	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.

	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.

	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.64.2 TDefaultFieldsAdapter Methods

The methods of the TDefaultFieldsAdapter class are listed here.

Protected Methods

	Name	Description
	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.

173.1.64.2.1 TDefaultFieldsAdapter.AddDefaultActions Method

Adds default action components to this adapter.

Pascal

```
procedure AddDefaultActions(AComponents: TWebComponentList); virtual;
```

C++

```
virtual __fastcall AddDefaultActions(TWebComponentList AComponents);
```

Description

AddDefaultActions calls ImplGetActionsList (see page 24165). Descendant classes should override TCustomAdapter (see page 24139)'s ImplGetActionsList (see page 24165) method to provide the list of default actions that will be automatically added to this adapter.

See Also

TWebComponentList (see page 24708)

ImplGetActionsList (see page 24165)

173.1.64.2.2 TDefaultFieldsAdapter.AddDefaultFields Method

Adds default field components to this adapter.

Pascal

```
procedure AddDefaultFields(AComponents: TWebComponentList); virtual;
```

C++

```
virtual __fastcall AddDefaultFields(TWebComponentList AComponents);
```

Description

AddDefaultFields calls ImplGetFieldList. Descendant classes should override TCustomAdapter (see page 24139)'s ImplGetFieldList method to provide the list of default fields that will be automatically added to this adapter.

See Also

TWebComponentList (see page 24708)

ImplGetFieldsList (see page 24165)

173.1.64.2.3 TDefaultFieldsAdapter.DefaultWebComponentsChange Method

Notifies other components of changes to the list of default actions or fields.

Pascal

```
procedure DefaultWebComponentsChange(Sender: TObject);
```

C++

```
__fastcall DefaultWebComponentsChange(TObject * Sender);
```

Description

The list of default fields or actions may be based on properties of the adapter or properties of other components. For example, the default fields of TDataSetAdapter are based on the fields in the dataset. If the TDataSetAdapter references a different dataset then the default fields list will change. If the dataset's field list changes then TDataSetAdapter's default fields will change. DefaultWebCompoentsChange is called in these circumstances so that components that are using this adapter can be notified of changes to the list of fields or actions. DefaultWebComponentsChange calls NotifyAdapterChange (see page 24174).

See Also

NotifyAdapterChange (see page 24174)

173.1.64.2.4 TDefaultFieldsAdapter.GetActionsClass Method

Specifies the class to create as a container for adapter actions components.

Pascal

```
function GetActionsClass: TAdapterActionsClass; override;
```

C++

```
virtual __fastcall TAdapterActionsClass GetActionsClass();
```

Description

GetActionsClass returns TAdapterDefaultActions (see page 23770).

See Also

TAdapterDefaultActions (see page 23770)

173.1.64.2.5 TDefaultFieldsAdapter.GetDataClass Method

Specifies the class to create as a container for adapter field components.

Pascal

```
function GetDataClass: TAdapterFieldsClass; override;
```

C++

```
virtual __fastcall TAdapterFieldsClass GetDataClass();
```

Description

GetDataClass returns TAdapterDefaultFields (see page 23778).

See Also

TAdapterDefaultFields (see page 23778)

173.1.64.2.6 TDefaultFieldsAdapter.ImplGetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function ImplGetVisibleActions: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleActions();
```

Description

ImplGetVisibleActions returns a list of actions that have been added to the adapter. If no adapter fields have been explicitly added, ImplGetVisibleActions returns a list containing all default actions.

See Also

TWebComponentList (see page 24708)

ImplGetVisibleActions (see page 24167)

173.1.64.2.7 TDefaultFieldsAdapter.ImplGetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function ImplGetVisibleFields: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleFields();
```

Description

ImplGetVisibleFields returns a list of fields that have been added to the adapter. If no adapter fields have been explicitly added, ImplGetVisibleFields returns a list containing all default fields.

See Also

TWebComponentList (see page 24708)

ImplGetVisibleFields (see page 24167)

173.1.64.2.8 TDefaultFieldsAdapter.ImplSetActions Method

Initializes the Actions (see page 24402) property.

Pascal

```
procedure ImplSetActions(const Value: TAdapterSubComponent); override;
```

C++

```
virtual __fastcall ImplSetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 24402) property is the container for adapter action components.

See Also

ImplSetActions (see page 24170)

173.1.64.2.9 TDefaultFieldsAdapter.ImplSetData Method

Initializes the Data (see page 24402) property.

Pascal

```
procedure ImplSetData(const Value: TAdapterSubComponent); override;
```

C++

```
virtual __fastcall ImplSetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 24402) property is the container for adapter field components.

