddFieldClass method of its associated adapter to determine whether it accepts the specified field class.

See Also

WebFields (see page 23837)

Adapter (see page 24006)

ImplCanAddClass (see page 23836)

CanAddFieldClass (see page 24150)

173.1.18.2.2 TAdapterFields.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 23996) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 23996) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterFields (see page 23830) object to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterFields (see page 23830) object can include a child of type AClass, false otherwise.

ImplCanAddClass returns true if one of the following two conditions is met:

AClass is an adapter field class that the associated adapter recognizes and accepts.

AClass is a data entry field (a descendant of TAdapterUpdateField (see page 24007)).

See Also

CanAddClass (see page 23996)

AdapterCanAddClass (see page 23835)

TAdapterUpdateField (see page 24007)

173.1.18.2.3 TAdapterFields.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.

Pascal

```
function ImplGetWebComponentNodeName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 24001) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the string 'Fields'.

See Also

GetWebComponentNodeName (see page 24001)

173.1.18.2.4 TAdapterFields.SetWebParent Method

Associates this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); override;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

SetWebParent sets up the association between this component and its parent adapter.

Value is the adapter component that acts as a parent to this collection.

SetWebParent assigns Value to the protected Adapter (see page 24006) property and replaces that adapter's Data property with this TAdapterFields (see page 23830) instance.

See Also

Data (see page 24181)

Adapter (see page 24006)

173.1.18.3 TAdapterFields Properties

The properties of the TAdapterFields class are listed here.

Public Properties

	Name	Description
R	WebFields (see page 23837)	Lists the field components that this object manages.

173.1.18.3.1 TAdapterFields.WebFields Property

Lists the field components that this object manages.

Pascal

```
property WebFields: TWebComponentList;
```

C++

```
__property TWebComponentList WebFields;
```

Description

Read WebFields to access the list of field components. Each component in this list is a descendant of TAdapterNamedField (see page 23925).

See Also

TAdapterNamedField (see page 23925)

173.1.19 TAdapterFileField Class

TAdapterFileField is an event handler based adapter field that can accept uploaded files.

Class Hierarchy

Pascal

```
TAdapterFileField = class(TCustomAdapterFileField);
```

C++

```
class TAdapterFileField : public TCustomAdapterFileField;
```

File

WebAdapt

Description

TAdapterFileField publishes the properties in TCustomAdapterFileField (see page 24220). TCustomAdapterFileField (see page 24220) calls event handlers to retrieve the adapter field's filenames, validate files uploaded by the end-user, and update the adapter field's files.

Add TAdapterFileField to TAdapter (see page 23713) or other adapter components types when you need an adapter field that

supports files using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 23818), TAdapterMultiValueField (see page 23900), TAdapterMemoField (see page 23889), TAdapterBooleanField (see page 23758) and TAdapterImageField (see page 23869).

See Also

TCustomAdapterFileField (see page 24220)

TAdapter (see page 23713)

TAdapterField (see page 23818)

TAdapterMemoField (see page 23889)

TAdapterMultiValueField (see page 23900)

TAdapterBooleanField (see page 23758)

TAdapterImageField (see page 23869)

173.1.19.1 TAdapterFileField Members

The following tables list the members exposed by TAdapterFileField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 24228)	Validates files uploaded by the end-user.
	EndValueIterator (see page 24093)	Completes iteration.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 24228)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.
	GetFileNames (see page 24229)	Returns the count of files associated with this adapter field.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 24229)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
V	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
V	GetValueCount (see page 24094)	Returns the number of values associated with this adapter field.
V	GetValueCount (see page 24229)	Returns the number of values associated with this adapter field.
V	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
V	GetValues (see page 24095)	Returns one of the values associated with the adapter field.
V	GetValues (see page 24230)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplCheckValueChange (see page 24230)	Indicates whether the end-user may have uploaded new files for this adapter field.
V	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.

	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 24096)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24230)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.

	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24092)	Constructor for TBaseAdapterMultiValueField (see page 24086).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24093)	Destructor for TBaseAdapterMultiValueField (see page 24086).
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FileCount (see page 24231)	Returns one of the filenames associated with this adapter field.
R	FileNames (see page 24231)	Returns a file associated with this adapter field.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetFileCount (see page 23848)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 23848)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 23848)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 23849)	Validates values entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 23845)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23846)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23846)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23846)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23847)	Indicates whether this adapter field is read-only.
	Required (see page 23847)	Indicates whether the end-user must enter a value for this adapter field.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 23847)	Identifies the rights required to view this field.

173.1.19.2 TAdapterFileField Properties

The properties of the TAdapterFileField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23845)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23846)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23846)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23846)	Identifies the rights required to update this field.
	ReadOnly (see page 23847)	Indicates whether this adapter field is read-only.
	Required (see page 23847)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 23847)	Identifies the rights required to view this field.

173.1.19.2.1 TAdapterFileField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.19.2.2 TAdapterFileField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.19.2.3 TAdapterFileField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.19.2.4 TAdapterFileField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.19.2.5 TAdapterFileField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.19.2.6 TAdapterFileField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.19.2.7 TAdapterFileField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.19.3 TAdapterFileField Events

The events of the TAdapterFileField class are listed here.

Published Events

	Name	Description
	OnGetFileCount (see page 23848)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 23848)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 23848)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 23849)	Validates values entered by the end-user.

173.1.19.3.1 TAdapterFileField.OnGetFileCount Event

Returns the number of values associated with this adapter field.

Pascal

```
property OnGetFileCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetFileCount;
```

Description

Write an OnGetFileCount event handler to indicate the number of filenames associated with this adapter field.

See Also

GetValueCount (see page 24229)

173.1.19.3.2 TAdapterFileField.OnGetFileNames Event

Returns one of the filenames associated with the adapter field.

Pascal

```
property OnGetFileNames: TAdapterFieldGetMultiValueStringEvent;
```

C++

```
__property TAdapterFieldGetMultiValueStringEvent OnGetFileNames;
```

Description

Write an OnGetFileNames event handler to provide the names of files associated with this adapter field.

See Also

GetFileNames (see page 24229)

173.1.19.3.3 TAdapterFileField.OnUploadFiles Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUploadFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnUploadFiles;
```

Description

OnUploadFiles is called by ImplUpdateValue. Write an OnUploadFiles event handler to accept files uploaded by the end-user. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 24230)

TUpdateFileList (see page 24550)

173.1.19.3.4 TAdapterFileField.OnValidateFiles Event

Validates values entered by the end-user.

Pascal

```
property OnValidateFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnValidateFiles;
```

Description

OnValidateFiles is called by DoOnValidateValue. Implement this event handler to validate files uploaded by the end-user. Raise an exception to indicate a validation error.

See Also

DoOnValidateValue (see page 24228)

TUpdateFileList (see page 24550)

173.1.20 TAdapterGotoPageAction Class

TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).

Class Hierarchy

Pascal

```
TAdapterGotoPageAction = class(TCustomAdapterGotoPageAction);
```

C++

```
class TAdapterGotoPageAction : public TCustomAdapterGotoPageAction;
```

File

WebAdapt

Description

TAdapterGotoPageAction is an adapter action that has a list of commands. Each command has a parameter that identifies a page in the parent adapter. When executed, TAdapterGotoPageAction changes the current page in the parent adapter. TAdapterGotoPageAction publishes the properties of TCustomAdapterGotoPageAction (see page 24233). Add TAdapterGotoPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 24403) such as TPagedAdapter (see page 24525).

See Also

TCustomAdapterGotoPageAction (see page 24233)

TDefaultFieldsPagedAdapter (see page 24403)

TPagedAdapter (see page 24525)

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

173.1.20.1 TAdapterGotoPageAction Members

The following tables list the members exposed by TAdapterGotoPageAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultActionName (see page 24240)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 24241)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.

	GetItemCount (see page 24241)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24241)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24242)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetDisplayLabel (see page 24242)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIsAdapterActionList (see page 24243)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplIsDefaultAction (see page 24243)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24243)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.

	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 23857)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23858)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23858)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23859)	Called before the adapter action response is generated.
	OnGetPageName (see page 23859)	Provides the display labels for each goto page command.
	OnGetParams (see page 23859)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	ExecuteAccess (see page 23856)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 23857)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.20.2 TAdapterGotoPageAction Properties

The properties of the TAdapterGotoPageAction class are listed here.

Published Properties

	Name	Description
	ExecuteAccess (see page 23856)	Defines the rights required to execute this action.
	RedirectOptions (see page 23857)	Indicates whether to perform an HTTP redirect after successfully executing this action.

173.1.20.2.1 TAdapterGotoPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

173.1.20.2.2 TAdapterGotoPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

173.1.20.3 TAdapterGotoPageAction Events

The events of the TAdapterGotoPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 23857)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23858)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23858)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23859)	Called before the adapter action response is generated.
	OnGetPageName (see page 23859)	Provides the display labels for each goto page command.
	OnGetParams (see page 23859)	Specifies name/value pairs needed to execute this adapter action.

173.1.20.3.1 TAdapterGotoPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.20.3.2 TAdapterGotoPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.20.3.3 TAdapterGotoPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.20.3.4 TAdapterGotoPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.20.3.5 TAdapterGotoPageAction.OnGetPageName Event

Provides the display labels for each goto page command.

Pascal

```
property OnGetPageName: TWebFormGetPageNameEvent;
```

C++

```
__property TWebFormGetPageNameEvent OnGetPageName;
```

Description

Implement this event handler to specify display labels for the commands that goto pages in the parent adapter. APageIndex is the zero-based index of the page to goto.

See Also

ImplGetDisplayLabel (see page 24242)

173.1.20.3.6 TAdapterGotoPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.21 TAdapterHiddenField Class

Class Hierarchy

Pascal

```
TAdapterHiddenField = class(TInterfacedObject, IAdapterHiddenField);
```

C++

```
class TAdapterHiddenField : public TInterfacedObject, public IAdapterHiddenField;
```

File

WebAdapt

Description

This is class WebAdapt.TAdapterHiddenField.

173.1.21.1 TAdapterHiddenField Members

The following tables list the members exposed by TAdapterHiddenField.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetName (see page 23862)	This is GetName, a member of class TAdapterHiddenField.
	GetValue (see page 23862)	This is GetValue, a member of class TAdapterHiddenField.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 23861)	This is Create, a member of class TAdapterHiddenField.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Name (see page 19671)	This is Name, a member of class IAdapterHiddenField.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Value (see page 19671)	This is Value, a member of class IAdapterHiddenField.

173.1.21.2 TAdapterHiddenField.Create Constructor

Pascal

```
constructor Create(AHiddenFields: TAdapterHiddenFieldsList; AIndex: Integer);
```

C++

```
__fastcall TAdapterHiddenField(TAdapterHiddenFieldsList AHiddenFields, int AIndex);
```

Description

This is Create, a member of class TAdapterHiddenField.

173.1.21.3 TAdapterHiddenField Methods

The methods of the TAdapterHiddenField class are listed here.

Protected Methods

	Name	Description
	GetName (see page 23862)	This is GetName, a member of class TAdapterHiddenField.
	GetValue (see page 23862)	This is GetValue, a member of class TAdapterHiddenField.

173.1.21.3.1 TAdapterHiddenField.GetName Method

Pascal

```
function GetName: string;
```

C++

```
__fastcall AnsiString GetName();
```

Description

This is GetName, a member of class TAdapterHiddenField.

173.1.21.3.2 TAdapterHiddenField.GetValue Method

Pascal

```
function GetValue: string;
```

C++

```
__fastcall AnsiString GetValue();
```

Description

This is GetValue, a member of class TAdapterHiddenField.

173.1.22 TAdapterHiddenFieldsList Class

TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.

Class Hierarchy

Pascal

```
TAdapterHiddenFieldsList = class(TInterfacedObject, IAdapterHiddenFields, IIterateIntfSupport);
```

C++

```
class TAdapterHiddenFieldsList : public TInterfacedObject, public IAdapterHiddenFields, public
IIterateIntfSupport;
```

File

WebAdapt

Description

Adapter components create instances of TAdapterHiddenFieldsList to store the name/value pairs they include as hidden fields in HTML forms. Each entry in the list has a field name and a value for that field. The adapter uses the methods of TAdapterHiddenFieldsList to add name/value pairs to the list, based on its hidden field options. When an adapter page producer generates a form using the adapter, it includes hidden fields for every name/value pair in the list. Those hidden fields are then included in any request that originates from the resulting HTML form, so that the adapter and its subcomponents can access those values to respond to the request.

For example, dataset adapters that have a Mode property that indicates whether the form is used for read-only browsing, inserting a new record, editing an existing record, or generating a query. The adapter includes the current mode as a hidden field. When the WebSnap application receives a message from the HTML form with that hidden field, the adapter can reestablish the correct mode for processing the request.

173.1.22.1 TAdapterHiddenFieldsList Members

The following tables list the members exposed by TAdapterHiddenFieldsList.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	EndIterator (see page 23866)	This is EndIterator, a member of class TAdapterHiddenFieldsList.
	GetCurrentIntf (see page 23867)	This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.
	GetField (see page 23867)	This is GetField, a member of class TAdapterHiddenFieldsList.
	GetFieldCount (see page 23867)	This is GetFieldCount, a member of class TAdapterHiddenFieldsList.
	NextIteration (see page 23867)	Advances to the objects next item.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 23868)	This is StartIterator, a member of class TAdapterHiddenFieldsList.

Protected Properties

	Name	Description
R	FieldCount (see page 23868)	This is FieldCount, a member of class TAdapterHiddenFieldsList.
R	Fields (see page 23868)	This is Fields, a member of class TAdapterHiddenFieldsList.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 23866)	Adds a name/value pair to the list.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 23866)	Clears the list of all the name/value pairs it currently holds.
	Create (see page 23865)	Creates and initializes a TAdapterHiddenFieldsList (see page 23862) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 23865)	Frees an instance of TAdapterHiddenFieldsList (see page 23862).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

173.1.22.2 TAdapterHiddenFieldsList.Create Constructor

Creates and initializes a TAdapterHiddenFieldsList (see page 23862) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAdapterHiddenFieldsList();
```

Description

Typically, applications have no need to create TAdapterHiddenFieldsList (see page 23862) instances. The adapter component creates and maintains its own internal TAdapterHiddenFieldsList (see page 23862) objects, which it uses to store the hidden fields it needs to add to HTML forms.

See Also

listhiddenfields (see page 24173)

ListHiddenRecordFields (see page 24173)

173.1.22.3 TAdapterHiddenFieldsList.Destroy Destructor

Frees an instance of TAdapterHiddenFieldsList (see page 23862).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterHiddenFieldsList();
```

Description

Do not use the Destroy method directly to free a TAdapterHiddenFieldsList (see page 23862) instance. Instead, use the Free method, which checks that the TAdapterHiddenFieldsList (see page 23862) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

173.1.22.4 TAdapterHiddenFieldsList Methods

The methods of the TAdapterHiddenFieldsList class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 23866)	This is EndIterator, a member of class TAdapterHiddenFieldsList.
	GetCurrentIntf (see page 23867)	This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.
	GetField (see page 23867)	This is GetField, a member of class TAdapterHiddenFieldsList.
	GetFieldCount (see page 23867)	This is GetFieldCount, a member of class TAdapterHiddenFieldsList.
	NextIteration (see page 23867)	Advances to the objects next item.
	StartIterator (see page 23868)	This is StartIterator, a member of class TAdapterHiddenFieldsList.

Public Methods

	Name	Description
	Add (see page 23866)	Adds a name/value pair to the list.
	Clear (see page 23866)	Clears the list of all the name/value pairs it currently holds.

173.1.22.4.1 TAdapterHiddenFieldsList.Add Method

Adds a name/value pair to the list.

Pascal

```
procedure Add(const AName: string; const AValue: string);
```

C++

```
__fastcall Add(const AnsiString AName, const AnsiString AValue);
```

Description

Call Add to add a new name/value pair to the list of hidden fields that the adapter maintains.

AName is the name of the field.

AValue is the value of the field.

See Also

Clear (see page 23866)

173.1.22.4.2 TAdapterHiddenFieldsList.Clear Method

Clears the list of all the name/value pairs it currently holds.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the TAdapterHiddenFieldsList (see page 23862) object. Clear discards any name/value pairs that have been added previously by a call to the Add (see page 23866) method.

See Also

Add (see page 23866)

173.1.22.4.3 TAdapterHiddenFieldsList.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TAdapterHiddenFieldsList.

173.1.22.4.4 TAdapterHiddenFieldsList.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.

173.1.22.4.5 TAdapterHiddenFieldsList.GetField Method

Pascal

```
function GetField(I: Integer): IAdapterHiddenField;
```

C++

```
__fastcall IAdapterHiddenField GetField(int I);
```

Description

This is GetField, a member of class TAdapterHiddenFieldsList.

173.1.22.4.6 TAdapterHiddenFieldsList.GetFieldCount Method

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

This is GetFieldCount, a member of class TAdapterHiddenFieldsList.

173.1.22.4.7 TAdapterHiddenFieldsList.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

startiterator (see page 19724)

enditerator (see page 19723)

173.1.22.4.8 TAdapterHiddenFieldsList.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TAdapterHiddenFieldsList.

173.1.22.5 TAdapterHiddenFieldsList Properties

The properties of the TAdapterHiddenFieldsList class are listed here.

Protected Properties

	Name	Description
R	FieldCount (see page 23868)	This is FieldCount, a member of class TAdapterHiddenFieldsList.
R	Fields (see page 23868)	This is Fields, a member of class TAdapterHiddenFieldsList.

173.1.22.5.1 TAdapterHiddenFieldsList.FieldCount Property

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

This is FieldCount, a member of class TAdapterHiddenFieldsList.

173.1.22.5.2 TAdapterHiddenFieldsList.Fields Property

Pascal

```
property Fields [I: Integer]: IAdapterHiddenField;
```

C++

```
__property IAdapterHiddenField Fields[int I];
```

Description

This is Fields, a member of class TAdapterHiddenFieldsList.

173.1.23 TAdapterImageField Class

TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.

Class Hierarchy

Pascal

```
TAdapterImageField = class(TCustomAdapterImageField);
```

C++

```
class TAdapterImageField : public TCustomAdapterImageField;
```

File

WebAdapt

Description

TAdapterImageField publishes the properties in TCustomAdapterImageField (see page 24244). TCustomAdapterImageField (see page 24244) calls event handlers to retrieve the adapter field's image file name, image file, and image file URL. It also defines event handler that are called to validate files uploaded by the end-user, and update the adapter field's image file.

Add TAdapterFileField (see page 23837) to TAdapter (see page 23713) or other adapter components types when you need an adapter field that supports an image using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 23818), TAdapterMultiValueField (see page 23900), TAdapterMemoField (see page 23889), TAdapterBooleanField (see page 23758) and TAdapterFileField (see page 23837).

See Also

TCustomAdapterImageField (see page 24244)

TAdapterField (see page 23818)

TAdapterMemoField (see page 23889)

TAdapterMultiValueField (see page 23900)

TAdapterBooleanField (see page 23758)

TAdapterFileField (see page 23837)

173.1.23.1 TAdapterImageField Members

The following tables list the members exposed by TAdapterImageField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
	CreateRequestContext (see page 24252)	Creates AdapterRequest and AdapterResponse objects.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
	DoOnValidateValue (see page 24253)	Validates files uploaded by the end-user.
	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 24253)	Provides an object that can be used to access the image properties of this adapter field.
	GetAdapterItemRequestParams (see page 24253)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayStyleType (see page 24254)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetInputStyleType (see page 24254)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HandleRequest (see page 24255)	Handles a request for the image file associated with this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.

	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplCheckValueChange (see page 24255)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 24255)	Creates AdapterRequest and AdapterResponse objects.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetValue (see page 24256)	Returns the name of the image file associated with this adapter field.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHandleRequest (see page 24256)	Handles a request for the image file associated with this adapter field.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24257)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	ImplWebImageHREF (see page 24257)	Returns a URL that can be used to access the image file associated with this adapter field.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RenderAdapterImage (see page 24258)	Responds to a request for an image file by providing a stream containing the image.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
	WebImageHREF (see page 24258)	Returns a URL that can be used to access the image file associated with this adapter field.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterImage (see page 19691)	This is GetAdapterImage, a member of class IGetAdapterImage.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.

	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.
	WebImageHREF (see page 19766)	Retrieves a URL for an external image file.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetHREF (see page 23880)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 23880)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 23881)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 23881)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 23881)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 23882)	Used to validate files uploaded by the end user.

Published Properties

	Name	Description
	DisplayLabel (see page 23876)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23877)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23877)	Identifies the name of this field when using server-side script.
	HREF (see page 23877)	Defines a URL that references the image associated with the adapter field.
	ModifyAccess (see page 23878)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23878)	Indicates whether this adapter field is read-only.
	Required (see page 23879)	Indicates whether the end-user must enter a value for this adapter field.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValuesList (see page 23879)	Associates a list of values with the adapter field.
	ViewAccess (see page 23879)	Identifies the rights required to view this field.

173.1.23.2 TAdapterImageField Properties

The properties of the TAdapterImageField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23876)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23877)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23877)	Identifies the name of this field when using server-side script.
	HREF (see page 23877)	Defines a URL that references the image associated with the adapter field.
	ModifyAccess (see page 23878)	Identifies the rights required to update this field.
	ReadOnly (see page 23878)	Indicates whether this adapter field is read-only.
	Required (see page 23879)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 23879)	Associates a list of values with the adapter field.
	ViewAccess (see page 23879)	Identifies the rights required to view this field.

173.1.23.2.1 TAdapterImageField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.23.2.2 TAdapterImageField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.23.2.3 TAdapterImageField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.23.2.4 TAdapterImageField.HREF Property

Defines a URL that references the image associated with the adapter field.

Pascal

```
property HREF: string;
```

C++

```
__property AnsiString HREF;
```

Description

Use the HREF property when this adapter field is associated with an external image file URL. Use the OnGetHREF event to dynamically define an external image file URL. If the image file will be dynamically generated, use the OnGetImage and OnGetImageParams event handlers instead of the HREF property or the OnGetHREF event handler.

See Also

ImplWebImageHREF (see page 24257)

OnGetHREF (see page 24260)

OnGetImage (see page 24260)

OnGetImageName (see page 24260)

173.1.23.2.5 TAdapterImageField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.23.2.6 TAdapterImageField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.23.2.7 TAdapterImageField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.23.2.8 TAdapterImageField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 19740)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

173.1.23.2.9 TAdapterImageField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.23.3 TAdapterImageField Events

The events of the TAdapterImageField class are listed here.

Published Events

	Name	Description
	OnGetHREF (see page 23880)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 23880)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 23881)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 23881)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 23881)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 23882)	Used to validate files uploaded by the end user.

173.1.23.3.1 TAdapterImageField.OnGetHREF Event

Provides the URL of an external image file associated with this adapter field.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Implement OnGetHREF to dynamically identify the URL of an external image file associated with this adapter field. When OnGetHREF is called, the HREF parameter will contain the value of the HREF property. To dynamically generate an image file for this adapter file, implement the OnGetImage event handler instead.

See Also

ImplWebImageHREF (see page 24257)

HREF (see page 24259)

OnGetImage (see page 24260)

173.1.23.3.2 TAdapterImageField.OnGetImage Event

Retrieves a stream containing the image file associated with this adapter field.

Pascal

```
property OnGetImage: TImageFieldGetImageEvent;
```

C++

```
__property TImageFieldGetImageEvent OnGetImage;
```

Description

Implement OnGetImage to dynamically generate an image file associated with this adapter field. Don't implement OnGetImage if the image file is external. Instead implement OnGetHREF event handler or use the HREF property to specify the URL of an

external image.

See Also

RenderAdapterImage (see page 24258)

OnGetParams (see page 24261)

OnGetHREF (see page 24260)

HREF (see page 24259)

173.1.23.3.3 TAdapterImageField.OnGetImageName Event

Returns the name of the image file associated with this adapter field.

Pascal

```
property OnGetImageName: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetImageName;
```

Description

Implement this event handler to identify the name of the image file associated with this adapter field.

See Also

ImplGetValue (see page 24256)

173.1.23.3.4 TAdapterImageField.OnGetParams Event

Provides name/value pairs that identify this adapter field's image.

Pascal

```
property OnGetParams: TImageFieldGetParamsEvent;
```

C++

```
__property TImageFieldGetParamsEvent OnGetParams;
```

Description

Implement this event handler to provide name/value pairs that are needed to identify this adapter field's image file. OnGetParams is called while generating an HTML page with a URL reference to this adapter field's image. The parameters returned by OnGetParams will be passed to OnGetImage when the image file is requested.

See Also

GetAdapterItemRequestParams (see page 24253)

OnGetImage (see page 24260)

173.1.23.3.5 TAdapterImageField.OnUploadFile Event

Updates this adapter field with an image file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

This event handler is called by ImplUpdateValue. This event handler should store the uploaded image file. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 24257)

TAbstractWebRequestFile (see page 15073)

173.1.23.3.6 TAdapterImageField.OnValidateFile Event

Used to validate files uploaded by the end user.

Pascal

```
property OnValidateFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnValidateFile;
```

Description

Validates the file uploaded by the end-user. Raise an exception to indicate an error. For example, it raises an exception if the Mime type of the file is not supported.

See Also

DoOnValidateValue (see page 24253)

TAbstractWebRequestFile (see page 15073)

173.1.24 TAdapterLoginField Class

TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 24500) component.

Class Hierarchy

Pascal

```
TAdapterLoginField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterLoginField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterLoginField implements functionality that is used by an adapter field that is a child of TLoginFormAdapter (see page 24500).

See Also

TLoginFormAdapter (see page 24500)

TAdapterNamedDisplayField (see page 23913)

TAdapterUserNameField (see page 24024)

TAdapterPasswordField (see page 23971)

173.1.24.1 TAdapterLoginField Members

The following tables list the members exposed by TAdapterLoginField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.

	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.

R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 23888)	Returns the parent adapter of this adapter field.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.24.2 TAdapterLoginField Properties

The properties of the TAdapterLoginField class are listed here.

Public Properties

	Name	Description
R	Adapter (see page 23888)	Returns the parent adapter of this adapter field.

173.1.24.2.1 TAdapterLoginField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TCustomLoginFormAdapter;
```

C++

```
__property TCustomLoginFormAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter. GetAdapter (see page 23932) implements this property.

See Also

TCustomLoginFormAdapter (see page 24344)

GetAdapter

173.1.25 TAdapterMemoField Class

TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.

Class Hierarchy

Pascal

```
TAdapterMemoField = class(TCustomAdapterMemoField);
```

C++

```
class TAdapterMemoField : public TCustomAdapterMemoField;
```

File

WebAdapt

Description

TAdapterMemoField publishes the properties in TCustomAdapterMemoField (see page 24262). TCustomAdapterMemoField (see page 24262) calls event handlers to retrieve the adapter field's text value, validate a value entered end-user, and update the adapter field's value.

Add TAdapterMemoField to TAdapter (see page 23713) or other adapter components types when you need an adapter field that supports a multi-line text value. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 23818), TAdapterMultiValueField (see page 23900), TAdapterFileField (see page 23837), TAdapterBooleanField (see page 23758) and TAdapterImageField (see page

23869).

TAdapter (see page 23713)

TAdapterField (see page 23818)

TAdapterFileField (see page 23837)

TAdapterMultiValueField (see page 23900)

TAdapterBooleanField (see page 23758)

TAdapterImageField (see page 23869)

173.1.25.1 TAdapterMemoField Members

The following tables list the members exposed by TAdapterMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 24269)	Validates a value entered by the end user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.

	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayStyleType (see page 24270)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetInputStyleType (see page 24270)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplCheckValueChange (see page 24270)	Indicates whether the end-user may have entered a new value for this adapter field.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetValue (see page 24271)	Returns the value of this adapter field as a variant.

	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24271)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValue (see page 23899)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23900)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 23900)	Called to update the adapter field's value with a file uploaded by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 23897)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23897)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23898)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23898)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23898)	Indicates whether this adapter field is read-only.
	Required (see page 23899)	Indicates whether the end-user must enter a value for this adapter field.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 23899)	Identifies the rights required to view this field.

173.1.25.2 TAdapterMemoField Properties

The properties of the TAdapterMemoField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23897)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23897)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23898)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23898)	Identifies the rights required to update this field.
	ReadOnly (see page 23898)	Indicates whether this adapter field is read-only.
	Required (see page 23899)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 23899)	Identifies the rights required to view this field.

173.1.25.2.1 TAdapterMemoField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.25.2.2 TAdapterMemoField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.25.2.3 TAdapterMemoField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.25.2.4 TAdapterMemoField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.25.2.5 TAdapterMemoField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.25.2.6 TAdapterMemoField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.25.2.7 TAdapterMemoField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.25.3 TAdapterMemoField Events

The events of the TAdapterMemoField class are listed here.

Published Events

	Name	Description
	OnGetValue (see page 23899)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 23900)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 23900)	Called to update the adapter field's value with a file uploaded by the end-user.

173.1.25.3.1 TAdapterMemoField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24271)

173.1.25.3.2 TAdapterMemoField.OnUpdateValue Event

Called to update the adapter field's value with a text value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldStringEvent;
```

C++

```
__property TAdapterFieldStringEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24271)

173.1.25.3.3 TAdapterMemoField.OnUploadFile Event

Called to update the adapter field's value with a file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

OnUploadFile is called when an action request contains an uploaded file for this adapter field. If this event handler is not implemented, the file uploaded by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24271)

173.1.26 TAdapterMultiValueField Class

TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.

Class Hierarchy

Pascal

```
TAdapterMultiValueField = class(TCustomAdapterMultiValueField);
```

C++

```
class TAdapterMultiValueField : public TCustomAdapterMultiValueField;
```

File

WebAdapt

Description

TAdapterMultiValueField publishes the properties in TCustomAdapterMultiValueField (see page 24273). TCustomAdapterMultiValueField (see page 24273) calls event handlers to retrieve the adapter field's values, validate values entered by the end-user, and update the adapter field's values.

Add TAdapterMultiValueField to TAdapter (see page 23713) or other adapter components types when you need an adapter

field that supports a multiple values using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 23818), TAdapterFileField (see page 23837), TAdapterMemoField (see page 23889), TAdapterBooleanField (see page 23758) and TAdapterImageField (see page 23869).

See Also

TCustomAdapterMultiValueField (see page 24273)

TAdapter (see page 23713)

TAdapterField (see page 23818)

TAdapterMemoField (see page 23889)

TAdapterFileField (see page 23837)

TAdapterBooleanField (see page 23758)

TAdapterImageField (see page 23869)

173.1.26.1 TAdapterMultiValueField Members

The following tables list the members exposed by TAdapterMultiValueField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 24281)	Validates values entered by the end-user.
	EndValueIterator (see page 24093)	Completes iteration.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 24281)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 24282)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
V	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
V	GetValueCount (see page 24094)	Returns the number of values associated with this adapter field.
V	GetValueCount (see page 24282)	Returns the number of values associated with this adapter field.
V	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
V	GetValues (see page 24095)	Returns one of the values associated with the adapter field.
V	GetValues (see page 24282)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.

	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 24096)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasValue (see page 24283)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 24283)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.

	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24092)	Constructor for TBaseAdapterMultiValueField (see page 24086).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.

	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24093)	Destructor for TBaseAdapterMultiValueField (see page 24086).
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
R	ValueCount (see page 24284)	Returns the number of values associated with this adapter field.
R	Values (see page 24284)	Returns one of the values associated with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValueCount (see page 23911)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 23912)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 23912)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 23912)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 23913)	Validates field values entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 23908)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23909)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23909)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23909)	Identifies the rights required to update this field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ReadOnly (see page 23910)	Indicates whether this adapter field is read-only.
	Required (see page 23910)	Indicates whether the end-user must enter a value for this adapter field.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ValuesList (see page 23910)	Associates a list of values with the adapter field.
	ViewAccess (see page 23911)	Identifies the rights required to view this field.

173.1.26.2 TAdapterMultiValueField Properties

The properties of the TAdapterMultiValueField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23908)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23909)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23909)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23909)	Identifies the rights required to update this field.
	ReadOnly (see page 23910)	Indicates whether this adapter field is read-only.
	Required (see page 23910)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 23910)	Associates a list of values with the adapter field.
	ViewAccess (see page 23911)	Identifies the rights required to view this field.

173.1.26.2.1 TAdapterMultiValueField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.26.2.2 TAdapterMultiValueField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.26.2.3 TAdapterMultiValueField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.26.2.4 TAdapterMultiValueField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.26.2.5 TAdapterMultiValueField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.26.2.6 TAdapterMultiValueField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.26.2.7 TAdapterMultiValueField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 19740)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

173.1.26.2.8 TAdapterMultiValueField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.26.3 TAdapterMultiValueField Events

The events of the TAdapterMultiValueField class are listed here.

Published Events

	Name	Description
	OnGetValueCount (see page 23911)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 23912)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 23912)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 23912)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 23913)	Validates field values entered by the end-user.

173.1.26.3.1 TAdapterMultiValueField.OnGetValueCount Event

Responsible for returning the count of values associated with the adapter field.

Pascal

```
property OnGetValueCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetValueCount;
```

Description

Implement this event handler to provide the count of values associated with an adapter field. Also implement OnGetValues to provide the individual values.

See Also

GetValueCount (see page 24282)

OnGetValues (see page 24285)

173.1.26.3.2 TAdapterMultiValueField.OnGetValues Event

Responsible for returning one of the values associated with the adapter field.

Pascal

```
property OnGetValues: TAdapterFieldGetMultiValueEvent;
```

C++

```
__property TAdapterFieldGetMultiValueEvent OnGetValues;
```

Description

Implement this event handler to provide the values associated with an adapter field. The Index parameter is zero-based. Also implement OnGetValueCount to provide the count of values associated with this adapter field.

See Also

GetValues (see page 24282)

OnGetValueCount (see page 24285)

173.1.26.3.3 TAdapterMultiValueField.OnHasValue Event

Indicates whether a particular value is associated with this adapter field.

Pascal

```
property OnHasValue: TAdapterFieldHasValueEvent;
```

C++

```
__property TAdapterFieldHasValueEvent OnHasValue;
```

Description

ImplHasValue calls this event handler. Implement this event handler to lookup a matching value. Implementation of this event handler is optional. If OnHasValue is nil, ImplHasValue will search for a matching value the Values and ValueCount properties.

See Also

ImplHasValue (see page 24283)

ValueCount (see page 24284)

Values (see page 24284)

173.1.26.3.4 TAdapterMultiValueField.OnUpdateValues Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUpdateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnUpdateValues;
```

Description

Implement this event handler to process values entered by the end-user. Raise an exception if an error occurs.

See Also

OnValidateValues (see page 24286)

ImplUpdateValue (see page 24283)

173.1.26.3.5 TAdapterMultiValueField.OnValidateValues Event

Validates field values entered by the end-user.

Pascal

```
property OnValidateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnValidateValues;
```

Description

Implement this event handler to validate values entered by the end-user. Raise an exception if an error occurs.

See Also

OnValidateValues (see page 24286)

173.1.27 TAdapterNamedDisplayField Class

The AdapterNamedDisplayField is a base class for adapter fields.

Class Hierarchy

Pascal

```
TAdapterNamedDisplayField = class(TAdapterNamedField, IGetHTMLStyle);
```

C++

```
class TAdapterNamedDisplayField : public TAdapterNamedField, public IGetHTMLStyle;
```

File

WebAdapt

Description

TAdapterNameDisplayField implements the IGetHTMLStyle interface used to inquire how this adapter field should be displayed in an HTML form. For example, IGetHTMLStyle's GetInputStyle (see page 23920) method may indicate that this field should be displayed using a select list. TAdapterNamedField (see page 23925) also declares properties that may be modified at design-time to control how the adapter field should be displayed. For example, the DisplayLabel (see page 23923) property is used to suggest display label for this adapter field.

See Also

TAdapterNamedField (see page 23925)

TCustomAdapter (see page 24139)

TAdapter (see page 23713)

IGetHTMLStyle (see page 19699)

173.1.27.1 TAdapterNamedDisplayField Members

The following tables list the members exposed by TAdapterNamedDisplayField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.

	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.

	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.27.2 TAdapterNamedDisplayField.Create Constructor

Creates an instance of TAdapterNamedDisplayField (see page 23913).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterNamedDisplayField(TComponent * AOwner);
```

Description

Do not call Create. It will be called automatically when the TAdapterNamedDisplayField (see page 23913) object is created

173.1.27.3 TAdapterNamedDisplayField Methods

The methods of the TAdapterNamedDisplayField class are listed here.

Protected Methods

	Name	Description
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.

	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.

173.1.27.3.1 TAdapterNamedDisplayField.GetDisplayStyle Method

Returns a string value to suggest an HTML display style for this adapter field.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(const AnsiString AAdapterMode);
```

Description

GetDisplayStyle implements IGetHTMLStyle's GetDisplayStyle by translating the result value of GetDisplayStyleType (see page 23920) into a string.

See Also

GetDisplayStyle (see page 19700)

GetDisplayStyleType (see page 23920)

173.1.27.3.2 TAdapterNamedDisplayField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmldText, indicating that this adapter field should be displayed by simple text. Descendant classes may override this method to suggest other HTML display types.

See Also

GetDisplayStyle (see page 23920)

173.1.27.3.3 TAdapterNamedDisplayField.GetInputStyle Method

Returns a string value to suggest an HTML input style for this adapter field.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetInputStyle(const AnsiString AAdapterMode);
```

Description

GetInputStyle implements IGetHTMLStyle's GetInputType method by translating the result value of GetInputStyleType (see page 23921) into a string.

See Also

GetInputStyle (see page 19700)

GetInputStyleType (see page 23921)

173.1.27.3.4 TAdapterNamedDisplayField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; virtual;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType returns htmliTextInput, indicating that this adapter field should be edited by a single line input field. Descendant classes may override this method to suggest a different HTML input type.

See Also

GetInputStyle (see page 23920)

173.1.27.3.5 TAdapterNamedDisplayField.GetViewMode Method

Returns a string value to suggest a view mode for this adapter field.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetViewMode(const AnsiString AAdapterMode);
```

Description

GetViewMode implements IGetHTMLStyle's GetViewMode method by translating the result value of GetViewModeType (see page 23921) into a string.