See Also

ImplSetData (see page 24171)

173.1.64.3 TDefaultFieldsAdapter Properties

The properties of the TDefaultFieldsAdapter class are listed here.

Public Properties

	Name	Description
R	Actions (see page 24402)	Container for adapter actions components.
R	Data (see page 24402)	Container for adapter field components.

173.1.64.3.1 TDefaultFieldsAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterDefaultActions;
```

C++

```
__property TAdapterDefaultActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.64.3.2 TDefaultFieldsAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterDefaultFields;
```

C++

```
__property TAdapterDefaultFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.65 TDefaultFieldsPagedAdapter Class

TDefaultFieldsPagedAdapter is a base class for adapters that support paging.

Class Hierarchy

Pascal

```
TDefaultFieldsPagedAdapter = class(TDefaultFieldsAdapter);
```

C++

```
class TDefaultFieldsPagedAdapter : public TDefaultFieldsAdapter;
```

File

WebAdapt

Description

Enable paging by setting the PageSize (see page 24419) property. When paging is enabled, the way that the adapter enumerates records is affected. The adapter calculates the number of pages by dividing the number of records by the page size. It keeps track of a current page number. When the enumerating records, the records on the current page are enumerated. Server-side script simply enumerates the records. Server-side script does not need to be aware of the page size or current page number. When paging is enabled, default actions for moving between pages are automatically added to the adapter.

See Also

TDefaultFieldsAdapter (see page 24392)

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

173.1.65.1 TDefaultFieldsPagedAdapter Members

The following tables list the members exposed by TDefaultFieldsPagedAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24411)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	EncodeActionParams (see page 24411)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 24412)	Indicates whether the record index has gone past the last record in the current page.
	ExtractRequestParams (see page 24412)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEOF (see page 24412)	Indicates whether the record position has passed the last record.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetFirstRecord (see page 24413)	Set the record position to the first record.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetNextRecord (see page 24413)	Increments the record position.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPageCount (see page 24413)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 24414)	Returns the total number of records.
	GetRecordIndex (see page 24414)	Returns the index of the current record.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.

	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 24415)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
V	ImplEndIterator (see page 24415)	Implements IteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 24415)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 24166)	Returns an action or field.
V	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
V	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 24416)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 24416)	Clears the current page variable.
V	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
V	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
V	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
V	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
V	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 24416)	Implements IteratorSupport.StartIterator (see page 24176) to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.

	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetPageSize (see page 24417)	Updates the pagesize variable.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SkipToPage (see page 24417)	Skips records until the current record is within the current page.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 24420)	Implement this event to indicate when the current record index has exceeded the total record count.

	OnGetFirstRecord (see page 24420)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24421)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 24421)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 24421)	Implement this event to identify the zero-based current record.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.

	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentPage (see page 24418)	Sets or gets the current page index.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PageCount (see page 24418)	Calculates the number of pages needed to display all adapter records.
	PageSize (see page 24419)	Sets or gets the page size variable.
R	RecordCount (see page 24419)	Returns the total number of records.
R	RecordIndex (see page 24419)	Returns the index of the current record.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.65.2 TDefaultFieldsPagedAdapter Methods

The methods of the TDefaultFieldsPagedAdapter class are listed here.

Protected Methods

	Name	Description
V	AddDefaultActions (see page 24411)	Adds default action components to this adapter.
V	EncodeActionParams (see page 24411)	Writes name/value pairs that represent adapter state.
	EndOfPage (see page 24412)	Indicates whether the record index has gone past the last record in the current page.

	ExtractRequestParams (see page 24412)	Reads name/value pairs from the HTTP request.
	GetEOF (see page 24412)	Indicates whether the record position has passed the last record.
	GetFirstRecord (see page 24413)	Set the record position to the first record.
	GetNextRecord (see page 24413)	Increments the record position.
	GetPageCount (see page 24413)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 24414)	Returns the total number of records.
	GetRecordIndex (see page 24414)	Returns the index of the current record.
	ImplCanAddActionClass (see page 24415)	Indicates whether a type of adapter action can be added to this adapter.
	ImplEndIterator (see page 24415)	Implements IteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplGetActionsList (see page 24415)	Provides a list of action types that can be added to this adapter.
	ImplNextIteration (see page 24416)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyDeactivate (see page 24416)	Clears the current page variable.
	ImplStartIterator (see page 24416)	Implements IteratorSupport.StartIterator (see page 24176) to support iterating over the records of the adapter.
	SetPageSize (see page 24417)	Updates the pagesize variable.
	SkipToPage (see page 24417)	Skips records until the current record is within the current page.

173.1.65.2.1 TDefaultFieldsPagedAdapter.AddDefaultActions Method

Adds default action components to this adapter.