See Also

GetViewMode (see page 19701)

GetViewModeType (see page 23921)

173.1.27.3.6 TAdapterNamedDisplayField.GetViewModeType Method

Suggests a view mode for this adapter field.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const AnsiString AAdapterMode);
```

Description

GetViewModeType returns htmlvmDisplay if the ReadOnly (see page 23924) property is true. Otherwise, htmlvmInput is returned.

See Also

ReadOnly (see page 23924)

GetViewMode (see page 23921)

173.1.27.3.7 TAdapterNamedDisplayField.ImplGetDisplayLabel Method

Implements interface access to the DisplayLabel (see page 23923) property.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 23923) property.

See Also

DisplayLabel (see page 23923)

173.1.27.3.8 TAdapterNamedDisplayField.ImplGetDisplayWidth Method

Implements interface access to the DisplayWidth (see page 23924) property.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

ImplGetDisplayWidth returns the value of the DisplayWidth (see page 23924) property.

See Also

DisplayWidth (see page 23924)

173.1.27.3.9 TAdapterNamedDisplayField.ImplGetRequired Method

Implements interface access to the Required (see page 23924) property.

Pascal

```
function ImplGetRequired: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetRequired();
```

Description

ImplGetRequired returns the value of the Required (see page 23924) property.

See Also

Required (see page 23924)

173.1.27.3.10 TAdapterNamedDisplayField.SetDisplayLabel Method

SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.

Pascal

```
procedure SetDisplayLabel(const AValue: string);
```

C++

```
__fastcall SetDisplayLabel(const AnsiString AValue);
```

Description

Use SetDisplayLabel to set the value of the DisplayLabel (see page 23923) property to AValue.

See Also

DisplayLabel (see page 23923)

173.1.27.4 TAdapterNamedDisplayField Properties

The properties of the TAdapterNamedDisplayField class are listed here.

Public Properties

	Name	Description
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.

173.1.27.4.1 TAdapterNamedDisplayField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.27.4.2 TAdapterNamedDisplayField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.27.4.3 TAdapterNamedDisplayField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode (see page 23921) which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.27.4.4 TAdapterNamedDisplayField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 23934)

173.1.28 TAdapterNamedField Class

TAdapterNamedField is a based class for adapter field components.

Class Hierarchy

Pascal

```
TAdapterNamedField = class(TWebContainedComponent, IWebVariableName, IWebInputName,
IWebGetFieldValue, IEchoActionFieldValue, IAsFormatted, IWebGetFieldName, IWebSetFieldName,
IWebGetDisplayWidth, IWebGetDisplayLabel, IWebGetMaxLength, IWebSnapObjClass,
IAdapterFieldAccess, IAdapterFieldAttributes);
```

C++

```
class TAdapterNamedField : public TWebContainedComponent, public IWebVariableName, public
IWebInputName, public IWebGetFieldValue, public IEchoActionFieldValue, public IAsFormatted,
public IWebGetFieldName, public IWebSetFieldName, public IWebGetDisplayWidth, public
IWebGetDisplayLabel, public IWebGetMaxLength, public IWebSnapObjClass, public
IAdapterFieldAccess, public IAdapterFieldAttributes;
```

File

WebAdapt

Description

TAdapterNamedField implements interfaces used to access an adapter field's properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to

customize the behavior of the adapter field class.

See Also

TAdapterNamedDisplayField (see page 23913)

TAdapter (see page 23713)

173.1.28.1 TAdapterNamedField Members

The following tables list the members exposed by TAdapterNamedField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.

	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.28.2 TAdapterNamedField Methods

The methods of the TAdapterNamedField class are listed here.

Protected Methods

	Name	Description
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.

	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.

173.1.28.2.1 TAdapterNamedField.AsFormatted Method

Returns text used to generate a representation of the adapter field value.

Pascal

```
function AsFormatted: string;
```

C++

```
__fastcall AnsiString AsFormatted();
```

Description

This function returns a text that is typically used when generating a read-only representation of the adapter field value. The value returned by this function can be accessed with server-side script using the DisplayText property.

See Also

ImplAsFormatted (see page 23937)

173.1.28.2.2 TAdapterNamedField.CheckModifyAccess Method

Checks end-user rights to modify the adapter field value.

Pascal

```
procedure CheckModifyAccess;
```

C++

```
__fastcall CheckModifyAccess();
```

Description

This procedure is called to verify that the current user has rights to modify this field. An exception will be raised if access is denied.

See Also

ModifyAccess (see page 23944)

HasModifyAccess (see page 23936)

173.1.28.2.3 TAdapterNamedField.CheckViewAccess Method

Checks end-user rights to view the adapter field value.

Pascal

```
procedure CheckViewAccess;
```

C++

```
__fastcall CheckViewAccess();
```

Description

This procedure is called to verify that the current user has rights to view this field. An exception will be raised if access is denied.

See Also

ViewAccess (see page 23945)

HasModifyAccess (see page 23936)

173.1.28.2.4 TAdapterNamedField.FullyQualifyInputName Method

Indicates whether the HTML input names must be qualified with the name of the adapter.

Pascal

```
function FullyQualifyInputName: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean FullyQualifyInputName();
```

Description

This functions returns true if, when generating an HTML input referencing this adapter field, the name of the HTML input must be qualified with the name of the adapter component. Input names must be fully qualified when a single HTML form is used to input values for multiple adapters.

See Also

MasterAdapter (see page 7809)

173.1.28.2.5 TAdapterNamedField.GetAdapter Method

GetAdapter returns the parent adapter component.

Pascal

```
function GetAdapter: TCustomAdapter;
```

C++

```
__fastcall TCustomAdapter GetAdapter();
```

Description

To improve the efficiency of this function, a reference to the parent adapter component is cached in an instance variable.

173.1.28.2.6 TAdapterNamedField.GetDefaultDisplayLabel Method

Provides the default display label for this adapter field.

Pascal

```
function GetDefaultDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultDisplayLabel();
```

Description

When the display label for the field matches this value then the display label property does not need to be stored in the form file.

173.1.28.2.7 TAdapterNamedField.GetDefaultFieldName Method

Gets the default name used to reference this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

This function returns the default field name for the field. This name will be used when a field name has not be set using ImplSetFieldName (see page 23941). GetDefaultFieldName returns the name of the adapter field component. Descendants may override this function.

See Also

ImplGetVariableName (see page 23939)

ImplSetFieldName (see page 23941)

173.1.28.2.8 TAdapterNamedField.GetDisplayLabel Method

Returns the suggested display label for this adapter field.

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall AnsiString GetDisplayLabel();
```

Description

GetDisplayLabel provides label that may be used when generating HTML to display the value of this adapter field. The value returned by this function can be accessed with server-side script using the DisplayLabel property. GetDisplayLabel calls ImplGetDisplayLabel (see page 23937).

See Also

ImplGetDisplayLabel (see page 23937)

173.1.28.2.9 TAdapterNamedField.GetDisplayWidth Method

Returns the suggested display width for this adapter field.

Pascal

```
function GetDisplayWidth: Integer;
```

C++

```
__fastcall int GetDisplayWidth();
```

Description

This function returns the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. The value returned by this function can be accessed with server-side script using the DisplayWidth property. GetDisplayWidth calls ImplGetDisplayWidth (see page 23937).

See Also

ImplGetDisplayWidth (see page 23937)

173.1.28.2.10 TAdapterNamedField.GetEchoActionFieldValue Method

Returns the value of the echo flag.

Pascal

```
function GetEchoActionFieldValue: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValue();
```

Description

EchoActionFieldValue (see page 23944) calls ImplEchoActionFieldValue.

See Also

EchoActionFieldValue (see page 23944)

173.1.28.2.11 TAdapterNamedField.GetInputName Method

Identifies the name to use when generating an HTML input for this adapter field.

Pascal

```
function GetInputName: string;
```

C++

```
__fastcall AnsiString GetInputName();
```

Description

This functions returns the name used for an HTML input associated with this adapter field. This value is accessed with server-side script using the InputName property. GetInputName calls ImplGetInputName (see page 23938).

See Also

ImplGetInputName (see page 23938)

173.1.28.2.12 TAdapterNamedField.GetMaxLength Method

Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.

Pascal

```
function GetMaxLength: Integer;
```

C++

```
__fastcall int GetMaxLength();
```

Description

The value returned by this function can be accessed with server-side script using the MaxLength property. Server-side script may use this value to define HTML elements that limit the number of characters that can be entered by the end-user. GetMaxLength calls ImplGetMaxLength (see page 23938).

See Also

ImplGetMaxLength (see page 23938)

173.1.28.2.13 TAdapterNamedField.GetRequired Method

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This function returns true or false to indicate whether a value must be entered by the end user before submitting a form. The value returned by this function can be accessed with server-side script using the Required property. Typically, this function is called while executing an adapter action that validates field values. The adapter action component will raise an exception if the value of the submitted field is empty. GetRequired calls ImplGetRequired (see page 23939).

See Also

ImplGetRequired (see page 23939)

173.1.28.2.14 TAdapterNamedField.GetValue Method

Gets the value of this adapter field as a Variant.

Pascal

```
function GetValue: Variant;
```

C++

```
__fastcall Variant GetValue();
```

Description

GetValue returns the result of ImplGetValue (see page 23939).

See Also

Value (see page 23945)

ImplGetValue (see page 23939)

173.1.28.2.15 TAdapterNamedField.GetVariableName Method

Gets the name used to reference this adapter field with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall AnsiString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter field with server-side script. GetVariableName calls ImplGetVariableName (see page 23939).

See Also

ImplGetVariableName (see page 23939)

173.1.28.2.16 TAdapterNamedField.GetVisible Method

Indicates whether the value of this adapter field should be displayed to the end-user.

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

The value returned by this function can be accessed with server-side script using the Visible property. GetVisible calls ImplGetVisible (see page 23940).

See Also

ImplGetVisible (see page 23940)

173.1.28.2.17 TAdapterNamedField.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

173.1.28.2.18 TAdapterNamedField.HasModifyAccess Method

Checks the end-user's right to modify this adapter field.

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanModify property. HasModifyAccess calls ImplHasModifyAccess (see page 23940).

See Also

ImplHasModifyAccess (see page 23940)

173.1.28.2.19 TAdapterNamedField.HasViewAccess Method

Checks the end-user's right to view this adapter field.

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanView property. HasViewAccess calls ImplHasViewAccess (see page 23940).

See Also

ImplHasViewAccess (see page 23940)

173.1.28.2.20 TAdapterNamedField.ImplAsFormatted Method

Returns text used to generate a representation of the adapter field value.

Pascal

```
function ImplAsFormatted: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplAsFormatted();
```

Description

ImplAsFormatted is called by AsFormatted (see page 23931).

See Also

AsFormatted (see page 23931)

173.1.28.2.21 TAdapterNamedField.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter field.

Pascal

```
function ImplGetDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel is called by GetDisplayLabel (see page 23933). ImplGetDisplayLabel returns the result of GetDefaultDisplayLabel (see page 23932). Descendants may override this function.

See Also

GetDisplayLabel (see page 23933)

GetDefaultDisplayLabel (see page 23932)

173.1.28.2.22 TAdapterNamedField.ImplGetDisplayWidth Method

Returns the suggested display width for this adapter field.

Pascal

```
function ImplGetDisplayWidth: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

This function is called by GetDisplayWidth (see page 23933) to retrieve the suggested display width for this adapter field. ImplGetDisplayWidth returns –1 to indicate an undefined display width. Descendants may override this function.

See Also

GetDisplayWidth (see page 23933)

173.1.28.2.23 TAdapterNamedField.ImplGetEchoActionFieldValue Method

Returns the value of the echo flag.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

This function is called by GetEchoActionFieldValue (see page 23933).

See Also

EchoActionFieldValue (see page 23944)

GetEchoActionFieldValue (see page 23933)

173.1.28.2.24 TAdapterNamedField.ImplGetInputName Method

Identifies the name to use when generating the HTML input for this adapter field.

Pascal

```
function ImplGetInputName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetInputName();
```

Description

When an action request is received, the name/value pairs in the HTTP are searched for adapter field values. For each adapter field value found, an IActionFieldValue (see page 24596) implementation is created. In order for the HTTP request to be interpreted properly, the HTML input fields must have names that correspond to the adapter fields they represent.

See Also

GetInputName (see page 23934)

IActionFieldValue (see page 920)

173.1.28.2.25 TAdapterNamedField.ImplGetMaxLength Method

Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.

Pascal

```
function ImplGetMaxLength: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetMaxLength();
```

Description

ImplGetMaxLength is called by GetMaxLength (see page 23934). ImplGetMaxLength returns –1 to indicate an undefined maximum length. Descendants may override this function.

See Also

GetMaxLength (see page 23934)

173.1.28.2.26 TAdapterNamedField.ImplGetRequired Method

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
function ImplGetRequired: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetRequired();
```

Description

ImplGetRequired returns False. Descendants may override this function.

See Also

GetRequired (see page 23934)

173.1.28.2.27 TAdapterNamedField.ImplGetValue Method

Gets the value of this adapter field as a Variant.

Pascal

```
function ImplGetValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

This function is called by GetValue (see page 23935). ImplGetValue returns Unassigned. Descendants override this function.

See Also

Value (see page 23945)

GetValue (see page 23935)

173.1.28.2.28 TAdapterNamedField.ImplGetVariableName Method

Gets the name used to reference this adapter field with server-side script.

Pascal

```
function ImplGetVariableName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetVariableName();
```

Description

This function is called by GetVariableName (see page 23935). GetVariableName (see page 23935) returns the field name set by ImplSetFieldName (see page 23941) unless this name is blank. If the field name is blank, the result of GetDefaultFieldName (see page 23932) is returned.

See Also

GetVariableName (see page 23935)

ImplSetFieldName (see page 23941)

GetDefaultFieldName (see page 23932)

173.1.28.2.29 TAdapterNamedField.ImplGetVisible Method

Indicates whether the value of this adapter field should be displayed to the end-user.

Pascal

```
function ImplGetVisible: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

This function returns true to indicate that the field should be displayed to the end user. Descendants may override this method.

See Also

GetVisible (see page 23935)

173.1.28.2.30 TAdapterNamedField.ImplHasModifyAccess Method

Checks the end-user's right to modify this adapter field.

Pascal

```
function ImplHasModifyAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyAccess();
```

Description

This function is called by HasModifyAccess (see page 23936) to check the end-user's right to modify the adapter field. If the ModifyAccess (see page 23944) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ModifyAccess (see page 23944) property value.

See Also

hasmodifyaccess (see page 24162)

ModifyAccess (see page 23944)

HasModifyAccess (see page 23936)

173.1.28.2.31 TAdapterNamedField.ImplHasViewAccess Method

Checks the end-user's right to view this adapter field.

Pascal

```
function ImplHasViewAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewAccess();
```

Description

This function is called by HasViewAccess (see page 23936) to check the end-user's right to view the adapter field. If the ViewAccess (see page 23945) property is not blank, this function calls the EndUserAdapter's HasViewRights function, passing the ViewAccess (see page 23945) property value.

See Also

HasViewAccess (see page 24162)

ViewAccess (see page 23945)

HasViewAccess (see page 23936)

173.1.28.2.32 TAdapterNamedField.ImplSetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); virtual;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplEchoActionFieldValue is called by SetEchoActionFieldValue (see page 23942). ImplEchoActionFieldValue is a placeholder. Descendants may override this method.

See Also

EchoActionFieldValue (see page 23944)

SetEchoActionFieldValue (see page 23942)

173.1.28.2.33 TAdapterNamedField.ImplSetFieldName Method

Sets the name that is used to reference this adapter field with server-side script.

Pascal

```
procedure ImplSetFieldName(const Value: string); virtual;
```

C++

```
virtual __fastcall ImplSetFieldName(const AnsiString Value);
```

Description

ImplSetFieldName is called by SetFieldName (see page 23942). ImplSetFieldName stores the name in an instance variable. This method may be overridden by descendants.

See Also

SetFieldName (see page 23942)

173.1.28.2.34 TAdapterNamedField.ParentChanged Method

Handles movement of the component to a different parent.

Pascal

```
procedure ParentChanged; override;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called when the parent component is changed. TAdapterNamedField (see page 23925) clears its cached reference to the parent adapter.

173.1.28.2.35 TAdapterNamedField.SetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure SetEchoActionFieldValue(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValue(Boolean AValue);
```

Description

SetEchoActionFieldValue calls ImplSetActionFieldValue.

See Also

EchoActionFieldValue (see page 23944)

ImplSetEchoActionFieldValue (see page 23941)

173.1.28.2.36 TAdapterNamedField.SetFieldName Method

Sets the name that is used to reference this adapter field with server-side script.

Pascal

```
procedure SetFieldName(const AName: string);
```

C++

```
__fastcall SetFieldName(const AnsiString AName);
```

Description

SetFieldName is typically called at design time to set the field name of a new adapter field. SetFieldName calls ImplSetFieldName (see page 23941).

See Also

ImplSetFieldName (see page 23941)

173.1.28.3 TAdapterNamedField Properties

The properties of the TAdapterNamedField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.

173.1.28.3.1 TAdapterNamedField.ActionOrigValue Property

Retrieve the original value of this adapter field.

Pascal

```
property ActionOrigValue: IActionFieldValue;
```

C++

```
__property IActionFieldValue ActionOrigValue;
```

Description

Some adapter fields will include their original value as a hidden field in an HTML form. The original value can be compared with the current value to verify that the current value hasn't been changed by another user between the time that the HTML form was generated and the HTML form was submitted. Use this property when executing an adapter action to retrieve the original value for this adapter field at the time that the HTML form was generated.

See Also

FieldFlags (see page 7752)

173.1.28.3.2 TAdapterNamedField.ActionValue Property

Retrieve the value for this adapter field entered by the end-user.

Pascal

```
property ActionValue: IActionFieldValue;
```

C++

```
__property IActionFieldValue ActionValue;
```

Description

The ActionValue property retrieves the value(s) entered by the end-user and passed in the HTTP request when an HTML form is submitted. When executing an adapter action, use this property to retrieve the value(s) entered by the end-user.

173.1.28.3.3 TAdapterNamedField.Adapter Property

Returns the parent adapter component.

Pascal

```
property Adapter: TCustomAdapter;
```

C++

```
__property TCustomAdapter Adapter;
```

Description

Use this property to access the parent adapter component. The type of this class is TComponent because adapter components are not required to descend from a common adapter base class. Typically the adapter component is accessed through interfaces.

173.1.28.3.4 TAdapterNamedField.EchoActionFieldValue Property

Used to echo the value(s) entered by the end-user when generating an HTML form.

Pascal

```
property EchoActionFieldValue: Boolean;
```

C++

```
__property Boolean EchoActionFieldValue;
```

Description

The EchoActionFieldValue property is used to alter the source of the adapter fields value. When this flag is set, the adapter field retrieves it's value from the HTTP request. When this flag is clear, the adapter field retrieves it's current value. Typically, this flag is set after an error occurs while processing an adapter action. Setting this flag results in generated HTML that displays values entered by the end-user. This allows the end-user to make corrections and resubmit the form.

See Also

SetEchoActionFieldValue (see page 23942)

173.1.28.3.5 TAdapterNamedField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.28.3.6 TAdapterNamedField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

hasmodifyaccess (see page 24162)

173.1.28.3.7 TAdapterNamedField.Value Property

Provides the value of an adapter field as a variant.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

The Value property returns the value of an adapter field as a Variant. Server-side script can access this value using the Value property. Note that descendant adapter fields support multiple values per field, files and images. For these fields, the Value property will not correctly represent the value of the adapter field.

See Also

GetValueCount (see page 24017)

GetValues (see page 24017)

173.1.28.3.8 TAdapterNamedField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

173.1.29 TAdapterNextPageAction Class

TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 24403).

Class Hierarchy

Pascal

```
TAdapterNextPageAction = class(TCustomAdapterPageAction);
```

C++

```
class TAdapterNextPageAction : public TCustomAdapterPageAction;
```

File

WebAdapt

Description

Add TAdapterNextPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 24403) such as TPagedAdapter (see page 24525).

See Also

TCustomAdapterPageAction (see page 24286)

TDefaultFieldsPagedAdapter (see page 24403)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

TPagedAdapter (see page 24525)

TDefaultFieldsPagedAdapter (see page 24403)

173.1.29.1 TAdapterNextPageAction Members

The following tables list the members exposed by TAdapterNextPageAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 23952)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 23953)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 24293)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetNewPage (see page 23953)	Indicates the page to display when this action is executed.

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24294)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24294)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplIsDefaultAction (see page 24295)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24295)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.

V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 23955)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23955)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23956)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23956)	Called before the adapter action response is generated.
	OnGetParams (see page 23957)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 23954)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23954)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 23954)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.29.2 TAdapterNextPageAction Methods

The methods of the TAdapterNextPageAction class are listed here.

Protected Methods

	Name	Description
V	GetDefaultActionName (see page 23952)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 23953)	Provides the default display label for this adapter action.
V	GetNewPage (see page 23953)	Indicates the page to display when this action is executed.

173.1.29.2.1 TAdapterNextPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns "NextPage".

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.29.2.2 TAdapterNextPageAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultDisplayLabel();
```

Description

GetDefaultDisplayLabel returns ">>". This displays as '>>' in the browser.

See Also

DisplayLabel (see page 24073)

173.1.29.2.3 TAdapterNextPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

GetNewPage determines whether the current page can be incremented. If so, the AValue parameter is modified and true is returned. Otherwise, false is returned.

See Also

GetNewPage (see page 24294)

RecordCount (see page 24419)

PageSize (see page 24419)

CurrentPage (see page 24418)

173.1.29.3 TAdapterNextPageAction Properties

The properties of the TAdapterNextPageAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23954)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23954)	Defines the rights required to execute this action.
	RedirectOptions (see page 23954)	Indicates whether to perform an HTTP redirect after successfully executing this action.

173.1.29.3.1 TAdapterNextPageAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.29.3.2 TAdapterNextPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

173.1.29.3.3 TAdapterNextPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

173.1.29.4 TAdapterNextPageAction Events

The events of the TAdapterNextPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 23955)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23955)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23956)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23956)	Called before the adapter action response is generated.
	OnGetParams (see page 23957)	Specifies name/value pairs needed to execute this adapter action.

173.1.29.4.1 TAdapterNextPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.29.4.2 TAdapterNextPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.29.4.3 TAdapterNextPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.29.4.4 TAdapterNextPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.29.4.5 TAdapterNextPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.30 TAdapterNextPageField Class

The TAdapterNextPageField navigates to the next page of data.

Class Hierarchy

Pascal

```
TAdapterNextPageField = class(TAdapterLoginField, IGetAdapterValuesList, IUpdateValue);
```

C++

```
class TAdapterNextPageField : public TAdapterLoginField, public IGetAdapterValuesList, public
IUpdateValue;
```

File

WebAdapt

Description

TAdapterNextPageField is one of the components that is used by TPagedAdapter (see page 24525) along with the TAdapterNextPageAction (see page 23945) to navigate to the next page of data.

The TPagedAdapter (see page 24525) PageSize property indicates the number of rows displayed on a page. When the PageSize is not 0, the TPagedAdapter (see page 24525) component automatically adds built-in actions for moving between pages. These actions are TAdapterGotoPageAction (see page 23849), TAdapterPrevPageAction (see page 23979), and TAdapterNextPageAction (see page 23945). The TAdapterPageProducer can be used to generate HTML hyperlinks or buttons for these actions.

See Also

TPagedAdapter (see page 24525)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

TCustomAdapterNextPageAction

TCustomAdapterPageAction (see page 24286)

173.1.30.1 TAdapterNextPageField Members

The following tables list the members exposed by TAdapterNextPageField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 23964)	Returns a values list adapter containing the names of the published pages.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23964)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23965)	Returns the echo flag for this adapter field.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23965)	Returns the page name to be displayed after login.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23965)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
V	UpdateValue (see page 23966)	Updates the parent adapter's next page property with the value entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 23963)	Frees an instance of TAdapterNextPageField (see page 23957).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 23888)	Returns the parent adapter of this adapter field.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 23966)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23967)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23967)	Identifies the name of this field when using server-side script.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.30.2 TAdapterNextPageField.Destroy Destructor

Frees an instance of TAdapterNextPageField (see page 23957).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterNextPageField();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TAdapterNextPageField (see page 23957).

173.1.30.3 TAdapterNextPageField Methods

The methods of the TAdapterNextPageField class are listed here.

Protected Methods

	Name	Description
	GetAdapterValuesList (see page 23964)	Returns a values list adapter containing the names of the published pages.
V	GetInputStyleType (see page 23964)	Suggests an HTML input type for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23965)	Returns the echo flag for this adapter field.
V	ImplGetValue (see page 23965)	Returns the page name to be displayed after login.
V	ImplSetEchoActionFieldValue (see page 23965)	Sets the echo flag for this adapter field.
V	UpdateValue (see page 23966)	Updates the parent adapter's next page property with the value entered by the end-user.

173.1.30.3.1 TAdapterNextPageField.GetAdapterValuesList Method

Returns a values list adapter containing the names of the published pages.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList returns a reference to TLogicalPageList (see page 24492). This function will be called when server-side script references the ValuesList property of this adapter field. Typically, server-side script uses the ValuesList property to populate an HTML select list with the names of published pages. The end-user may select one of these pages to go to after login.

See Also

IValuesListAdapter (see page 19740)

173.1.30.3.2 TAdapterNextPageField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType. GetInputStyleType returns htmliSelect indicating that a single selection list HTML element should be used to input a value for this adapter field.

See Also

GetInputStyleType (see page 23921)

TAdapterInputHTMLElementType

173.1.30.3.3 TAdapterNextPageField.ImplGetEchoActionFieldValue Method

Returns the echo flag for this adapter field.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

ImplGetEchoActionFieldValue returns the value of an instance variable.

See Also

ImplGetEchoActionFieldValue (see page 23938)

EchoActionFieldValue (see page 23944)

ImplGetValue (see page 23965)

ImplSetEchoActionFieldValue (see page 23965)

173.1.30.3.4 TAdapterNextPageField.ImplGetValue Method

Returns the page name to be displayed after login.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

If the EchoActionFieldValue (see page 23944) property is true, then the page name selected or entered by end-user is returned. If the EchoActionFieldValue (see page 23944) property is false then the parent adapter's NextPage property is returned. The value returned by ImplGetValue is used when server-side script references the EditText property of this adapter field while generating the login form.

See Also

EchoActionFieldValue (see page 23944)

ActionValue (see page 23943)

NextPage (see page 24359)

173.1.30.3.5 TAdapterNextPageField.ImplSetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplSetEchoActionFieldValue sets an internal variable to true. The echo flag is typically set by an adapter action when an error occurs while processing an HTTP request. The purpose of the echo flag is to preserve the value entered by the end-user. When the echo flag is true, ImplGetValue (see page 23965) returns the value entered by the end-user rather than the value of the adapter field.

See Also

ImplSetEchoActionFieldValue (see page 23941)

EchoActionFieldValue (see page 23944)

ImplGetValue (see page 23965)

ImplGetEchoActionFieldValue (see page 23965)

173.1.30.3.6 TAdapterNextPageField.UpdateValue Method

Updates the parent adapter's next page property with the value entered by the end-user.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

Typically a single selection list HTML element is displayed on the login form. The list contains all of the published pages. The HTTP request will contain the page name selected by the end-user.

See Also

NextPage (see page 24359)

IActionRequest (see page 935)

173.1.30.4 TAdapterNextPageField Properties

The properties of the TAdapterNextPageField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23966)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23967)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23967)	Identifies the name of this field when using server-side script.

173.1.30.4.1 TAdapterNextPageField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.30.4.2 TAdapterNextPageField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.30.4.3 TAdapterNextPageField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.31 TAdapterObjectErrorsList Class

Class Hierarchy

Pascal

```
TAdapterObjectErrorsList = class(TBaseAdapterErrorsList);
```

C++

```
class TAdapterObjectErrorsList : public TBaseAdapterErrorsList;
```

File

WebAdapt

Description

This is class WebAdapt.TAdapterObjectErrorsList.

173.1.31.1 TAdapterObjectErrorsList Members

The following tables list the members exposed by TAdapterObjectErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	EndIterator (see page 24081)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 24081)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 24082)	Returns a particular error.
	GetErrorCount (see page 24082)	Return the number of errors in the errors list.
	GetObjectErrors (see page 24082)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 24082)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 24083)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 23970)	This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.
V	ImplGetError (see page 23970)	This is ImplGetError, a member of class TAdapterObjectErrorsList.
V	ImplGetErrorCount (see page 23971)	This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.
V	ImplGetObjectErrors (see page 24084)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 24084)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 24084)	Advances to the objects next item.

	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 24085)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddError (see page 24080)	This is the overview for the AddError method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 19664)	Clears the errors list.
	ClearErrors (see page 24080)	Clear error list.
	Create (see page 23970)	This is Create, a member of class TAdapterObjectErrorsList.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DefineLabel (see page 19664)	Associates a label with all errors associated with a particular adapter field.
	DefineLabel (see page 24081)	Define error label for field.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetCurrentIntf (see page 19718)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	GetError (see page 19664)	Returns a particular error.
	GetErrorCount (see page 19665)	Return the number of errors in the errors list.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetObjectErrors (see page 19665)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 19665)	Indicates whether the errors list contains objects associated with a particular adapter field.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
	ErrorCount (see page 19666)	Returns the number of errors in the errors list.
	ErrorCount (see page 24085)	Number of error objects contained.
	Errors (see page 19666)	Returns an error from the list.
	Errors (see page 24085)	Access to error objects.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

173.1.31.2 TAdapterObjectErrorsList.Create Constructor

Pascal

```
constructor Create(AErrors: TAdapterErrorsList; const AName: string);
```

C++

```
__fastcall TAdapterObjectErrorsList(TAdapterErrorsList AErrors, const AnsiString AName);
```

Description

This is Create, a member of class TAdapterObjectErrorsList.

173.1.31.3 TAdapterObjectErrorsList Methods

The methods of the TAdapterObjectErrorsList class are listed here.

Protected Methods

	Name	Description
	ImplDefineLabel (see page 23970)	This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.
	ImplGetError (see page 23970)	This is ImplGetError, a member of class TAdapterObjectErrorsList.
	ImplGetErrorCount (see page 23971)	This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.

173.1.31.3.1 TAdapterObjectErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); override;
```

C++

```
virtual __fastcall ImplDefineLabel(const AnsiString AName, const AnsiString ALabel);
```

Description

This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.

173.1.31.3.2 TAdapterObjectErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; override;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TAdapterObjectErrorsList.

173.1.31.3.3 TAdapterObjectErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.

173.1.32 TAdapterPasswordField Class

TAdapterPasswordField is an adapter field used to access the password entered by the end-user.

Class Hierarchy

Pascal

```
TAdapterPasswordField = class(TAdapterLoginField);
```

C++

```
class TAdapterPasswordField : public TAdapterLoginField;
```

File

WebAdapt

Description

TAdapterPasswordField is added to TLoginFormAdapter (see page 24500). TAdapterUserNameField (see page 24024), TAdapterPasswordField, TLoginFormAdapterLoginAction (see page 24514) and TAdapterNextPageField (see page 23957) are used with TLoginFormAdapter (see page 24500) to generate an HTML login form. When the HTML form is submitted, TAdapterPasswordField is used to extract the end user's password from the HTTP request.

See Also

TAdapterLoginField (see page 23882)

TLoginFormAdapter (see page 24500)

TAdapterUserNameField (see page 24024)

TAdapterNextPageField (see page 23957)

TLoginFormAdapterLoginAction (see page 24514)

173.1.32.1 TAdapterPasswordField Members

The following tables list the members exposed by TAdapterPasswordField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23978)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.

	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23978)	Returns the value associated with this adapter field.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Adapter (see page 23943)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 23888)	Returns the parent adapter of this adapter field.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 23978)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23979)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23979)	Identifies the name of this field when using server-side script.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.32.2 TAdapterPasswordField Methods

The methods of the TAdapterPasswordField class are listed here.

Protected Methods

	Name	Description
V	GetInputStyleType (see page 23978)	Suggests an HTML input type for this adapter field.
V	ImplGetValue (see page 23978)	Returns the value associated with this adapter field.

173.1.32.2.1 TAdapterPasswordField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliPassword indicating that a password input HTML element should be used to input a value for this adapter field.

GetInputStyleType (see page 23921)

TAdapterInputHTMLElementType

173.1.32.2.2 TAdapterPasswordField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns an empty string. Server-side script accesses the result of this function using the EditText or Value (see page 23945) property of the adapter field. These server-side script properties may be used to generate the HTML login form. ImplGetValue returns an empty string so that the generated login form's password field will be blank. When the login form is submitted, the ActionValue (see page 23943) property can be used to access the password entered by the end-user.

See Also

ActionValue (see page 23943)

173.1.32.3 TAdapterPasswordField Properties

The properties of the TAdapterPasswordField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23978)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23979)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 23979)	Identifies the name of this field when using server-side script.

173.1.32.3.1 TAdapterPasswordField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.32.3.2 TAdapterPasswordField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.32.3.3 TAdapterPasswordField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.33 TAdapterPrevPageAction Class

TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 24403).

Class Hierarchy

Pascal

```
TAdapterPrevPageAction = class(TCustomAdapterPageAction);
```

C++

```
class TAdapterPrevPageAction : public TCustomAdapterPageAction;
```

File

WebAdapt

Description

Add TAdapterPrevPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 24403) such as TPagedAdapter (see page 24525).

See Also

TCustomAdapterPageAction (see page 24286)

TDefaultFieldsPagedAdapter (see page 24403)

TAdapterNextPageAction (see page 23945)

TAdapterGotoPageAction (see page 23849)

TPagedAdapter (see page 24525)

TDefaultFieldsPagedAdapter (see page 24403)

173.1.33.1 TAdapterPrevPageAction Members

The following tables list the members exposed by TAdapterPrevPageAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 23986)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 23987)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 24293)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetNewPage (see page 23987)	Indicates the page to display when this action is executed.

	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24294)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24294)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplIsDefaultAction (see page 24295)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24295)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.

V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 23989)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23989)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23990)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23990)	Called before the adapter action response is generated.
	OnGetParams (see page 23991)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 23988)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23988)	Defines the rights required to execute this action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RedirectOptions (see page 23988)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.33.2 TAdapterPrevPageAction Methods

The methods of the TAdapterPrevPageAction class are listed here.

Protected Methods

	Name	Description
V	GetDefaultActionName (see page 23986)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 23987)	Provides the default display label for this adapter action.
V	GetNewPage (see page 23987)	Indicates the page to display when this action is executed.

173.1.33.2.1 TAdapterPrevPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns "PrevPage".

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.33.2.2 TAdapterPrevPageAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultDisplayLabel();
```

Description

GetDefaultDisplayLabel returns "<<". This displays as '<<' in the browser.

See Also

DisplayLabel (see page 24073)

173.1.33.2.3 TAdapterPrevPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

GetNewPage determines whether the current page can be incremented. If so, the AValue parameter is modified and true is returned. Otherwise, false is returned.

See Also

GetNewPage (see page 24294)

RecordCount (see page 24419)

PageSize (see page 24419)

CurrentPage (see page 24418)

173.1.33.3 TAdapterPrevPageAction Properties

The properties of the TAdapterPrevPageAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 23988)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 23988)	Defines the rights required to execute this action.
	RedirectOptions (see page 23988)	Indicates whether to perform an HTTP redirect after successfully executing this action.

173.1.33.3.1 TAdapterPrevPageAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.33.3.2 TAdapterPrevPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

173.1.33.3.3 TAdapterPrevPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

173.1.33.4 TAdapterPrevPageAction Events

The events of the TAdapterPrevPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 23989)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 23989)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 23990)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 23990)	Called before the adapter action response is generated.
	OnGetParams (see page 23991)	Specifies name/value pairs needed to execute this adapter action.

173.1.33.4.1 TAdapterPrevPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.33.4.2 TAdapterPrevPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.33.4.3 TAdapterPrevPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.33.4.4 TAdapterPrevPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.33.4.5 TAdapterPrevPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.34 TAdapterSubComponent Class

TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.

Class Hierarchy

Pascal

```
TAdapterSubComponent = class(TWebContainerComponent, IWebContainerSubComponent,
IWebComponentEditor, IWebVariablesContainer, IGetWebComponentNodeName, IIterateObjectSupport);
```

C++

```
class TAdapterSubComponent : public TWebContainerComponent, public IWebContainerSubComponent,
public IWebComponentEditor, public IWebVariablesContainer, public IGetWebComponentNodeName,
public IIterateObjectSupport;
```

File

WebAdapt

Description

Adapter (see page 24006) components use a TAdapterSubComponent descendant to represent the list of actions they can

execute or the list of fields whose values they support. Each TAdapterSubComponent is specialized for a specific type of object (actions or fields), and represents either the set of explicitly assigned actions or fields, or the set that the adapter contains by default.

TAdapterSubComponent introduces support for:

Associating the collection with an adapter component.

Assigning variable names to the child items in the collection. These are the names of variables that server-side script can use to refer to the actions or fields.

Letting server-side script use an enumerator to iterate over all the child items in the collection.

Working with the WebSnap designers at design time.

See Also

TAdapterActions (see page 23738)

TAdapterFields (see page 23830)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

173.1.34.1 TAdapterSubComponent Members

The following tables list the members exposed by TAdapterSubComponent.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24755)	Executes a callback for each child Web item.
	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 23999)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 24001)	Returns the value of the VariablesInUse (see page 24007) property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 24002)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 24003)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 24004)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetWebParent (see page 24005)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24755)	Frees an instance of TWebContainerComponent (see page 24751).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 24000)	Returns the associated adapter.
V	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.34.2 TAdapterSubComponent Methods

The methods of the TAdapterSubComponent class are listed here.

Protected Methods

	Name	Description
	CanAddClass (see page 23996)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 23997)	Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 23997)	Returns the item from this list with a specified variable name.
	FindVariable (see page 23998)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 23998)	Returns the Web module that contains a specified item from this list.
	GetCurrentObject (see page 23999)	Returns the current field or action from the list when an enumerator is iterating over child items.

	GetDefaultWebComponents (see page 23999)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetVariable (see page 24000)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 24000)	Indicates the number of items in this list that can be accessed from server-side script.
	GetVariablesInUse (see page 24001)	Returns the value of the VariablesInUse (see page 24007) property.
	GetWebComponentNodeName (see page 24001)	Returns a string that indicates the type of items in this collection.
	ImplCanAddClass (see page 24002)	Provides the underlying implementation for the CanAddClass (see page 23996) method.
	ImplGetWebComponentNodeName (see page 24003)	Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.
	NextIteration (see page 24003)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 24003)	Notifies the associated adapter when the list of items changes.
	SetDefaultWebComponents (see page 24004)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetWebParent (see page 24005)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 24006)	Makes the first child item with a variable name the current object.

Public Methods

	Name	Description
	GetParentComponent (see page 24000)	Returns the associated adapter.
	HasParent (see page 24002)	Indicates whether this component has an associated adapter.
	ReadState (see page 24004)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetParentComponent (see page 24005)	Sets the Adapter (see page 24006) property to be the same as this component's parent.

173.1.34.2.1 TAdapterSubComponent.CanAddClass Method

Indicates whether an object of a specified type can be added to this collection.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The IDE calls CanAddClass to determine what Web items can be added to this list. This method allows the IDE to limit the actions or fields in the collection to those that are appropriate for the associated adapter.

AParent is the TAdapterSubComponent (see page 23991) descendant to which the Web item will be added.

AClass is the class of the proposed child item.

CanAddClass returns true if the TAdapterSubComponent (see page 23991) descendant can include a child of type AClass, false otherwise.

CanAddClass calls the virtual ImplCanAddClass (see page 24002) method to determine whether a class of Web item is valid.

See Also

ImplCanAddClass (see page 24002)

Adapter (see page 24006)

173.1.34.2.2 TAdapterSubComponent.EndIterator Method

Stops the TAdapterSubComponent (see page 23991) object from iterating over the Web items it lists.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

EndIterator is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called when the enumeration stops. In TAdapterSubComponent (see page 23991), EndIterator does nothing. This method exists only as a backstop for the standard call made from server-side script.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 24006) or NextIteration (see page 24003) method. TAdapterSubComponent (see page 23991) does not use the OwnerData parameter.

See Also

StartIterator (see page 24006)

NextIteration (see page 24003)

GetCurrentObject (see page 23999)

173.1.34.2.3 TAdapterSubComponent.FindNamedVariable Method

Returns the item from this list with a specified variable name.

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const AnsiString AName);
```

Description

FindNamedVariable searches the list of child items that have variable names (the VariablesInUse (see page 24007) property) to find one with the specified name. The associated adapter component calls this method from its FindNamedField or FindNamedAction method to look up a field or action with a specified name.

AName is a variable name. Typically, this comes from server-side script that is looking for a child of an adapter with this name.

FindNamedVariable returns the item from the list with the specified variable name. If none of the items in the list have the name AName, FindNamedVariable returns nil (Delphi) or NULL (C++).

See Also

VariablesInUse (see page 24007)

FindVariable (see page 23998)

GetVariable (see page 24000)

GetVariableCount (see page 24000)

FindVariableContainer (see page 23998)

FindNamedField (see page 24154)

FindNamedAction (see page 24154)

173.1.34.2.4 TAdapterSubComponent.FindVariable Method

Returns the item from this list with a specified variable name.

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const AnsiString AName);
```

Description

FindVariable method is called from server-side script to locate a field or action with a specified name. This method is identical to the FindNamedVariable (see page 23997) method, except that it is not virtual. Instead, FindVariable calls the virtual FindNamedVariable (see page 23997) method.