Pascal

```
procedure AddDefaultActions(AComponents: TWebComponentList); override;
```

C++

```
virtual __fastcall AddDefaultActions(TWebComponentList AComponents);
```

Description

AddDefaultActions adds TAdapterNextPageAction (see page 23945), TAdapterGotoPageAction (see page 23849), and TAdapterPrevPageAction (see page 23979).

See Also

TWebComponentList (see page 24708)

TAdapterNextPageAction (see page 23945)

TAdapterGotoPageAction (see page 23849)

TAdapterPrevPageAction (see page 23979)

173.1.65.2.2 TDefaultFieldsPagedAdapter.EncodeActionParams Method

Writes name/value pairs that represent adapter state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

ExtractRequestParams (see page 24412) writes the current page number as a name/value pair.

See Also

ExtractRequestParams (see page 24153)

ExtractRequestParams (see page 24412)

173.1.65.2.3 TDefaultFieldsPagedAdapter.EndOfPage Method

Indicates whether the record index has gone past the last record in the current page.

Pascal

```
function EndOfPage: Boolean;
```

C++

```
__fastcall Boolean EndOfPage();
```

Description

EndOfPage tests for the end of page using PageSize (see page 24419), RecordIndex (see page 24419), and CurrentPage (see page 24418).

See Also

PageSize (see page 24419)

RecordIndex (see page 24419)

PageSize (see page 24419)

CurrentPage (see page 24418)

173.1.65.2.4 TDefaultFieldsPagedAdapter.ExtractRequestParams Method

Reads name/value pairs from the HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); override;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams is called by a child adapter action before executing the action. This gives the adapter an opportunity to extract values from the HTTP request that are important to the behavior of the adapter. ExtractRequestParams extracts the current page number from the request.

See Also

EncodeActionParams (see page 24411)

ExtractRequestParams (see page 24153)

173.1.65.2.5 TDefaultFieldsPagedAdapter.GetEOF Method

Indicates whether the record position has passed the last record.

Pascal

```
function GetEOF: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetEOF();
```

Description

GetEOF calls the OnGetFirstRecord (see page 24420) event handler. If OnGetFirstRecord (see page 24420) is not implemented then the RecordIndex (see page 24419) is compared to the RecordCount (see page 24419). Descendant classes may override this method. For example, TDataSetAdapter tests the dataset's EOF.

See Also

OnGetEOF (see page 24420)

RecordIndex (see page 24419)

RecordCount (see page 24419)

173.1.65.2.6 TDefaultFieldsPagedAdapter.GetFirstRecord Method

Set the record position to the first record.

Pascal

```
function GetFirstRecord: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetFirstRecord();
```

Description

GetFirstRecord calls the OnGetFirstRecord (see page 24420) event handler. Descendant classes may override this method. For example, TDataSetAdapter sets the record position of a dataset.

See Also

OnGetFirstRecord (see page 24420)

173.1.65.2.7 TDefaultFieldsPagedAdapter.GetNextRecord Method

Increments the record position.

Pascal

```
function GetNextRecord: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetNextRecord();
```

Description

GetNextRecord calls the OnGetNextRecord (see page 24421) event handler. Descendant classes may override this method. For example, TDataSetAdapter increments the record position of a dataset.

See Also

OnGetNextRecord (see page 24421)

173.1.65.2.8 TDefaultFieldsPagedAdapter.GetPageCount Method

Calculates the number of pages needed to display all adapter records.

Pascal

```
function GetPageCount: Integer;
```

C++

```
__fastcall int GetPageCount();
```

Description

GetPageCount calculates the page count using PageCount (see page 24418), PageSize (see page 24419), and RecordCount (see page 24419).

See Also

RecordCount (see page 24419)

PageCount (see page 24418)

PageSize (see page 24419)

173.1.65.2.9 TDefaultFieldsPagedAdapter.GetRecordCount Method

Returns the total number of records.

Pascal

```
function GetRecordCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

GetRecordCount calls the OnGetRecordCount (see page 24421) event handler. Descendant classes may override this method. For example, TDataSetAdapter returns the number of records in the dataset.

See Also

OnGetRecordCount (see page 24421)

RecordCount (see page 24419)

173.1.65.2.10 TDefaultFieldsPagedAdapter.GetRecordIndex Method

Returns the index of the current record.

Pascal