AName is a variable name.

FindNamedVariable (see page 23997) returns the item from the list with the specified variable name. If none of the items in the list have the name AName, FindNamedVariable (see page 23997) returns nil (Delphi) or NULL (C++).

See Also

VariablesInUse (see page 24007)

FindNamedVariable (see page 23997)

GetVariable (see page 24000)

GetVariableCount (see page 24000)

FindVariableContainer (see page 23998)

173.1.34.2.5 TAdapterSubComponent.FindVariableContainer Method

Returns the Web module that contains a specified item from this list.

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const AnsiString AName);
```

Description

FindVariableContainer searches the list of child items that have variable names (the VariablesInUse (see page 24007) property) to find one with the specified name. It then returns the Web module that contains the component it located.

AName is the name of the action or field to locate.

FindVariableContainer returns the Web module that containse the specified item. If there is no item in the list with the name AName, FindVariableContainer returns nil (Delphi) or NULL (C++). If FindVariableContainer includes an item with the specified name, but is unable to determine what Web module contains that item, FindVariableContainer raises an EAdapterException (see page 23696) exception.

See Also

VariablesInUse (see page 24007)

FindNamedVariable (see page 23997)

GetVariable (see page 24000)

GetVariableCount (see page 24000)

EAdapterException (see page 23696)

173.1.34.2.6 TAdapterSubComponent.GetCurrentObject Method

Returns the current field or action from the list when an enumerator is iterating over child items.

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

GetCurrentObject is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method returns the current child item.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 24006) or NextIteration (see page 24003) method. TAdapterSubComponent (see page 23991) does not use the OwnerData parameter.

See Also

StartIterator (see page 24006)

NextIteration (see page 24003)

EndIterator (see page 23997)

173.1.34.2.7 TAdapterSubComponent.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent (see page 23991), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 23770) and TAdapterDefaultFields (see page 23778)) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 24756)

TAdapterDefaultActions (see page 23770)

TAdapterDefaultFields (see page 23778)

173.1.34.2.8 TAdapterSubComponent.GetParentComponent Method

Returns the associated adapter.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TAdapterSubComponent (see page 23991) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the Adapter (see page 24006) property (the adapter that uses this component to represent the set of its fields or actions).

See Also

GetParentComponent

HasParent (see page 24002)

Adapter (see page 24006)

173.1.34.2.9 TAdapterSubComponent.GetVariable Method

Returns a child item from this list, given its position in the list of child items with variable names.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

FindNamedVariable (see page 23997) indexes into the list of child items that have variable names (the VariablesInUse (see page 24007) property) and returns the item in the specified position.

I is the index of the child item, where 0 is the first item that can be reference from server-side script, 1 is the second item, and so on. The GetVariableCount (see page 24000) method returns an upper limit for this index.

See Also

VariablesInUse (see page 24007)

FindNamedVariable (see page 23997)

FindVariable (see page 23998)

GetVariableCount (see page 24000)

173.1.34.2.10 TAdapterSubComponent.GetVariableCount Method

Indicates the number of items in this list that can be accessed from server-side script.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount returns the number of child items that have variable names. This is the number of items in the VariablesInUse (see page 24007) proprety. Use GetVariableCount as an upper bound to the I parameter of the GetVariable (see page 24000) method.

See Also

VariablesInUse (see page 24007)

GetVariable (see page 24000)

173.1.34.2.11 TAdapterSubComponent.GetVariablesInUse Method

Returns the value of the VariablesInUse (see page 24007) property.

Pascal

```
function GetVariablesInUse: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse (see page 24007) property.

In TAdapterSubComponent (see page 23991), GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 24007)

GetWebComponents (see page 24756)

173.1.34.2.12 TAdapterSubComponent.GetWebComponentNodeName Method

Returns a string that indicates the type of items in this collection.

Pascal

```
function GetWebComponentNodeName: string;
```

C++

```
__fastcall AnsiString GetWebComponentNodeName();
```

Description

GetWebComponentNodeName returns the label for the type of items in the collection. For example, if the TAdapterSubComponent (see page 23991) descendant holds the fields belonging to an adapter, GetWebComponentNodeName returns the string 'Fields'. If the TAdapterSubComponent (see page 23991) descendant holds the actions belonging to an adapter, GetWebComponentNodeName returns the string 'Actions'.

GetWebComponentNodeName delegates the task of supplying a name to the virtual ImplGetWebComponentNodeName (see page 24003) method.

See Also

ImplGetWebComponentNodeName (see page 24003)

173.1.34.2.13 TAdapterSubComponent.HasParent Method

Indicates whether this component has an associated adapter.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TAdapterSubComponent (see page 23991) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the Adapter (see page 24006) property is not nil (Delphi) or NULL (C++).

If the TAdapterSubComponent (see page 23991) object has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 24000)

Adapter (see page 24006)

173.1.34.2.14 TAdapterSubComponent.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 23996) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 23996) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterSubComponent (see page 23991) descendant to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterSubComponent (see page 23991) descendant can include a child of type AClass, false otherwise.

In TAdapterSubComponent (see page 23991), ImplCanAddClass always returns false, disallowing any child items. Descendant classes override this method to conditionally allow those fields or actions that are appropriate to the associated adapter.

See Also

CanAddClass (see page 23996)

Adapter (see page 24006)

173.1.34.2.15 TAdapterSubComponent.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 24001) method.

Pascal

```
function ImplGetWebComponentNodeName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 24001) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the name of the type of items in this list.

In TAdapterSubComponent (see page 23991), ImplGetWebComponentNodeName returns an empty string. Descendant classes created for specific types of elements override this method to return an appropriate string such as 'Fields' or 'Actions'.

See Also

GetWebComponentNodeName (see page 24001)

173.1.34.2.16 TAdapterSubComponent.NextIteration Method

Changes the current object to the next item that has a variable name.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

NextIteration is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to move to the next item in the list. After a call to NextIteration, the GetCurrentObject (see page 23999) method returns the next item in the VariablesInUse (see page 24007) list.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 24006) or NextIteration method. TAdapterSubComponent (see page 23991) does not use the OwnerData parameter.

NextIteration returns true if it successfully moves to a new item, false if there was no addition item to which it could move.

See Also

StartIterator (see page 24006)

EndIterator (see page 23997)

GetCurrentObject (see page 23999)

VariablesInUse (see page 24007)

173.1.34.2.17 TAdapterSubComponent.NotifyAdapterChange Method

Notifies the associated adapter when the list of items changes.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

TAdapterSubComponent (see page 23991) descendants call NotifyAdapterChange internally when the items in this list change. NotifyAdapterChange passes this notification on to the associated adapter so that it can make any necessary adjustments.

See Also

Adapter (see page 24006)

NotifyAdapterChange (see page 24174)

173.1.34.2.18 TAdapterSubComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TAdapterSubComponent (see page 23991) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the Adapter (see page 24006) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 24000)

Adapter (see page 24006)

173.1.34.2.19 TAdapterSubComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents (see page 23999) supplies the default set of child items for this component. As implemented in TAdapterSubComponent (see page 23991), GetDefaultWebComponents (see page 23999) always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of

the associated adapter (TAdapterDefaultActions (see page 23770) and TAdapterDefaultFields (see page 23778)) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent, SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 23770) and TAdapterDefaultFields (see page 23778)) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 23999)

IsDefaultField (see page 24728)

173.1.34.2.20 TAdapterSubComponent.SetParentComponent Method

Sets the Adapter (see page 24006) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TAdapterSubComponent (see page 23991) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the Adapter (see page 24006) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 24002)

Adapter (see page 24006)

173.1.34.2.21 TAdapterSubComponent.SetWebParent Method

Introduces a method to associate this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); virtual;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

TAdapterSubComponent (see page 23991) introduces SetWebParent as a virtual method for setting the read-only Adapter (see page 24006) property.

Value is the adapter component that acts as a parent to this collection.

In TAdapterSubComponent (see page 23991), SetWebParent does nothing. Descendant classes override this method to set the Adapter (see page 24006) property and populate the list with actions or fields appropriate to that adapter.

See Also

Adapter (see page 24006)

173.1.34.2.22 TAdapterSubComponent.StartIterator Method

Makes the first child item with a variable name the current object.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

StartIterator is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to begin iterating over the items in the list. After a call to StartIterator, the GetCurrentObject (see page 23999) method returns the first item in the VariablesInUse (see page 24007) list.

OwnerData is a pointer to object-specific information returned that should be passed to the NextIteration (see page 24003) or EndIterator (see page 23997) method. TAdapterSubComponent (see page 23991) does not use the OwnerData parameter.

StartIterator returns true if it successfully moves to the first item, false if the VariablesInUse (see page 24007) property does not list any items.

See Also

NextIteration (see page 24003)

EndIterator (see page 23997)

GetCurrentObject (see page 23999)

VariablesInUse (see page 24007)

173.1.34.3 TAdapterSubComponent Properties

The properties of the TAdapterSubComponent class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24006)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 24007)	Lists those fields or actions in the collection for which variables are defined.

173.1.34.3.1 TAdapterSubComponent.Adapter Property

Indicates the adapter that uses this object to manage its fields or actions.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Read Adapter to access the adapter component that uses this collection. This TAdapterSubComponent (see page 23991) object is the value of the adapter's Data or Actions property.

See Also

Actions (see page 24181)

Data (see page 24181)

Actions (see page 24402)

Data (see page 24402)

173.1.34.3.2 TAdapterSubComponent.VariablesInUse Property

Lists those fields or actions in the collection for which variables are defined.

Pascal

```
property VariablesInUse: TWebComponentList;
```

C++

```
__property TWebComponentList VariablesInUse;
```

Description

Read VariablesInUse to access the child items (fields or actions) that can be addressed from server-side script.

TAdapterSubComponent (see page 23991) implements VariablesInUse to include all of the fields or actions that have been added to the list. Descendant classes can override this property to provide a different set of items, such as the default fields or actions of the associated adapter.

See Also

FindNamedVariable (see page 23997)

FindVariable (see page 23998)

GetVariable (see page 24000)

GetVariableCount (see page 24000)

FindVariableContainer (see page 23998)

173.1.35 TAdapterUpdateField Class

TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.

Class Hierarchy

Pascal

```
TAdapterUpdateField = class(TAdapterNamedDisplayField, IGetAdapterValuesList, IUpdateValue,
IValidateValue, ICheckValueChange);
```

C++

```
class TAdapterUpdateField : public TAdapterNamedDisplayField, public IGetAdapterValuesList,
public IUpdateValue, public IValidateValue, public ICheckValueChange;
```

File

WebAdapt

Description

TAdapterUpdateField implements the interfaces necessary to support field validation and updating. Descendant classes support different types of data that can be entered by the user (for example, image upload, file upload, single value, multiple value, memo and Boolean).

See Also

TAdapterNamedDisplayField (see page 23913)

TCustomAdapterField (see page 24211)

TAdapter (see page 23713)

173.1.35.1 TAdapterUpdateField Members

The following tables list the members exposed by TAdapterUpdateField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.

	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.

	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.35.2 TAdapterUpdateField.Create Constructor

Creates an instance of TAdapterUpdateField (see page 24007).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterUpdateField(TComponent * AOwner);
```

Description

Do not call TAdapterUpdateField (see page 24007). It will be called automatically when the TAdapterUpdateField (see page 24007) object is created.

See Also

Create_d

173.1.35.3 TAdapterUpdateField Methods

The methods of the TAdapterUpdateField class are listed here.

Protected Methods

	Name	Description
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
V	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
V	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
V	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.

	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Notification (see page 24021)	Clears references to a deleted component.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.

173.1.35.3.1 TAdapterUpdateField.CheckValueChange Method

Checks the value(s) entered by the end-user against the value associated with this adapter field.

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

CheckValueChange is called to determine whether the value(s) entered by the user is different from the value(s) provided by the adapter field. CheckValueChange calls the virtual function ImplCheckValueChange (see page 24018).

See Also

ImplCheckValueChange (see page 24018)

173.1.35.3.2 TAdapterUpdateField.ConvertValue Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValue(AValue: IActionFieldValue): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValue(IActionFieldValue AValue);
```

Description

ConvertValue is called to retrieve, as a variant, the value entered by the user for this adapter field. ConvertValue using index 0 to retrieve a value from the IActionFieldValue (see page 24596) parameter. Typically, IActionFieldValue (see page 24596) will contain a string value. Descendants may override this function to caste the value into another type.

See Also

ConvertValue (see page 24208)

173.1.35.3.3 TAdapterUpdateField.ConvertValueCount Method

Retrieves the number of values entered by the end-user.

Pascal

```
function ConvertValueCount(AValue: IActionFieldValue): Integer; virtual;
```

C++

```
virtual __fastcall int ConvertValueCount(IActionFieldValue AValue);
```

Description

ConvertValueCount is called to retrieve the number of values entered by the user. ConvertValueCount returns 1. Descendants may override this method.

173.1.35.3.4 TAdapterUpdateField.ConvertValues Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValues(AValue: IActionFieldValue; Index: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValues(IActionFieldValue AValue, int Index);
```

Description

ConvertValues is called to retrieve, as a variant, a particular value entered by the end-user for this adapter field.

173.1.35.3.5 TAdapterUpdateField.DoOnValidateValue Method

Validates field values entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); virtual;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue is called when the field value entered by the end-user is to be validated. DoOnValidateValue calls the OnValidateValue (see page 24024) event handler. DoOnValidateValue may be overridden by descendants.

See Also

OnValidateValue (see page 24024)

ImplValidateValue (see page 24020)

173.1.35.3.6 TAdapterUpdateField.GetAdapterValuesList Method

Provides an interface to a component that can be used to generate a list of possible values for this adapter field.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList provides an interface to a component that can be used to generate a list of possible values for this adapter field. It does this by returning the value of the ValuesList (see page 24023) property.

See Also

IValuesListAdapter (see page 19740)

173.1.35.3.7 TAdapterUpdateField.GetInputStyleType Method

Indicates the preferred HTML element to use when editing this adapter field's value.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType returns htmliSelect if the ValuesList (see page 24023) property is not nil (Delphi) or NULL (C++). Otherwise, htmliTextInput is returned.

See Also

TAdapterInputHTMLElementType

ValuesList (see page 24023)

173.1.35.3.8 TAdapterUpdateField.GetValueCount Method

Provides the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns the number of values provided by this adapter field. GetValueCount returns 1. Descendant classes override this method.

See Also

TAdapterMultiValueField (see page 23900)

GetValueCount

173.1.35.3.9 TAdapterUpdateField.GetValues Method

Returns one of the values provided by this adapter field.

Pascal

```
function GetValues(I: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns one of the values provided by this adapter field. GetValues calls GetValue (see page 23935). Descendant classes override this method.

See Also

GetValues

TAdapterMultiValueField (see page 23900)

173.1.35.3.10 TAdapterUpdateField.ImplAsFormatted Method

Returns a string representation of the adapter field's value that is appropriate for a read-only display.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall AnsiString ImplAsFormatted();
```

Description

ImplAsFormatted calls the OnGetDisplayText (see page 24023) event handler, if one is defined. Otherwise, ImplAsFormatted returns the adapter field's value converted to a string. Server-side script accesses the value returned by this function using the AsDisplayText property.

See Also

OnGetDisplayText (see page 24023)

GetValue (see page 23935)

173.1.35.3.11 TAdapterUpdateField.ImplCheckValueChange Method

Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange compares the number and content of values associated with the adapter field with the number and content of values entered by the end-user.

See Also

CheckValueChange (see page 24015)

173.1.35.3.12 TAdapterUpdateField.ImplGetDisplayLabel Method

Gets the preferred display label for this adapter field.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 23923) property.

See Also

DisplayLabel (see page 23923)

173.1.35.3.13 TAdapterUpdateField.ImplGetDisplayWidth Method

Returns the preferred display width for the HTML element used to edit or display this adapter field's value.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

ImplGetDisplayWidth returns the value of the DisplayWidth (see page 23924) property.

See Also

DisplayWidth (see page 23924)

173.1.35.3.14 TAdapterUpdateField.ImplGetEchoActionFieldValue Method

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

See Also

ImplSetEchoActionFieldValue (see page 24020)

173.1.35.3.15 TAdapterUpdateField.ImplGetVariableName Method

Gets the name used to access this adapter field with server-side script.

Pascal

```
function ImplGetVariableName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetVariableName();
```

Description

ImplGetVariableName returns the value of the FieldName (see page 23944) property.

See Also

FieldName (see page 23944)

173.1.35.3.16 TAdapterUpdateField.ImplSetEchoActionFieldValue Method

Sets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplSetEchoActionFieldValue is typically called when an error occurs during the execution of an adapter action. It allows the page generated after the error to display the values entered by the user rather than the action adapter field values.

173.1.35.3.17 TAdapterUpdateField.ImplSetFieldName Method

Sets the name used to access this adapter field with server-side script.

Pascal

```
procedure ImplSetFieldName(const Value: string); override;
```

C++

```
virtual __fastcall ImplSetFieldName(const AnsiString Value);
```

Description

ImplSetVariableName sets the value of the FieldName (see page 23944) property.

See Also

FieldName (see page 23944)

173.1.35.3.18 TAdapterUpdateField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue is a placeholder. Descendants override this method.

See Also

UpdateValue (see page 24021)

173.1.35.3.19 TAdapterUpdateField.ImplValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ImplValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplValidateValue calls the virtual function DoOnValidateValue (see page 24016) after extracting an IActionFieldValue (see page 24596) that contains the value(s) entered by the user. The AFieldIndex parameter identifies that location of the IActionFieldValue (see page 24596) in the AActionRequest.

See Also

ValidateValue (see page 24022)

DoOnValidateValue (see page 24016)

IActionRequest (see page 935)

173.1.35.3.20 TAdapterUpdateField.IsMultiValueField Method

Indicates whether this adapter field can support multiple values.

Pascal

```
function IsMultiValueField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsMultiValueField();
```

Description

IsMultiValueField return true to indicate that this adapter field can provide multiple values. IsMultiValueField returns false. Descendants may override this function.

See Also

GetValueCount (see page 24017)

GetValues (see page 24017)

TAdapterMultiValueField (see page 23900)

173.1.35.3.21 TAdapterUpdateField.Notification Method

Clears references to a deleted component.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted. TAdapterUpdateField (see page 24007) clears the ValuesList (see page 24023) property when the associated component is deleted.

173.1.35.3.22 TAdapterUpdateField.UpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

UpdateValue calls the virtual method ImplUpdateValue (see page 24020).

See Also

ImplUpdateValue (see page 24020)

173.1.35.3.23 TAdapterUpdateField.ValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ValidateValue calls the virtual function ImplValidateValue (see page 24020).

See Also

ImplValidateValue (see page 24020)

IActionRequest (see page 935)

173.1.35.4 TAdapterUpdateField Properties

The properties of the TAdapterUpdateField class are listed here.

Public Properties

	Name	Description
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.

173.1.35.4.1 TAdapterUpdateField.Value Property

Retrieves the value associated with this adapter field.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

GetValue (see page 23935) calls the GetValue (see page 23935) method to retrieve the value of the adapter field as a variant.

See Also

GetValue (see page 23935)

173.1.35.4.2 TAdapterUpdateField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 19740)

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

173.1.35.5 TAdapterUpdateField Events

The events of the TAdapterUpdateField class are listed here.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

173.1.35.5.1 TAdapterUpdateField.OnGetDisplayText Event

Event handler called to retrieve a string representation of the adapter field's value.

Pascal

```
property OnGetDisplayText: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

The OnGetDisplayText event handler is called to retrieve a string representation an adapter field's value appropriate for a read-only display. If OnGetDisplayText is nil (Delphi) or NULL (C++), then the value of the adapter field will be used (after conversion to a string).

See Also

ImplAsFormatted (see page 24018)

173.1.35.5.2 TAdapterUpdateField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue (see page 24016) to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

DoOnValidateValue (see page 24016)

IActionFieldValue (see page 920)

173.1.36 TAdapterUserNameField Class

TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.

Class Hierarchy

Pascal

```
TAdapterUserNameField = class(TAdapterLoginField);
```

C++

```
class TAdapterUserNameField : public TAdapterLoginField;
```

File

WebAdapt

Description

TAdapterUserNameField is added to TLoginFormAdapter (see page 24500). TAdapterUserNameField, TAdapterPasswordField (see page 23971), TLoginFormAdapterLoginAction (see page 24514) and TAdapterNextPageField (see page 23957) are used with TLoginFormAdapter (see page 24500) to generate an HTML login form. When the HTML form is submitted, TAdapterUserNameField is used to extract the end user's name from the HTTP request.

See Also

TAdapterLoginField (see page 23882)

TLoginFormAdapter (see page 24500)

TAdapterPasswordField (see page 23971)

TAdapterNextPageField (see page 23957)

TLoginFormAdapterLoginAction (see page 24514)

173.1.36.1 TAdapterUserNameField Members

The following tables list the members exposed by TAdapterUserNameField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.

	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 24031)	Returns the value associated with this adapter field.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	Adapter (see page 23943)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 23888)	Returns the parent adapter of this adapter field.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 24031)	Suggests a display label for this adapter field.
	DisplayWidth (see page 24031)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 24032)	Identifies the name of this field when using server-side script.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.36.2 TAdapterUserNameField Methods

The methods of the TAdapterUserNameField class are listed here.

Protected Methods

	Name	Description
V	ImplGetValue (see page 24031)	Returns the value associated with this adapter field.

173.1.36.2.1 TAdapterUserNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns an empty string. Server-side script accesses the result of this function using the EditText or Value (see page 23945) property of the adapter field. These server-side script properties may be used to generate the HTML login form. ImplGetValue returns an empty string so that the generated login form's user name field will be blank. When the login form is submitted, the ActionValue (see page 23943) property can be used to access the user name entered by the end-user.

See Also

ActionValue (see page 23943)

173.1.36.3 TAdapterUserNameField Properties

The properties of the TAdapterUserNameField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 24031)	Suggests a display label for this adapter field.
	DisplayWidth (see page 24031)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 24032)	Identifies the name of this field when using server-side script.

173.1.36.3.1 TAdapterUserNameField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 23933)

173.1.36.3.2 TAdapterUserNameField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 23933)

173.1.36.3.3 TAdapterUserNameField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

173.1.37 TApplicationAdapter Class

TApplicationAdapter is a container for field and action components that are available through the Application script variable.

Class Hierarchy

Pascal

```
TApplicationAdapter = class(TCustomApplicationAdapter);
```

C++

```
class TApplicationAdapter : public TCustomApplicationAdapter;
```

File

WebAdapt

Description

By default, TApplicationAdapter contains a single field called Title that gets its value from the ApplicationTitle (see page 24040) property. The TApplicationAdapter can be customized by adding additional field and action components. When writing server-side script, use the Application variable to access fields and actions of the ApplicationAdapter. For example, <%= Application.Title %> writes the title of the application.

See Also

TAdapter (see page 23713)

TApplicationAdapter

173.1.37.1 TApplicationAdapter Members

The following tables list the members exposed by TApplicationAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetApplicationAdapter (see page 24303)	Implements IWebApplicationInfo's GetApplicationAdapter method.
	GetApplicationTitle (see page 24303)	Implements IWebApplicationInfo's GetApplicationTitle method.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
V	GetWebSnapObjClass (see page 24304)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddActionClass (see page 24304)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 24304)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
V	ImplGetActionsList (see page 24305)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
V	ImplGetFieldsList (see page 24305)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 24166)	Returns an action or field.
V	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.

	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.

	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetApplicationAdapter (see page 19747)	Returns the value of the ApplicationAdapter (see page 19747) property.
	GetApplicationTitle (see page 19747)	Returns the value of the ApplicationTitle (see page 19748) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ApplicationAdapter (see page 19747)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.

R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24041)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24042)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24042)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24042)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24043)	Supplies name/value pairs needed to execute an adapter action.

Published Properties

	Name	Description
	Actions (see page 24040)	Container for adapter actions components.
	ApplicationTitle (see page 24040)	Defines the title of the application.
	Data (see page 24041)	Container for adapter field components.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.37.2 TApplicationAdapter Properties

The properties of the TApplicationAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 24040)	Container for adapter actions components.
	ApplicationTitle (see page 24040)	Defines the title of the application.
	Data (see page 24041)	Container for adapter field components.

173.1.37.2.1 TApplicationAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.37.2.2 TApplicationAdapter.ApplicationTitle Property

Defines the title of the application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property AnsiString ApplicationTitle;__property AnsiString ApplicationTitle;
```

Description

Set this property to identify an application title that can be accessed with server-side script as the Application.Title property.

173.1.37.2.3 TApplicationAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.37.3 TApplicationAdapter Events

The events of the TApplicationAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24041)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24042)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24042)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24042)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24043)	Supplies name/value pairs needed to execute an adapter action.

173.1.37.3.1 TApplicationAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.37.3.2 TApplicationAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.37.3.3 TApplicationAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.37.3.4 TApplicationAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.37.3.5 TApplicationAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.38 TBaseAdapterAction Class

TBaseAdapterAction is a based class for adapter action components.

Class Hierarchy

Pascal

```
TBaseAdapterAction = class(TWebContainedComponent, IWebVariableName, IWebEnabled,
IGetAdapterItemRequestParams, IWebGetActionName, IWebGetDisplayLabel, IWebSnapObjClass,
IAdapterActionAccess, IAdapterRequestHandler, IGetAdapterActionRedirectOptions, IGetHTMLStyle,
IAdapterActionAttributes, IIteratorSupport, IIteratorIndex, IIsAdapterActionList,
IWebIsDefaultAction);
```

C++

```
class TBaseAdapterAction : public TWebContainedComponent, public IWebVariableName, public
IWebEnabled, public IGetAdapterItemRequestParams, public IWebGetActionName, public
IWebGetDisplayLabel, public IWebSnapObjClass, public IAdapterActionAccess, public
IAdapterRequestHandler, public IGetAdapterActionRedirectOptions, public IGetHTMLStyle, public
IAdapterActionAttributes, public IIteratorSupport, public IIteratorIndex, public
IIsAdapterActionList, public IWebIsDefaultAction;
```

File

WebAdapt

Description

TBaseAdapterAction implements interfaces used to access an adapter action's properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter action class.

See Also

TCustomAdapterAction (see page 24188)

TAdapter (see page 23713)

173.1.38.1 TBaseAdapterAction Members

The following tables list the members exposed by TBaseAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.

	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
V	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.

V	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
V	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
V	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.

R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.38.2 TBaseAdapterAction Methods

The methods of the TBaseAdapterAction class are listed here.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.

	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.38.2.1 TBaseAdapterAction.CheckExecuteAccess Method

Checks end-user rights to execute this adapter action.

Pascal

```
procedure CheckExecuteAccess;
```

C++

```
__fastcall CheckExecuteAccess();
```

Description

This procedure is called to verify that the current user has rights to execute this action. An exception will be raised if access is denied.

See Also

ExecuteAccess (see page 24073)

HasExecuteAccess (see page 24062)

ExecuteActionRequest (see page 24053)

173.1.38.2.2 TBaseAdapterAction.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls this function before calling HandleRequest (see page 24061). The result of this function is stored in the WebContext variable. During the course of executing this action, the object returned by CreateRequestContext will be used to access the action parameters and field values that were passed in the HTTP request to execute this action.

See Also

ImplCreateRequestContext (see page 24062)

AdapterRequest (see page 24655)

TAdapterDispatcher (see page 24840)

HandleRequest (see page 24061)

173.1.38.2.3 TBaseAdapterAction.DoAfterExecuteActionRequest Method

Calls event handlers after the adapter action is executed.

Pascal

```
procedure DoAfterExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoAfterExecuteActionRequest is called by ExecuteActionRequest (see page 24053). DoAfterExecuteActionRrequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnAfterExecuteAction event handler is called first. If it does not handle the action request then the OnAfterExecute (see page 24075) event handler is called.

See Also

OnAfterExecute (see page 24075)

OnAfterExecuteAction (see page 24184)

DoAfterExecuteActionRequest

ExecuteActionRequest (see page 24053)

173.1.38.2.4 TBaseAdapterAction.DoAfterGetExecuteActionResponse Method

Calls event handlers after the adapter action response is formulated.

Pascal

```
procedure DoAfterGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoAfterGetExecuteActionResponse is called by GetExecuteActionResponse (see page 24057). The parent adapter's OnAfterGetActionResponse event handler is called first. If it does not handle the action response then the OnAfterGetResponse (see page 24075) event handler is called.

See Also

OnAfterGetResponse (see page 24075)

OnAfterGetActionResponse (see page 24185)

DoBeforeGetExecuteActionResponse (see page 24052)

GetExecuteActionResponse (see page 24057)

173.1.38.2.5 TBaseAdapterAction.DoBeforeExecuteActionRequest Method

Calls event handlers before the adapter action is executed.

Pascal

```
procedure DoBeforeExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoBeforeExecuteActionRequest is called by ExecuteActionRequest (see page 24053). DoBeforeExecuteActionRequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnBeforeExecuteAction event handler is called first. If it does not handle the action request then the OnBeforeExecute (see page 24076) event handler is called. If either event handler handles the request then the IActionRequest (see page 24596)'s Handled property is set to true.

See Also

OnBeforeExecute (see page 24076)

OnBeforeExecuteAction (see page 24186)

DoAfterExecuteActionRequest (see page 24051)

ExecuteActionRequest (see page 24053)

173.1.38.2.6 TBaseAdapterAction.DoBeforeGetExecuteActionResponse Method

Calls event handlers before the adapter action response is formulated.

Pascal

```
procedure DoBeforeGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoBeforeGetExecuteActionResponse is called by GetExecuteActionResponse (see page 24057). The parent adapter's OnBeforeGetActionResponse event handler is called first. If it does not handle the action response then the OnBeforeGetResponse (see page 24076) event handler is called. If either event handler handles the action response then the IActionResponse's Handled property is set to true.

See Also

OnBeforeGetResponse (see page 24076)

OnBeforeGetActionResponse (see page 24186)

DoAfterGetExecuteActionResponse (see page 24051)

GetExecuteActionResponse (see page 24057)

173.1.38.2.7 TBaseAdapterAction.EndIterator Method

Implements IIteratorSupport's EndIterator method.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

IIteratorSupport is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 23849) is an example of an adapter action that supports multiple commands. EndIterator calls ImplNextIteration (see page 24068).

See Also

IIteratorSupport (see page 19722)

IIteratorIndex (see page 19720)

enditerator (see page 19723)

ImplEndIterator (see page 24062)

173.1.38.2.8 TBaseAdapterAction.ExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall ExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ExecuteActionRequest is called by ImplHandleRequest (see page 24067) when a request to execute this adapter action is found in the HTTP request. ExecuteActionRequest first calls CheckExecuteAccess (see page 24050). CheckExecuteAccess (see page 24050) raises an exception if the end-user does not have execute rights. ExecuteActionRequest then calls, in turn, DoBeforeExecuteActionRequest (see page 24052), ImplExecuteActionRequest (see page 24063), and DoAfterExecuteActionRequest (see page 24051).

See Also

DoBeforeExecuteActionRequest (see page 24052)

DoAfterExecuteActionRequest (see page 24051)

CheckExecuteAccess (see page 24050)

ImplExecuteActionRequest (see page 24063)

ImplHandleRequest (see page 24067)

173.1.38.2.9 TBaseAdapterAction.GetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall AnsiString GetActionName();
```

Description

GetActionName is called to retrieve the name used to access this adapter field with server-side script. GetActionName calls ImplGetActionName (see page 24063).

See Also

ActionName (see page 24072)

ImplGetActionName (see page 24063)

173.1.38.2.10 TBaseAdapterAction.GetAdapter Method

GetAdapter returns the parent adapter component.

Pascal

```
function GetAdapter: TCustomAdapter;
```

C++

```
__fastcall TCustomAdapter GetAdapter();
```

Description

To improve the efficiency of this function, a reference to the parent adapter component is cached in an instance variable.

See Also

Adapter (see page 24072)

173.1.38.2.11 TBaseAdapterAction.GetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(AnsiString AIdentifier, IAdapterItemRequestParams
Params);
```

Description

The name/value pairs provided by this method will written to the HTTP response when the HTML page is generated and passed back in the HTTP request when this adapter action is to be executed. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted.

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.38.2.12 TBaseAdapterAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 24063)

173.1.38.2.13 TBaseAdapterAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDefaultDisplayLabel();
```

Description

When the display label for the action matches this value then the display label property does not need to be stored in the form file.

173.1.38.2.14 TBaseAdapterAction.GetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall AnsiString GetDisplayLabel();
```

Description

GetDisplayLabel provides label that may be used when generating HTML to display a button or hyperlink for this adapter action. The value returned by this function can be accessed with server-side script using the DisplayLabel (see page 24073) property. GetDisplayLabel calls ImplGetDisplayLabel (see page 24064).

See Also

DisplayLabel (see page 24073)

ImplGetDisplayLabel (see page 24064)

173.1.38.2.15 TBaseAdapterAction.GetDisplayStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetDisplayStyle(const AnsiString AAdapterMode);
```

Description

GetDisplayStyle implements IGetHTMLStyle's GetDisplayStyle method by translating the result value of GetDisplayStyleType (see page 24056) into a string.

See Also

GetDisplayStyle (see page 19700)

GetDisplayStyleType (see page 24056)

173.1.38.2.16 TBaseAdapterAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaButton, indicating that this adapter action should be displayed using a submit button. Descendant classes may override this method to suggest other HTML display types.

See Also

GetDisplayStyle (see page 24056)

173.1.38.2.17 TBaseAdapterAction.GetErrors Method

Pascal

```
function GetErrors: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetErrors();
```

Description

This is GetErrors, a member of class TBaseAdapterAction.

173.1.38.2.18 TBaseAdapterAction.GetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure GetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall GetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

GetExecuteActionResponse is called by ImplHandleRequest (see page 24067) after executing an adapter action specified by the HTTP request. GetExecuteActionResponse calls, in turn, DoBeforeGetExecuteActionResponse (see page 24052), ImplGetExecuteActionResponse (see page 24064), and DoAfterGetExecuteActionResponse (see page 24051).

See Also

IActionRequest (see page 935)

IActionResponse (see page 941)

DoBeforeGetExecuteActionResponse (see page 24052)

DoAfterGetExecuteActionResponse (see page 24051)

ImplGetExecuteActionResponse (see page 24064)

ImplHandleRequest (see page 24067)

173.1.38.2.19 TBaseAdapterAction.GetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function GetFailureOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetFailureOptions();
```

Description

Set RedirectOptions (see page 24074) when an HTTP redirect should be performed after execution of this adapter action fails. GetFailureOptions returns the result of ImplGetFailureOptions (see page 24065).

See Also

ImplGetFailureOptions (see page 24065)

GetSuccessOptions (see page 24059)

RedirectOptions (see page 24074)

173.1.38.2.20 TBaseAdapterAction.GetInputStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetInputStyle(const AnsiString AAdapterMode);
```

Description

GetInputStyle implements IGetHTMLStyle's GetInputType method by returning the result of GetDisplayStyle (see page 24056). This method must be implemented as part of IGetHTMLStyle. GetInputStyle is treated as a synonym of GetDisplayStyle (see page 24056).

See Also

GetInputStyle (see page 19700)

GetDisplayStyle (see page 24056)

173.1.38.2.21 TBaseAdapterAction.GetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function GetIsAdapterActionList: Boolean;
```

C++

```
__fastcall Boolean GetIsAdapterActionList();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 23849) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 24525). GetIsAdapterActionList calls ImplGetIsAdapterActionList (see page 24065).

See Also

ImplGetIsAdapterActionList (see page 24065)

TAdapterGotoPageAction (see page 23849)

173.1.38.2.22 TBaseAdapterAction.GetItemCount Method

Returns the number of commands defined by this adapter action.

Pascal

```
function GetItemCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 23849) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 24525). GetItemCount returns 1. GetItemCount may be overridden by a descendant class.

See Also

ItemCount (see page 24074)

ItemIndex (see page 24074)

TAdapterGotoPageAction (see page 23849)

GetIsAdapterActionList (see page 24058)

173.1.38.2.23 TBaseAdapterAction.GetIteratorIndex Method

Implements IIteratorIndex's GetIteratorIndex method.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

IIteratorIndex and IIteratorSupport are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. GetIteratorIndex returns the index of the current command. GetIteratorIndex calls ImplGetIteratorIndex (see page 24065).

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

GetIteratorIndex (see page 19721)

ImplGetIteratorIndex (see page 24065)

173.1.38.2.24 TBaseAdapterAction.GetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function GetSuccessOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetSuccessOptions();
```

Description

Set RedirectOptions (see page 24074) when an HTTP redirect should be performed after executing an action. GetSuccessOptions returns the result of ImplGetSuccessOptions (see page 24066).

See Also

ImplGetSuccessOptions (see page 24066)

GetFailureOptions (see page 24057)

RedirectOptions (see page 24074)

173.1.38.2.25 TBaseAdapterAction.GetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall AnsiString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter action with server-side script. GetVariableName calls ImplGetVariableName (see page 24066).

See Also

ImplGetVariableName (see page 24066)

173.1.38.2.26 TBaseAdapterAction.GetViewMode Method

Returns a string value to suggest a view mode for this adapter action.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall AnsiString GetViewMode(const AnsiString AAdapterMode);
```

Description

GetViewMode implements IGetHTMLStyle's GetViewMode method by translating the result value of GetViewModeType (see page 24060) into a string.

See Also

GetViewMode (see page 19701)

GetViewModeType (see page 24060)

173.1.38.2.27 TBaseAdapterAction.GetViewModeType Method

Suggests a view mode for this adapter action.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const AnsiString AAdapterMode);
```

Description

GetViewModeType returns htmlvmInput.

See Also

ReadOnly (see page 23924)

GetViewMode (see page 23921)

173.1.38.2.28 TBaseAdapterAction.GetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

The state of the parent adapter may dictate whether a button or hyperlink for a particular adapter action should not be shown. For example, TDataSetAdapterApplyRowAction can be configured to return false when the parent TDataSetAdapter is in browse mode. GetVisible calls ImplGetVisible (see page 24066). Server-side script can access the value returned by GetVisible using the Visible property of an adapter action object.

See Also

ImplGetVisible (see page 24066)

173.1.38.2.29 TBaseAdapterAction.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

173.1.38.2.30 TBaseAdapterAction.HandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to execute the adapter action and generate a response. HandleRequest calls

ImplHandleRequest (see page 24067).

See Also

CreateRequestContext (see page 24050)

173.1.38.2.31 TBaseAdapterAction.HasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanExecute property. HasExecuteAccess calls ImplHasExecuteAccess (see page 24067).

See Also

CheckExecuteAccess (see page 24050)

ImplHasExecuteAccess (see page 24067)

173.1.38.2.32 TBaseAdapterAction.ImplCreateRequestContext Method

Creates an object that describes the action parameters and field values.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

ImplCreateRequestContext is called by CreateRequestContext (see page 24050). ImplCreateRequestContext returns the result of TCustomAdapter (see page 24139)'s CreateActionRequestContext method.

See Also

CreateRequestContext (see page 24050)

CreateActionRequestContext (see page 24151)

173.1.38.2.33 TBaseAdapterAction.ImplEndIterator Method

Implements IIteratorSupport's EndIterator (see page 24053) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer);
```

C++

```
__fastcall ImplEndIterator(void * OwnerData);
```

Description

ImplEndIterator is called by EndIterator (see page 24053). ImplEndIterator resets internal variables.

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

EndIterator (see page 24053)

173.1.38.2.34 TBaseAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest is called by ExecuteActionRequest (see page 24053). ImplExecuteActionRequest must be overridden by a descendant class.

See Also

IActionRequest (see page 935)

IActionResponse (see page 941)

ExecuteActionRequest (see page 24053)

173.1.38.2.35 TBaseAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetActionName();
```

Description

This function is called by GetActionName (see page 24054). ImplGetActionName returns the result of GetDefaultActionName (see page 24055). Descendants may override this function.

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.38.2.36 TBaseAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 24055). ImplGetAdapterItemRequestParams calls the OnGetActionParams event handler of the parent adapter and then calls the OnGetParams (see page 24077) event handler.

See Also

GetAdapterItemRequestParams (see page 24055)

OnGetActionParams (see page 24187)

OnGetParams (see page 24077)

173.1.38.2.37 TBaseAdapterAction.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function ImplGetDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 24073) property.

See Also

DisplayLabel (see page 24073)

173.1.38.2.38 TBaseAdapterAction.ImplGetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure ImplGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplGetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplGetExecuteActionResponse is called by GetExecuteActionResponse (see page 24057). ImplGetExecuteActionResponse sets properties of IActionResponse to identify the response to this action request.

See Also

GetExecuteActionResponse (see page 24057)

173.1.38.2.39 TBaseAdapterAction.ImplGetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function ImplGetFailureOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetFailureOptions();
```

Description

ImplGetFailureOptions returns an empty set.

See Also

GetFailureOptions (see page 24057)

173.1.38.2.40 TBaseAdapterAction.ImplGetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function ImplGetIsAdapterActionList: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetIsAdapterActionList();
```

Description

ImplGetIsAdapterActionList is called by GetIsAdapterActionList (see page 24058). ImplGetIsAdapterActionList returns false. ImplGetIsAdapterActionList may be overridden by descendant classes.

See Also

GetIsAdapterActionList (see page 24058)

ImplGetIsAdapterActionList (see page 24243)

173.1.38.2.41 TBaseAdapterAction.ImplGetIteratorIndex Method

Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex is called by GetIteratorIndex (see page 24059). ImplGetIteratorIndex returns the value of an internal iteration index.

See Also

GetIteratorIndex (see page 19721)

GetIteratorIndex (see page 24059)

173.1.38.2.42 TBaseAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 24074) property.

See Also

GetSuccessOptions (see page 24059)

RedirectOptions (see page 24074)

173.1.38.2.43 TBaseAdapterAction.ImplGetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetVariableName: string;
```

C++

```
__fastcall AnsiString ImplGetVariableName();
```

Description

This function is called by GetVariableName (see page 24060). GetVariableName (see page 24060) returns the result of GetActionName (see page 24054).

See Also

GetVariableName (see page 24060)

GetActionName (see page 24054)

173.1.38.2.44 TBaseAdapterAction.ImplGetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function ImplGetVisible: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

ImplGetVisible is called by GetVisible (see page 24061). ImplGetVisible returns true. ImplGetVisible may be overridden by descendant components.

See Also

GetVisible (see page 24061)

173.1.38.2.45 TBaseAdapterAction.ImplHandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

ImplHandleRequest is called by HandleRequest (see page 24061). ImplHandleRequest calls ExecuteActionRequest (see page 24053) followed by GetExecuteActionResponse (see page 24057).

See Also

ExecuteActionRequest (see page 24053)

GetExecuteActionResponse (see page 24057)

173.1.38.2.46 TBaseAdapterAction.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 24062) to check the end-user's right to execute the adapter action. First, the parent adapter's HasExecuteAccess (see page 24062) method is called. If the adapter allows execute access and the ExecuteAccess (see page 24073) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ExecuteAccess (see page 24073) property value.

See Also

HasExecuteRights (see page 24111)

ExecuteAccess (see page 24073)

HasExecuteAccess (see page 24062)

hasexecuteaccess (see page 24162)

173.1.38.2.47 TBaseAdapterAction.ImplInIterator Method

Implements IIteratorIndex's InIterator (see page 24069) method.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

ImplInIterator is called by InIterator (see page 24069). ImplInIterator returns the value of an internal flag.

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

InIterator (see page 19721)

ImplInIterator

173.1.38.2.48 TBaseAdapterAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 24070). ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

173.1.38.2.49 TBaseAdapterAction.ImplNextIteration Method

Implements IIteratorSupport's NextIteration (see page 24070) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration is called by NextIteration (see page 24070). ImplNextIteration increments an internal iteration index. true is returned if the iteration index is within the bounds defined by ItemCount (see page 24074).

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

NextIteration (see page 24070)

173.1.38.2.50 TBaseAdapterAction.ImplStartIterator Method

Implements IIteratorSupport's StartIterator (see page 24071) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator is called by StartIterator (see page 24071). ImplStartIterator initializes the internal iteration index. ImplStartIterator returns true because it is assumed that there is at least one command associated with this adapter action.

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

startiterator (see page 19724)

StartIterator (see page 24071)

173.1.38.2.51 TBaseAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled is called by WebEnabled (see page 24071). ImplWebEnabled returns true. Descendant classes may override this method.

See Also

WebEnabled (see page 24071)

173.1.38.2.52 TBaseAdapterAction.InIterator Method

Implements IIteratorIndex's InIterator method.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

IIteratorIndex and IIteratorSupport are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. InIterator calls ImplInIterator (see page 24067).

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

InIterator (see page 19721)

ImplInIterator (see page 24067)

173.1.38.2.53 TBaseAdapterAction.IsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function IsDefaultAction(ADisplay: TObject): Boolean;
```

C++

```
__fastcall Boolean IsDefaultAction(TObject * ADisplay);
```

Description

Some adapter components have built in support for specific types of adapter actions. These actions are often added to the adapter component by default unless the developer explicitly adds one or more adapter actions. IsDefaultAction is called by the adapter while adding default actions to determine whether this adapter action should be added. ADisplay identifies characteristics of the adapter component. IsDefaultAction calls ImplIsDefaultAction (see page 24068).

See Also

ImplIsDefaultAction (see page 24068)

173.1.38.2.54 TBaseAdapterAction.NextIteration Method

Implements IIteratorSupport's NextIteration method.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

IIteratorSupport is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 23849) is an example of an adapter action that supports multiple commands. NextIterations returns the result of ImplNextIteration (see page 24068).

See Also

IIteratorSupport (see page 19722)

IIteratorIndex (see page 19720)

ImplNextIteration (see page 24068)

NextIteration (see page 19723)

173.1.38.2.55 TBaseAdapterAction.ParentChanged Method

Handles movement of the component to a different parent.

Pascal

```
procedure ParentChanged; override;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called when the parent component is changed. TBaseAdapterAction (see page 24043) clears its cached reference to the parent adapter.

173.1.38.2.56 TBaseAdapterAction.SetDisplayLabel Method

Set the value of the DisplayLabel (see page 24073) property.

Pascal

```
procedure SetDisplayLabel(const Value: string);
```

C++

```
__fastcall SetDisplayLabel(const AnsiString Value);
```

Description

SetDisplayLabel sets the value of the DisplayLabel (see page 24073) property.

See Also

DisplayLabel (see page 24073)

173.1.38.2.57 TBaseAdapterAction.StartIterator Method

Implements IIteratorSupport's StartIterator method.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

IIteratorIndex and IIteratorSupport are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. StartIterator calls ImplImplInIterator.

See Also

IIteratorIndex (see page 19720)

IIteratorSupport (see page 19722)

startiterator (see page 19724)

ImplStartIterator (see page 24068)

173.1.38.2.58 TBaseAdapterAction.WebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function WebEnabled: Boolean;
```

C++

```
__fastcall Boolean WebEnabled();
```

Description

The state of the parent adapter may dictate when a button or hyperlink for a particular adapter action should not be enabled. For example, TDataSetAdapterPrevRowAction returns False when the dataset is positioned at BOF. WebEnabled calls ImplWebEnabled (see page 24069). Server-side script can access the value returned by WebEnabled using the Enabled property of an adapter action object.

See Also

ImplWebEnabled (see page 24069)

173.1.38.3 TBaseAdapterAction Properties

The properties of the TBaseAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.

Public Properties

	Name	Description
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.

173.1.38.3.1 TBaseAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

GetActionName (see page 24054)

173.1.38.3.2 TBaseAdapterAction.Adapter Property

Provides access to the parent adapter component.

Pascal

```
property Adapter: TCustomAdapter;
```

C++

```
__property TCustomAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter component.

173.1.38.3.3 TBaseAdapterAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.38.3.4 TBaseAdapterAction.Errors Property

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

This is Errors, a member of class TBaseAdapterAction.

173.1.38.3.5 TBaseAdapterAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user

attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 25625)

hasexecuteaccess (see page 24162)

173.1.38.3.6 TBaseAdapterAction.ItemCount Property

Returns the number of items defined by an adapter action.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

An adapter action may have a list of commands. The ItemCount property is implemented by GetItemCount (see page 24058). The TAdapterGotoPageAction (see page 23849) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 23849) displays a different page of the parent TPagedAdapter (see page 24525).

See Also

GetItemCount (see page 24058)

ItemIndex (see page 24074)

TAdapterGotoPageAction (see page 23849)

GetIsAdapterActionList (see page 24058)

173.1.38.3.7 TBaseAdapterAction.ItemIndex Property

Returns the index of the current item of an adapter action.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

An adapter action may have a list of commands. The ItemIndex indicates the current item in the list. The TAdapterGotoPageAction (see page 23849) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 23849) displays a different page of the parent TPagedAdapter (see page 24525).

See Also

ItemCount (see page 24074)

TAdapterGotoPageAction (see page 23849)

GetIsAdapterActionList (see page 24058)

173.1.38.3.8 TBaseAdapterAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect (see page 15201)

173.1.38.4 TBaseAdapterAction Events

The events of the TBaseAdapterAction class are listed here.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

173.1.38.4.1 TBaseAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest (see page 24051).

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.38.4.2 TBaseAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse

OnBeforeGetActionResponse (see page 24186)

173.1.38.4.3 TBaseAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest (see page 24052).

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.38.4.4 TBaseAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.38.4.5 TBaseAdapterAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.39 TBaseAdapterErrorsList Class

TBaseAdapterErrorsList is the base class for adapter error object managers.

Class Hierarchy

Pascal

```
TBaseAdapterErrorsList = class(TInterfacedObject, IAdapterErrors, IIterateIntfSupport);
```

C++

```
class TBaseAdapterErrorsList : public TInterfacedObject, public IAdapterErrors, public
IIterateIntfSupport;
```

File

WebAdapt

Description

TBaseAdapterErrorsList is the base class for objects that manage lists of adapter error objects. Do not instantiate TBaseAdapterErrorsList directly. Use TAdapterErrorsList (see page 23810).

See Also

TAdapterErrorsList (see page 23810)

IAdapterError (see page 19660)

173.1.39.1 TBaseAdapterErrorsList Members

The following tables list the members exposed by TBaseAdapterErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	EndIterator (see page 24081)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 24081)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 24082)	Returns a particular error.
	GetErrorCount (see page 24082)	Return the number of errors in the errors list.
	GetObjectErrors (see page 24082)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 24082)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 24083)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 24083)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
V	ImplGetError (see page 24083)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
V	ImplGetErrorCount (see page 24083)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
V	ImplGetObjectErrors (see page 24084)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 24084)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 24084)	Advances to the objects next item.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 24085)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AddError (see page 24080)	This is the overview for the AddError method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 24080)	Clear error list.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	DefineLabel (see page 24081)	Define error label for field.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCount (see page 24085)	Number of error objects contained.
R	Errors (see page 24085)	Access to error objects.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

173.1.39.2 TBaseAdapterErrorsList Methods

The methods of the TBaseAdapterErrorsList class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 24081)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 24081)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 24082)	Returns a particular error.
	GetErrorCount (see page 24082)	Return the number of errors in the errors list.
	GetObjectErrors (see page 24082)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 24082)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 24083)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 24083)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
V	ImplGetError (see page 24083)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
V	ImplGetErrorCount (see page 24083)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
V	ImplGetObjectErrors (see page 24084)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 24084)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 24084)	Advances to the objects next item.
	StartIterator (see page 24085)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	AddError (see page 24080)	This is the overview for the AddError method overload.
	ClearErrors (see page 24080)	Clear error list.
	DefineLabel (see page 24081)	Define error label for field.

173.1.39.2.1 AddError Method

This is the overview for the AddError method overload.

Overload List

	Name	Description
	TBaseAdapterErrorsList.AddError (Exception, string) (see page 24080)	Add error to list.
	TBaseAdapterErrorsList.AddError (Exception, TObject) (see page 24080)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, string, Integer) (see page 24080)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, TObject, Integer) (see page 24080)	Add error to list.

173.1.39.2.1.1 TBaseAdapterErrorsList.AddError Method (Exception, TObject)

Add error to list.

Pascal

```
procedure AddError(AException: Exception; const AObjectName: string = ''); virtual; overload;
procedure AddError(const AMessage: string; const AObjectName: string = ''; AID: Integer = 0);
virtual; overload;
procedure AddError(const AMessage: string; AObject: TObject; AID: Integer = 0); virtual;
overload;
procedure AddError(AException: Exception; AObject: TObject); virtual; overload;
```

C++

```
virtual __fastcall AddError(Exception AException, const AnsiString AObjectName = '');
virtual __fastcall AddError(const AnsiString AMessage, const AnsiString AObjectName = '', int
AID = 0);
virtual __fastcall AddError(const AnsiString AMessage, TObject * AObject, int AID = 0);
virtual __fastcall AddError(Exception AException, TObject * AObject);
```

Description

AddError adds an error to the list maintained by the TBaseAdapterErrorsList (see page 24077) instance. As implemented in TBaseAdapterErrorsList (see page 24077), AddError does nothing. This method must be implemented by descendant classes.

See Also

AddError (see page 23815)

173.1.39.2.2 TBaseAdapterErrorsList.ClearErrors Method

Clear error list.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

Clear errors deletes all error information maintained by the TBaseAdapterErrorsList (see page 24077) instance.

See Also

AddError (see page 23815)

173.1.39.2.3 TBaseAdapterErrorsList.DefineLabel Method

Define error label for field.

Pascal

```
procedure DefineLabel(const AName: string; const ALabel: string);
```

C++

```
__fastcall DefineLabel(const AnsiString AName, const AnsiString ALabel);
```

Description

DefineLabel defines a string label that represents a dataset field in error message. AName is the the field name. ALabel is the label.

See Also

AddError (see page 23815)

173.1.39.2.4 TBaseAdapterErrorsList.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TBaseAdapterErrorsList.

173.1.39.2.5 TBaseAdapterErrorsList.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.

173.1.39.2.6 TBaseAdapterErrorsList.GetError Method

Returns a particular error.

Pascal

```
function GetError(I: Integer): IAdapterError;
```

C++

```
__fastcall IAdapterError GetError(int I);
```

Description

I is a zero-based index.

See Also

IAdapterError (see page 19660)

173.1.39.2.7 TBaseAdapterErrorsList.GetErrorCount Method

Return the number of errors in the errors list.

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

Return the number of errors in the errors list.

173.1.39.2.8 TBaseAdapterErrorsList.GetObjectErrors Method

Returns an object that is used to enumerate all errors associated with an adapter field.

Pascal

```
function GetObjectErrors(const AName: string): TObject;
```

C++

```
__fastcall TObject * GetObjectErrors(const AnsiString AName);
```

Description

AName identifies an adapter field. nil (Delphi) or NULL (C++) is returned if there are no errors associated with the adapter field.

See Also

HasObjectErrors (see page 19665)

173.1.39.2.9 TBaseAdapterErrorsList.HasObjectErrors Method

Indicates whether the errors list contains objects associated with a particular adapter field.

Pascal

```
function HasObjectErrors(const AName: string): Boolean;
```

C++

```
__fastcall Boolean HasObjectErrors(const AnsiString AName);
```

Description

HasObjectErrors returns true if any errors are associated with the given adapter field. AName identifies an adapter field.

See Also

GetObjectErrors (see page 19665)

173.1.39.2.10 TBaseAdapterErrorsList.ImplClearErrors Method

Pascal

```
procedure ImplClearErrors; virtual;
```

C++

```
virtual __fastcall ImplClearErrors();
```

Description

This is ImplClearErrors, a member of class TBaseAdapterErrorsList.

173.1.39.2.11 TBaseAdapterErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); virtual;
```

C++

```
virtual __fastcall ImplDefineLabel(const AnsiString AName, const AnsiString ALabel);
```

Description

This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.

173.1.39.2.12 TBaseAdapterErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; virtual;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TBaseAdapterErrorsList.

173.1.39.2.13 TBaseAdapterErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.

173.1.39.2.14 TBaseAdapterErrorsList.ImplGetObjectErrors Method

Pascal

```
function ImplGetObjectErrors(const AName: string): TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetObjectErrors(const AnsiString AName);
```

Description

This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.

173.1.39.2.15 TBaseAdapterErrorsList.ImplHasObjectErrors Method

Pascal

```
function ImplHasObjectErrors(const AName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasObjectErrors(const AnsiString AName);
```

Description

This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.

173.1.39.2.16 TBaseAdapterErrorsList.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

startiterator (see page 19724)

enditerator (see page 19723)

173.1.39.2.17 TBaseAdapterErrorsList.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TBaseAdapterErrorsList.

173.1.39.3 TBaseAdapterErrorsList Properties

The properties of the TBaseAdapterErrorsList class are listed here.

Public Properties

	Name	Description
R	ErrorCount (see page 24085)	Number of error objects contained.
R	Errors (see page 24085)	Access to error objects.

173.1.39.3.1 TBaseAdapterErrorsList.ErrorCount Property

Number of error objects contained.

Pascal

```
property ErrorCount: Integer;
```

C++

```
__property int ErrorCount;
```

Description

ErrorCount returns the number of error objects available.

See Also

Errors (see page 24085)

173.1.39.3.2 TBaseAdapterErrorsList.Errors Property

Access to error objects.

Pascal

```
property Errors [I: Integer]: IAdapterError;
```

C++

```
__property IAdapterError Errors[int I];
```

Description

Errors returns a specific error object.

See Also

ErrorCount (see page 24085)

173.1.40 TBaseAdapterMultiValueField Class

TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.

Class Hierarchy

Pascal

```
TBaseAdapterMultiValueField = class(TAdapterUpdateField, IGetFieldValuesAdapter,
IWebGetFieldValues);
```

C++

```
class TBaseAdapterMultiValueField : public TAdapterUpdateField, public IGetFieldValuesAdapter,
public IWebGetFieldValues;
```

File

WebAdapt

Description

TBaseAdapterMultiValueField is used to represent a data value that can have multiple values. Server-side script is used to generate a form displaying this field. Typically, the HTML form will contain group check boxes or a select list supporting multiple selection. When an Adapter (see page 23943) action is executed, TBaseAdapterMultiValueField is used to retrieve the submitted field value(s) from the HTTP request.

See Also

TCustomAdapterMultiValueField (see page 24273)

TCustomAdapterFileField (see page 24220)

173.1.40.1 TBaseAdapterMultiValueField Members

The following tables list the members exposed by TBaseAdapterMultiValueField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
	EndValueIterator (see page 24093)	Completes iteration.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.

	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24094)	Returns the number of values associated with this adapter field.
	GetValues (see page 24095)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.

	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 24096)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24020)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 24092)	Constructor for TBaseAdapterMultiValueField (see page 24086).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24093)	Destructor for TBaseAdapterMultiValueField (see page 24086).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.

	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.

R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.40.2 TBaseAdapterMultiValueField.Create Constructor

Constructor for TBaseAdapterMultiValueField (see page 24086).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseAdapterMultiValueField(TComponent * AOwner);
```

Description

Creates an instance of TFieldValuesAdapter (see page 24471) and calls the inherited creator method. TFieldValuesAdapter (see page 24471) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 24471)

ImplGetFieldValuesAdapter (see page 24096)

Destroy (see page 24093)

173.1.40.3 TBaseAdapterMultiValueField.Destroy Destructor

Destructor for TBaseAdapterMultiValueField (see page 24086).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseAdapterMultiValueField();
```

Description

Destroys the instance of TFieldValuesAdapter (see page 24471) and calls the inherited destructor. TFieldValuesAdapter (see page 24471) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 24471)

ImplGetFieldValuesAdapter (see page 24096)

Create (see page 24092)

173.1.40.4 TBaseAdapterMultiValueField Methods

The methods of the TBaseAdapterMultiValueField class are listed here.

Protected Methods

	Name	Description
	EndValueIterator (see page 24093)	Completes iteration.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.
V	GetValueCount (see page 24094)	Returns the number of values associated with this adapter field.
V	GetValues (see page 24095)	Returns one of the values associated with the adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
V	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
V	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
V	ImplHasValue (see page 24096)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.

173.1.40.4.1 TBaseAdapterMultiValueField.EndValueIterator Method

Completes iteration.

Pascal

```
procedure EndValueIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndValueIterator(void * OwnerData);
```

Description

The EndValueIterator procedure is called when iteration has completed.

See Also

NextValueIteration (see page 24096)

StartValueIterator (see page 24097)

173.1.40.4.2 TBaseAdapterMultiValueField.GetCurrentValue Method

Implements IWebGetFieldValues' GetCurrentValue.

Pascal

```
function GetCurrentValue: Variant;
```

C++

```
__fastcall Variant GetCurrentValue();
```

Description

GetCurrentValue returns the result of ImplGetCurrentValue (see page 24095).

See Also

GetCurrentValue (see page 19761)

ImplGetCurrentValue (see page 24095)

173.1.40.4.3 TBaseAdapterMultiValueField.GetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function GetFieldValuesAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetFieldValuesAdapter();
```

Description

GetFieldValuesAdapter is called when server-side script references the Values property of this adapter field. GetFieldValuesAdapter calls ImplGetFieldValuesAdapter (see page 24096).

See Also

ImplGetFieldValuesAdapter (see page 24096)

173.1.40.4.4 TBaseAdapterMultiValueField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns 0. Descendants of TBaseAdapterMultiValueField (see page 24086) override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValues (see page 24095)

173.1.40.4.5 TBaseAdapterMultiValueField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns Unassigned. Descendants override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValueCount (see page 24094)

173.1.40.4.6 TBaseAdapterMultiValueField.HasValue Method

Implements IWebGetFieldValues' HasValue method.

Pascal

```
function HasValue(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(const Variant AValue);
```

Description

HasValue returns the result of ImplHasValue (see page 24096).

See Also

HasValue (see page 19761)

ImplHasValue (see page 24096)

173.1.40.4.7 TBaseAdapterMultiValueField.ImplGetCurrentValue Method

Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.

Pascal

```
function ImplGetCurrentValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetCurrentValue();
```

Description

ImplGetCurrentValue is called by GetCurrentValue (see page 24094). ImplGetCurrentValue calls GetValues (see page 24095) with the value of the internal iterator index.

See Also

GetCurrentValue (see page 24094)

GetValues (see page 24095)

173.1.40.4.8 TBaseAdapterMultiValueField.ImplGetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function ImplGetFieldValuesAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetFieldValuesAdapter();
```

Description

ImplGetFieldValuesAdapter returns an instance of TFieldValuesAdapter (see page 24471).

See Also

TFieldValuesAdapter (see page 24471)

GetFieldValuesAdapter (see page 24094)

Create (see page 24092)

Destroy (see page 24093)

173.1.40.4.9 TBaseAdapterMultiValueField.ImplHasValue Method

Implements IWebGetFieldValues' HasValue (see page 24095) method.

Pascal

```
function ImplHasValue(const Value: Variant): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasValue(const Variant Value);
```

Description

ImplHasValue is called by HasValue (see page 24095). ImplHasValue returns False (indicating that there is no matching value). Descendants override this method.

See Also

HasValue (see page 24095)

173.1.40.4.10 TBaseAdapterMultiValueField.NextValueIteration Method

Implements IWebGetFieldValues' NextValueIteration method.

Pascal

```
function NextValueIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextValueIteration(void * OwnerData);
```

Description

NextValueIteration increments an internal iterator index. false is returned if the iterator index is not less than the GetValueCount (see page 24094) .

See Also

NextValueIteration (see page 19762)

GetValueCount (see page 24094)

173.1.40.4.11 TBaseAdapterMultiValueField.StartValueIterator Method

Implements IWebGetFieldValues' StartValueIterator method.

Pascal

```
function StartValueIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartValueIterator(void * OwnerData);
```

Description

StartValueIterator initializes an internal iterator index to zero. false is returned if GetValueCount (see page 24094) is zero.

See Also

StartValueIterator (see page 19762)

GetValueCount (see page 24094)

173.1.41 TBaseEndUserAdapter Class

TBaseEndUserAdapter contains user information.

Class Hierarchy

Pascal

```
TBaseEndUserAdapter = class(TDefaultFieldsAdapter, IWebEndUser);
```

C++

```
class TBaseEndUserAdapter : public TDefaultFieldsAdapter, public IWebEndUser;
```

File

WebAdapt

Description

TBaseEndUserAdapter contains information about a user such as their name, access rights, and whether they are logged in. TBaseEndUserAdapter has default fields to represent the end user's display name and login state. It has default actions for logging a user in and logging a user out. End user adapters are responsible validating end user access. For example, when the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access the page.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

173.1.41.1 TBaseEndUserAdapter Members

The following tables list the members exposed by TBaseEndUserAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
V	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 24108)	Starts the server-side login process.
V	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
V	ExecuteLogout (see page 24108)	Performs server-side logout.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.

	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 24109)	Retrieves the display name string.
	GetDisplayNameValue (see page 24109)	Gets the display name of the end user.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
	GetLoggedInValue (see page 24110)	Determines if the user is logged in.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserID (see page 24111)	Gets the UserID from this TBaseEndUserAdapter (see page 24097).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.

	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogIn (see page 24117)	Logs in a specified user.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.

V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24117)	Generates the login page.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24118)	Gets the user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.

	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 24119)	Determines if the user rights match the rights being queried.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnProduceLoginPage (see page 24119)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
	LoginPage (see page 24118)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.41.2 TBaseEndUserAdapter Methods

The methods of the TBaseEndUserAdapter class are listed here.

Protected Methods

	Name	Description
	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
	ExecuteLogin (see page 24108)	Starts the server-side login process.
	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
	ExecuteLogout (see page 24108)	Performs server-side logout.
	GetDisplayName (see page 24109)	Retrieves the display name string.
	GetDisplayNameValue (see page 24109)	Gets the display name of the end user.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
	GetLoggedInValue (see page 24110)	Determines if the user is logged in.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
	GetUserID (see page 24111)	Gets the UserID from this TBaseEndUserAdapter (see page 24097).
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	LogIn (see page 24117)	Logs in a specified user.
	ProduceLoginPage (see page 24117)	Generates the login page.
	UserList (see page 24118)	Gets the user list.

173.1.41.2.1 TBaseEndUserAdapter.CanExecuteLoginForm Method

Determines if there is a static login page.

Pascal

```
function CanExecuteLoginForm: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLoginForm();
```

Description

The CanExecuteLoginForm calls CanProduceLoginPage (see page 24107) to determine if there is a static login page, or if one

can be generated. Then if the user is not already logged in, this function returns true. If the login page cannot be produced or the user is already logged in, then this function returns false.

See Also

CanProduceLoginPage (see page 24107)

173.1.41.2.2 TBaseEndUserAdapter.CanExecuteLogout Method

Determines if the user is logged in.

Pascal

```
function CanExecuteLogout: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLogout();
```

Description

The CanExecuteLogout function calls ImplGetLoggedIn (see page 24114) to determine if the user is logged in. If the user is logged in, this function returns true.

See Also

ImplGetLoggedIn (see page 24114)

173.1.41.2.3 TBaseEndUserAdapter.CanProduceLoginPage Method

Determines whether there is a static login page or an automatically produced login page.

Pascal

```
function CanProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanProduceLoginPage();
```

Description

The CanProduceLoginPage returns true if there is a static login page, or if there is an event handler defined to automatically produce the login page.

See Also

OnProduceLoginPage (see page 24119)

173.1.41.2.4 TBaseEndUserAdapter.DoOnHasRights Method

Determines whether the user has view rights.

Pascal

```
function DoOnHasRights(AEvent: TEndUserRightsEvent; const ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoOnHasRights(TEndUserRightsEvent AEvent, const AnsiString ARights);
```

Description

The DoOnHasRights function is called from ImplHasViewRights (see page 24116). It matches the given access rights to the rights in the user list and returns true if the user has view rights.

AEvent is the event handler that DoOnHasRights should call first to check access rights.

ARights is a string that represents the rights the user needs.

See Also

ImplHasViewRights (see page 24116)

HasViewRights (see page 24112)

173.1.41.2.5 TBaseEndUserAdapter.ExecuteLogin Method

Starts the server-side login process.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

The ExecuteLogin function is called from sever-side script to start the login process. This base class version of the function is empty. A customized overridden version of this function can be written to do specific login processing for the application.

See Also

ImplProduceLoginPage (see page 24117)

173.1.41.2.6 TBaseEndUserAdapter.ExecuteLoginForm Method

Creates the HTML login page.

Pascal

```
procedure ExecuteLoginForm; virtual;
```

C++

```
virtual __fastcall ExecuteLoginForm();
```

Description

The ExecuteLoginForm function is called from server-side script to create the HTML login page. This function calls ImplProduceLoginPage (see page 24117) to make the page producer generate the login page.

See Also

ImplProduceLoginPage (see page 24117)

173.1.41.2.7 TBaseEndUserAdapter.ExecuteLogout Method

Performs server-side logout.

Pascal

```
procedure ExecuteLogout; virtual;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

The ExecuteLogout function is called from server-side script to perform the logout process. This base class version of the

function is empty. A customized overridden version of this function can be written to do specific logout processing for the application.

See Also

CanExecuteLogout (see page 24107)

173.1.41.2.8 TBaseEndUserAdapter.GetDisplayName Method

Retrieves the display name string.

Pascal

```
function GetDisplayName: string;
```

C++

```
__fastcall AnsiString GetDisplayName();
```

Description

The GetDisplayName function is called from server-side script to get the display name string. It calls ImplGetDisplayName (see page 24114) to get the display name for this TBaseEndUserAdapter (see page 24097).

See Also

ImplGetDisplayName (see page 24114)

GetDisplayNameValue (see page 24109)

173.1.41.2.9 TBaseEndUserAdapter.GetDisplayNameValue Method

Gets the display name of the end user.

Pascal

```
function GetDisplayNameValue: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDisplayNameValue();
```

Description

The GetDisplayNameValue is called from server-side script to get the display name of the end user. This base class version of the function returns an empty string. A customized overridden version of this function could be written to return the display name for the end user in your application.

See Also

ImplGetDisplayName (see page 24114)

GetDisplayName (see page 24109)

173.1.41.2.10 TBaseEndUserAdapter.GetEndUserAdapter Method

Gets the end-user adapter.

Pascal

```
function GetEndUserAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetEndUserAdapter();
```

Description

The GetEndUserAdapter function is called from server-side script to get the end-user adapter. This function returns itself, that is, this TBaseEndUserAdapter (see page 24097).

See Also

ImplGetEndUserAdapter (see page 24114)

173.1.41.2.11 TBaseEndUserAdapter.GetLoggedIn Method

Determines if the user is logged in

Pascal

```
function GetLoggedIn: Boolean;
```

C++

```
__fastcall Boolean GetLoggedIn();
```

Description

The GetLoggedIn function is called from server-side script to determine if the user is logged in. This function calls ImplGetLoggedIn (see page 24114) to get the result.

See Also

ImplGetLoggedIn (see page 24114)

GetLoggedInValue (see page 24110)

173.1.41.2.12 TBaseEndUserAdapter.GetLoggedInValue Method

Determines if the user is logged in.

Pascal

```
function GetLoggedInValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

The GetLoggedInValue function is called from server-side script to determine if the user is logged in. This base class version of the function always returns false. A customized overridden version could be written specifically for your application.

See Also

ImplGetLoggedIn (see page 24114)

GetLoggedIn (see page 24110)

173.1.41.2.13 TBaseEndUserAdapter.GetLoginFormAction Method

Gets the action component for the login form.

Pascal

```
function GetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * GetLoginFormAction();
```

Description

The GetLoginFormAction is called from server-side script to get the action component for the login form. This function calls ImplGetLoginFormAction (see page 24115) to get the action component.

See Also

ImplGetLoginFormAction (see page 24115)

173.1.41.2.14 TBaseEndUserAdapter.GetLogoutAction Method

Gets the action component for the logout form.

Pascal

```
function GetLogoutAction: TComponent;
```

C++

```
__fastcall TComponent * GetLogoutAction();
```

Description

The GetLogoutAction is called from server-side script to get the action component for the logout form. This function calls ImplGetLogoutFormAction to get the action component.

See Also

ImplGetLogoutAction (see page 24115)

173.1.41.2.15 TBaseEndUserAdapter.GetUserID Method

Gets the UserID from this TBaseEndUserAdapter (see page 24097).

Pascal

```
function GetUserID: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

The GetUserID function is called from server-side script to get the UserID from this TBaseEndUserAdapter (see page 24097). This base class version of the function always returns Unassigned. A customized overridden version of this function could be written specifically for your application.

173.1.41.2.16 TBaseEndUserAdapter.HasExecuteRights Method

Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).

Pascal

```
function HasExecuteRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasExecuteRights(AnsiString ARights);
```

Description

The HasExecuteRights function is called from server-side script to determine if the user has execute rights for the TBaseEndUserAdapter (see page 24097). This function calls ImplHasExecuteRights (see page 24115) to check the user rights.

See Also

ImplHasExecuteRights (see page 24115)

HasModifyRights (see page 24112)

HasViewRights (see page 24112)

173.1.41.2.17 TBaseEndUserAdapter.HasModifyRights Method

Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).

Pascal

```
function HasModifyRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasModifyRights(AnsiString ARights);
```

Description

The HasModifyRights function is called from server-side script to determine if the user has modify rights for the TBaseEndUserAdapter (see page 24097). This function calls ImplHasModifyRights (see page 24116) to check the user rights.

See Also

ImplHasModifyRights (see page 24116)

HasModifyRights

HasViewRights (see page 24112)

173.1.41.2.18 TBaseEndUserAdapter.HasViewRights Method

Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).

Pascal

```
function HasViewRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasViewRights(AnsiString ARights);
```

Description

The HasViewRights function is called from server-side script to determine if the user has view rights for the TBaseEndUserAdapter (see page 24097). This function calls ImplHasViewRights (see page 24116) to check the user rights.

See Also

ImplHasViewRights (see page 24116)

HasModifyRights (see page 24112)

HasViewRights

173.1.41.2.19 TBaseEndUserAdapter.ImplCanAddActionClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddActionClass function calls the base class to determine if the given action class can be added. In addition, it allows actions components to be added if they are derived from TCustomEndUserAdapterAction (see page 24326) at some level. This function returns true if the action class is allowed to be added, or false otherwise.

See Also

ImplCanAddActionClass (see page 24163)

TCustomEndUserAdapterAction (see page 24326)

173.1.41.2.20 TBaseEndUserAdapter.ImplCanAddFieldClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddFieldClass function calls the base class to determine if the given action class can be added. In addition to that, it allows fields components to be added if they are derived from TAdapterEndUserField (see page 23793).

See Also

ImplCanAddFieldClass (see page 24163)

TAdapterEndUserField (see page 23793)

173.1.41.2.21 TBaseEndUserAdapter.ImplGetActionsList Method

Lists supported end-user adapter actions.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

The ImplGetActionsList procedure obtains the list of all supported actions for the end-user adapter.

173.1.41.2.22 TBaseEndUserAdapter.ImplGetDisplayName Method

Gets the display name for this TBaseEndUserAdapter (see page 24097).

Pascal

```
function ImplGetDisplayName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayName();
```

Description

The ImplGetDisplayName function is called from GetDisplayName (see page 24109) to get the display name for this TBaseEndUserAdapter (see page 24097). It gets the display name from the DisplayName field component.

See Also

GetDisplayName (see page 24109)

173.1.41.2.23 TBaseEndUserAdapter.ImplGetEndUserAdapter Method

Returns this TBaseEndUserAdapter (see page 24097).

Pascal

```
function ImplGetEndUserAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetEndUserAdapter();
```

Description

The ImplGetEndUserAdapter simply returns this TBaseEndUserAdapter (see page 24097).

See Also

GetEndUserAdapter (see page 24109)

173.1.41.2.24 TBaseEndUserAdapter.ImplGetFieldsList Method

Obtains the list of all of the fields for the end-user adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The ImplGetFieldsList procedure obtains the list of all of the fields for the end-user adapter.

173.1.41.2.25 TBaseEndUserAdapter.ImplGetLoggedIn Method

Checks the value of the LoggedIn field.

Pascal

```
function ImplGetLoggedIn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetLoggedIn();
```

Description

The ImplGetLoggedIn function is called from GetLoggedIn (see page 24110). It checks the value of the LoggedIn field component and returns the result.

See Also

GetLoggedIn (see page 24110)

173.1.41.2.26 TBaseEndUserAdapter.ImplGetLoginFormAction Method

Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).

Pascal

```
function ImplGetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * ImplGetLoginFormAction();
```

Description

The ImplGetLoginFormAction function is called from GetLoginFormAction (see page 24110) to get the LoginForm action component for this TBaseEndUserAdapter (see page 24097).

See Also

GetLoginFormAction (see page 24110)

173.1.41.2.27 TBaseEndUserAdapter.ImplGetLogoutAction Method

Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).

Pascal

```
function ImplGetLogoutAction: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetLogoutAction();
```

Description

The ImplGetLogoutAction function is called from GetLogoutAction (see page 24111) to get the Logout action component for this TBaseEndUserAdapter (see page 24097).

See Also

GetLogoutAction (see page 24111)

173.1.41.2.28 TBaseEndUserAdapter.ImplHasExecuteRights Method

Checks user rights and determines if the user has execute rights.

Pascal

```
function ImplHasExecuteRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteRights(AnsiString ARights);
```

Description

The ImplHasExecuteRights function is called from the HasExecuteRights (see page 24111) function. It calls the DoOnHasRights (see page 24107) function to check the user rights and determines if the user has execute rights.

See Also

OnHasRights (see page 24119)

173.1.41.2.29 TBaseEndUserAdapter.ImplHasModifyRights Method

Checks user rights and determines if the user has modify rights.

Pascal

```
function ImplHasModifyRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyRights(AnsiString ARights);
```

Description

The ImplHasModifyRights function is called from the HasModifyRights (see page 24112) function. It calls the DoOnHasRights (see page 24107) function to check the user rights and determine if the user has modify rights.

See Also

OnHasRights (see page 24119)

173.1.41.2.30 TBaseEndUserAdapter.ImplHasViewRights Method

Checks user rights and determines if the user has view rights.

Pascal

```
function ImplHasViewRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewRights(AnsiString ARights);
```

Description

The ImplHasViewRights is called from the HasViewRights (see page 24112) function. It calls the DoOnHasRights (see page 24107) function to check the user rights and determine if the user has view rights.

See Also

DoOnHasRights (see page 24107)

173.1.41.2.31 TBaseEndUserAdapter.ImplLogIn Method

Processes the login for the given user.

Pascal

```
procedure ImplLogIn(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ImplLogIn(Variant AUserID);
```

Description

The ImplLogIn procedure is called from LogIn (see page 24117). This function calls ExecuteLogin (see page 24108) to

process the login for the given user.

See Also

Login (see page 24117)

ExecuteLogin (see page 24108)

173.1.41.2.32 TBaseEndUserAdapter.ImplProduceLoginPage Method

Generate the HTML login page.