```
function GetRecordIndex: Integer; virtual;
```

C++

```
virtual __fastcall int GetRecordIndex();
```

Description

GetRecordIndex calls the OnGetRecordIndex (see page 24421) event handler.

See Also

OnGetRecordIndex (see page 24421)

173.1.65.2.11 TDefaultFieldsPagedAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass allows action classes that derive from TCustomPagedAdapterAction (see page 24371) in addition to those allowed by TCustomAdapter (see page 24139)'s ImplCanAddActionsClass method.

See Also

ImplCanAddActionClass (see page 24163)

ImplCanAddClass (see page 23743)

TCustomPagedAdapterAction (see page 24371)

173.1.65.2.12 TDefaultFieldsPagedAdapter.ImplEndIterator Method

Implements IteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

EndIterator (see page 24152) is called when record iteration is complete.

See Also

enditerator (see page 19723)

173.1.65.2.13 TDefaultFieldsPagedAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList lists PrevPage, GotoPage, and NextPage actions.

See Also

TAdapterNextPageAction (see page 23945)

TAdapterGotoPageAction (see page 23849)

TAdapterPrevPageAction (see page 23979)

ImplGetActionsList (see page 24165)

173.1.65.2.14 TDefaultFieldsPagedAdapter.ImplNextIteration Method

Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration calls GetNextRecord (see page 24413) if the RecordIndex (see page 24419) can be incremented without running past the end of the current page. false is returned if RecordIndex (see page 24419) can't be incremented.

See Also

NextIteration (see page 19723)

RecordIndex (see page 24419)

RecordCount (see page 24419)

GetNextRecord (see page 24413)

GetEOF (see page 24412)

EndOfPage (see page 24412)

173.1.65.2.15 TDefaultFieldsPagedAdapter.ImplNotifyDeactivate Method

Clears the current page variable.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The current page is reset to zero when the module is deactivated. This ensures that the current page set during the processing of an HTTP request will not affect another HTTP request. To keep track of the current page for a particular end-user, the current page is typically passed between end-user requests using action parameters.

See Also

ImplNotifyDeactivate (see page 24170)

EncodeActionParams (see page 24411)

ExtractRequestParams (see page 24412)

173.1.65.2.16 TDefaultFieldsPagedAdapter.ImplStartIterator Method

Implements IteratorSupport.StartIterator (see page 24176) to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator locates the first record in the current page using the GetFirstRecord (see page 24413) and SkipToPage (see page 24417) methods.

See Also

startiterator (see page 19724)

ImplNextIteration (see page 24416)

GetFirstRecord (see page 24413)

SkipToPage (see page 24417)

CurrentPage (see page 24418)

173.1.65.2.17 TDefaultFieldsPagedAdapter.SetPageSize Method

Updates the pagesize variable.

Pascal

```
procedure SetPageSize(const Value: Integer);
```

C++

```
__fastcall SetPageSize(const int Value);
```

Description

If the pagesize variable is not zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the pagesize variable is changed back to zero then the these actions are removed.

See Also

PageSize (see page 24419)

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

173.1.65.2.18 TDefaultFieldsPagedAdapter.SkipToPage Method

Skips records until the current record is within the current page.

Pascal

```
procedure SkipToPage;
```

C++

```
__fastcall SkipToPage();
```

Description

SkipToPage calls GetNextRecord (see page 24413) to reach the first record in the current page.

See Also

CurrentPage (see page 24418)

GetNextRecord (see page 24413)

173.1.65.3 TDefaultFieldsPagedAdapter Properties

The properties of the TDefaultFieldsPagedAdapter class are listed here.

Public Properties

	Name	Description
	CurrentPage (see page 24418)	Sets or gets the current page index.
R	PageCount (see page 24418)	Calculates the number of pages needed to display all adapter records.
	PageSize (see page 24419)	Sets or gets the page size variable.
R	RecordCount (see page 24419)	Returns the total number of records.
R	RecordIndex (see page 24419)	Returns the index of the current record.

173.1.65.3.1 TDefaultFieldsPagedAdapter.CurrentPage Property

Sets or gets the current page index.

Pascal

```
property CurrentPage: Integer;
```

C++

```
__property int CurrentPage;
```

Description

Current page is a zero-based index that must be less than PageCount (see page 24418). Current page is used by the NextPage, GotoPage, and PrevPage actions to move between page.

See Also

PageCount (see page 24418)

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

EncodeActionParams (see page 24411)

ExtractRequestParams (see page 24412)

173.1.65.3.2 TDefaultFieldsPagedAdapter.PageCount Property

Calculates the number of pages needed to display all adapter records.

Pascal

```
property PageCount: Integer;
```

C++

```
__property int PageCount;
```

Description

PageCount returns the result of GetPageCount (see page 24413).

See Also

GetPageCount (see page 24413)

RecordCount (see page 24419)

PageCount

PageSize (see page 24419)

173.1.65.3.3 TDefaultFieldsPagedAdapter.PageSize Property

Sets or gets the page size variable.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

If the page size variable is set to a value greater than zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the page size variable is changed back to zero then the these actions are removed.

See Also

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

173.1.65.3.4 TDefaultFieldsPagedAdapter.RecordCount Property

Returns the total number of records.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

The RecordCount property returns the result of GetRecordCount (see page 24414).

See Also

GetRecordCount (see page 24414)

173.1.65.3.5 TDefaultFieldsPagedAdapter.RecordIndex Property

Returns the index of the current record.

Pascal