Pascal

```
function ImplProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplProduceLoginPage();
```

Description

The ImplProduceLoginPage is called to generate the HTML login page It first calls the OnProduceLoginPage (see page 24119) event handler to allow for a customized version. If no event handler is defined, it then has default code to generate the page using the page producer.

See Also

OnProduceLoginPage (see page 24119)

173.1.41.2.33 TBaseEndUserAdapter.LogIn Method

Logs in a specified user.

Pascal

```
procedure LogIn(AUserID: Variant);
```

C++

```
__fastcall LogIn(Variant AUserID);
```

Description

Call LogIn to record a user as logged in. Typically, LogIn is called in response to a message from the login page that ProduceLoginPage generates.

UserID is the identifier of the user that logged in. It is the value of the UserID property of the entry for the user in a WebUserList component, or, in applications that implement their own login scheme, any other Variant that identifies an end user.

See Also

LoggedIn (see page 24678)

ProduceLoginPage (see page 24677)

TWebUserList (see page 25625)

UserID (see page 25619)

TLoginFormAdapter (see page 24500)

173.1.41.2.34 TBaseEndUserAdapter.ProduceLoginPage Method

Generates the login page.

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

The ProduceLoginPage function is called from server-side script to generate the login page. This function calls ImplProduceLoginPage (see page 24117) to generate the page.

See Also

ImplProduceLoginPage (see page 24117)

173.1.41.2.35 TBaseEndUserAdapter.UserList Method

Gets the user list.

Pascal

```
function UserList: IWebUserList;
```

C++

```
__fastcall IWebUserList UserList();
```

Description

The UserList function is called from server-side script to get the user list. If the user list is not stored in this TBaseEndUserAdapter (see page 24097), it then attempts to retrieve the user list through the application module.

173.1.41.3 TBaseEndUserAdapter Properties

The properties of the TBaseEndUserAdapter class are listed here.

Public Properties

	Name	Description
	LoginPage (see page 24118)	Specifies the name of the page that acts as the login page.

173.1.41.3.1 TBaseEndUserAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property AnsiString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter (see page 24097). The name of the login page is the name of the Web page module that generates the login page.

173.1.41.4 TBaseEndUserAdapter Events

The events of the TBaseEndUserAdapter class are listed here.

Public Events

	Name	Description
	OnHasRights (see page 24119)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 24119)	Allows implementation of a customized login page.

173.1.41.4.1 TBaseEndUserAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights (see page 24107) to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 24107)

ImplHasExecuteRights (see page 24115)

ImplHasModifyRights (see page 24116)

ImplHasViewRights (see page 24116)

173.1.41.4.2 TBaseEndUserAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage (see page 24117). If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 24117)

ProduceLoginPage (see page 24117)

CanProduceLoginPage (see page 24107)

173.1.42 TBaseValuesListAdapter Class

TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.

Class Hierarchy

Pascal

```
TBaseValuesListAdapter = class(TDefaultFieldsAdapter, IValuesListAdapter);
```

C++

```
class TBaseValuesListAdapter : public TDefaultFieldsAdapter, public IValuesListAdapter;
```

File

WebAdapt

Description

Descendants of TBaseValuesListAdapter (such as TStringsValuesList (see page 24540) and TDataSetValuesList) are used to provide name/value pairs for an adapter field. Adapter fields reference a values list adapter using the adapter field's ValuesList

property. Typically, the list of name/value pairs is used by server-side scripts to populate <select>, <input type=checkbox>, or <input type=radio>.

TBaseValuesListAdapter has two default fields. One field is responsible for providing a value and the other for providing a name.

See Also

TStringsValuesList (see page 24540)

TDataSetValuesList (see page 8079)

TAdapterUpdateField (see page 24007)

173.1.42.1 TBaseValuesListAdapter Members

The following tables list the members exposed by TBaseValuesListAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.

	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValueFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.

	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 24131)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 24132)	Looks up a name for a value.
	ImplGetListValue (see page 24132)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.42.2 TBaseValuesListAdapter Methods

The methods of the TBaseValuesListAdapter class are listed here.

Protected Methods

	Name	Description
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
V	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
V	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
V	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
V	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
V	ImplGetListName (see page 24131)	Responsible returning the name of the name/value pair.
V	ImplGetListNameOfValue (see page 24132)	Looks up a name for a value.
V	ImplGetListValue (see page 24132)	Responsible for returning the value of the name/value pair.

173.1.42.2.1 TBaseValuesListAdapter.GetListImage Method

Returns an image associated with the current name/value pair.

Pascal

```
function GetListImage: TComponent;
```

C++

```
__fastcall TComponent * GetListImage();
```

Description

GetListImage returns the result of ImplGetListImage (see page 24131).

See Also

ImplGetListImage (see page 24131)

173.1.42.2.2 TBaseValuesListAdapter.GetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function GetListImageOfValue(Value: Variant): TComponent;
```

C++

```
__fastcall TComponent * GetListImageOfValue(Variant Value);
```

Description

GetListImageOfValue returns the result of ImplGetListImageOfValue (see page 24131).

See Also

ImplGetListImageOfValue (see page 24131)

173.1.42.2.3 TBaseValuesListAdapter.GetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function GetListName: string;
```

C++

```
__fastcall AnsiString GetListName();
```

Description

GetListName returns the result of ImplGetListName (see page 24131).

See Also

GetListName

ImplGetListValue (see page 24132)

173.1.42.2.4 TBaseValuesListAdapter.GetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function GetListNameOfValue(Value: Variant): string;
```

C++

```
__fastcall AnsiString GetListNameOfValue(Variant Value);
```

Description

GetListNameOfValue returns the result of ImplGetListNameOfValue (see page 24132).

See Also

ImplGetListNameOfValue (see page 24132)

173.1.42.2.5 TBaseValuesListAdapter.GetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function GetListValue: Variant;
```

C++

```
__fastcall Variant GetListValue();
```

Description

GetListValue returns the result of ImplGetListValue (see page 24132).

See Also

GetListName (see page 24128)

ImplGetListValue (see page 24132)

173.1.42.2.6 TBaseValuesListAdapter.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetValueFieldClass (see page 24129)

173.1.42.2.7 TBaseValuesListAdapter.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetNameFieldClass (see page 24129)

173.1.42.2.8 TBaseValuesListAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; override;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

173.1.42.2.9 TBaseValuesListAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass check the field class by calling GetNameFieldClass (see page 24129), GetValueFieldClass (see page 24129), and TCustomAdapter (see page 24139)'s ImplCanAddFieldClass method.

See Also

GetNameFieldClass (see page 24129)

GetValueFieldClass (see page 24129)

ImplCanAddFieldClass (see page 24163)

173.1.42.2.10 TBaseValuesListAdapter.ImplGetFieldsList Method

Adds default field components to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList adds a value field and a name field using the classes returned by GetNameFieldClass (see page 24129) and GetValueFieldClass (see page 24129).

See Also

GetNameFieldClass (see page 24129)

GetValueFieldClass (see page 24129)

173.1.42.2.11 TBaseValuesListAdapter.ImplGetListImage Method

Responsible returning an image associated with the current name/value pair.

Pascal

```
function ImplGetListImage: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImage();
```

Description

ImplGetListImage is a placeholder. Descendant adapters that support images must override this method.

See Also

GetListImage (see page 24128)

173.1.42.2.12 TBaseValuesListAdapter.ImplGetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function ImplGetListImageOfValue(Value: Variant): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImageOfValue(Variant Value);
```

Description

ImplGetListImageOfValue is a placeholder. Descendant classes that support image lookups must override this function.

See Also

GetListImageOfValue (see page 24128)

173.1.42.2.13 TBaseValuesListAdapter.ImplGetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function ImplGetListName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetListName();
```

Description

ImplGetListName returns an empty string. ImplGetListName must be overridden by a descendant class.

See Also

GetListName (see page 24128)

173.1.42.2.14 TBaseValuesListAdapter.ImplGetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetListNameOfValue(Variant Value);
```

Description

ImplGetListNameOfValue is a placeholder. Descendant classes that support name lookups must override this function.

See Also

GetListNameOfValue (see page 24128)

173.1.42.2.15 TBaseValuesListAdapter.ImplGetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function ImplGetListValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

ImplGetListValue is a placeholder. ImplGetListValue must be overriden by a descendant class.

See Also

GetListValue (see page 24129)

173.1.43 TBaseValuesListField Class

TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.

Class Hierarchy

Pascal

```
TBaseValuesListField = class(TAdapterNamedField);
```

C++

```
class TBaseValuesListField : public TAdapterNamedField;
```

File

WebAdapt

Description

Derive from TBaseValuesListField to declare an adapter field that can be a child of TBaseValuesListAdapter (see page 24120).

See Also

TStringsValuesList (see page 24540)

TBaseValuesListAdapter (see page 24120)

TAdapterNamedField (see page 23925)

TValuesListNameField (see page 24552)

TValuesListValueField (see page 24558)

173.1.43.1 TBaseValuesListField Members

The following tables list the members exposed by TBaseValuesListField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 24138)	Retrieves the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.

V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24139)	Retrieves the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.

	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.43.2 TBaseValuesListField Methods

The methods of the TBaseValuesListField class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 24138)	Retrieves the parent adapter component.

173.1.43.2.1 TBaseValuesListField.GetAdapter Method

Retrieves the parent adapter component.

Pascal

```
function GetAdapter: TBaseValuesListAdapter;
```

C++

```
__fastcall TBaseValuesListAdapter GetAdapter();
```

Description

GetAdapter implements the Adapter (see page 24139) property.

See Also

Adapter (see page 24139)

TBaseValuesListAdapter (see page 24120)

173.1.43.3 TBaseValuesListField Properties

The properties of the TBaseValuesListField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24139)	Retrieves the parent adapter component.

173.1.43.3.1 TBaseValuesListField.Adapter Property

Retrieves the parent adapter component.

Pascal

```
property Adapter: TBaseValuesListAdapter;
```

C++

```
__property TBaseValuesListAdapter Adapter;
```

Description

The Adapter property is used by descendants to access the parent adapter component.

See Also

Adapter

TBaseValuesListAdapter (see page 24120)

173.1.44 TCustomAdapter Class

TCustomAdapter is a base class for adapter components.

Class Hierarchy

Pascal

```
TCustomAdapter = class(TComponent, IIdentifyAdapter, IWebVariableName, IWebVariablesContainer,
INotifyList, IWebSnapObjClass, IGetAdapterErrors, IGetAdapterErrorsList, INotifyWebActivate,
IAdapterEditor, IGetAdapterFields, IGetAdapterActions, IIteratorSupport, IClearAdapterValues,
IEchoAdapterFieldValues, IAdapterAccess, IGetAdapterHiddenFields, ICreateActionRequestContext,
IWebDataFields, IWebActionsList, IAdapterNotifyAdapterChange, IIteratorIndex);
```

C++

```
class TCustomAdapter : public TComponent, public IIdentifyAdapter, public IWebVariableName,
public IWebVariablesContainer, public INotifyList, public IWebSnapObjClass, public
IGetAdapterErrors, public IGetAdapterErrorsList, public INotifyWebActivate, public
IAdapterEditor, public IGetAdapterFields, public IGetAdapterActions, public IIteratorSupport,
public IClearAdapterValues, public IEchoAdapterFieldValues, public IAdapterAccess, public
IGetAdapterHiddenFields, public ICreateActionRequestContext, public IWebDataFields, public
IWebActionsList, public IAdapterNotifyAdapterChange, public IIteratorIndex;
```

File

WebAdapt

Description

TCustomAdapter implements interfaces used to access an adapter properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize

the behavior of the adapter class.

See Also

TAdapter (see page 23713)

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

TFieldValuesAdapter (see page 24471)

TDataSetValuesList (see page 8079)

TStringsValuesList (see page 24540)

TDataSetAdapter (see page 7872)

TPagedAdapter (see page 24525)

173.1.44.1 TCustomAdapter Members

The following tables list the members exposed by TCustomAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.

	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.

	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.

	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.44.2 TCustomAdapter.Create Constructor

Constructor for TCustomAdapter (see page 24139).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapter(TComponent * AOwner);
```

Description

Creates instance variables that hold interfaces, object references used by TCustomAdapter (see page 24139).

See Also

Create_d

173.1.44.3 TCustomAdapter.Destroy Destructor

Destructor for TCustomAdapter (see page 24139).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapter();
```

Description

Frees objects used by TCustomAdapter (see page 24139).

See Also

Free (see page 22300)

173.1.44.4 TCustomAdapter Methods

The methods of the TCustomAdapter class are listed here.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.

	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 24166)	Returns an action or field.
V	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
V	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
V	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
V	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
V	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.

	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Public Methods

	Name	Description
	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

173.1.44.4.1 TCustomAdapter.AddAdapterModeHiddenField Method

Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddAdapterModeHiddenField(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddAdapterModeHiddenField(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may support modes. For example, TDataSetAdapter supports Edit, Insert, and Browse modes. The hidden field defined by AddAdapterModeHiddenField is added to an HTML form using the server-side script method HiddenFields.WriteFields.

See Also

listhiddenfields (see page 24173)

173.1.44.4.2 TCustomAdapter.AddOrigValueHiddenFields Method

Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddOrigValueHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddOrigValueHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

In order to ensure that the data associated with the adapter hasn't been changed by another user, descendant adapters may check that the current values of adapter fields are the same as the original values. For example, TDataSetAdapter raises an exception if the original values are not the same as the dataset's values. The hidden fields defined by AddOrigValueHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 24173)

173.1.44.4.3 TCustomAdapter.AddRecordKeysHiddenFields Method

Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddRecordKeysHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddRecordKeysHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may use key values to define the relationship between values in the HTTP request and adapter data values. For example, TDataSetAdapter supports updates to multiple detail records by using hidden fields to identify the relationship between values in the HTTP request with dataset rows. The hidden fields defined by AddRecordKeysHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 24173)

173.1.44.4.4 TCustomAdapter.CanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function CanAddActionClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

CanAddActionClass is called at design-time when editing an adapter. CanAddActionClass returns the result of ImplCanAddActionClass (see page 24163).

See Also

ImplCanAddActionClass (see page 24163)

173.1.44.4.5 TCustomAdapter.CanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function CanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

CanAddFieldClass is called at design-time when editing an adapter. CanAddFieldClass returns the result of ImplCanAddFieldClass (see page 24163).

See Also

ImplCanAddFieldClass (see page 24163)

173.1.44.4.6 TCustomAdapter.CheckModifyAccess Method

Pascal

```
procedure CheckModifyAccess;
```

C++

```
__fastcall CheckModifyAccess();
```

Description

This is CheckModifyAccess, a member of class TCustomAdapter.

173.1.44.4.7 TCustomAdapter.ClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ClearAdapterValues;
```

C++

```
__fastcall ClearAdapterValues();
```

Description

ClearAdapterValues calls ImplClearAdapterValues (see page 24163).

See Also

ImplNotifyDeactivate (see page 24170)

ImplClearAdapterValues (see page 24163)

173.1.44.4.8 TCustomAdapter.ClearErrors Method

Clears the content of the adapter's Errors (see page 24182) property.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

The errors are cleared when the web module is deactivated. This ensures that the errors encountered during the processing of an HTTP request will not affect another HTTP request.

See Also

Errors (see page 24182)

ClearErrors (see page 24080)

ImplNotifyDeactivate (see page 24170)

173.1.44.4.9 TCustomAdapter.CreateActionRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateActionRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateActionRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

Child adapter actions call this method.

See Also

IAdapterDispatchParams (see page 19655)

CreateRequestContext (see page 24050)

WebContext (see page 24687)

173.1.44.4.10 TCustomAdapter.CreateErrorsList Method

Creates the object used to manage errors associated with this adapter.

Pascal

```
function CreateErrorsList: TBaseAdapterErrorsList; virtual;
```

C++

```
virtual __fastcall TBaseAdapterErrorsList CreateErrorsList();
```

Description

CreateErrorsList creates TAdapterErrorsList (see page 23810). Descendants may override this function to create a custom errors list.

See Also

Errors (see page 24182)

TAdapterErrorsList (see page 23810)

173.1.44.4.11 TCustomAdapter.EncodeActionParams Method

Writes name/value pairs that represent adapter state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

EncodeActionParams is called by a child adapter actions when generating the name/value pairs that must be sent in the HTTP request when executing an action. For example, TDefaultFieldsPagedAdapter (see page 24403) writes the current page number as a name/value pair. ExtractRequestParams (see page 24153) and EncodeActionParams work together. ExtractRequestParams (see page 24153) reads name/value pairs that are written by EncodeActionParams.

See Also

EncodeActionParams (see page 24411)

ExtractRequestParams (see page 24153)

173.1.44.4.12 TCustomAdapter.EndIterator Method

Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. EndIterator calls ImplEndIterator (see page 24164).

See Also

enditerator (see page 19723)

ImplEndIterator (see page 24164)

173.1.44.4.13 TCustomAdapter.ExtractRequestParams Method

Reads name/value pairs from the HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); virtual;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams is called by a child adapter action before executing the action. This gives the adapter an opportunity to extract values from the HTTP request that are important to the behavior of the adapter. For example, TDefaultFieldsPagedAdapter (see page 24403) extracts the current page number from the request. ExtractRequestParams and EncodeActionParams (see page 24152) work together. ExtractRequestParams reads name/value pairs that are written by EncodeActionParams (see page 24152).

See Also

ExtractRequestParams (see page 24412)

EncodeActionParams (see page 24152)

173.1.44.4.14 TCustomAdapter.FindAction Method

Returns an action component with a matching action name.

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const AnsiString AName);
```

Description

The action name is used when a component property references an adapter action by name. Actions (see page 24181) also have a variable name that is used to reference the action with server-side script. The variable name and action name are usually the same. The only time that they need to be different is when the action name is not a valid server-side script identifier.

See Also

FindField (see page 24154)

173.1.44.4.15 TCustomAdapter.FindField Method

Returns an adapter field component with a matching field name.

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const AnsiString AName);
```

Description

The field name is used when a component property references an adapter field by name. Adapter fields also have a variable name that is used to reference the field with server-side script. The variable name and field name are usually the same. The only time that they need to be different is when the field name is not a valid server-side script identifier.

See Also

FindField

173.1.44.4.16 TCustomAdapter.FindNamedAction Method

Finds an action with a matching variable name.

Pascal

```
function FindNamedAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedAction(const AnsiString AName);
```

Description

The AName parameter contains the name used when referencing an action with server-side script. This name may not be the same as the component name. For example, server-side script accesses actions in a TDataSetAdapter with using the command name (e.g.; DeleteRow) rather than the adapter action component name.

See Also

FindNamedVariable (see page 24155)

173.1.44.4.17 TCustomAdapter.FindNamedField Method

Finds an adapter field with a matching variable name.

Pascal

```
function FindNamedField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedField(const AnsiString AName);
```

Description

The AName parameter contains the name used when referencing a field with server-side script. This name may not be the same as the component name. For example, server-side script accesses fields in a TDataSetAdapter with using the dataset field name rather than the adapter field component name.

See Also

FindNamedVariable (see page 24155)

173.1.44.4.18 TCustomAdapter.FindNamedVariable Method

Finds a field or action with a matching variable name.

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const AnsiString AName);
```

Description

FindNamedVariable calls FindNamedField (see page 24154) and FindNamedAction (see page 24154). The AName parameter contains the name used when referencing an action or field with server-side script. This name may not be the same as the component name. For example, server-side script references fields in a TDataSetAdapter using the dataset field name rather than the adapter field component name.

See Also

FindNamedAction (see page 24154)

FindNamedField (see page 24154)

173.1.44.4.19 TCustomAdapter.FindVariable Method

Finds an adapter action or adapter field with the given variable name.

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const AnsiString AName);
```

Description

FindVariable is called when server side script references a property of an adapter object. FindVariable calls ImplFindVariable (see page 24164).

See Also

ImplFindVariable (see page 24164)

173.1.44.4.20 TCustomAdapter.FindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const AnsiString AName);
```

Description

FindVariableContainer is called when server side script references a property of a property. FindVariableContainer returns the result of ImplFindVariableContainer (see page 24164).

See Also

FindVariable (see page 24155)

ImplFindVariableContainer (see page 24164)

173.1.44.4.21 TCustomAdapter.GetActionsClass Method

Specifies the class to create as a container for adapter actions components.

Pascal

```
function GetActionsClass: TAdapterActionsClass; virtual;
```

C++

```
virtual __fastcall TAdapterActionsClass GetActionsClass();
```

Description

Descendants override this method to specify a different adapter action container.

See Also

Actions (see page 24181)

173.1.44.4.22 TCustomAdapter.GetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure GetActionsList(AList: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings AList);
```

Description

GetActionsList is called at design time to get a list containing names and objects. Each name identifies an action name to insert and each object identifies a class of adapter action component. When editing the adapter, these action names are displayed in the dialog box that is used to add new actions. For example, when editing a TDataSetAdapter a list of all of the dataset commands are displayed such as NextRow, PrevRow, DeleteRow, etc.

See Also

ImplGetActionsList (see page 24165)

173.1.44.4.23 TCustomAdapter.GetAdapterActions Method

Returns the adapter actions container object.

Pascal

```
function GetAdapterActions: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterActions();
```

Description

Returns the adapter actions container object.

See Also

Actions (see page 24181)

173.1.44.4.24 TCustomAdapter.GetAdapterErrors Method

Pascal

```
function GetAdapterErrors: TObject;
```

C++

```
__fastcall TObject * GetAdapterErrors();
```

Description

This is GetAdapterErrors, a member of class TCustomAdapter.

173.1.44.4.25 TCustomAdapter.GetAdapterErrorsList Method

<insert text here>

Pascal

```
function GetAdapterErrorsList: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetAdapterErrorsList();
```

Description

Returns an object used to track errors.

See Also

TBaseAdapterErrorsList (see page 24077)

Errors (see page 24182)

173.1.44.4.26 TCustomAdapter.GetAdapterFields Method

Returns the adapter fields container object.

Pascal

```
function GetAdapterFields: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterFields();
```

Description

Returns the adapter fields container object.

See Also

Data (see page 24181)

173.1.44.4.27 TCustomAdapter.GetAdapterHiddenFields Method

Returns a list of hidden fields that hold adapter state information.

Pascal

```
function GetAdapterHiddenFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenFields();
```

Description

GetAdapterHiddenFields populates a list by calling ListHiddenFields (see page 24173).

See Also

listhiddenfields (see page 24173)

173.1.44.4.28 TCustomAdapter.GetAdapterHiddenRecordFields Method

Returns a list of hidden fields that associate HTML form fields and adapter field.

Pascal

```
function GetAdapterHiddenRecordFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenRecordFields();
```

Description

GetAdapterHiddenRecordsFields populates a list by calling ListHiddenRecordFields (see page 24173). If the list is empty, nil (Delphi) or NULL (C++) is returned. Otherwise, the list is returned.

See Also

ListHiddenRecordFields (see page 24173)

173.1.44.4.29 TCustomAdapter.GetChildren Method

Provides the interface for a method that adapters use to return their child components.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TCustomAdapter (see page 24139) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It calls the Proc procedure passing the Actions (see page 24181) and Data (see page 24181) properties. This allows the adapter actions and adapter fields to be loaded and saved with the TCustomAdapter (see page 24139) object.

See Also

Actions (see page 24181)

Data (see page 24181)

173.1.44.4.30 TCustomAdapter.GetDataClass Method

Specifies the class to create as a container for adapter fields components.

Pascal

```
function GetDataClass: TAdapterFieldsClass; virtual;
```

C++

```
virtual __fastcall TAdapterFieldsClass GetDataClass();
```

Description

Descendants override this method to specify a different adapter fields container.

See Also

TAdapterField (see page 23818)

Data (see page 24181)

173.1.44.4.31 TCustomAdapter.GetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function GetEchoActionFieldValues: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValues();
```

Description

EchoActionFieldValues (see page 24182) calls ImplEchoActionFieldValues.

See Also

EchoActionFieldValues (see page 24182)

ImplGetEchoActionFieldValues (see page 24165)

173.1.44.4.32 TCustomAdapter.GetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

GetFieldsList is called at design time to get a list containing names and objects. Each name identifies a field name to insert and each object identifies a class of adapter field. When editing the adapter, these field names are displayed in the dialog box that is used to add new adapter fields. For example, when editing a TDataSetAdapter a list of all of the dataset's fields are displayed. GetFieldsList calls ImplGetFieldsList (see page 24165).

See Also

ImplGetFieldsList (see page 24165)

173.1.44.4.33 TCustomAdapter.GetHiddenFieldOptions Method

Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

Pascal

```
function GetHiddenFieldOptions: TAdapterHiddenFieldOptions; virtual;
```

C++

```
virtual __fastcall TAdapterHiddenFieldOptions GetHiddenFieldOptions();
```

Description

An adapter may use hidden fields to pass state information down to the client with the HTTP response so that the state information is available when processing a resulting HTTP response. Descendant classes may override this method.

See Also

listhiddenfields (see page 24173)

ListHiddenRecordFields (see page 24173)

173.1.44.4.34 TCustomAdapter.GetIteratorIndex Method

Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

Adapters may support multiple data records. For example, TDataSetAdapter provides access to the records in a dataset. GetIteratorIndex calls ImplGetIteratorIndex (see page 24166).

See Also

GetIteratorIndex (see page 19721)

ImplGetIteratorIndex (see page 24166)

173.1.44.4.35 TCustomAdapter.GetVariable Method

Returns an action or field.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

GetVariableCount (see page 24161) and GetVariable is used to iterate over actions and fields in an adapter. The I parameter is a zero-based index that must be less than the result of GetVariableCount (see page 24161). GetVariable calls ImplGetVariable (see page 24166).

See Also

GetVariable

ImplGetVariable (see page 24166)

GetVariableCount (see page 24161)

173.1.44.4.36 TCustomAdapter.GetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount and GetVariable (see page 24160) is used to iterate over the actions and fields in an adapter. GetVariableCount calls ImplGetVariableCount (see page 24167).

See Also

GetVariable (see page 24160)

ImplGetVariableCount (see page 24167)

173.1.44.4.37 TCustomAdapter.GetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall AnsiString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter with server-side script. GetVariableName calls ImplGetVariableName (see page 24167).

See Also

ImplGetVariableName (see page 24167)

173.1.44.4.38 TCustomAdapter.GetVisibleActions Method

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

This is GetVisibleActions, a member of class TCustomAdapter.

173.1.44.4.39 TCustomAdapter.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class TCustomAdapter.

173.1.44.4.40 TCustomAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

173.1.44.4.41 TCustomAdapter.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class TCustomAdapter.

173.1.44.4.42 TCustomAdapter.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class TCustomAdapter.

173.1.44.4.43 TCustomAdapter.HasViewAccess Method

Checks the end-user's right to view this adapter's fields.

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanView property. HasViewAccess calls ImplHasViewAccess (see page 24169).

See Also

ViewAccess (see page 24183)

173.1.44.4.44 TCustomAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass returns false. This means that only TAdapterAction (see page 23726) can be added. Descendants override this method to allow additional field types.

See Also

CanAddActionClass (see page 24150)

ImplCanAddClass (see page 23743)

173.1.44.4.45 TCustomAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass returns false. This means that only TAdapterField (see page 23818) can be added. Descendants override this method to allow additional field types.

See Also

CanAddFieldClass (see page 24150)

ImplCanAddClass (see page 23836)

173.1.44.4.46 TCustomAdapter.ImplClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ImplClearAdapterValues; virtual;
```

C++

```
virtual __fastcall ImplClearAdapterValues();
```

Description

ClearAdapterValues (see page 24151) clears the echo flag.

See Also

ImplSetEchoActionFieldValues (see page 24171)

ClearAdapterValues (see page 24151)

173.1.44.4.47 TCustomAdapter.ImplEndIterator Method

Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); virtual;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplEndIterator sets the ItemIndex to 0 and the iterator flag to false.

See Also

enditerator (see page 19723)

EndIterator (see page 24152)

173.1.44.4.48 TCustomAdapter.ImplFindVariable Method

Finds an adapter action or adapter field child with a matching variable name.

Pascal

```
function ImplFindVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariable(const AnsiString AName);
```

Description

ImpFindVariable returns the result of FindNamedVariable (see page 24155).

See Also

FindVariable (see page 24155)

173.1.44.4.49 TCustomAdapter.ImplFindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function ImplFindVariableContainer(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariableContainer(const AnsiString AName);
```

Description

FindVariableContainer (see page 24155) is called when server side script references a property of a property. ImplFindVariableContainer tries to find an adapter field or adapter action that is a container for other objects.

See Also

FindVariableContainer (see page 24155)

173.1.44.4.50 TCustomAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList is called by GetActionsList (see page 24156). ImplGetActionsList provides an empty list. ImplGetActionsList may be overridden by descendant classes.

See Also

GetActionsList (see page 24156)

173.1.44.4.51 TCustomAdapter.ImplGetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function ImplGetEchoActionFieldValues: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValues();
```

Description

ImplGetEchoActionFieldValues returns the value passed to ImplSetEchoActionFieldValues (see page 24171). If ImplSetEchoActionFieldValues (see page 24171) has not been processed during the current HTTP request then False is returned.

See Also

EchoActionFieldValues (see page 24182)

GetEchoActionFieldValues (see page 24159)

173.1.44.4.52 TCustomAdapter.ImplGetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList is called by GetFieldsList (see page 24159). ImplGetFieldsList provides an empty list. ImplGetFieldsList may be overridden by descendant classes.

See Also

GetFieldsList (see page 24159)

173.1.44.4.53 TCustomAdapter.ImplGetIteratorIndex Method

Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex returns the value ItemIndex. ItemIndex is modified by ImplStartIterator (see page 24171), ImplNextIteration (see page 24169), and ImplEndIterator (see page 24164).

See Also

GetIteratorIndex (see page 19721)

GetIteratorIndex (see page 24160)

ImplStartIterator (see page 24171)

ImplNextIteration (see page 24169)

ImplEndIterator (see page 24164)

173.1.44.4.54 TCustomAdapter.ImplGetVariable Method

Returns an action or field.

Pascal

```
function ImplGetVariable(I: Integer): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetVariable(int I);
```

Description

ImplGetVariable is called by GetVariable (see page 24160). ImplGetVariable uses the I parameter to locate an adapter action or adapter field.

See Also

GetVariable (see page 24160)

173.1.44.4.55 TCustomAdapter.ImplGetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function ImplGetVariableCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetVariableCount();
```

Description

ImplGetVariableCount is called by GetVariableCount (see page 24161).

See Also

GetVariableCount (see page 24161)

173.1.44.4.56 TCustomAdapter.ImplGetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function ImplGetVariableName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetVariableName();
```

Description

ImplGetVariableName returns the component name.

See Also

GetVariableName (see page 24161)

173.1.44.4.57 TCustomAdapter.ImplGetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function ImplGetVisibleActions: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleActions();
```

Description

ImplGetVisibleActions is called by GetVisibleActions (see page 24161). ImplGetVisibleActions may be overriden by descendant classes.

See Also

getvisibleactions (see page 24161)

173.1.44.4.58 TCustomAdapter.ImplGetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function ImplGetVisibleFields: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleFields();
```

Description

ImplGetVisibleFields is called by GetVisibleFields (see page 24161). ImplGetVisibleFields may be overridden by descendant classes.

See Also

getvisiblefields (see page 24161)

173.1.44.4.59 TCustomAdapter.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter's actions.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 24162) to check the end-user's right to execute the adapter's actions. If the ExecuteAccess (see page 24183) property is not blank, this function calls the EndUserAdapter's HasExecuteRights function, passing the ExecuteAccess (see page 24183) property value.

See Also

hasexecuteaccess (see page 24162)

executeaccess (see page 24183)

HasExecuteAccess (see page 24062)

173.1.44.4.60 TCustomAdapter.ImplHasModifyAccess Method

Checks the end-user's right to modify this adapter's fields.

Pascal

```
function ImplHasModifyAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyAccess();
```

Description

This function is called by HasModifyAccess (see page 24162) to check the end-user's right to modify the adapter field. If the ModifyAccess (see page 24183) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ModifyAccess (see page 24183) property value.

See Also

hasmodifyaccess (see page 24162)

modifyaccess (see page 24183)

hasmodifyaccess (see page 24162)

173.1.44.4.61 TCustomAdapter.ImplHasViewAccess Method

Pascal

```
function ImplHasViewAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewAccess();
```

Description

This is ImplHasViewAccess, a member of class TCustomAdapter.

173.1.44.4.62 TCustomAdapter.ImplInIterator Method

Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplGetInIterator returns the value of the iteration flag. The iteration flag is set to true by TCustomAdapter (see page 24139)'s ImplStartIterator (see page 24171) method.

See Also

InIterator (see page 19721)

InIterator (see page 24172)

ImplStartIterator (see page 24171)

173.1.44.4.63 TCustomAdapter.ImplNextIteration Method

Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplNextIteration increments ItemIndex and returns true if the iteration index is less than ItemCount.

See Also

NextIteration (see page 19723)

NextIteration (see page 24173)

ImplStartIterator (see page 24171)

ImplEndIterator (see page 24164)

173.1.44.4.64 TCustomAdapter.ImplNotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure ImplNotifyActivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyActivate();
```

Description

A web module is activated when an HTTP request is received. ImplNotifyActivate is a placeholder. Descendant classes override this method to initialize the adapter before an HTTP request processed.

See Also

NotifyActivate (see page 24174)

173.1.44.4.65 TCustomAdapter.ImplNotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure ImplNotifyDeactivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. ImplNotifyDeactivate discards adapter state information including adapter errors, iteration flag, and iteration index.

See Also

NotifyDeactivate (see page 24175)

173.1.44.4.66 TCustomAdapter.ImplSetActions Method

Initializes the Actions (see page 24181) property.

Pascal

```
procedure ImplSetActions(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 24181) property is the container for adapter action components. Descendants may override this method.

See Also

Actions (see page 24181)

SetActions (see page 24175)

173.1.44.4.67 TCustomAdapter.ImplSetData Method

Initializes the Data (see page 24181) property.

Pascal

```
procedure ImplSetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 24181) property is the container for adapter field components. Descendants may override this method.

See Also

Data (see page 24181)

SetData (see page 24175)

173.1.44.4.68 TCustomAdapter.ImplSetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure ImplSetEchoActionFieldValues(AValue: Boolean); virtual;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValues(Boolean AValue);
```

Description

ImplEchoActionFieldValues modified the EchoActionFieldValue property of the adapter's fields.

See Also

GetEchoActionFieldValues (see page 24159)

SetEchoActionFieldValues (see page 24176)

EchoActionFieldValue (see page 23944)

173.1.44.4.69 TCustomAdapter.ImplStartIterator Method

Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplStartIterator sets ItemIndex to 0 and sets the iteration flag to true. true is returned.

See Also

startiterator (see page 19724)

StartIterator (see page 24176)

ImplNextIteration (see page 24169)

ImplEndIterator (see page 24164)

173.1.44.4.70 TCustomAdapter.InIterator Method

Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. InIterator calls ImplInIterator (see page 24169).

See Also

InIterator (see page 19721)

ImplInIterator (see page 24169)

173.1.44.4.71 TCustomAdapter.IsActionInUse Method

Indicates whether a particular action has been added to the adapter.

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const AnsiString AName);
```

Description

IsActionInUse is called at design time to determine whether an action with a particular name has been added to the adapter. When editing the adapter, the names of actions in use are not displayed in the dialog box used to add new actions.

See Also

IsFieldInUse (see page 24172)

GetFieldsList (see page 24159)

173.1.44.4.72 TCustomAdapter.IsFieldInUse Method

Indicates whether a particular field has been added to the adapter.

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const AnsiString AName);
```

Description

IsFieldInUse is called at design time to determine whether a field with a particular name has been added to the adapter. When editing the adapter, the names of these fields if use are not displayed in the dialog box used to add new fields.

See Also

IsActionInUse (see page 24172)

GetFieldsList (see page 24159)

173.1.44.4.73 TCustomAdapter.ListHiddenFields Method

Pascal

```
procedure ListHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

This is ListHiddenFields, a member of class TCustomAdapter.

173.1.44.4.74 TCustomAdapter.ListHiddenRecordFields Method

Specifies the HTML form hidden fields needed by the adapter.

Pascal

```
procedure ListHiddenRecordFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenRecordFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Some adapters may use hidden fields to define the relationship between input fields in the HTML form and data of the adapter. For example, an HTML form that contains an HTML table for updating 5 detail records of a TDataSetAdapter will have 5 sets of hidden fields. Each set provides state information needed by the adapter to determine the relationship between the input fields in the HTTP request and the dataset.

ListHiddenRecordFields may call AddOrigValueHiddenFields (see page 24149) and/or AddRecordKeysHiddenFields (see page 24149) depending on the flags returned by GetHiddenFieldOptions (see page 24159).

See Also

GetHiddenFieldOptions (see page 24159)

TAdapterHiddenFieldsList (see page 23862)

ListHiddenRecordFields

AddOrigValueHiddenFields (see page 24149)

AddRecordKeysHiddenFields (see page 24149)

GetAdapterHiddenRecordFields (see page 24158)

173.1.44.4.75 TCustomAdapter.NextIteration Method

Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. NextIteration calls ImplNextIteration (see page 24169).

See Also

NextIteration (see page 19723)

ImplNextIteration (see page 24169)

173.1.44.4.76 TCustomAdapter.Notification Method

Clears references to deleted components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted.

173.1.44.4.77 TCustomAdapter.NotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

A web module is activated when an HTTP request is received. NotifyActivate calls ImplNotifyActivate (see page 24170).

See Also

ImplNotifyActivate (see page 24170)

NotifyDeactivate (see page 24175)

173.1.44.4.78 TCustomAdapter.NotifyAdapterChange Method

Notifies components that the adapter has changed in some way.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

NotifyAdapterChange calls components that have registered a notification callback to let them know that the adapter has changed. For example, TAdapterFieldGroup needs to know when an adapter field is added to the adapter component that the TAdapterFieldGroup references.

See Also

NotifyList (see page 24183)

173.1.44.4.79 TCustomAdapter.NotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. NotifyDeactivate calls ImplNotifyDeactivate (see page 24170).

See Also

ImplNotifyDeactivate (see page 24170)

NotifyActivate (see page 24174)

173.1.44.4.80 TCustomAdapter.SetActions Method

Initializes the Actions (see page 24181) property.

Pascal

```
procedure SetActions(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 24181) property is the container for adapter action components. SetActions calls ImplSetActions (see page 24170).

See Also

Actions (see page 24181)

ImplSetActions (see page 24170)

173.1.44.4.81 TCustomAdapter.SetData Method

Initializes the Data (see page 24181) property.

Pascal

```
procedure SetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall SetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 24181) property is the container for adapter field components. SetData calls ImplSetData (see page 24171).

See Also

Data (see page 24181)

ImplSetData (see page 24171)

173.1.44.4.82 TCustomAdapter.SetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure SetEchoActionFieldValues(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValues(Boolean AValue);
```

Description

SetEchoActionFieldValues calls ImplSetActionFieldValues.

See Also

EchoActionFieldValues (see page 24182)

ImplSetEchoActionFieldValues (see page 24171)

173.1.44.4.83 TCustomAdapter.StartIterator Method

Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. StartIterator calls ImplStartIterator (see page 24171).

See Also

startiterator (see page 19724)

ImplStartIterator (see page 24171)

173.1.44.4.84 TCustomAdapter.UpdateFieldsExecuteValues Method

Executes the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsExecuteValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsExecuteValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsExecuteValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ExecuteValue function. Adapter fields raise an exception to indicate an error. If an exception occurs, the exception message is added to the Errors (see page 24182) object and execution continues.

When a field is executable, the field value passed in the HTTP request is used to execute a command rather than update a value. For example, an HTML form may contain a table with a delete row checkbox on each row. When the form is submitted, the values in the HTTP request indicate whether to delete one or more rows. Executable adapter fields must implement the IExecuteValue (see page 24575) interface.

See Also

Errors (see page 24182)

IActionRequest (see page 935)

IExecuteValue (see page 24575)

173.1.44.4.85 TCustomAdapter.UpdateFieldsGetAnyChanges Method

Determines whether the values in the HTTP request change any adapter fields.

Pascal

```
function UpdateFieldsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateFieldsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

TAdapterUpdateField (see page 24007)'s CheckValueChange method loops through the adapter fields passed in the AAdapterFields parameter, calling the CheckValueChange function. UpdateFieldsGetAnyChanges will return true if any adapter field returns true when its CheckValueChange method is called.

See Also

Errors (see page 24182)

ValidateValue (see page 24022)

IActionRequest (see page 935)

CheckValueChange (see page 24015)

173.1.44.4.86 TCustomAdapter.UpdateFieldsUpdateValues Method

Updates the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsUpdateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the UpdateValue function. Adapter fields raise an exception to indicate a update error. If an exception occurs, the exception message is added to the Errors (see page 24182) object and updating continues. OnBeforeUpdateFields (see page 24187) and OnAfterUpdateFields (see page 24185) are at the beginning and end of this method.

See Also

OnBeforeUpdateFields (see page 24187)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

UpdateValue (see page 24021)

IActionRequest (see page 935)

173.1.44.4.87 TCustomAdapter.UpdateFieldsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, th exception messages are added to the Errors (see page 24182) object and validation continues. OnBeforeValidateFields (see page 24187) and OnAfterValidateFields (see page 24186) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 24187)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

ValidateValue (see page 24022)

IActionRequest (see page 935)

173.1.44.4.88 TCustomAdapter.UpdateRecords Method

Updates the adapter's fields with the field values passed in an HTTP request.

Pascal

```
function UpdateRecords(AActionRequest: IActionRequest = nil): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecords(IActionRequest AActionRequest = nil);
```

Description

Call UpdateRecords to update the adapter's fields with the field values passed in an HTTP request. Typically, UpdateRecords will be called by an adapter action that submits an HTML form. UpdatesRecords first verifies that the end-user has rights to modify the adapter by calling CheckModifyAccess (see page 24150). CheckModifyAccess (see page 24150) will raise an exception if access is denied. Next, UpdateRecordsGetAnyChanges (see page 24179) is called to determine whether the values in the HTTP request represent changes to the adapter fields. If there are changes then UpdateRecordsValidateValues (see page 24180) is called followed by UpdateRecordsUpdateValues (see page 24180). Exceptions raised during validation or update are added to the adapter's errors object. UpdateRecords returns true if the errors object contains no errors. The AActionRequest parameter is optional.

See Also

IActionRequest (see page 935)

checkmodifyaccess (see page 24150)

UpdateRecordsGetAnyChanges (see page 24179)

UpdateRecordsValidateValues (see page 24180)

UpdateRecordsUpdateValues (see page 24180)

Errors (see page 24182)

173.1.44.4.89 TCustomAdapter.UpdateRecordsGetAnyChanges Method

Determines whether values passed in the HTTP request will change any adapter fields.

Pascal

```
function UpdateRecordsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecordsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsGetAnyChanges iterates all the records in the HTTP request, calling UpdateFieldsGetAnyChanges (see page 24177) for each record.

See Also

UpdateFieldsGetAnyChanges (see page 24177)

173.1.44.4.90 TCustomAdapter.UpdateRecordsUpdateValues Method

Updates adapter fields with values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsUpdateValues iterates all the records in the HTTP request, calling UpdateFieldUpdateValues for each record.

See Also

UpdateFieldsUpdateValues (see page 24178)

173.1.44.4.91 TCustomAdapter.UpdateRecordsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues (see page 24178) loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, the exception message is added to the Errors (see page 24182) object and validation continues. OnBeforeValidateFields (see page 24187) and OnAfterValidateFields (see page 24186) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 24187)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

ValidateValue (see page 24022)

IActionRequest (see page 935)

173.1.44.4.92 TCustomAdapter.WebComponentsChange Method

WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Pascal

```
procedure WebComponentsChange(Sender: TObject);
```

C++

```
__fastcall WebComponentsChange(TObject * Sender);
```

Description

WebComponentsChange will be called, for example, when an adapter field is added to the adapter or when an adapter field is removed from the adapter. WebComponentsChange calls NotifyAdapterChange (see page 24174).

See Also

NotifyAdapterChange (see page 24174)

173.1.44.5 TCustomAdapter Properties

The properties of the TCustomAdapter class are listed here.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Data (see page 24181)	Data is the container for adapter field components.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.

173.1.44.5.1 TCustomAdapter.Actions Property

Actions is the container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterActions (see page 23738)

173.1.44.5.2 TCustomAdapter.Data Property

Data is the container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterFields (see page 23830)

173.1.44.5.3 TCustomAdapter.EchoActionFieldValues Property

Modifies the adapter's echo flag.

Pascal

```
property EchoActionFieldValues: Boolean;
```

C++

```
__property Boolean EchoActionFieldValues;
```

Description

The echo flag is used to alter the value returned by the adapter's fields. When this flag is set, the adapter's fields retrieves their value from the HTTP request. When this flag is clear, the adapter's fields retrieve their current value. Typically, this flag is set after an error occurs while executing an adapter action. Setting this flag results in generated HTML that displays values entered by the end-user. This allows the end-user to make corrections and resubmit the form.

See Also

SetEchoActionFieldValues (see page 24176)

GetEchoActionFieldValues (see page 24159)

173.1.44.5.4 TCustomAdapter.Errors Property

Returns an object used to track errors on behalf of this adapter.

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

Adapter actions typically catch exceptions raised during execution and add the exception messages to the parent adapter's errors object. Server-side script may enumerate the errors recorded by the Errors property in order to write error messages to an HTML page.

See Also

GetAdapterErrorsList (see page 24157)

TBaseAdapterErrorsList (see page 24077)

TAdapterErrorsList (see page 23810)

173.1.44.5.5 TCustomAdapter.ExecuteAccess Property

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property AnsiString ExecuteAccess;
```

Description

This is ExecuteAccess, a member of class TCustomAdapter.

173.1.44.5.6 TCustomAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TCustomAdapter.

173.1.44.5.7 TCustomAdapter.NotifyList Property

Keeps track of components that are to be notified when the adapter is changed.

Pascal

```
property NotifyList: TNotifyList;
```

C++

```
__property TNotifyList NotifyList;
```

Description

Keeps track of components that are to be notified when the adapter is changed.

See Also

NotifyAdapterChange (see page 24174)

TNotifyList (see page 19636)

173.1.44.5.8 TCustomAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

implhasviewaccess (see page 24169)

173.1.44.5.9 TCustomAdapter.VisibleActions Property

Pascal

```
property VisibleActions: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleActions;
```

Description

This is VisibleActions, a member of class TCustomAdapter.

173.1.44.5.10 TCustomAdapter.VisibleFields Property

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

This is VisibleFields, a member of class TCustomAdapter.

173.1.44.6 TCustomAdapter Events

The events of the TCustomAdapter class are listed here.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

173.1.44.6.1 TCustomAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.44.6.2 TCustomAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.44.6.3 TCustomAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnBeforeUpdateFields (see page 24187)

Errors (see page 24182)

173.1.44.6.4 TCustomAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 24178)

OnBeforeValidateFields (see page 24187)

Errors (see page 24182)

173.1.44.6.5 TCustomAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.44.6.6 TCustomAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to

indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.44.6.7 TCustomAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

173.1.44.6.8 TCustomAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 24178)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

173.1.44.6.9 TCustomAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.44.6.10 TCustomAdapter.OnIterateRecords Event

Occurs when the adapter needs to iterate over its data records.

Pascal

```
property OnIterateRecords: TIterateRecordsEvent;
```

C++

```
__property TIterateRecordsEvent OnIterateRecords;
```

Description

Implement this event when the adapter supports multiple data records. This event handler is called when server-side script iterates over the records in adapter, such as when generating an HTML table displaying all records. The event handler must update an iteration pointer or cursor that adapter fields are also aware of. Adapter fields must use this iteration pointer when called to retrieve their value.

See Also

IIteratorSupport (see page 19722)

173.1.45 TCustomAdapterAction Class

TCustomAdapterAction is a base class for adapter actions.

Class Hierarchy

Pascal

```
TCustomAdapterAction = class(TBaseAdapterAction, IWebSetActionName);
```

C++

```
class TCustomAdapterAction : public TBaseAdapterAction, public IWebSetActionName;
```

File

WebAdapt

Description

TCustomAdapterAction calls event handlers to retrieve the adapter action parameters and execute the adapter action. Derive from TCustomAdapterAction to define an adapter action component that can be added to any adapter. Derive from TImplementAdapterAction to define an adapter action component that works with specific adapter component types.

See Also

TBaseAdapterAction (see page 24043)

TAdapter (see page 23713)

TAdapterAction (see page 23726)

TImplementedAdapterAction (see page 24491)

173.1.45.1 TCustomAdapterAction Members

The following tables list the members exposed by TCustomAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.

	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.

	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.

R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.45.2 TCustomAdapterAction Methods

The methods of the TCustomAdapterAction class are listed here.

Protected Methods

	Name	Description
V	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
V	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.

173.1.45.2.1 TCustomAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute (see page 24200) event handler.

See Also

ImplExecuteActionRequest (see page 24063)

OnExecute (see page 24200)

173.1.45.2.2 TCustomAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetActionName();
```

Description

Gets the name used to reference this adapter action with server-side script.

See Also

ActionName (see page 24198)

ImplGetActionName (see page 24063)

173.1.45.2.3 TCustomAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

When this adapter action is executed, it provides name/value pairs which will be written when the HTML page is generated and passed back in the HTTP request. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted. When the HTML page is generated a hyperlink or button is written that identifies the name and parameters of the action. When the hyperlink or button is clicked the name of the action and parameters are passed back to the web application in the HTTP request.

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.45.2.4 TCustomAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; override;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 24074) property.

See Also

RedirectOptions (see page 24074)

173.1.45.2.5 TCustomAdapterAction.ImplSetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure ImplSetActionName(const Value: string);
```

C++

```
__fastcall ImplSetActionName(const AnsiString Value);
```

Description

ImplSetActionName is called by SetActionName (see page 24197). ImplSetActionName stores the name in an instance variable.

See Also

SetActionName (see page 24197)

173.1.45.2.6 TCustomAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled calls the OnGetEnabled (see page 24200) event handler.

See Also

ImplWebEnabled (see page 24069)

OnGetEnabled (see page 24200)

173.1.45.2.7 TCustomAdapterAction.SetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure SetActionName(const Value: string);
```

C++

```
__fastcall SetActionName(const AnsiString Value);
```

Description

SetActionName is typically called at design time to set the action name of a new adapter action. SetActionName calls ImplSetActionName (see page 24197).

See Also

ImplSetActionName (see page 24197)

173.1.45.3 TCustomAdapterAction Properties

The properties of the TCustomAdapterAction class are listed here.

Public Properties

	Name	Description
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.

173.1.45.3.1 TCustomAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

ImplGetActionName (see page 24195)

ImplSetActionName (see page 24197)

173.1.45.4 TCustomAdapterAction Events

The events of the TCustomAdapterAction class are listed here.

Public Events

	Name	Description
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.45.4.1 TCustomAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action

parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.45.4.2 TCustomAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.45.4.3 TCustomAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.45.4.4 TCustomAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.45.4.5 TCustomAdapterAction.OnExecute Event

Called to execute this action using parameters passed in the HTTP request.

Pascal

```
property OnExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnExecute;
```

Description

Implement this event handler to execute this adapter action. Params contains the name/value pairs that were passed in the HTTP request. OnExecute is called by ImplExecuteActionRequest (see page 24195).

See Also

ImplExecuteActionRequest (see page 24195)

OnGetParams (see page 24077)

173.1.45.4.6 TCustomAdapterAction.OnGetEnabled Event

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
property OnGetEnabled: TActionGetEnabledEvent;
```

C++

```
__property TActionGetEnabledEvent OnGetEnabled;
```

Description

ImplWebEnabled (see page 24197) calls the OnGetEnabled event handler. Set the Enabled parameter to false to indicate that

this adapter action should not be enabled.

See Also

ImplWebEnabled (see page 24197)

173.1.46 TCustomAdapterBooleanField Class

tcustomadapterbooleanfield is a base class for adapter fields that provide a single Boolean value.

Class Hierarchy

Pascal

```
TCustomAdapterBooleanField = class(TAdapterUpdateField, IWebValueIsEqual);
```

C++

```
class TCustomAdapterBooleanField : public TAdapterUpdateField, public IWebValueIsEqual;
```

File

WebAdapt

Description

tcustomadapterbooleanfield calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

See Also

TAdapterUpdateField (see page 24007)

TAdapterBooleanField (see page 23758)

TAdapter (see page 23713)

173.1.46.1 TCustomAdapterBooleanField Members

The following tables list the members exposed by TCustomAdapterBooleanField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24208)	Retrieves a Boolean value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24016)	Validates field values entered by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.

	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 24208)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 24208)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 24209)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplIsEqual (see page 24209)	Indicates whether the value of this field is equal to a particular Variant value.

V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 24209)	Called to update the adapter field's value with a value entered by the end-user.
V	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsEqual (see page 24210)	Indicates whether the value of this field is equal to a particular Variant value.
V	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 24210)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24211)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.

	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.46.2 TCustomAdapterBooleanField Methods

The methods of the TCustomAdapterBooleanField class are listed here.

Protected Methods

	Name	Description
V	ConvertValue (see page 24208)	Retrieves a Boolean value entered by the end-user.
V	GetDisplayStyleType (see page 24208)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 24208)	Suggests an HTML input type for this adapter field.

	ImplGetValue (see page 24209)	Returns the value of this adapter field as a variant.
	ImplIsEqual (see page 24209)	Indicates whether the value of this field is equal to a particular Variant value.
	ImplUpdateValue (see page 24209)	Called to update the adapter field's value with a value entered by the end-user.
	IsEqual (see page 24210)	Indicates whether the value of this field is equal to a particular Variant value.

173.1.46.2.1 TCustomAdapterBooleanField.ConvertValue Method

Retrieves a Boolean value entered by the end-user.

Pascal

```
function ConvertValue(AValue: IActionFieldValue): Variant; override;
```

C++

```
virtual __fastcall Variant ConvertValue(IActionFieldValue AValue);
```

Description

ConvertValue overrides TAdapterUpdateField (see page 24007)'s ConvertValue method. Convert value attempts to cast the value entered by the end-user to a Boolean. If the cast fails, false is returned.

See Also

ConvertValue (see page 24015)

173.1.46.2.2 TCustomAdapterBooleanField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 23913)'s GetDisplayStyleType method. GetDispayStyleType returns htmldText, indicating that this adapter field should be displayed by as an HTML text block (paragraph).

See Also

GetDisplayStyleType (see page 23920)

TAdapterDisplayHTMLElementType

173.1.46.2.3 TCustomAdapterBooleanField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliCheckBox indicating that a check box should be used to input this adapter field's value.

See Also

GetInputStyleType (see page 23921)

TAdapterInputHTMLElementType

173.1.46.2.4 TCustomAdapterBooleanField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 23944) property is true, then the value entered by end-user is returned. If the EchoActionFieldValue (see page 23944) property is false then the OnGetValue (see page 24210) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 24210)

173.1.46.2.5 TCustomAdapterBooleanField.ImplIsEqual Method

Indicates whether the value of this field is equal to a particular Variant value.

Pascal

```
function ImplIsEqual(const AValue: Variant): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsEqual(const Variant AValue);
```

Description

ImplIsEqual is called by IsEqual (see page 24210). ImplIsEqual compares the parameter value with the value associated with this adapter field.

See Also

IsEqual (see page 24210)

173.1.46.2.6 TCustomAdapterBooleanField.ImplUpdateValue Method

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If the OnUpdateValue (see page 24211) event handler is not nil (Delphi) or NULL (C++), it is called to update the adapter field's value.

See Also

OnUpdateValue (see page 24211)

173.1.46.2.7 TCustomAdapterBooleanField.IsEqual Method

Indicates whether the value of this field is equal to a particular Variant value.

Pascal

```
function IsEqual(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean IsEqual(const Variant AValue);
```

Description

IsEqual is called when server-side script calls the IsEqual method of this adapter field. Server-side script may use the IsEqual function to determine whether to check an HTML checkbox that displays this adapter field's value. IsEqual returns the result of ImplIsEqual (see page 24209).

See Also

ImplIsEqual (see page 24209)

173.1.46.3 TCustomAdapterBooleanField Events

The events of the TCustomAdapterBooleanField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 24210)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24211)	Called to update the adapter field's value with a value entered by the end-user.

173.1.46.3.1 TCustomAdapterBooleanField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetBooleanEvent;
```

C++

```
__property TAdapterFieldGetBooleanEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 24209) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24209)

173.1.46.3.2 TCustomAdapterBooleanField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldBooleanValueEvent;
```

C++

```
__property TAdapterFieldBooleanValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24209)

173.1.47 TCustomAdapterField Class

TCustomAdapterField is a base class for adapter fields that provide a single value.

Class Hierarchy

Pascal

```
TCustomAdapterField = class(TAdapterUpdateField);
```

C++

```
class TCustomAdapterField : public TAdapterUpdateField;
```

File

WebAdapt

Description

TCustomAdapterField calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

See Also

TAdapterUpdateField (see page 24007)

TAdapterField (see page 23818)

TAdapter (see page 23713)

173.1.47.1 TCustomAdapterField Members

The following tables list the members exposed by TCustomAdapterField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24218)	Validates a single value entered by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 23920)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 23921)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 24017)	Indicates the preferred HTML element to use when editing this adapter field's value.

	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 24219)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24219)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.

V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 24220)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24220)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.47.2 TCustomAdapterField Methods

The methods of the TCustomAdapterField class are listed here.

Protected Methods

	Name	Description
V	DoOnValidateValue (see page 24218)	Validates a single value entered by the end-user.
V	ImplGetValue (see page 24219)	Returns the value of this adapter field as a variant.
V	ImplUpdateValue (see page 24219)	Called to update the adapter field's value with a value entered by the end-user.

173.1.47.2.1 TCustomAdapterField.DoOnValidateValue Method

Validates a single value entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue calls the inherited DoOnValidateValue. If this succeeds by not raising an exception then additional checks are made. One check tests that the request does not contain more than one value for this adapter field. Another check is performed if the Required (see page 23924) property is True. In this case, the request must contain a value for this adapter

field. An exception is raised if any of these checks fail.

See Also

DoOnValidateValue (see page 24016)

Required (see page 23924)

173.1.47.2.2 TCustomAdapterField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue function returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 23944) property is True, then the value entered by end-user should is returned. If the EchoActionFieldValue (see page 23944) property is False then the OnGetValue (see page 24220) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 24220)

CheckViewAccess (see page 23931)

EchoActionFieldValue (see page 23944)

173.1.47.2.3 TCustomAdapterField.ImplUpdateValue Method

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value using the given action request. The AfieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated agains the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If the OnUpdateValue (see page 24220) event handler is not nil, it is called to update the adapter field's value.

See Also

OnUpdateValue (see page 24220)

173.1.47.3 TCustomAdapterField Events

The events of the TCustomAdapterField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 24220)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24220)	Called to update the adapter field's value with a value entered by the end-user.

173.1.47.3.1 TCustomAdapterField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetValueEvent;
```

C++

```
__property TAdapterFieldGetValueEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 24219) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24219)

173.1.47.3.2 TCustomAdapterField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldValueEvent;
```

C++

```
__property TAdapterFieldValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

173.1.48 TCustomAdapterFileField Class

TCustomAdapterFileField is a base class for adapter fields that can have associated files.

Class Hierarchy

Pascal

```
TCustomAdapterFileField = class(TBaseAdapterMultiValueField);
```

C++

```
class TCustomAdapterFileField : public TBaseAdapterMultiValueField;
```

File

WebAdapt

Description

Derive from TCustomAdapterFileField when the adapter field can have zero or more associated files. Typically, file input HTML elements are used to upload files. Multiple file input HTML elements having the same name can be used to upload multiple files in a single request.

See Also

TBaseAdapterMultiValueField (see page 24086)

TAdapterFileField (see page 23837)

TAdapterImageField (see page 23869)

173.1.48.1 TCustomAdapterFileField Members

The following tables list the members exposed by TCustomAdapterFileField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24228)	Validates files uploaded by the end-user.
	EndValueIterator (see page 24093)	Completes iteration.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 24228)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.

	GetFileNames (see page 24229)	Returns the count of files associated with this adapter field.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 24229)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24229)	Returns the number of values associated with this adapter field.
	GetValues (see page 24230)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24230)	Indicates whether the end-user may have uploaded new files for this adapter field.
	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 24096)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.

V	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 24230)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetFileCount (see page 24232)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 24232)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 24233)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 24233)	Validates values entered by the end-user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24092)	Constructor for TBaseAdapterMultiValueField (see page 24086).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24093)	Destructor for TBaseAdapterMultiValueField (see page 24086).
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
R	FileCount (see page 24231)	Returns one of the filenames associated with this adapter field.
R	FileNames (see page 24231)	Returns a file associated with this adapter field.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.48.2 TCustomAdapterFileField Methods

The methods of the TCustomAdapterFileField class are listed here.

Protected Methods

	Name	Description
	DoOnValidateValue (see page 24228)	Validates files uploaded by the end-user.
	GetDisplayStyleType (see page 24228)	Suggests an HTML display type for this adapter field.
	GetFileNames (see page 24229)	Returns the count of files associated with this adapter field.
	GetInputStyleType (see page 24229)	Suggests an HTML input type for this adapter field.
	GetValueCount (see page 24229)	Returns the number of values associated with this adapter field.
	GetValues (see page 24230)	Returns one of the values associated with the adapter field.
	ImplCheckValueChange (see page 24230)	Indicates whether the end-user may have uploaded new files for this adapter field.
	ImplUpdateValue (see page 24230)	Updates the adapter field with value(s) entered by the end-user.

173.1.48.2.1 TCustomAdapterFileField.DoOnValidateValue Method

Validates files uploaded by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 24007)'s DoOnValidateValue method. If the OnValidateFiles (see page 24233) event handler is not nil (Delphi) or NULL (C++), DoOnValidateValue calls it to validate uploaded files. If the Required (see page 23924) property is true, DoOnValidateValues also verifies that 1 of more values have been entered by the end-user. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 24016)

OnValidateValue (see page 24024)

Required (see page 23924)

OnValidateFiles (see page 24233)

173.1.48.2.2 TCustomAdapterFileField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 23913)'s GetDisplayStyleType.

GetDispayStyleTypereturns htmldList, indicating that this adapter field should be displayed by as a list of read-only values.

See Also

GetDisplayStyle (see page 23920)

TAdapterDisplayHTMLElementType

173.1.48.2.3 TCustomAdapterFileField.GetFileNames Method

Returns the count of files associated with this adapter field.

Pascal

```
function GetFileNames(I: Integer): string;
```

C++

```
__fastcall AnsiString GetFileNames(int I);
```

Description

GetFileNames implements the FileNames (see page 24231) property. If the EchoActionFieldValue (see page 23944) flag is true then the filename is extracted from the HTTP request. Otherwise, the OnGetFileNames (see page 24232) event is called. GetFileNames returns and empty string if a value can't be found because OnGetFileNames (see page 24232) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a filename for this adapter field.

See Also

FileNames (see page 24231)

OnGetFileNames (see page 24232)

173.1.48.2.4 TCustomAdapterFileField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliFile indicating that file upload HTML elements should be used to input values for this adapter field.

See Also

GetInputStyleType (see page 23921)

TAdapterInputHTMLElementType

173.1.48.2.5 TCustomAdapterFileField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount implements the FileCount (see page 24231) property. If the EchoActionFieldValue (see page 23944) flag is true then the result is the number of values in the HTTP request for this adapter field. Otherwise, the OnGetFileCount (see page 24232) event is called. GetValueCount returns zero if a value can't be found because OnGetFileCount (see page 24232) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

FileCount (see page 24231)

OnGetFileCount (see page 24232)

173.1.48.2.6 TCustomAdapterFileField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns the result of GetFileNames (see page 24229).

See Also

GetFileNames (see page 24229)

173.1.48.2.7 TCustomAdapterFileField.ImplCheckValueChange Method

Indicates whether the end-user may have uploaded new files for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 24007)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the end-user has uploaded any files.

See Also

IActionRequest (see page 935)

ImplCheckValueChange (see page 24018)

173.1.48.2.8 TCustomAdapterFileField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue overrides TAdapterUpdateField (see page 24007)'s ImplUpdateValue method. After checking that the end-user has rights to modify this adapter field, the OnUploadFiles (see page 24233) event is called.

See Also

IActionRequest (see page 935)

OnUploadFiles (see page 24233)

ImplUpdateValue (see page 24020)

173.1.48.3 TCustomAdapterFileField Properties

The properties of the TCustomAdapterFileField class are listed here.

Public Properties

	Name	Description
R	FileCount (see page 24231)	Returns one of the filenames associated with this adapter field.
R	FileNames (see page 24231)	Returns a file associated with this adapter field.

173.1.48.3.1 TCustomAdapterFileField.FileCount Property

Returns one of the filenames associated with this adapter field.

Pascal

```
property FileCount: Integer;
```

C++

```
__property int FileCount;
```

Description

```
__property int FileCount = {read=GetValueCount, nodefault};
```

FileCount can be used with the FileNames (see page 24231) property to access all the filenames associated with this adapter field. FileCount is implemented by GetValueCount (see page 24229).

See Also

FileNames (see page 24231)

GetValueCount (see page 24229)

173.1.48.3.2 TCustomAdapterFileField.FileNames Property

Returns a file associated with this adapter field.

Pascal

```
property FileNames [I: Integer]: string;
```

C++

```
__property AnsiString FileNames[int I];
```

Description

FileNames can be used with the FileCount (see page 24231) property to access all the filenames associated with this adapter field. FileNames is implemented by GetFileNames (see page 24229).

See Also

FileCount (see page 24231)

GetFileNames (see page 24229)

173.1.48.4 TCustomAdapterFileField Events

The events of the TCustomAdapterFileField class are listed here.

Public Events

	Name	Description
	OnGetFileCount (see page 24232)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 24232)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 24233)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 24233)	Validates values entered by the end-user.

173.1.48.4.1 TCustomAdapterFileField.OnGetFileCount Event

Returns the number of values associated with this adapter field.

Pascal

```
property OnGetFileCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetFileCount;
```

Description

Write an OnGetFileCount event handler to indicate the number of filenames associated with this adapter field.

See Also

GetValueCount (see page 24229)

173.1.48.4.2 TCustomAdapterFileField.OnGetFileNames Event

Returns one of the filenames associated with the adapter field.

Pascal

```
property OnGetFileNames: TAdapterFieldGetMultiValueStringEvent;
```

C++

```
__property TAdapterFieldGetMultiValueStringEvent OnGetFileNames;
```

Description

Write an OnGetFileNames event handler to provide the names of files associated with this adapter field.

See Also

GetFileNames (see page 24229)

173.1.48.4.3 TCustomAdapterFileField.OnUploadFiles Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUploadFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnUploadFiles;
```

Description

OnUploadFiles is called by ImplUpdateValue (see page 24230). Write an OnUploadFiles event handler to accept files uploaded by the end-user. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 24230)

TUpdateFileList (see page 24550)

173.1.48.4.4 TCustomAdapterFileField.OnValidateFiles Event

Validates values entered by the end-user.

Pascal

```
property OnValidateFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnValidateFiles;
```

Description

OnValidateFiles is called by DoOnValidateValue (see page 24228). Implement this event handler to validate files uploaded by the end-user. Raise an exception to indicate a validation error.

See Also

DoOnValidateValue (see page 24228)

TUpdateFileList (see page 24550)

173.1.49 TCustomAdapterGotoPageAction Class

TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 24403).

Class Hierarchy

Pascal

```
TCustomAdapterGotoPageAction = class(TCustomPagedAdapterAction);
```

C++

```
class TCustomAdapterGotoPageAction : public TCustomPagedAdapterAction;
```

File

WebAdapt

Description

TCustomAdapterGotoPageAction is an adapter action that has a list of commands. Each command has a parameter that identifies a page in the parent adapter. When executed, TCustomAdapterGotoPageAction examines the parameter and changes the current page in the parent adapter.

See Also

TCustomPagedAdapterAction (see page 24371)

TAdapterGotoPageAction (see page 23849)

173.1.49.1 TCustomAdapterGotoPageAction Members

The following tables list the members exposed by TCustomAdapterGotoPageAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24240)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24241)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24241)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.

	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24241)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24242)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24242)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24243)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24243)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24243)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetPageName (see page 24244)	Provides the display labels for each goto page command.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.

	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.49.2 TCustomAdapterGotoPageAction Methods

The methods of the TCustomAdapterGotoPageAction class are listed here.

Protected Methods

	Name	Description
V	GetDefaultActionName (see page 24240)	Gets the name used to reference this adapter action with server-side script.
V	GetDisplayStyleType (see page 24241)	Suggests an HTML display type for this adapter action.
V	GetItemCount (see page 24241)	Returns the number of commands defined by this adapter action.
V	ImplExecuteActionRequest (see page 24241)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetAdapterItemRequestParams (see page 24242)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 24242)	Returns the suggested display label for this adapter action.
V	ImplGetIsAdapterActionList (see page 24243)	Indicates whether this adapter action may have multiple commands.
V	ImplIsDefaultAction (see page 24243)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	ImplWebEnabled (see page 24243)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.49.2.1 TCustomAdapterGotoPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns 'GotoPage'.

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.49.2.2 TCustomAdapterGotoPageAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaAnchor, indicating that goto page commands should be displayed using a hyperlink.

See Also

GetDisplayStyle (see page 24056)

173.1.49.2.3 TCustomAdapterGotoPageAction.GetItemCount Method

Returns the number of commands defined by this adapter action.

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

TCustomAdapterGotoPageAction (see page 24233) returns the value of the parent adapter's PageCount property.

See Also

ItemCount (see page 24074)

ItemIndex (see page 24074)

GetIsAdapterActionList (see page 24058)

PageCount (see page 24418)

173.1.49.2.4 TCustomAdapterGotoPageAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest sets the parent adapter's current page using the page index passed in the AActionRequest

parameter.

See Also

ImplExecuteActionRequest (see page 24063)

173.1.49.2.5 TCustomAdapterGotoPageAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 24055). ImplGetAdapterItemRequestParams adds the value of the iteration index as a parameter. Then the inherited ImplGetAdapterItemRequestParams method is called so that any event handlers that may be defined will be called.

See Also

GetAdapterItemRequestParams (see page 24055)

OnGetActionParams (see page 24187)

OnGetParams (see page 24077)

ItemIndex (see page 24074)

173.1.49.2.6 TCustomAdapterGotoPageAction.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the display label suggested for the goto page command that is identified by the iteration index. If the OnGetPageName (see page 24244) event handler is not nil (Delphi) or NULL (C++), it is called. Otherwise, the ItemIndex (see page 24074) property is converted to a string and returned.

See Also

DisplayLabel (see page 24073)

ItemIndex (see page 24074)

OnGetPageName (see page 24244)

173.1.49.2.7 TCustomAdapterGotoPageAction.ImplGetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function ImplGetIsAdapterActionList: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetIsAdapterActionList();
```

Description

ImplGetIsAdapterActionList is called by GetIsAdapterActionList (see page 24058). ImplGetIsAdapterActionList returns true if the parent adapters PageSize property is greater than zero.

See Also

GetIsAdapterActionList (see page 24058)

PageSize (see page 24419)

173.1.49.2.8 TCustomAdapterGotoPageAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 24070). ImplIsDefaultAction returns true if the display characteristics identified by ADisplay indicate that the goto page commands are appropriate.

See Also

IsDefaultAction (see page 24070)

173.1.49.2.9 TCustomAdapterGotoPageAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of false if the iteration index is equal to the parent adapter's current page. In other words, the command that goes to the parent adapter's current page will be disabled. Commands to goto all other pages will be enabled.

See Also

WebEnabled (see page 24071)

CurrentPage (see page 24418)

ItemIndex (see page 24074)

173.1.49.3 TCustomAdapterGotoPageAction Events

The events of the TCustomAdapterGotoPageAction class are listed here.

Public Events

	Name	Description
	OnGetPageName (see page 24244)	Provides the display labels for each goto page command.

173.1.49.3.1 TCustomAdapterGotoPageAction.OnGetPageName Event

Provides the display labels for each goto page command.

Pascal

```
property OnGetPageName: TWebFormGetPageNameEvent;
```

C++

```
__property TWebFormGetPageNameEvent OnGetPageName;
```

Description

Implement this event handler to specify display labels for the commands that goto pages in the parent adapter. APageIndex is the zero-based index of the page to goto.

See Also

ImplGetDisplayLabel (see page 24242)

173.1.50 TCustomAdapterImageField Class

TCustomAdapterImageField is a base class for adapter fields that have an associated image file.

Class Hierarchy

Pascal

```
TCustomAdapterImageField = class(TAdapterUpdateField, IGetAdapterImage,
IGetAdapterItemRequestParams, IAdapterRequestHandler, IWebImageHREF);
```

C++

```
class TCustomAdapterImageField : public TAdapterUpdateField, public IGetAdapterImage, public
IGetAdapterItemRequestParams, public IAdapterRequestHandler, public IWebImageHREF;
```

File

WebAdapt

Description

Derived from TCustomAdapterImageField when the adapter field can an associated image file. Typically, a file input HTML element is used to upload an image file. HTML IMG elements are used to display the image.

See Also

TAdapterImageField (see page 23869)

TAdapterFileField (see page 23837)

173.1.50.1 TCustomAdapterImageField Members

The following tables list the members exposed by TCustomAdapterImageField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
	CreateRequestContext (see page 24252)	Creates AdapterRequest and AdapterResponse objects.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24253)	Validates files uploaded by the end-user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 24253)	Provides an object that can be used to access the image properties of this adapter field.
	GetAdapterItemRequestParams (see page 24253)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.

	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 24254)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 24254)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
V	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
V	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HandleRequest (see page 24255)	Handles a request for the image file associated with this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 24255)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 24255)	Creates AdapterRequest and AdapterResponse objects.
V	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 24256)	Returns the name of the image file associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHandleRequest (see page 24256)	Handles a request for the image file associated with this adapter field.

	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24257)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	ImplWebImageHREF (see page 24257)	Returns a URL that can be used to access the image file associated with this adapter field.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RenderAdapterImage (see page 24258)	Responds to a request for an image file by providing a stream containing the image.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
	WebImageHREF (see page 24258)	Returns a URL that can be used to access the image file associated with this adapter field.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetHREF (see page 24260)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 24260)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 24260)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 24261)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 24261)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 24261)	Used to validate files uploaded by the end user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	HREF (see page 24259)	Defines a URL that references the image associated with the adapter field.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 24259)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.50.2 TCustomAdapterImageField Methods

The methods of the TCustomAdapterImageField class are listed here.

Protected Methods

	Name	Description
	CreateRequestContext (see page 24252)	Creates AdapterRequest and AdapterResponse objects.
V	DoOnValidateValue (see page 24253)	Validates files uploaded by the end-user.
	GetAdapterImage (see page 24253)	Provides an object that can be used to access the image properties of this adapter field.
	GetAdapterItemRequestParams (see page 24253)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
V	GetDisplayStyleType (see page 24254)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 24254)	Suggests an HTML input type for this adapter field.
	HandleRequest (see page 24255)	Handles a request for the image file associated with this adapter field.
V	ImplCheckValueChange (see page 24255)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 24255)	Creates AdapterRequest and AdapterResponse objects.
V	ImplGetValue (see page 24256)	Returns the name of the image file associated with this adapter field.
V	ImplHandleRequest (see page 24256)	Handles a request for the image file associated with this adapter field.
V	ImplUpdateValue (see page 24257)	Updates the adapter field with value entered by the end-user.
V	ImplWebImageHREF (see page 24257)	Returns a URL that can be used to access the image file associated with this adapter field.
V	RenderAdapterImage (see page 24258)	Responds to a request for an image file by providing a stream containing the image.
	WebImageHREF (see page 24258)	Returns a URL that can be used to access the image file associated with this adapter field.

173.1.50.2.1 TCustomAdapterImageField.CreateRequestContext Method

Creates AdapterRequest and AdapterResponse objects.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext implements IAdapterRequestHandler's CreateRequestContext method. CreateRequestContext calls ImplCreateRequestContext (see page 24255).

See Also

IAdapterDispatchParams (see page 19655)

IAdapterRequestHandler (see page 19680)

AdapterRequest (see page 24655)

AdapterResponse (see page 24656)

ImplCreateRequestContext (see page 24255)

173.1.50.2.2 TCustomAdapterImageField.DoOnValidateValue Method

Validates files uploaded by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 24007)'s DoOnValidateValue method. If the OnValidateFile (see page 24261) event handler is not nil (Delphi) or NULL (C++), DoOnValidateValue calls it to validate an uploaded file. DoOnValidateValues also validates that not more than one image file was uploaded and, if the required property is true, that a single file was uploaded. An exception is raised to indicate a validation error.

See Also

DoOnValidateValue (see page 24016)

OnValidateValue (see page 24024)

Required (see page 23924)

OnValidateFile (see page 24261)

173.1.50.2.3 TCustomAdapterImageField.GetAdapterImage Method

Provides an object that can be used to access the image properties of this adapter field.

Pascal

```
function GetAdapterImage: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterImage();
```

Description

GetAdapterImage returns Self. GetAdapterImage will be called when server-side script references the Image property of this adapter field.

173.1.50.2.4 TCustomAdapterImageField.GetAdapterItemRequestParams Method

Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(AnsiString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

WebImageHREF (see page 24258) and GetAdapterItemRequestParams are used to identify the URL that is used to retrieve the image file associated with this adapter field. These functions are called when server-side script uses the Image.AsHREF property. If WebImageHREF (see page 24258) returns False then GetAdapterItemRequestParams is called. WebImageHREF (see page 24258) is responsible for returning a reference to an external object. GetAdapterItemRequestParams is used to generate a URL that will result in a request to the adapter field to dynamically generate the image file. GetAdapterItemRequestParams calls OnGetParams (see page 24261) to get the name/value pairs.

See Also

IAdapterItemRequestParams (see page 19673)

RenderAdapterImage (see page 24258)

OnGetParams (see page 24261)

WebImageHREF (see page 24258)

TAdapterDispatcher (see page 24840)

173.1.50.2.5 TCustomAdapterImageField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 23913)'s GetDisplayStyleType method. GetDispayStyleType returns htmldImage, indicating that this adapter field should be displayed by an HTML image element.

See Also

GetDisplayStyleType (see page 23920)

173.1.50.2.6 TCustomAdapterImageField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliFile indicating that a file upload HTML element should be used to input a value for this adapter field.

See Also

GetInputStyleType (see page 23921)

173.1.50.2.7 TCustomAdapterImageField.HandleRequest Method

Handles a request for the image file associated with this adapter field.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

HandleRequest implements IAdapterRequestHandler's HandleRequest method. HandleRequest calls ImplHandleRequest (see page 24256).

See Also

IAdapterDispatchParams (see page 19655)

ImplHandleRequest (see page 24256)

IAdapterRequestHandler (see page 19680)

173.1.50.2.8 TCustomAdapterImageField.ImplCheckValueChange Method

Indicates whether the end-user may have uploaded a new image file for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 24007)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the end-user has uploaded an image file.