```
property RecordIndex: Integer;
```

C++

```
__property int RecordIndex;
```

Description

RecordIndex returns the result of GetRecordIndex (see page 24414).

See Also

OnGetRecordIndex (see page 24421)

GetRecordIndex (see page 24414)

173.1.65.4 TDefaultFieldsPagedAdapter Events

The events of the TDefaultFieldsPagedAdapter class are listed here.

Public Events

	Name	Description
	OnGetEOF (see page 24420)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 24420)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24421)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 24421)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 24421)	Implement this event to identify the zero-based current record.

173.1.65.4.1 TDefaultFieldsPagedAdapter.OnGetEOF Event

Implement this event to indicate when the current record index has exceeded the total record count.

Pascal

```
property OnGetEOF: TGetEOFEvent;
```

C++

```
__property TGetEOFEvent OnGetEOF;
```

Description

OnGetEOF is called to determine when to stop the iteration. If OnGetEOF is not implemented, the result of the OnGetRecordCount (see page 24421) event handler will be compared to the result of the OnGetRecordIndex (see page 24421) event handler.

173.1.65.4.2 TDefaultFieldsPagedAdapter.OnGetFirstRecord Event

Implement this method to initialize the iteration index to zero.

Pascal

```
property OnGetFirstRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetFirstRecord;
```

Description

This method is called when the iteration is started. If there are no records then set the EOF flag.

173.1.65.4.3 TDefaultFieldsPagedAdapter.OnGetNextRecord Event

Implement this method to increment the iteration index.

Pascal

```
property OnGetNextRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetNextRecord;
```

Description

This method is called when the next record is requested. This method is not a next then set the EOF flag.

173.1.65.4.4 TDefaultFieldsPagedAdapter.OnGetRecordCount Event

Implement this event to identify the total number of records that can be iterated.

Pascal

```
property OnGetRecordCount: TGetRecordCountEvent;
```

C++

```
__property TGetRecordCountEvent OnGetRecordCount;
```

Description

OnGetRecordCount is called to calculate the number of pages.

173.1.65.4.5 TDefaultFieldsPagedAdapter.OnGetRecordIndex Event

Implement this event to identify the zero-based current record.

Pascal

```
property OnGetRecordIndex: TGetRecordIndexEvent;
```

C++

```
__property TGetRecordIndexEvent OnGetRecordIndex;
```

Description

OnGetRecordIndex is called to calculate the current page.

173.1.66 TEndUserAdapter Class

TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy

Pascal

```
TEndUserAdapter = class(TCustomEndUserAdapter);
```

C++

```
class TEndUserAdapter : public TCustomEndUserAdapter;
```

File

WebAdapt

Description

Add TEndUserSessionAdapter (see page 24458) to a WebSnap application where users must log in before accessing Web pages. TEndUserSessionAdapter (see page 24458) handles login and logout actions on behalf of the end user by generating events where you can retrieve user information and execute user actions

TEndUserAdapter supports two default Adapter fields: DisplayName and LoggedIn. These fields provide access to the user's name and login state. Implement the OnGetDisplayName (see page 24434) and OnIsLoggedIn (see page 24434) events to provide values for these fields.

TEndUserAdapter contains two default actions: LoginForm and LogoutOut. These actions are used to display a login form and to

log the user out. Use the LoginPage (see page 24431) property to specify the name of the login page. Implement the OnLogin (see page 24435) and OnLogout (see page 24436) events to change the login state of an end user.

The EndUser script variable is used to by server-side script to display end user information and execute end user actions. The following JavaScript displays the name of the logged in end user, if any.

```
<% if (EndUser.LoggedIn) { %>
<h1>Welcome <%= EndUser.DisplayName %> </h1>
<% } %>
```

The following JavaScript displays a login or logout hyperlink.

```
<%   if (EndUser.Logout.Enabled) { %>
  <a href="<%=EndUser.Logout.AsHREF%>">Logout</a>
<%   } %>
<%   if (EndUser.LoginForm.Enabled) { %>
  <a href=<%=EndUser.LoginForm.AsHREF%>>Login</a>
<%   } %>
```

TEndUserAdapter also determines access rights for a user. If the WebSnap application contains a TWebUserList or equivalent, TEndUserAdapter calls the TWebUserList component to check rights for a particular user ID. Implement the OnHasRights (see page 24434) event to check rights in an event handler.

173.1.66.1 TEndUserAdapter Members

The following tables list the members exposed by TEndUserAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
V	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	ExecuteLogin (see page 24108)	Starts the server-side login process.
	ExecuteLogin (see page 24321)	Generates an OnLogin (see page 24325) event.
	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
	ExecuteLogout (see page 24108)	Performs server-side logout.
	ExecuteLogout (see page 24322)	Generates an OnLogout (see page 24326) event.
	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 24109)	Retrieves the display name string.
	GetDisplayNameValue (see page 24109)	Gets the display name of the end user.
	GetDisplayNameValue (see page 24322)	Generates an OnGetDisplayName (see page 24324) event.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
	GetLoggedInValue (see page 24110)	Determines if the user is logged in.
	GetLoggedInValue (see page 24323)	Generates an OnIsLoggedIn (see page 24324) event.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
	GetOwner (see page 2778)	Returns the owner of a component.

	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserID (see page 24111)	Gets the UserID from this TBaseEndUserAdapter (see page 24097).
	GetUserID (see page 24323)	Generates an OnGetUserID (see page 24324) event.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.

	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogIn (see page 24117)	Logs in a specified user.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24117)	Generates the login page.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.

	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24118)	Gets the user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetUserID (see page 24324)	Occurs when the adapter needs to provide the ID of the current end user.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).

	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.

	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LogIn (see page 24677)	Logs in a specified user.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.

	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24432)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24432)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24433)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24433)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24433)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 24434)	Occurs when the adapter needs to provide the name of the current end user.
	OnHasRights (see page 24434)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 24434)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 24435)	Logs in the current end user.
	OnLogout (see page 24436)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 24436)	Allows implementation of a customized login page.

Published Properties

	Name	Description
	Actions (see page 24431)	Container for adapter actions components.
	Data (see page 24431)	Container for adapter field components.
	LoginPage (see page 24431)	Specifies the name of the page that acts as the login page.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.66.2 TEndUserAdapter Properties

The properties of the TEndUserAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 24431)	Container for adapter actions components.
	Data (see page 24431)	Container for adapter field components.
	LoginPage (see page 24431)	Specifies the name of the page that acts as the login page.

173.1.66.2.1 TEndUserAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.66.2.2 TEndUserAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.66.2.3 TEndUserAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property AnsiString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter. The name of the login page is the name of the Web page module that generates the login page.

173.1.66.3 TEndUserAdapter Events

The events of the TEndUserAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24432)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24432)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24433)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24433)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24433)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 24434)	Occurs when the adapter needs to provide the name of the current end user.
	OnHasRights (see page 24434)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 24434)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 24435)	Logs in the current end user.
	OnLogout (see page 24436)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 24436)	Allows implementation of a customized login page.

173.1.66.3.1 TEndUserAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.66.3.2 TEndUserAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.66.3.3 TEndUserAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.66.3.4 TEndUserAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.66.3.5 TEndUserAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.66.3.6 TEndUserAdapter.OnGetDisplayName Event

Occurs when the adapter needs to provide the name of the current end user.

Pascal

```
property OnGetDisplayName: TEndUserGetNameEvent;
```

C++

```
__property TEndUserGetNameEvent OnGetDisplayName;
```

Description

Write an OnGetDisplayName event handler to provide the value of the DisplayName field. When a server-side script (or a caller of the IWebEndUser interface) requests the display name for the current end user, TCustomEndUserAdapter generates an OnGetDisplayName event to retrieve that value.

Note: If you do not supply an OnGetDisplayName event handler, TCustomEndUserAdapter always returns an empty string as the display name for the current end user.

See Also

DisplayName (see page 24678)

EndUser (see page 24657)

WebContext (see page 24687)

173.1.66.3.7 TEndUserAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 24107)

ImplHasExecuteRights (see page 24115)

ImplHasModifyRights (see page 24116)

ImplHasViewRights (see page 24116)

173.1.66.3.8 TEndUserAdapter.OnIsLoggedIn Event

Occurs when the adapter needs to indicate whether the current end user has logged in.

Pascal

```
property OnIsLoggedIn: TEndUserIsLoggedInEvent;
```

C++

```
__property TEndUserIsLoggedInEvent OnIsLoggedIn;
```

Description

Write an OnIsLoggedIn event handler to provide the value of the LoggedIn field. When a server-side script (or a caller of the IWebEndUser interface) inquires whether the current user has logged in, TCustomEndUserAdapter generates an OnIsLoggedIn event to retrieve that information.

Note: If you do not supply an OnIsLoggedIn event handler, TCustomEndUserAdapter always returns false, indicating that the current end user has not logged in.

See Also

LoggedIn (see page 24678)

EndUser (see page 24657)

WebContext (see page 24687)

OnLogin (see page 24325)

OnLogout (see page 24326)

173.1.66.3.9 TEndUserAdapter.OnLogin Event

Logs in the current end user.

Pascal

```
property OnLogin: TEndUserUserIDEvent;
```

C++

```
__property TEndUserUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to allow the TCustomEndUserAdapter object to log users in. When a server-side script (or a caller of the IWebEndUser interface) attempts to log in a user, TCustomEndUserAdapter generates an OnLogin event to perform whatever steps are involved in the login process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter does nothing to log users in.