See Also

IActionRequest (see page 935)

ImplCheckValueChange (see page 24018)

173.1.50.2.9 TCustomAdapterImageField.ImplCreateRequestContext Method

Creates AdapterRequest and AdapterResponse objects.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

ImplCreateRequestContext creates a new request and response objects based on the specified parameters and stores it with the global Web context. The adapter dispatcher calls this function before calling HandleRequest (see page 24255). The

WebSnap can access the resulting request and response context by reading the AdapterRequest and AdapterResponse properties of the Web context, which is available through the global WebContext function.

DispatchParams is an interface that contains the parameters that were included in the incoming request. These parameters can then be used to identify an image for this field's value.

See Also

CreateRequestContext (see page 24252)

AdapterRequest (see page 24655)

AdapterResponse (see page 24656)

IAdapterDispatchParams (see page 19655)

WebContext (see page 24687)

173.1.50.2.10 TCustomAdapterImageField.ImplGetValue Method

Returns the name of the image file associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the name of the image file associated with this adapter field

First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 23944) property is true, then the file name entered by end-user is returned. If the EchoActionFieldValue (see page 23944) property is false then the OnGetImageName (see page 24260) event handler is called to retrieve the name of the image file. The value returned by ImplGetValue is used when server-side script references the Value (see page 24022) or DisplayText properties.

See Also

OnGetImageName (see page 24260)

EchoActionFieldValue (see page 23944)

173.1.50.2.11 TCustomAdapterImageField.ImplHandleRequest Method

Handles a request for the image file associated with this adapter field.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

ImplHandleRequest is called by HandleRequest (see page 24255). ImplHandleRequest extracts IImageRequest and IImageResponse from the AdapterRequest and AdapterResponse. ImplHandleRequest returns the result of RenderAdapterImage (see page 24258).

See Also

IAdapterDispatchParams (see page 19655)

ImplHandleRequest

AdapterRequest (see page 24655)

AdapterResponse (see page 24656)

RenderAdapterImage (see page 24258)

IImageRequest (see page 965)

IImageRequest (see page 965)

173.1.50.2.12 TCustomAdapterImageField.ImplUpdateValue Method

Updates the adapter field with value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If action request single file for this adapter field, the OnUploadFile (see page 24261) event handler is called.

See Also

OnUploadFile (see page 24261)

ImplUpdateValue (see page 24020)

173.1.50.2.13 TCustomAdapterImageField.ImplWebImageHREF Method

Returns a URL that can be used to access the image file associated with this adapter field.

Pascal

```
function ImplWebImageHREF(var AHREF: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebImageHREF(AnsiString AHREF);
```

Description

ImplWebImageHREF is called by WebImageHREF (see page 24258). If the OnGetHREF (see page 24260) event handler is not nil (Delphi) or NULL (C++), ImplWebImageHREF will call it passing the value of the HREF (see page 24259) property.

See Also

WebImageHREF (see page 24258)

HREF (see page 24259)

OnGetHREF (see page 24260)

173.1.50.2.14 TCustomAdapterImageField.RenderAdapterImage Method

Responds to a request for an image file by providing a stream containing the image.

Pascal

```
procedure RenderAdapterImage(ARequest: IImageRequest; AResponse: IImageResponse); virtual;
```

C++

```
virtual __fastcall RenderAdapterImage(IImageRequest ARequest, IImageResponse AResponse);
```

Description

RenderAdapterImage is called when the TAdapterDispatcher detects a request for an image from this adapter field. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the OnGetImage (see page 24260) event handler is not nil (Delphi) or NULL (C++), it is called to retrieve the image file as a stream.

See Also

OnGetImage (see page 24260)

TAdapterDispatcher (see page 24840)

ImplHandleRequest (see page 24256)

173.1.50.2.15 TCustomAdapterImageField.WebImageHREF Method

Returns a URL that can be used to access the image file associated with this adapter field.

Pascal

```
function WebImageHREF(var AHREF: string): Boolean;
```

C++

```
__fastcall Boolean WebImageHREF(AnsiString AHREF);
```

Description

WebImageHREF and GetAdapterItemRequestParams (see page 24253) are used to identify the URL that is used to retrieve an image file associated with this adapter field. These functions are called when server-side script uses the Image.AsHREF property. WebImageHREF returns the result of ImplWebImageHREF (see page 24257).

See Also

ImplWebImageHREF (see page 24257)

GetAdapterItemRequestParams (see page 24253)

173.1.50.3 TCustomAdapterImageField Properties

The properties of the TCustomAdapterImageField class are listed here.

Public Properties

	Name	Description
	HREF (see page 24259)	Defines a URL that references the image associated with the adapter field.
	ReadOnly (see page 24259)	Indicates whether this adapter field is read-only.

173.1.50.3.1 TCustomAdapterImageField.HREF Property

Defines a URL that references the image associated with the adapter field.

Pascal

```
property HREF: string;
```

C++

```
__property AnsiString HREF;
```

Description

Use the HREF property when this adapter field is associated with an external image file URL. Use the OnGetHREF (see page 24260) event to dynamically define an external image file URL. If the image file will be dynamically generated, use the OnGetImage (see page 24260) and OnGetImageParams event handlers instead of the HREF property or the OnGetHREF (see page 24260) event handler.

See Also

ImplWebImageHREF (see page 24257)

OnGetHREF (see page 24260)

OnGetImage (see page 24260)

OnGetImageName (see page 24260)

173.1.50.3.2 TCustomAdapterImageField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 23921)

173.1.50.4 TCustomAdapterImageField Events

The events of the TCustomAdapterImageField class are listed here.

Public Events

	Name	Description
	OnGetHREF (see page 24260)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 24260)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 24260)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 24261)	Provides name/value pairs that identify this adapter field's image.

	OnUploadFile (see page 24261)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 24261)	Used to validate files uploaded by the end user.

173.1.50.4.1 TCustomAdapterImageField.OnGetHREF Event

Provides the URL of an external image file associated with this adapter field.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Implement OnGetHREF to dynamically identify the URL of an external image file associated with this adapter field. When OnGetHREF is called, the HREF (see page 24259) parameter will contain the value of the HREF (see page 24259) property. To dynamically generate an image file for this adapter file, implement the OnGetImage (see page 24260) event handler instead.

See Also

ImplWebImageHREF (see page 24257)

HREF (see page 24259)

OnGetImage (see page 24260)

173.1.50.4.2 TCustomAdapterImageField.OnGetImage Event

Retrieves a stream containing the image file associated with this adapter field.

Pascal

```
property OnGetImage: TImageFieldGetImageEvent;
```

C++

```
__property TImageFieldGetImageEvent OnGetImage;
```

Description

Implement OnGetImage to dynamically generate an image file associated with this adapter field. Don't implement OnGetImage if the image file is external. Instead implement OnGetHREF (see page 24260) event handler or use the HREF (see page 24259) property to specify the URL of an external image.

See Also

RenderAdapterImage (see page 24258)

OnGetParams (see page 24261)

OnGetHREF (see page 24260)

HREF (see page 24259)

173.1.50.4.3 TCustomAdapterImageField.OnGetImageName Event

Returns the name of the image file associated with this adapter field.

Pascal

```
property OnGetImageName: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetImageName;
```

Description

Implement this event handler to identify the name of the image file associated with this adapter field.

See Also

ImplGetValue (see page 24256)

173.1.50.4.4 TCustomAdapterImageField.OnGetParams Event

Provides name/value pairs that identify this adapter field's image.

Pascal

```
property OnGetParams: TImageFieldGetParamsEvent;
```

C++

```
__property TImageFieldGetParamsEvent OnGetParams;
```

Description

Implement this event handler to provide name/value pairs that are needed to identify this adapter field's image file. OnGetParams is called while generating an HTML page with a URL reference to this adapter field's image. The parameters returned by OnGetParams will be passed to OnGetImage (see page 24260) when the image file is requested.

See Also

GetAdapterItemRequestParams (see page 24253)

OnGetImage (see page 24260)

173.1.50.4.5 TCustomAdapterImageField.OnUploadFile Event

Updates this adapter field with an image file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

This event handler is called by ImplUpdateValue (see page 24257). This event handler should store the uploaded image file. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 24257)

TAbstractWebRequestFile (see page 15073)

173.1.50.4.6 TCustomAdapterImageField.OnValidateFile Event

Used to validate files uploaded by the end user.

Pascal

```
property OnValidateFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnValidateFile;
```

Description

Validates the file uploaded by the end-user. Raise an exception to indicate an error. For example, it raises an exception if the Mime type of the file is not supported.

See Also

DoOnValidateValue (see page 24253)

TAbstractWebRequestFile (see page 15073)

173.1.51 TCustomAdapterMemoField Class

TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.

Class Hierarchy

Pascal

```
TCustomAdapterMemoField = class(TAdapterUpdateField);
```

C++

```
class TCustomAdapterMemoField : public TAdapterUpdateField;
```

File

WebAdapt

Description

Derive from TCustomAdapterMemoField when the adapter field has a multi-line text value. Typically, a text area HTML element is used to edit the value of this adapter field.

See Also

TAdapterUpdateField (see page 24007)

TAdapterMemoField (see page 23889)

173.1.51.1 TCustomAdapterMemoField Members

The following tables list the members exposed by TCustomAdapterMemoField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24269)	Validates a value entered by the end user.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 24270)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 24270)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24017)	Provides the number of values associated with this adapter field.
	GetValues (see page 24017)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24270)	Indicates whether the end-user may have entered a new value for this adapter field.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 24271)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 24271)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 23941)	Handles movement of the component to a different parent.

V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 24272)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24272)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 24273)	Called to update the adapter field's value with a file uploaded by the end-user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.

	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.51.2 TCustomAdapterMemoField Methods

The methods of the TCustomAdapterMemoField class are listed here.

Protected Methods

	Name	Description
V	DoOnValidateValue (see page 24269)	Validates a value entered by the end user.
V	GetDisplayStyleType (see page 24270)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 24270)	Suggests an HTML input type for this adapter field.
V	ImplCheckValueChange (see page 24270)	Indicates whether the end-user may have entered a new value for this adapter field.
V	ImplGetValue (see page 24271)	Returns the value of this adapter field as a variant.
V	ImplUpdateValue (see page 24271)	Updates the adapter field with value entered by the end-user.

173.1.51.2.1 TCustomAdapterMemoField.DoOnValidateValue Method

Validates a value entered by the end user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 24007)'s DoOnValidateValue method. After calling TAdapterUpdateField (see page 24007)'s DoOnValidateValue, DoOnValidate checks that only a single text file or file has been uploaded for this field. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 24016)

Required (see page 23924)

IActionFieldValue (see page 920)

OnValidateFiles (see page 24233)

173.1.51.2.2 TCustomAdapterMemoField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 23913)'s GetDisplayStyleType method. GetDispayStyleType returns htmldText, indicating that this adapter field should be displayed by as an HTML text block.

See Also

GetDisplayStyleType (see page 23920)

TAdapterDisplayHTMLElementType

173.1.51.2.3 TCustomAdapterMemoField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetDispayStyleTypereturns htmliTextArea, indicating that this adapter field's value should be input with an HTML multiline input field.

See Also

GetInputStyleType (see page 23921)

TAdapterInputHTMLElementType

173.1.51.2.4 TCustomAdapterMemoField.ImplCheckValueChange Method

Indicates whether the end-user may have entered a new value for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 24007)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the HTTP request has a new value for this adapter field.

See Also

ImplCheckValueChange (see page 24018)

173.1.51.2.5 TCustomAdapterMemoField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue function returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 23944) property is true, then the value entered by end-user should is returned. If the EchoActionFieldValue (see page 23944) property is false then the OnGetValue (see page 24272) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 24272)

EchoActionFieldValue (see page 23944)

173.1.51.2.6 TCustomAdapterMemoField.ImplUpdateValue Method

Updates the adapter field with value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If action request contains a string value for this adapter field, the OnUpdateValue (see page 24272) event handler is called. If the action request contains an uploaded file for this adapter field, the OnUploadFile (see page 24273) event handler is called.

See Also

OnUpdateValue (see page 24272)

OnUploadFile (see page 24273)

ImplUpdateValue (see page 24020)

173.1.51.3 TCustomAdapterMemoField Events

The events of the TCustomAdapterMemoField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 24272)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 24272)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 24273)	Called to update the adapter field's value with a file uploaded by the end-user.

173.1.51.3.1 TCustomAdapterMemoField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 24271) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 24271)

173.1.51.3.2 TCustomAdapterMemoField.OnUpdateValue Event

Called to update the adapter field's value with a text value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldStringEvent;
```

C++

```
__property TAdapterFieldStringEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24271)

173.1.51.3.3 TCustomAdapterMemoField.OnUploadFile Event

Called to update the adapter field's value with a file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

OnUploadFile is called when an action request contains an uploaded file for this adapter field. If this event handler is not implemented, the file uploaded by the end-user will be ignored.

See Also

ImplUpdateValue (see page 24271)

173.1.52 TCustomAdapterMultiValueField Class

TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.

Class Hierarchy

Pascal

```
TCustomAdapterMultiValueField = class(TBaseAdapterMultiValueField);
```

C++

```
class TCustomAdapterMultiValueField : public TBaseAdapterMultiValueField;
```

File

WebAdapt

Description

Derive from TCustomAdapterMultiValueField when the adapter field can have multiple values. Typically, multi-value fields are represented in HTML with multiple selection select lists or check boxes.

See Also

TBaseAdapterMultiValueField (see page 24086)

TAdapterMultiValueField (see page 23900)

173.1.52.1 TCustomAdapterMultiValueField Members

The following tables list the members exposed by TCustomAdapterMultiValueField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 24015)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 24015)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 24015)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 24016)	Retrieves a value entered by the end-user.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnValidateValue (see page 24281)	Validates values entered by the end-user.
	EndValueIterator (see page 24093)	Completes iteration.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 24016)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 24094)	Implements IWebGetFieldValues' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 23932)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 23920)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 24281)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 24094)	Returns the adapter object that implements the Values property.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 23920)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 24282)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetValueCount (see page 24282)	Returns the number of values associated with this adapter field.
	GetValues (see page 24282)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 23921)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 23921)	Suggests a view mode for this adapter field.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 24095)	Implements IWebGetFieldValues' HasValue method.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 24018)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 24018)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetCurrentValue (see page 24095)	Implements IWebGetFieldValues' GetCurrentValue (see page 24094) method.
	ImplGetDisplayLabel (see page 23922)	Implements interface access to the DisplayLabel (see page 23923) property.
	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 24018)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 23922)	Implements interface access to the DisplayWidth (see page 23924) property.
	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 24019)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 24019)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 24096)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 23922)	Implements interface access to the Required (see page 23924) property.
	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 23939)	Gets the value of this adapter field as a Variant.
	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 24019)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 24283)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 24020)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.

V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplSetFieldName (see page 24020)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 24283)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 24020)	Validates values(s) entered by the end-user.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	IsMultiValueField (see page 24021)	Indicates whether this adapter field can support multiple values.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextValueIteration (see page 24096)	Implements IWebGetFieldValues' NextValueIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24021)	Clears references to a deleted component.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 23923)	SetDisplayLabel sets the value of the DisplayLabel (see page 23923) property.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartValueIterator (see page 24097)	Implements IWebGetFieldValues' StartValueIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	UpdateValue (see page 24021)	Updates the adapter field with value(s) entered by the end-user.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateValue (see page 24022)	Validates values(s) entered by the end-user.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 24023)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValueCount (see page 24285)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 24285)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 24285)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 24286)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValue (see page 24024)	Event handler called to validate value(s) entered by the end-user.
	OnValidateValues (see page 24286)	Validates field values entered by the end-user.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 23919)	Creates an instance of TAdapterNamedDisplayField (see page 23913).
V	Create (see page 24014)	Creates an instance of TAdapterUpdateField (see page 24007).
V	Create (see page 24092)	Constructor for TBaseAdapterMultiValueField (see page 24086).
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24093)	Destructor for TBaseAdapterMultiValueField (see page 24086).
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndValueIterator (see page 19761)	Indicate the iteration is finished.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetAdapterValuesList (see page 19695)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetCurrentValue (see page 19761)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 19698)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 19761)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextValueIteration (see page 19762)	Position the iteration pointer on the next value.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.

	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartValueIterator (see page 19762)	Reset the iteration pointer to the first item.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 23923)	Suggests a display label for this adapter field.
	DisplayWidth (see page 23924)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ReadOnly (see page 23924)	Indicates whether this adapter field is read-only.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 23924)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	Value (see page 24022)	Retrieves the value associated with this adapter field.
R	ValueCount (see page 24284)	Returns the number of values associated with this adapter field.
R	Values (see page 24284)	Returns one of the values associated with the adapter field.
	ValuesList (see page 24023)	Associates a list of values with the adapter field.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.52.2 TCustomAdapterMultiValueField Methods

The methods of the TCustomAdapterMultiValueField class are listed here.

Protected Methods

	Name	Description
	DoOnValidateValue (see page 24281)	Validates values entered by the end-user.
	GetDisplayStyleType (see page 24281)	Suggests an HTML display type for this adapter field.
	GetInputStyleType (see page 24282)	Suggests an HTML input type for this adapter field.
	GetValueCount (see page 24282)	Returns the number of values associated with this adapter field.
	GetValues (see page 24282)	Returns one of the values associated with the adapter field.
	ImplHasValue (see page 24283)	Implements IWebGetFieldValues' HasValue (see page 24095) method.
	ImplUpdateValue (see page 24283)	Updates the adapter field with value(s) entered by the end-user.

173.1.52.2.1 TCustomAdapterMultiValueField.DoOnValidateValue Method

Validates values entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 24007)'s DoOnValidateValue method. If the OnValidateValues (see page 24286) event handler is not nil (Delphi) or NULL (C++), it is called it to validate values. If the Required (see page 23924) property is true, DoOnValidateValues also validates that 1 of more values have been entered by the end user. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 24016)

Required (see page 23924)

OnValidateValues (see page 24286)

173.1.52.2.2 TCustomAdapterMultiValueField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns the display type for an adapter field. Here, it returns htmldList to indicate a list.

See Also

GetDisplayStyleType (see page 23920)

173.1.52.2.3 TCustomAdapterMultiValueField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const AnsiString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. If the ValuesList (see page 24023) property is not nil (Delphi) or NULL (C++), GetInputStyleType returns htmliCheckBox indicating that this adapter field should be edited using a group of check boxes. If the ValuesList (see page 24023) property is nil (Delphi) or NULL (C++), then htmliTextInput is returned. htmliTextInput indicates that the adapter field value should be edited with a single line input.

See Also

GetInputStyleType (see page 23921)

ValuesList (see page 24023)

173.1.52.2.4 TCustomAdapterMultiValueField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount implements the ValueCount (see page 24284) property. If the EchoActionFieldValue (see page 23944) flag is true then the result is extracted from the HTTP request. Otherwise, the OnGetValueCount (see page 24285) event is called. GetValueCount returns zero if a value can't be found because OnGetValueCount (see page 24285) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

ValueCount (see page 24284)

Values (see page 24284)

EchoActionFieldValue (see page 23944)

173.1.52.2.5 TCustomAdapterMultiValueField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues implements the Values (see page 24284) property. If the EchoActionFieldValue (see page 23944) flag is true then the result is extracted from the HTTP request. Otherwise, the OnGetValues (see page 24285) event is called. GetValues returns Unassigned if a value can't be found because OnGetValues (see page 24285) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

Values (see page 24284)

OnGetValues (see page 24285)

EchoActionFieldValue (see page 23944)

EchoActionFieldValue (see page 23944)

173.1.52.2.6 TCustomAdapterMultiValueField.ImplHasValue Method

Implements IWebGetFieldValues' HasValue (see page 24095) method.

Pascal

```
function ImplHasValue(const Value: Variant): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHasValue(const Variant Value);
```

Description

ImplHasValue overrides TBaseAdapterMultiValueField (see page 24086)'s ImplHasValue method. If the OnHasValue (see page 24285) event is not nil (Delphi) or NULL (C++), it will be called for the result of ImplHasValue. Otherwise, ImplHasValue will loop through the values of the adapter field, looking for a matching value.

See Also

ImplHasValue (see page 24096)

HasValue (see page 19761)

173.1.52.2.7 TCustomAdapterMultiValueField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue overrides TAdapterUpdateField (see page 24007)'s ImplUpdateValue method. After checking that the end-user has rights to modify this adapter field, the OnUpdateValues (see page 24286) event is called.

See Also

OnUpdateValues (see page 24286)

ImplUpdateValue (see page 24020)

173.1.52.3 TCustomAdapterMultiValueField Properties

The properties of the TCustomAdapterMultiValueField class are listed here.

Public Properties

	Name	Description
R	ValueCount (see page 24284)	Returns the number of values associated with this adapter field.
R	Values (see page 24284)	Returns one of the values associated with the adapter field.

173.1.52.3.1 TCustomAdapterMultiValueField.ValueCount Property

Returns the number of values associated with this adapter field.

Pascal

```
property ValueCount: Integer;
```

C++

```
__property int ValueCount;
```

Description

ValueCount can be used with the Values (see page 24284) property to access all the values associated with this adapter field. ValueCount is implemented by GetValueCount (see page 24282).

See Also

GetValueCount (see page 24282)

Values (see page 24284)

173.1.52.3.2 TCustomAdapterMultiValueField.Values Property

Returns one of the values associated with the adapter field.

Pascal

```
property Values [I: Integer]: Variant;
```

C++

```
__property Variant Values[int I];
```

Description

Values can be used with the ValueCount (see page 24284) property to access all the values associated with this adapter field. Values is implemented by GetValues (see page 24282).

See Also

GetValues (see page 24282)

ValueCount (see page 24284)

173.1.52.4 TCustomAdapterMultiValueField Events

The events of the TCustomAdapterMultiValueField class are listed here.

Public Events

	Name	Description
	OnGetValueCount (see page 24285)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 24285)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 24285)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 24286)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 24286)	Validates field values entered by the end-user.

173.1.52.4.1 TCustomAdapterMultiValueField.OnGetValueCount Event

Responsible for returning the count of values associated with the adapter field.

Pascal

```
property OnGetValueCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetValueCount;
```

Description

Implement this event handler to provide the count of values associated with an adapter field. Also implement OnGetValues (see page 24285) to provide the individual values.

See Also

GetValueCount (see page 24282)

OnGetValues (see page 24285)

173.1.52.4.2 TCustomAdapterMultiValueField.OnGetValues Event

Responsible for returning one of the values associated with the adapter field.

Pascal

```
property OnGetValues: TAdapterFieldGetMultiValueEvent;
```

C++

```
__property TAdapterFieldGetMultiValueEvent OnGetValues;
```

Description

Implement this event handler to provide the values associated with an adapter field. The Index parameter is zero-based. Also implement OnGetValueCount (see page 24285) to provide the count of values associated with this adapter field.

See Also

GetValues (see page 24282)

OnGetValueCount (see page 24285)

173.1.52.4.3 TCustomAdapterMultiValueField.OnHasValue Event

Indicates whether a particular value is associated with this adapter field.

Pascal

```
property OnHasValue: TAdapterFieldHasValueEvent;
```

C++

```
__property TAdapterFieldHasValueEvent OnHasValue;
```

Description

ImplHasValue (see page 24283) calls this event handler. Implement this event handler to lookup a matching value. Implementation of this event handler is optional. If OnHasValue is nil, ImplHasValue (see page 24283) will search for a matching value the Values (see page 24284) and ValueCount (see page 24284) properties.

See Also

ImplHasValue (see page 24283)

ValueCount (see page 24284)

Values (see page 24284)

173.1.52.4.4 TCustomAdapterMultiValueField.OnUpdateValues Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUpdateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnUpdateValues;
```

Description

Implement this event handler to process values entered by the end-user. Raise an exception if an error occurs.

See Also

OnValidateValues (see page 24286)

ImplUpdateValue (see page 24283)

173.1.52.4.5 TCustomAdapterMultiValueField.OnValidateValues Event

Validates field values entered by the end-user.

Pascal

```
property OnValidateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnValidateValues;
```

Description

Implement this event handler to validate values entered by the end-user. Raise an exception if an error occurs.

OnValidateValues

173.1.53 TCustomAdapterPageAction Class

TCustomPagedAdapterAction (see page 24371) is a base class for adapter actions that execute the next or previous page

commands.

Class Hierarchy

Pascal

```
TCustomAdapterPageAction = class(TCustomPagedAdapterAction);
```

C++

```
class TCustomAdapterPageAction : public TCustomPagedAdapterAction;
```

File

WebAdapt

Description

TCustomPagedAdapterAction (see page 24371) provide methods that are used by TAdapterNextPageAction (see page 23945) and TAdapterPrevPageAction (see page 23979).

See Also

TDefaultFieldsPagedAdapter (see page 24403)

TCustomPagedAdapterAction (see page 24371)

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

173.1.53.1 TCustomAdapterPageAction Members

The following tables list the members exposed by TCustomAdapterPageAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24293)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetNewPage (see page 24294)	Indicates the page to display when this action is executed.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24294)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24294)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24295)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24295)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.

	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.53.2 TCustomAdapterPageAction Methods

The methods of the TCustomAdapterPageAction class are listed here.

Protected Methods

	Name	Description
V	GetDisplayStyleType (see page 24293)	Suggests an HTML display type for this adapter action.
V	GetNewPage (see page 24294)	Indicates the page to display when this action is executed.
V	ImplExecuteActionRequest (see page 24294)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetAdapterItemRequestParams (see page 24294)	Provides the name/value pairs needed to execute this adapter action.
V	ImplIsDefaultAction (see page 24295)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	ImplWebEnabled (see page 24295)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.53.2.1 TCustomAdapterPageAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const AnsiString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaAnchor, indicating that next page and previous page commands should be displayed using a hyperlink.

See Also

GetDisplayStyle (see page 24056)

173.1.53.2.2 TCustomAdapterPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

This is a placeholder. Descendant classes must override this method. true is returned if the action can move to a new page. The AValue parameter identifies the new page. GetNewPage is called by ImplExecuteActionRequest (see page 24294).

See Also

GetNewPage (see page 23953)

GetNewPage (see page 23987)

ImplExecuteActionRequest (see page 24294)

173.1.53.2.3 TCustomAdapterPageAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest is called by ExecuteActionRequest (see page 24053). ImplExecuteActionRequest calls ExtractRequestParams followed by GetNewPage (see page 24294). If GetNewPage (see page 24294) returns true then the parent adapter's current page is changed.

See Also

ExecuteActionRequest (see page 24053)

ExtractRequestParams (see page 24412)

GetNewPage (see page 24294)

CurrentPage (see page 24418)

173.1.53.2.4 TCustomAdapterPageAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 24055). ImplGetAdapterItemRequestParams calls the parent adapter's EncodeActionParams method to add the current page as a parameter. Then the inherited ImplGetAdapterItemRequestParams method is called so that any event handlers that may be defined will be called.

See Also

ImplGetAdapterItemRequestParams (see page 24063)

GetAdapterItemRequestParams (see page 24055)

EncodeActionParams (see page 24411)

OnGetActionParams (see page 24187)

OnGetParams (see page 24077)

173.1.53.2.5 TCustomAdapterPageAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 24070). ImplIsDefaultAction returns true if the display characteristics identified by ADisplay indicate the a previous or next page command is appropriate.

See Also

IsDefaultAction (see page 24070)

ImplIsDefaultAction (see page 24243)

173.1.53.2.6 TCustomAdapterPageAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled is called by WebEnabled (see page 24071). ImplWebEnabled returns the result of GetNewPage (see page

24294).

See Also

WebEnabled (see page 24071)

GetNewPage (see page 24294)

173.1.54 TCustomApplicationAdapter Class

TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.

Class Hierarchy

Pascal

```
TCustomApplicationAdapter = class(TDefaultFieldsAdapter, IWebApplicationInfo);
```

C++

```
class TCustomApplicationAdapter : public TDefaultFieldsAdapter, public IWebApplicationInfo;
```

File

WebAdapt

Description

TCustomApplicationAdapter implements IWebApplicationInfo. This interface is used to support server-side scripting. TCustomApplicationAdapter automatically adds an adapter field that provides the application title. Additional fields and actions may be added to this adapter. They are accessed as named properties of the server-side script Application object.

173.1.54.1 TCustomApplicationAdapter Members

The following tables list the members exposed by TCustomApplicationAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.

	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetApplicationAdapter (see page 24303)	Implements IWebApplicationInfo's GetApplicationAdapter method.
	GetApplicationTitle (see page 24303)	Implements IWebApplicationInfo's GetApplicationTitle method.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24304)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24304)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24304)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24305)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24305)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.

	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.

	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.

	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ApplicationAdapter (see page 19747)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
	ApplicationTitle (see page 24305)	Defines the title of the application.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.

R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.54.2 TCustomApplicationAdapter Methods

The methods of the TCustomApplicationAdapter class are listed here.

Protected Methods

	Name	Description
	GetApplicationAdapter (see page 24303)	Implements IWebApplicationInfo's GetApplicationAdapter method.
	GetApplicationTitle (see page 24303)	Implements IWebApplicationInfo's GetApplicationTitle method.
V	GetWebSnapObjClass (see page 24304)	Returns the class type for this adapter field.
V	ImplCanAddActionClass (see page 24304)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24304)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplGetActionsList (see page 24305)	Provides a list of action types that can be added to this adapter.
V	ImplGetFieldsList (see page 24305)	Provides a list of field types that can be added to this adapter.

173.1.54.2.1 TCustomApplicationAdapter.GetApplicationAdapter Method

Implements IWebApplicationInfo's GetApplicationAdapter method.

Pascal

```
function GetApplicationAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetApplicationAdapter();
```

Description

GetApplicationAdapter returns Self.

See Also

GetApplicationAdapter (see page 19747)

173.1.54.2.2 TCustomApplicationAdapter.GetApplicationTitle Method

Implements IWebApplicationInfo's GetApplicationTitle method.

Pascal

```
function GetApplicationTitle: string;
```

C++

```
__fastcall AnsiString GetApplicationTitle();
```

Description

GetApplicationTitle returns the application title that can be accessed with server-side script as the Application.Title property.

See Also

GetApplicationTitle (see page 19747)

173.1.54.2.3 TCustomApplicationAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; override;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

173.1.54.2.4 TCustomApplicationAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass allows actions classes that derive from TCustomApplicationAdapterAction (see page 24306) in addition to those allows by TCustomAdapter (see page 24139)'s ImplCanAddActionsClass method.

See Also

ImplCanAddActionClass (see page 24163)

TCustomApplicationAdapterAction (see page 24306)

173.1.54.2.5 TCustomApplicationAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass allows field classes that derive from TApplicationAdapterField in addition to those allowed by TCustomAdapter (see page 24139)'s ImplCanAddFieldClass method.

See Also

ImplCanAddFieldClass (see page 24163)

173.1.54.2.6 TCustomApplicationAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList clears the list. There are no default actions.

173.1.54.2.7 TCustomApplicationAdapter.ImplGetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetActionsList (see page 24305) lists the title field.

See Also

TAdapterApplicationTitleField (see page 23752)

173.1.54.3 TCustomApplicationAdapter Properties

The properties of the TCustomApplicationAdapter class are listed here.

Public Properties

	Name	Description
	ApplicationTitle (see page 24305)	Defines the title of the application.

173.1.54.3.1 TCustomApplicationAdapter.ApplicationTitle Property

Defines the title of the application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property AnsiString ApplicationTitle;
```

Description

Set this property to identify an application title that can be accessed with server-side script as the Application.Title property.

173.1.55 TCustomApplicationAdapterAction Class

TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 24296).

Class Hierarchy

Pascal

```
TCustomApplicationAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomApplicationAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomApplicationAdapterAction has two purposes. First, it provides a property that is used by descendants to access the parent adapter. Second, it defines a base class that TCustomApplicationAdapter (see page 24296) checks for when

determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 24491)

TCustomAdapterAction (see page 24188)

TAdapter (see page 23713)

TApplicationAdapter (see page 24032)

173.1.55.1 TCustomApplicationAdapterAction Members

The following tables list the members exposed by TCustomApplicationAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.

	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24312)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.

	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.55.2 TCustomApplicationAdapterAction Properties

The properties of the TCustomApplicationAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24312)	Returns the parent adapter of this adapter action.

173.1.55.2.1 TCustomApplicationAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TCustomApplicationAdapter;
```

C++

```
__property TCustomApplicationAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

173.1.56 TCustomEndUserAdapter Class

TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy

Pascal

```
TCustomEndUserAdapter = class(TBaseEndUserAdapter);
```

C++

```
class TCustomEndUserAdapter : public TBaseEndUserAdapter;
```

File

WebAdapt

Description

TCustomEndUserAdapter is the base class for end user adapters that use event handlers to implement the default adapter fields and actions. It introduces events to provide values for the default end user fields (DisplayName and LoggedIn) and to implement the default end user actions (logging in and logging out).

As with any end user adapter, TCustomEndUserAdapter has a LoginPage (see page 24118) property that lets you specify the page name of the Web page that handles the login process. As an end user adapter, it also handles validation of end user access. When the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access that page.

Do not create instances of TCustomEndUserAdapter. Instead, use a descendant such as the TEndUserAdapter (see page 24421) component, which publishes the events whose handlers you must supply to make this adapter work.

TEndUserAdapter (see page 24421)

173.1.56.1 TCustomEndUserAdapter Members

The following tables list the members exposed by TCustomEndUserAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
V	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.

	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	ExecuteLogin (see page 24321)	Generates an OnLogin (see page 24325) event.
	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
	ExecuteLogout (see page 24322)	Generates an OnLogout (see page 24326) event.
	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 24109)	Retrieves the display name string.
	GetDisplayNameValue (see page 24322)	Generates an OnGetDisplayName (see page 24324) event.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
	GetLoggedInValue (see page 24323)	Generates an OnIsLoggedIn (see page 24324) event.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.

	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserID (see page 24323)	Generates an OnGetUserID (see page 24324) event.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.

	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogIn (see page 24117)	Logs in a specified user.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24117)	Generates the login page.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24118)	Gets the user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 24324)	Occurs when the adapter needs to provide the name of the current end user.
	OnGetUserID (see page 24324)	Occurs when the adapter needs to provide the ID of the current end user.
	OnHasRights (see page 24119)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 24324)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnLogin (see page 24325)	Logs in the current end user.
	OnLogout (see page 24326)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 24119)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LogIn (see page 24677)	Logs in a specified user.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
	LoginPage (see page 24118)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.56.2 TCustomEndUserAdapter Methods

The methods of the TCustomEndUserAdapter class are listed here.

Protected Methods

	Name	Description
V	ExecuteLogin (see page 24321)	Generates an OnLogin (see page 24325) event.
V	ExecuteLogout (see page 24322)	Generates an OnLogout (see page 24326) event.
V	GetDisplayNameValue (see page 24322)	Generates an OnGetDisplayName (see page 24324) event.
V	GetLoggedInValue (see page 24323)	Generates an OnIsLoggedIn (see page 24324) event.
V	GetUserID (see page 24323)	Generates an OnGetUserID (see page 24324) event.

173.1.56.2.1 TCustomEndUserAdapter.ExecuteLogin Method

Generates an OnLogin (see page 24325) event.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); override;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

ExecuteLogin is the implementation of the Login action. When a server-side script executes the login action, it generates a call to ExecuteLogin to start the login process. TCustomEndUserAdapter (see page 24313) responds by generating an OnLogin (see page 24325) event, where you can take whatever action is necessary to log in the specified user.

AUserID is the user ID of the user to log in.

See Also

OnLogin (see page 24325)

173.1.56.2.2 TCustomEndUserAdapter.ExecuteLogout Method

Generates an OnLogout (see page 24326) event.

Pascal

```
procedure ExecuteLogout; override;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

ExecuteLogout is the implementation of the Logout action. When a server-side script executes the logout action, it generates a call to ExecuteLogout. TCustomEndUserAdapter (see page 24313) responds by generating an OnLogout (see page 24326) event, where you can take whatever action is necessary to log the specified user out.

See Also

OnLogout (see page 24326)

173.1.56.2.3 TCustomEndUserAdapter.GetDisplayNameValue Method

Generates an OnGetDisplayName (see page 24324) event.

Pascal

```
function GetDisplayNameValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayNameValue();
```

Description

GetDisplayNameValue is the implementation of the DisplayName adapter field. When a server-side script references the display name of the current user, it generates a call to GetDisplayNameValue. TCustomEndUserAdapter (see page 24313) responds by generating an OnGetDisplayName (see page 24324) event, where you can take supply the name of the current user.

GetDisplayNameValue returns the display name that the OnGetDisplayName (see page 24324) event handler provides. If you do not supply an OnGetDisplayName (see page 24324) event handler, GetDisplayNameValue returns an empty string.

See Also

OnGetDisplayName (see page 24324)

173.1.56.2.4 TCustomEndUserAdapter.GetLoggedInValue Method

Generates an OnIsLoggedIn (see page 24324) event.

Pascal

```
function GetLoggedInValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

GetLoggedInValue is the implementation of the LoggedIn adapter field. When a server-side script references the LoggedIn field for the current user, it generates a call to GetLoggedInValue. TCustomEndUserAdapter (see page 24313) responds by generating an OnIsLoggedIn (see page 24324) event, where you can indicate whether the current user has logged in.

GetLoggedInValue returns the value that the OnGetLoggedIn event handler provides. If you do not supply an OnGetLoggedIn event handler, GetLoggedInValue returns false.

See Also

OnIsLoggedIn (see page 24324)

173.1.56.2.5 TCustomEndUserAdapter.GetUserID Method

Generates an OnGetUserID (see page 24324) event.

Pascal

```
function GetUserID: Variant; override;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

GetUserIDValue is the implementation of the UserID adapter field. When a server-side script references the user ID of the current user, it generates a call to GetUserIDValue. TCustomEndUserAdapter (see page 24313) responds by generating an OnGetUserID (see page 24324) event, where you can take supply the ID of the current user.

GetUserIDValue returns the user ID that the OnGetUserID (see page 24324) event handler provides. If you do not supply an OnGetUserID (see page 24324) event handler, GetUserIDValue returns an unassigned Variant.

See Also

OnGetUserID (see page 24324)

173.1.56.3 TCustomEndUserAdapter Events

The events of the TCustomEndUserAdapter class are listed here.

Public Events

	Name	Description
	OnGetDisplayName (see page 24324)	Occurs when the adapter needs to provide the name of the current end user.
	OnGetUserID (see page 24324)	Occurs when the adapter needs to provide the ID of the current end user.
	OnIsLoggedIn (see page 24324)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 24325)	Logs in the current end user.

	OnLogout (see page 24326)	Occurs when the current user logs out.

173.1.56.3.1 TCustomEndUserAdapter.OnGetDisplayName Event

Occurs when the adapter needs to provide the name of the current end user.

Pascal

```
property OnGetDisplayName: TEndUserGetNameEvent;
```

C++

```
__property TEndUserGetNameEvent OnGetDisplayName;
```

Description

Write an OnGetDisplayName event handler to provide the value of the DisplayName field. When a server-side script (or a caller of the IWebEndUser interface) requests the display name for the current end user, TCustomEndUserAdapter (see page 24313) generates an OnGetDisplayName event to retrieve that value.

Note: If you do not supply an OnGetDisplayName event handler, TCustomEndUserAdapter (see page 24313) always returns an empty string as the display name for the current end user.

See Also

DisplayName (see page 24678)

EndUser (see page 24657)

WebContext (see page 24687)

173.1.56.3.2 TCustomEndUserAdapter.OnGetUserID Event

Occurs when the adapter needs to provide the ID of the current end user.

Pascal

```
property OnGetUserID: TEndUserGetUserIDEvent;
```

C++

```
__property TEndUserGetUserIDEvent OnGetUserID;
```

Description

Write an OnGetDisplayName (see page 24324) event handler to provide the user ID for the current user. When a server-side script requests ID for the current end user, TCustomEndUserAdapter (see page 24313) generates an OnGetUserID event to retrieve that value.

Note: If you do not supply an OnGetUserID event handler, TCustomEndUserAdapter (see page 24313) always returns an unassigned Variant as the user ID.

See Also

GetDisplayNameValue (see page 24322)

TWebUserList (see page 25625)

OnLogin (see page 24325)

173.1.56.3.3 TCustomEndUserAdapter.OnIsLoggedIn Event

Occurs when the adapter needs to indicate whether the current end user has logged in.

Pascal

```
property OnIsLoggedIn: TEndUserIsLoggedInEvent;
```

C++

```
__property TEndUserIsLoggedInEvent OnIsLoggedIn;
```

Description

Write an OnIsLoggedIn event handler to provide the value of the LoggedIn field. When a server-side script (or a caller of the IWebEndUser interface) inquires whether the current user has logged in, TCustomEndUserAdapter (see page 24313) generates an OnIsLoggedIn event to retrieve that information.

Note: If you do not supply an OnIsLoggedIn event handler, TCustomEndUserAdapter (see page 24313) always returns false, indicating that the current end user has not logged in.

See Also

LoggedIn (see page 24678)

EndUser (see page 24657)

WebContext (see page 24687)

OnLogin (see page 24325)

OnLogout (see page 24326)

173.1.56.3.4 TCustomEndUserAdapter.OnLogin Event

Logs in the current end user.

Pascal

```
property OnLogin: TEndUserUserIDEvent;
```

C++

```
__property TEndUserUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to allow the TCustomEndUserAdapter (see page 24313) object to log users in. When a server-side script (or a caller of the IWebEndUser interface) attempts to log in a user, TCustomEndUserAdapter (see page 24313) generates an OnLogin event to perform whatever steps are involved in the login process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter (see page 24313) does nothing to log users in.

See Also

LogIn (see page 24677)

173.1.56.3.5 TCustomEndUserAdapter.OnLogout Event

Occurs when the current user logs out.

Pascal

```
property OnLogout: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLogout;
```

Description

Write an OnLogout event handler to allow the TCustomEndUserAdapter (see page 24313) object to log users out. When a server-side script attempts to log a user out, TCustomEndUserAdapter (see page 24313) generates an OnLogout event to perform whatever steps are involved in the logout process.

Note: If you do not supply an OnLogin (see page 24325) event handler, TCustomEndUserAdapter (see page 24313) does nothing to log users out.

173.1.57 TCustomEndUserAdapterAction Class

TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 24313).

Class Hierarchy

Pascal

```
TCustomEndUserAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomEndUserAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomEndUserAdapterAction has two purposes. First, it provides a property that descendants use to access the parent adapter. Second, it defines a base class that TCustomEndUserAdapter (see page 24313) checks for when determining whether an adapter action can be added as a child.

173.1.57.1 TCustomEndUserAdapterAction Members

The following tables list the members exposed by TCustomEndUserAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24333)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.

	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.

	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.57.2 TCustomEndUserAdapterAction Properties

The properties of the TCustomEndUserAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24333)	Returns the parent adapter of this adapter action.

173.1.57.2.1 TCustomEndUserAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TBaseEndUserAdapter;
```

C++

```
__property TBaseEndUserAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

See Also

TCustomEndUserAdapter (see page 24313)

173.1.58 TCustomEndUserSessionAdapter Class

TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy

Pascal

```
TCustomEndUserSessionAdapter = class(TBaseEndUserAdapter);
```

C++

```
class TCustomEndUserSessionAdapter : public TBaseEndUserAdapter;
```

File

WebAdapt

Description

TCustomEndUserSessionAdapter is the base class for end user adapters that use a TSessionsService object to implement the default adapter fields and actions. It handles login and logout actions on behalf of the end user, and uses the TSessionsService component to store information about the current end user. The WebSnap application must contain a TSessionsService component (or equivalent) in order for the TCustomEndUserSessionAdapter to work properly.

As with any end user adapter, TCustomEndUserSessionAdapter has a LoginPage (see page 24118) property that lets you specify the page name of the Web page that handles the login process. As an end user adapter, it also handles validation of end user access. When the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access that page.

173.1.58.1 TCustomEndUserSessionAdapter Members

The following tables list the members exposed by TCustomEndUserSessionAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
V	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 24342)	Logs in an end user.
V	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
V	ExecuteLogout (see page 24342)	Logs out the current user.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.

	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 24109)	Retrieves the display name string.
V	GetDisplayNameValue (see page 24343)	Returns the name of the current end user.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
V	GetLoggedInValue (see page 24343)	Indicates whether the current end user has logged in.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetUserID (see page 24343)	Returns the user ID of the current user.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.

	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogIn (see page 24117)	Logs in a specified user.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24117)	Generates the login page.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24118)	Gets the user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.

R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 24119)	Determines if the user rights match the rights being queried.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnProduceLoginPage (see page 24119)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LogIn (see page 24677)	Logs in a specified user.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
	LoginPage (see page 24118)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	UserID (see page 24344)	Specifies the user ID of the current end user.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.58.2 TCustomEndUserSessionAdapter Methods

The methods of the TCustomEndUserSessionAdapter class are listed here.

Protected Methods

	Name	Description
V	ExecuteLogin (see page 24342)	Logs in an end user.
V	ExecuteLogout (see page 24342)	Logs out the current user.
V	GetDisplayNameValue (see page 24343)	Returns the name of the current end user.
V	GetLoggedInValue (see page 24343)	Indicates whether the current end user has logged in.
V	GetUserID (see page 24343)	Returns the user ID of the current user.

173.1.58.2.1 TCustomEndUserSessionAdapter.ExecuteLogin Method

Logs in an end user.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); override;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

ExecuteLogin is the implementation of the Login action. When a server-side script executes the login action, it generates a call to ExecuteLogin to start the login process.

In TCustomEndUserAdapter (see page 24313), ExecuteLogin assigns the supplied user ID to the UserID (see page 24344) property, which saves the current user ID with the current session.

AUserID is the user ID of the user to log in.

173.1.58.2.2 TCustomEndUserSessionAdapter.ExecuteLogout Method

Logs out the current user.

Pascal

```
procedure ExecuteLogout; override;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

ExecuteLogout is the implementation of the Logout action. When a server-side script executes the logout action, it generates a call to ExecuteLogout.

In TCustomEndUserAdapter (see page 24313), ExecuteLogout terminates the current Web session.

173.1.58.2.3 TCustomEndUserSessionAdapter.GetDisplayNameValue Method

Returns the name of the current end user.

Pascal

```
function GetDisplayNameValue: string; override;
```

C++

```
virtual __fastcall AnsiString GetDisplayNameValue();
```

Description

GetDisplayNameValue is the implementation of the DisplayName adapter field. When a server-side script references the display name of the current user, it generates a call to GetDisplayNameValue.

In TCustomEndUserSessionAdapter (see page 24333), GetDisplayNameValue returns the value of the UserID (see page 24344) property, formatted as a string.

173.1.58.2.4 TCustomEndUserSessionAdapter.GetLoggedInValue Method

Indicates whether the current end user has logged in.

Pascal

```
function GetLoggedInValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

GetLoggedInValue is the implementation of the LoggedIn adapter field. When a server-side script references the LoggedIn field for the current user, it generates a call to GetLoggedInValue.

In TCustomEndUserAdapter (see page 24313), GetLoggedInValue checks whether the UserID (see page 24344) property has been assigned. If UserID (see page 24344) is an assigned Variant other than an empty string, GetLoggedInValue returns true, indicating that the user has logged in. Otherwise, GetLoggedInValue returns false.

173.1.58.2.5 TCustomEndUserSessionAdapter.GetUserID Method

Returns the user ID of the current user.

Pascal

```
function GetUserID: Variant; override;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

GetUserIDValue is the implementation of the UserID (see page 24344) adapter field. When a server-side script references the user ID of the current user, it generates a call to GetUserIDValue.

In TCustomEndUserSessionAdapter (see page 24333), GetUserID fetches the value of the UserID (see page 24344) property from the current Web session. This value is set when the user first logs in.

See Also

GetUserID (see page 24323)

ExecuteLogin (see page 24321)

TWebSession (see page 24968)

173.1.58.3 TCustomEndUserSessionAdapter Properties

The properties of the TCustomEndUserSessionAdapter class are listed here.

Public Properties

	Name	Description
	UserID (see page 24344)	Specifies the user ID of the current end user.

173.1.58.3.1 TCustomEndUserSessionAdapter.UserID Property

Specifies the user ID of the current end user.

Pascal

```
property UserID: Variant;
```

C++

```
__property Variant UserID;
```

Description

Use UserID to get or set the user ID of the current user. When a user logs in (that is, when TCustomEndUserSessionAdapter (see page 24333) executes the Login action), TCustomEndUserSessionAdapter (see page 24333) assigns the user's ID as the value of UserID. TCustomEndUserSessionAdapter (see page 24333) stores this value with the current session.

173.1.59 TCustomLoginFormAdapter Class

TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.

Class Hierarchy

Pascal

```
TCustomLoginFormAdapter = class(TDefaultFieldsAdapter);
```

C++

```
class TCustomLoginFormAdapter : public TDefaultFieldsAdapter;
```

File

WebAdapt

Description

TCustomLoginFormAdapter introduces default fields and actions that support building a login form. The adapter fields include user name (UserName (see page 24360)), password (Password (see page 24360)), and next page (NextPage (see page 24359)). The next page field lists the Web pages in the application. The properties of TCustomLoginFormAdapter reflect the values that are assigned to those fields. TCustomLoginFormAdapter implements a single default action for logging in. If the WebSnap application also contains an end user adapter such as TEndUserAdapter (see page 24421) or TEndUserSessionAdapter (see page 24458), TLoginFormAdapter (see page 24500) calls the end user adapter's Login method to log the user in. As an alternate approach, you can provide an OnLogin (see page 24361) event handler.

Do not create instances of TCustomLoginFormAdapter. It is intended only as a base class. Instead, use a TCustomLoginFormAdapter descendant such as TLoginFormAdapter (see page 24500).

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

TAdapterPageProducer (see page 19802)

TLoginFormAdapter (see page 24500)

173.1.59.1 TCustomLoginFormAdapter Members

The following tables list the members exposed by TCustomLoginFormAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndUser (see page 24353)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 24353)	Logs in the user after the user name and password have been validated.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.

	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetNextPage (see page 24354)	Returns the value of the NextPage (see page 24359) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24354)	Provides the underlying implementation for the CanAddActionClass (see page 24150) method.
V	ImplCanAddFieldClass (see page 24355)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 24355)	Provides the underlying implementation for the GetActionsList (see page 24156) method.
V	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 24356)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.

	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24356)	Provides the underlying implementation for the NotifyDeactivate (see page 24175) method.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RaiseBlankPassword (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied password is blank.
	RaiseBlankUserName (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied user name is blank.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24357)	Returns the interface of the WebSnap application's Web user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidatePassword (see page 24358)	Validates the password that the user supplied to the login form.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateUserName (see page 24358)	Validates the name that the user supplied to the login form.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnLogin (see page 24361)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 24362)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 24362)	Occurs when the login form adapter must validate the name that the user supplied.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
	NextPage (see page 24359)	Names the Web page the user should see after successfully logging in.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Password (see page 24360)	Indicates the password that the user supplied to the login form.
	PasswordRequired (see page 24360)	Indicates whether the user must supply a password to log in.
R	UserName (see page 24360)	Indicates the name that the user supplied to the login form.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.59.2 TCustomLoginFormAdapter Methods

The methods of the TCustomLoginFormAdapter class are listed here.

Protected Methods

	Name	Description
	EndUser (see page 24353)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 24353)	Logs in the user after the user name and password have been validated.
V	GetNextPage (see page 24354)	Returns the value of the NextPage (see page 24359) property.
V	ImplCanAddActionClass (see page 24354)	Provides the underlying implementation for the CanAddActionClass (see page 24150) method.
V	ImplCanAddFieldClass (see page 24355)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
V	ImplGetActionsList (see page 24355)	Provides the underlying implementation for the GetActionsList (see page 24156) method.
V	ImplGetFieldsList (see page 24356)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.
V	ImplNotifyDeactivate (see page 24356)	Provides the underlying implementation for the NotifyDeactivate (see page 24175) method.
	RaiseBlankPassword (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied password is blank.

	RaiseBlankUserName (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied user name is blank.
	UserList (see page 24357)	Returns the interface of the WebSnap application's Web user list.
	ValidatePassword (see page 24358)	Validates the password that the user supplied to the login form.
	ValidateUserName (see page 24358)	Validates the name that the user supplied to the login form.

173.1.59.2.1 TCustomLoginFormAdapter.EndUser Method

Returns the interface of the WebSnap application's end user adapter.

Pascal

```
function EndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser EndUser();
```

Description

TCustomLoginFormAdapter (see page 24344) uses EndUser internally to interact with the WebSnap application's end user adapter. For example, the login form adapter calls the Login method on this interface to log in an end user after validating the user name and password.

EndUser returns the interface of an end user adapter such as TEndUserAdapter (see page 24421) or TEndUserSessionAdapter (see page 24458). If the WebSnap application does not include an end user adapter, EndUser returns nil (Delphi) or NULL (C++).

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

LogIn (see page 24677)

173.1.59.2.2 TCustomLoginFormAdapter.ExecuteLogin Method

Logs in the user after the user name and password have been validated.

Pascal

```
procedure ExecuteLogin(AUserID: Variant);
```

C++

```
__fastcall ExecuteLogin(Variant AUserID);
```

Description

The Login action calls ExecuteLogin to log the user in after validating the user name and password. This method first generates an OnLogin (see page 24361) event, so that the OnLogin (see page 24361) event handler can perform any application-specific tasks to log the user in. Then, if the EndUser (see page 24353) property is not nil (Delphi) or NULL (C++), ExecuteLogin calls the end user adapter's Login method, so that the end user adapter can log the user in.

AUserID is the user ID of the end user. If the WebSnap application includes a TWebUserList component, this is the user ID that the Web user list associates with the current user name and password. Otherwise, AUserID is the value of the UserName (see page 24360) property.

See Also

EndUser (see page 24353)

OnLogin (see page 24361)

LogIn (see page 24677)

UserName (see page 24360)

TWebUserList (see page 25625)

173.1.59.2.3 TCustomLoginFormAdapter.GetNextPage Method

Returns the value of the NextPage (see page 24359) property.

Pascal

```
function GetNextPage: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetNextPage();
```

Description

GetNextPage is the getter method for the NextPage (see page 24359) property. See the NextPage (see page 24359) property for more information.

See Also

NextPage (see page 24359)

173.1.59.2.4 TCustomLoginFormAdapter.ImplCanAddActionClass Method

Provides the underlying implementation for the CanAddActionClass (see page 24150) method.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass provides the underlying implementation of the CanAddActionClass (see page 24150) method that is introduced in TCustomAdapter (see page 24139). At design time, the Actions (see page 24402) editor calls this method to determine what actions it can add to the login form adapter.

AParent is the adapter that will act as a parent to the added action.

AClass is the class of the proposed action.

ImplCanAddActionClass returns true if the login form adapter can act as a parent to an action of the specified class.

In TCustomLoginFormAdapter (see page 24344), ImplCanAddActionClass returns true if AClass is (or descends from) TLoginFormAdapterLoginAction (see page 24514) (the Login action).

See Also

ImplCanAddFieldClass (see page 24355)

CanAddActionClass (see page 24150)

TLoginFormAdapterLoginAction (see page 24514)

ImplGetActionsList (see page 24355)

173.1.59.2.5 TCustomLoginFormAdapter.ImplCanAddFieldClass Method

Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass provides the underlying implementation of the CanAddFieldClass (see page 24150) method that is introduced in TCustomAdapter (see page 24139). At design time, the Fields editor calls this method to determine what fields it can add to the login form adapter.

AParent is the adapter that will act as a parent to the added field.

AClass is the class of the proposed field.

ImplCanAddFieldClass returns true if the login form adapter can act as a parent to a field of the specified class.

In TCustomLoginFormAdapter (see page 24344), ImplCanAddFieldClass returns true if AClass is (or descends from) TAdapterPasswordField (see page 23971), TAdapterUserNameField (see page 24024) or TAdapterNextPageField (see page 23957) (the Password (see page 24360), UserName (see page 24360), or NextPage (see page 24359) field).

See Also

ImplCanAddActionClass (see page 24354)

CanAddFieldClass (see page 24150)

TAdapterNextPageField (see page 23957)

TAdapterPasswordField (see page 23971)

TAdapterUserNameField (see page 24024)

ImplGetFieldsList (see page 24356)

173.1.59.2.6 TCustomLoginFormAdapter.ImplGetActionsList Method

Provides the underlying implementation for the GetActionsList (see page 24156) method.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList provides the underlying implementation of the GetActionsList (see page 24156) method that is introduced in TCustomAdapter (see page 24139). This method fills a string list with the names of all the actions an adapter can support, associating each action name with a class reference to the corresponding action class.

AList is an existing string list instance to fill with the names of the actions that this adapter supports.

In TCustomLoginFormAdapter (see page 24344), ImplGetActionsList clears the list of any strings it may contain on entry, and adds a single string, 'Login', which is the name of the login action. It associates this string with TLoginFormAdapterLoginAction (see page 24514).

See Also

ImplGetFieldsList (see page 24356)

GetActionsList (see page 24156)

TLoginFormAdapterLoginAction (see page 24514)

173.1.59.2.7 TCustomLoginFormAdapter.ImplGetFieldsList Method

Provides the underlying implementation for the GetFieldsList (see page 24159) method.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList provides the underlying implementation of the GetFieldsList (see page 24159) method that is introduced in TCustomAdapter (see page 24139). This method fills a string list with the names of all the fields an adapter can support, associating each field name with a class reference to the corresponding field class.

AList is an existing string list instance to fill with the names of the fields that this adapter supports.

In TCustomLoginFormAdapter (see page 24344), ImplGetFieldsList clears the list of any strings it may contain on entry, and adds the strings, 'UserName (see page 24360)', 'Password (see page 24360)', and 'NextPage (see page 24359)', which it associates with TAdapterUserNameField (see page 24024), TAdapterPasswordField (see page 23971), and TAdapterNextPageField (see page 23957), respectively.

See Also

ImplGetActionsList (see page 24355)

GetFieldsList (see page 24159)

TAdapterNextPageField (see page 23957)

TAdapterPasswordField (see page 23971)

TAdapterUserNameField (see page 24024)

173.1.59.2.8 TCustomLoginFormAdapter.ImplNotifyDeactivate Method

Provides the underlying implementation for the NotifyDeactivate (see page 24175) method.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

ImplNotifyDeactivate provides the underlying implementation of the NotifyDeactivate (see page 24175) method that is introduced in TCustomAdapter (see page 24139). This method is called when the WebSnap application deactivates the Web module that contains the adapter after processing an HTTP request message.

In TCustomLoginFormAdapter (see page 24344), ImplNotifyDeactivate clears the NextPage (see page 24359) property so

that the next time a request message arrives from the login form, it can be redirected to an appropriate next page.

173.1.59.2.9 TCustomLoginFormAdapter.RaiseBlankPassword Method

Raises an EAdapterFieldException (see page 23698) with a message that the supplied password is blank.

Pascal

```
procedure RaiseBlankPassword;
```

C++

```
__fastcall RaiseBlankPassword();
```

Description

TCustomLoginFormAdapter (see page 24344) calls RaiseBlankPassword internally when it is trying to validate a password that is an empty string and the PasswordRequired (see page 24360) property is true.

See Also

PasswordRequired (see page 24360)

EAdapterFieldException (see page 23698)

ValidatePassword (see page 24358)

173.1.59.2.10 TCustomLoginFormAdapter.RaiseBlankUserName Method

Raises an EAdapterFieldException (see page 23698) with a message that the supplied user name is blank.

Pascal

```
procedure RaiseBlankUserName;
```

C++

```
__fastcall RaiseBlankUserName();
```

Description

TCustomLoginFormAdapter (see page 24344) calls RaiseBlankUserName internally when it is trying to validate a user name that is an empty string.

See Also

EAdapterFieldException (see page 23698)

ValidateUserName (see page 24358)

173.1.59.2.11 TCustomLoginFormAdapter.UserList Method

Returns the interface of the WebSnap application's Web user list.

Pascal

```
function UserList: IWebUserList;
```

C++

```
__fastcall IWebUserList UserList();
```

Description

TCustomLoginFormAdapter (see page 24344) uses UserList internally to interact with the WebSnap application's Web user list. For example, the login form adapter calls the ValidateUser method on this interface when validating the user name and password.

UserList returns the interface of a Web user list such as TWebUserList. If the WebSnap application does not include a Web user list, UserList returns nil (Delphi) or NULL (C++).

See Also

TWebUserList (see page 25625)

ValidateUser (see page 19785)

173.1.59.2.12 TCustomLoginFormAdapter.ValidatePassword Method

Validates the password that the user supplied to the login form.

Pascal

```
procedure ValidatePassword;
```

C++

```
__fastcall ValidatePassword();
```

Description

The Login action associated with this adapter calls ValidatePassword to validate the password that the user supplies. ValidatePassword first generates an OnValidatePassword (see page 24362) event. If the event handler does not exist, or does not handle the validation, ValidatePassword checks whether the password is an empty string. If so, and if the PasswordRequired (see page 24360) property is true, ValidatePassword raises an EAdapterFieldException (see page 23698) exception.

See Also

OnValidatePassword (see page 24362)

PasswordRequired (see page 24360)

EAdapterFieldException (see page 23698)

Password (see page 24360)

173.1.59.2.13 TCustomLoginFormAdapter.ValidateUserName Method

Validates the name that the user supplied to the login form.

Pascal

```
procedure ValidateUserName;
```

C++

```
__fastcall ValidateUserName();
```

Description

The Login action associated with this adapter calls ValidateUserName to validate the name that the user supplies. ValidateUserName first generates an OnValidateUserName (see page 24362) event. If the event handler does not exist, or does not handle the validation, ValidateUserName checks whether the user name is an empty string. If so, it raises an

EAdapterFieldException (see page 23698) exception.

See Also

OnValidateUserName (see page 24362)

EAdapterFieldException (see page 23698)

UserName (see page 24360)

173.1.59.3 TCustomLoginFormAdapter Properties

The properties of the TCustomLoginFormAdapter class are listed here.

Public Properties

	Name	Description
	NextPage (see page 24359)	Names the Web page the user should see after successfully logging in.
R	Password (see page 24360)	Indicates the password that the user supplied to the login form.
	PasswordRequired (see page 24360)	Indicates whether the user must supply a password to log in.
R	UserName (see page 24360)	Indicates the name that the user supplied to the login form.

173.1.59.3.1 TCustomLoginFormAdapter.NextPage Property

Names the Web page the user should see after successfully logging in.

Pascal

```
property NextPage: string;
```

C++

```
__property AnsiString NextPage;
```

Description

NextPage specifies the page that the WebSnap application presents to end users after they successfully log in.

The NextPage adapter field supplies a value for the NextPage property. This is a page that the user selects using the login form. If NextPage is unassigned (that is, the if the login form does not contain a NextPage field or the user does not select a next page), TCustomLoginFormAdapter (see page 24344) checks whether the request parameters include a "success page", and if so, uses that. If there is no "success page" parameter, TCustomLoginFormAdapter (see page 24344) checks the Web context to see if there is a currently requested page the user was trying to reach before being diverted to the login page. If there is no "success page" parameter and no currently requested page, TCustomLoginFormAdapter (see page 24344) uses the application's default page.

See Also

DefaultPage (see page 24900)

RequestedPageName (see page 24658)

TAdapterPageProducer (see page 19802)

TLoginFormAdapter (see page 24500)

SuccessPage (see page 19677)

GetNextPage (see page 24354)

173.1.59.3.2 TCustomLoginFormAdapter.Password Property

Indicates the password that the user supplied to the login form.

Pascal

```
property Password: Variant;
```

C++

```
__property Variant Password;
```

Description

Read Password to obtain the password that the user supplied to the login form. The login form adapter reads this value from the current request message.

See Also

PasswordRequired (see page 24360)

OnValidatePassword (see page 24362)

173.1.59.3.3 TCustomLoginFormAdapter.PasswordRequired Property

Indicates whether the user must supply a password to log in.

Pascal

```
property PasswordRequired: Boolean;
```

C++

```
__property Boolean PasswordRequired;
```

Description

Set PasswordRequired to indicate whether users must supply a password to log in. If PasswordRequired is true and the OnValidatePassword (see page 24362) event handler does not handle the validation of the password, then the login form adapter checks that the value of Password (see page 24360) is not an empty string. If Password (see page 24360) is an empty string, the login form adapter raises an EAdapterFieldException (see page 23698) exception when it tries to validate the password. If the OnValidatePassword (see page 24362) event handler takes care of validating the password, PasswordRequired is ignored.

Note: The login form adapter validates the password (and hence checks PasswordRequired) when the WebSnap application executes this adapter's Login action.

See Also

Password (see page 24360)

OnValidatePassword (see page 24362)

TLoginFormAdapterLoginAction (see page 24514)

EAdapterFieldException (see page 23698)

173.1.59.3.4 TCustomLoginFormAdapter.UserName Property

Indicates the name that the user supplied to the login form.

Pascal

```
property UserName: Variant;
```

C++

```
__property Variant UserName;
```

Description

Read UserName to obtain the name that the user supplied when logging in. The login form adapter reads this value from the current request message.

See Also

Password (see page 24360)

OnValidateUserName (see page 24362)

173.1.59.4 TCustomLoginFormAdapter Events

The events of the TCustomLoginFormAdapter class are listed here.

Public Events

	Name	Description
	OnLogin (see page 24361)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 24362)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 24362)	Occurs when the login form adapter must validate the name that the user supplied.

173.1.59.4.1 TCustomLoginFormAdapter.OnLogin Event

Occurs after the password and user ID are validated.

Pascal

```
property OnLogin: TLoginUserIDEvent;
```

C++

```
__property TLoginUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to respond when a user has successfully logged in. This event allows your application to record the user login in an application-specific manner.

When the login form adapter's Login action executes, the adapter first receives an OnValidatePassword (see page 24362) and an OnValidateUserName (see page 24362) event. After validating the password and user name, the login form adapter receives an OnLogin event so that it can log the user in. After the OnLogin event, if the WebSnap application includes an end user adapter, the login form adapter calls the end user adapter's Login method. Thus, it may not be necessary to write an OnLogin event handler if the application includes an end user adapter.

See Also

OnValidatePassword (see page 24362)

OnValidateUserName (see page 24362)

LogIn (see page 24677)

TWebUserList (see page 25625)

UserName (see page 24360)

173.1.59.4.2 TCustomLoginFormAdapter.OnValidatePassword Event

Occurs when the login form adapter must validate the password that the user supplied.

Pascal

```
property OnValidatePassword: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidatePassword;
```

Description

Write an OnValidatePassword event handler to validate the password that the user supplies to the login form. This event is especially important if the WebSnap application does not include a TWebUserList component for checking passwords against user names. The supplied Password (see page 24360) is the value of the Value parameter on the event handler. You can check this against the user's name by reading the UserName (see page 24360) property.

When the login form adapter's Login action executes, the adapter first receives an OnValidatePassword event to check the password. If the event handler sets the Handled parameter to true, indicating that the password is valid, the adapter goes on to validate the user name using an OnValidateUserName (see page 24362) event, and then to log the user in using an OnLogin (see page 24361) event (and, if the application includes an end user adapter, by calling the end user adapter's Login method). If the event handler finds the password to be invalid, it should raise an exception. If the event handler does not validate the supplied password (that is, if it sets the Handled parameter to false), the login form adapter validates the password by checking whether it is non-blank if the PasswordRequired (see page 24360) property is true.

See Also

OnLogin (see page 24361)

OnValidateUserName (see page 24362)

Password (see page 24360)

UserName (see page 24360)

PasswordRequired (see page 24360)

173.1.59.4.3 TCustomLoginFormAdapter.OnValidateUserName Event

Occurs when the login form adapter must validate the name that the user supplied.

Pascal

```
property OnValidateUserName: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidateUserName;
```

Description

Write an OnValidateUserName event handler to validate the name that the user supplies when logging in. This event occurs after the OnValidatePassword (see page 24362) event and before the OnLogin (see page 24361) event.

If the event handler sets the Handled parameter to true, the login form adapter assumes that the user name (which is the value of the Value parameter and of the UserName (see page 24360) property) is valid. In this case, the adapter checks whether the WebSnap application includes a TWebUserList component, and if so, checks the user name against the password. If the event handler sets the Handled parameter to false, the adapter validates the user name by checking whether it is nonempty. In this case, the adapter raises an EAdapterFieldException (see page 23698) exception if the value of UserName (see page 24360) is an empty string. If the OnValidateUserName event handler finds the user name to be invalid, it should raise an

exception.

OnValidatePassword (see page 24362)

UserName (see page 24360)

EAdapterFieldException (see page 23698)

173.1.60 TCustomLoginFormAdapterAction Class

TCustomEndUserAdapterAction (see page 24326) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 24344).

Class Hierarchy

Pascal

```
TCustomLoginFormAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomLoginFormAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomLoginFormAdapterAction has two purposes. First, it implements a property that descendants use to access the parent adapter. Second, it defines a base class that TCustomLoginFormAdapter (see page 24344) checks for when determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 24491)

TCustomLoginFormAdapter (see page 24344)

173.1.60.1 TCustomLoginFormAdapterAction Members

The following tables list the members exposed by TCustomLoginFormAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.

	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24369)	Returns the adapter that acts as a parent to this action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.

	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.60.2 TCustomLoginFormAdapterAction Properties

The properties of the TCustomLoginFormAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 24369)	Returns the adapter that acts as a parent to this action.

173.1.60.2.1 TCustomLoginFormAdapterAction.Adapter Property

Returns the adapter that acts as a parent to this action.

Pascal

```
property Adapter: TCustomLoginFormAdapter;
```

C++

```
__property TCustomLoginFormAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

173.1.61 TCustomPagedAdapter Class

TCustomPagedAdapter is a base class for adapters that support paging.

Class Hierarchy

Pascal

```
TCustomPagedAdapter = class(TDefaultFieldsPagedAdapter);
```

C++

```
class TCustomPagedAdapter : public TDefaultFieldsPagedAdapter;
```

File

WebAdapt

Description

Derive from TCustomPagedAdapter to define a new adapter class that support paging. Paging is enabled when the PageSize (see page 24419) property is set.

See Also

TPagedAdapter (see page 24525)

173.1.62 TCustomPagedAdapterAction Class

TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 24403).

Class Hierarchy

Pascal

```
TCustomPagedAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomPagedAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomPagedAdapterAction has two purposes. First, it provides a property that is used by descendants to access the parent

adapter. Second, it defines a base class that TDefaultFieldsPagedAdapter (see page 24403) checks for when determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 24491)

TDefaultFieldsPagedAdapter (see page 24403)

TDefaultFieldsPagedAdapter (see page 24403)

173.1.62.1 TCustomPagedAdapterAction Members

The following tables list the members exposed by TCustomPagedAdapterAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24055)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.

	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24063)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 24195)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24378)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 24075)	Called after the adapter action has executed.
	OnAfterExecute (see page 24198)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24075)	Called after the adapter action response is generated.

	OnAfterGetResponse (see page 24199)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24076)	Called before the adapter action is executed.
	OnBeforeExecute (see page 24199)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24076)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 24200)	Called before the adapter action response is generated.
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 24077)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayLabel (see page 24073)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.62.2 TCustomPagedAdapterAction Methods

The methods of the TCustomPagedAdapterAction class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 24377)	Returns the parent adapter of this adapter action.

173.1.62.2.1 TCustomPagedAdapterAction.GetAdapter Method

Returns the parent adapter of this adapter action.

Pascal

```
function GetAdapter: TDefaultFieldsPagedAdapter;
```

C++

```
__fastcall TDefaultFieldsPagedAdapter GetAdapter();
```

Description

GetAdapter implements the Adapter (see page 24378) property.

See Also

TDefaultFieldsPagedAdapter (see page 24403)

Adapter (see page 24378)

173.1.62.3 TCustomPagedAdapterAction Properties

The properties of the TCustomPagedAdapterAction class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 24378)	Returns the parent adapter of this adapter action.

173.1.62.3.1 TCustomPagedAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TDefaultFieldsPagedAdapter;
```

C++

```
__property TDefaultFieldsPagedAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

See Also

GetAdapter (see page 24377)

173.1.63 TCustomStringsValuesList Class

TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.

Class Hierarchy

Pascal

```
TCustomStringsValuesList = class(TBaseValuesListAdapter);
```

C++

```
class TCustomStringsValuesList : public TBaseValuesListAdapter;
```

File

WebAdapt

Description

Use descendants of TCustomStringsValuesList with adapter fields to define a list of name/value pairs that are possible values for the adapter field. Adapter fields reference a values list adapter using the adapter field's ValuesList property.

See Also

TBaseValuesListAdapter (see page 24120)

TStringsValuesList (see page 24540)

TAdapterUpdateField (see page 24007)

173.1.63.1 TCustomStringsValuesList Members

The following tables list the members exposed by TCustomStringsValuesList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValueFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24388)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.

	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 24388)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 24388)	Looks up a name for a value.
	ImplGetListValue (see page 24389)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24389)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24389)	Clears the iteration index.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24390)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	PrepareStrings (see page 24390)	Customizes the content of the strings list.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 24391)	This flag indicates whether the strings list has been prepared or customized.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareStrings (see page 24391)	Implement OnPrepareStrings to customize the content of the strings list.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 24386)	Create is the constructor for TCustomStringsValuesList (see page 24378).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24386)	Destroy is the destructor for TCustomStringsList.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Strings (see page 24390)	This string list defines the list of name/value pairs.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.63.2 TCustomStringsValuesList.Create Constructor

Create is the constructor for TCustomStringsValuesList (see page 24378).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStringsValuesList(TComponent * AOwner);
```

Description

Create creates the strings list.

See Also

Strings (see page 24390)

173.1.63.3 TCustomStringsValuesList.Destroy Destructor

Destroy is the destructor for TCustomStringsList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStringsValuesList();
```

Description

Destroy frees the strings list.

See Also

Strings (see page 24390)

173.1.63.4 TCustomStringsValuesList Methods

The methods of the TCustomStringsValuesList class are listed here.

Protected Methods

	Name	Description
	GetNameFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetValueFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	ImplEndIterator (see page 24388)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.
	ImplGetListName (see page 24388)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 24388)	Looks up a name for a value.
	ImplGetListValue (see page 24389)	Responsible for returning the value of the name/value pair.
	ImplNextIteration (see page 24389)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyDeactivate (see page 24389)	Clears the iteration index.
	ImplStartIterator (see page 24390)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	PrepareStrings (see page 24390)	Customizes the content of the strings list.

173.1.63.4.1 TCustomStringsValuesList.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns a TValuesListNameField (see page 24552).

See Also

GetValueFieldClass (see page 24387)

TValuesListNameField (see page 24552)

173.1.63.4.2 TCustomStringsValuesList.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns TValuesListValueField (see page 24558).

See Also

GetNameFieldClass (see page 24387)

TValuesListValueField (see page 24558)

173.1.63.4.3 TCustomStringsValuesList.ImplEndIterator Method

Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.

See Also

enditerator (see page 19723)

173.1.63.4.4 TCustomStringsValuesList.ImplGetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function ImplGetListName: string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetListName();
```

Description

ImplGetListName uses the iteration index to retrieve a name from the strings list. The name may be blank.

See Also

Strings (see page 24390)

173.1.63.4.5 TCustomStringsValuesList.ImplGetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; override;
```

C++

```
virtual __fastcall AnsiString ImplGetListNameOfValue(Variant Value);
```

Description

ImplGetListNameOfValue searches the string list for a matching value and returns the name associated with this value. An empty string is returned if the value is not found or if the name associated with the value is blank.

See Also

Strings (see page 24390)

173.1.63.4.6 TCustomStringsValuesList.ImplGetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function ImplGetListValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

ImplGetListValue uses the iteration index to retrieve a value from the strings list.

See Also

Strings (see page 24390)

173.1.63.4.7 TCustomStringsValuesList.ImplNextIteration Method

Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration increments the iteration index. false is returned if the iteration index is out of the range defined by the Strings (see page 24390) property's Count property. The iteration index is used when retrieving a name or value from the strings list.

See Also

NextIteration (see page 19723)

173.1.63.4.8 TCustomStringsValuesList.ImplNotifyDeactivate Method

Clears the iteration index.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The StringsPrepared (see page 24391) property is cleared. This ensures that the strings list will be prepared during the processing of the next HTTP request.

173.1.63.4.9 TCustomStringsValuesList.ImplStartIterator Method

Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator initializes the iteration index to 0. false is returned if the iteration index is out of the range defined by the Strings (see page 24390) property's Count property. The iteration index is used when retrieving a name or value from the strings list.

See Also

startiterator (see page 19724)

173.1.63.4.10 TCustomStringsValuesList.PrepareStrings Method

Customizes the content of the strings list.

Pascal

```
procedure PrepareStrings; virtual;
```

C++

```
virtual __fastcall PrepareStrings();
```

Description

PrepareStrings calls the OnPrepareStrings (see page 24391) event handler.

See Also

StringsPrepared (see page 24391)

OnPrepareStrings (see page 24391)

173.1.63.5 TCustomStringsValuesList Properties

The properties of the TCustomStringsValuesList class are listed here.

Protected Properties

	Name	Description
	StringsPrepared (see page 24391)	This flag indicates whether the strings list has been prepared or customized.

Public Properties

	Name	Description
	Strings (see page 24390)	This string list defines the list of name/value pairs.

173.1.63.5.1 TCustomStringsValuesList.Strings Property

This string list defines the list of name/value pairs.

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

Each line in the string list represents a name/value pair. The name is optional. To specify a name/value enter a line with the name following by "=" followed by the value. For example, "Joe Smith=EMP111" is a named value. "EMP111" is an unnamed value.

173.1.63.5.2 TCustomStringsValuesList.StringsPrepared Property

This flag indicates whether the strings list has been prepared or customized.

Pascal

```
property StringsPrepared: Boolean;
```

C++

```
__property Boolean StringsPrepared;
```

Description

This flag is checked before calling PrepareStrings (see page 24390).

See Also

PrepareStrings (see page 24390)

173.1.63.6 TCustomStringsValuesList Events

The events of the TCustomStringsValuesList class are listed here.

Public Events

	Name	Description
	OnPrepareStrings (see page 24391)	Implement OnPrepareStrings to customize the content of the strings list.

173.1.63.6.1 TCustomStringsValuesList.OnPrepareStrings Event

Implement OnPrepareStrings to customize the content of the strings list.

Pascal

```
property OnPrepareStrings: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareStrings;
```

Description

OnPrepareStrings is called before the name/value pairs are retrieved by server-side script.

See Also

TNotifyEvent (see page 3298)

PrepareStrings (see page 24390)

173.1.64 TDefaultFieldsAdapter Class

TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.

Class Hierarchy

Pascal

```
TDefaultFieldsAdapter = class(TCustomAdapter);
```

C++

```
class TDefaultFieldsAdapter : public TCustomAdapter;
```

File

WebAdapt

Description

Derive from TDefaultFieldsAdapter to define adapter components that automatically add adapter field and/or adapter action components. Default fields are added to the adapter unless one or more field has been explicitly added.

Default actions are added to the adapter unless one or more action has been explicitly added.

See Also

TCustomAdapter (see page 24139)

173.1.64.1 TDefaultFieldsAdapter Members

The following tables list the members exposed by TDefaultFieldsAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