See Also

LogIn (see page 24677)

EndUser (see page 24657)

WebContext (see page 24687)

OnIsLoggedIn (see page 24324)

OnLogout (see page 24326)

TWebUserList (see page 25625)

OnGetUserID (see page 24324)

173.1.66.3.10 TEndUserAdapter.OnLogout Event

Occurs when the current user logs out.

Pascal

```
property OnLogout: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLogout;
```

Description

Write an OnLogout event handler to allow the TCustomEndUserAdapter object to log users out. When a server-side script attempts to log a user out, TCustomEndUserAdapter generates an OnLogout event to perform whatever steps are involved in the logout process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter does nothing to log users out.

See Also

OnIsLoggedIn (see page 24324)

OnLogin (see page 24325)

173.1.66.3.11 TEndUserAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage. If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 24117)

ProduceLoginPage (see page 24117)

CanProduceLoginPage (see page 24107)

173.1.67 TEndUserAdapterLoginFormAction Class

TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.

Class Hierarchy

Pascal

```
TEndUserAdapterLoginFormAction = class(TCustomEndUserAdapterAction);
```

C++

```
class TEndUserAdapterLoginFormAction : public TCustomEndUserAdapterAction;
```

File

WebAdapt

Description

This adapter action is typically executed when the end-user clicks on a "Login" hyperlink displayed at the top of a web page. The parent adapter's LoginPage property is used to specify the page displayed when this adapter action is executed.

See Also

TCustomEndUserAdapterAction (see page 24326)

TBaseEndUserAdapter (see page 24097)

TLoginFormAdapter (see page 24500)

TBaseEndUserAdapter (see page 24097)

173.1.67.1 TEndUserAdapterLoginFormAction Members

The following tables list the members exposed by TEndUserAdapterLoginFormAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24443)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.

	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24443)	Executes the adapter action.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24444)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24333)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.

R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 24445)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24445)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24446)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24446)	Called before the adapter action response is generated.
	OnGetParams (see page 24447)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 24444)	Suggests a display label for this adapter action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.67.2 TEndUserAdapterLoginFormAction Methods

The methods of the TEndUserAdapterLoginFormAction class are listed here.

Protected Methods

	Name	Description
V	GetDefaultActionName (see page 24443)	Gets the name used to reference this adapter action with server-side script.
V	ImplExecuteActionRequest (see page 24443)	Executes the adapter action.
V	ImplWebEnabled (see page 24444)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.67.2.1 TEndUserAdapterLoginFormAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns "LoginForm".

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.67.2.2 TEndUserAdapterLoginFormAction.ImplExecuteActionRequest Method

Executes the adapter action.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest calls the parent adapter's ExecuteLogin method. If an exception is raised, the exception message is added to the parent adapter's errors object.

See Also

IActionRequest (see page 935)

IActionResponse (see page 941)

ImplExecuteActionRequest (see page 24063)

ExecuteLogin (see page 24108)

Errors (see page 24182)

173.1.67.2.3 TEndUserAdapterLoginFormAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of the parent adapter's CanExecuteLoginForm function.

See Also

CanExecuteLoginForm (see page 24106)

WebEnabled (see page 24071)

173.1.67.3 TEndUserAdapterLoginFormAction Properties

The properties of the TEndUserAdapterLoginFormAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 24444)	Suggests a display label for this adapter action.

173.1.67.3.1 TEndUserAdapterLoginFormAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.67.4 TEndUserAdapterLoginFormAction Events

The events of the TEndUserAdapterLoginFormAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 24445)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24445)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24446)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24446)	Called before the adapter action response is generated.
	OnGetParams (see page 24447)	Specifies name/value pairs needed to execute this adapter action.

173.1.67.4.1 TEndUserAdapterLoginFormAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.67.4.2 TEndUserAdapterLoginFormAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.67.4.3 TEndUserAdapterLoginFormAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.67.4.4 TEndUserAdapterLoginFormAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.67.4.5 TEndUserAdapterLoginFormAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 24063)

173.1.68 TEndUserAdapterLogoutAction Class

TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.

Class Hierarchy

Pascal

```
TEndUserAdapterLogoutAction = class(TCustomEndUserAdapterAction);
```

C++

```
class TEndUserAdapterLogoutAction : public TCustomEndUserAdapterAction;
```

File

WebAdapt

Description

This action is typically executed when the end-user clicks on a "Logout" hyperlink displayed at the top of a web page.

173.1.68.1 TEndUserAdapterLogoutAction Members

The following tables list the members exposed by TEndUserAdapterLogoutAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24454)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
V	ImplExecuteActionRequest (see page 24454)	Executes the adapter action.
V	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.

	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24063)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 24196)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24455)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24333)	Returns the parent adapter of this adapter action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 24456)	Called after the adapter action has executed.

	OnAfterGetResponse (see page 24456)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24457)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24457)	Called before the adapter action response is generated.
	OnGetParams (see page 24458)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 24455)	Suggests a display label for this adapter action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.68.2 TEndUserAdapterLogoutAction Methods

The methods of the TEndUserAdapterLogoutAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 24454)	Gets the name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 24454)	Executes the adapter action.
	ImplWebEnabled (see page 24455)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

173.1.68.2.1 TEndUserAdapterLogoutAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns "Logout".

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.68.2.2 TEndUserAdapterLogoutAction.ImplExecuteActionRequest Method

Executes the adapter action.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest calls the parent adapter's ExecuteLogout method. If an exception is raised, the exception message is added to the parent adapter's errors object.

See Also

IActionRequest (see page 935)

IActionResponse (see page 941)

ImplExecuteActionRequest (see page 24063)

ExecuteLogout (see page 24108)

Errors (see page 24182)

173.1.68.2.3 TEndUserAdapterLogoutAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of the parent adapter's CanExecuteLogout function.

See Also

CanExecuteLogout (see page 24107)

WebEnabled (see page 24071)

173.1.68.3 TEndUserAdapterLogoutAction Properties

The properties of the TEndUserAdapterLogoutAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 24455)	Suggests a display label for this adapter action.

173.1.68.3.1 TEndUserAdapterLogoutAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side

script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.68.4 TEndUserAdapterLogoutAction Events

The events of the TEndUserAdapterLogoutAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 24456)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24456)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24457)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24457)	Called before the adapter action response is generated.
	OnGetParams (see page 24458)	Specifies name/value pairs needed to execute this adapter action.

173.1.68.4.1 TEndUserAdapterLogoutAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.68.4.2 TEndUserAdapterLogoutAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by

DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.68.4.3 TEndUserAdapterLogoutAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.68.4.4 TEndUserAdapterLogoutAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.68.4.5 TEndUserAdapterLogoutAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

ImplGetAdapterItemRequestParams (see page 24063)

173.1.69 TEndUserSessionAdapter Class

TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy

Pascal

```
TEndUserSessionAdapter = class(TCustomEndUserSessionAdapter);
```

C++

```
class TEndUserSessionAdapter : public TCustomEndUserSessionAdapter;
```

File

WebAdapt

Description

Add TEndUserSessionAdapter to a WebSnap application where users must log in before accessing Web pages. TEndUserSessionAdapter handles login and logout actions on behalf of the end user. TEndUserSessionAdapter uses the TSessionsService component to store information about the current end user. The WebSnap application must contain a TSessionsService component (or equivalent) in order for the TEndUserSessionAdapter to work properly.

TEndUserSessionAdapter supports two default Adapter fields: DisplayName and LoggedIn. These fields provide access to the user's name and login state. TEndUserSessionAdapter retrieves the values for these fields from a Web session, which is maintained by the TSessionsService component.

TEndUserSessionAdapter supports two default actions: LoginForm and LogoutOut. These actions are used to display a login form and to log the user out. Use the LoginPage (see page 24468) property to specify the name of the login page. The default implementation of the logout action terminates the session.

The EndUser script variable is used by server-side script to display end user information and execute end user actions. The following JavaScript displays the name of the logged in end user, if any.

```
<% if (EndUser.LoggedIn) { %>
<h1>Welcome <%= EndUser.DisplayName %> </h1>
<% } %>
```

The following JavaScript displays a login or logout hyperlink.

```
<%   if (EndUser.Logout.Enabled) { %>
  <a href="<%=EndUser.Logout.AsHREF%>">Logout</a>
<%   } %>
<%   if (EndUser.LoginForm.Enabled) { %>
  <a href=<%=EndUser.LoginForm.AsHREF%>>Login</a>
<%   } %>
```

TEndUserSessionAdapter also determines access rights for a user. If the WebSnap application contains a TWebUserList or equivalent, TEndUserAdapter (see page 24421) calls the TWebUserList component to check rights for a particular user ID. Implement the OnHasRights (see page 24471) event to check rights in an event handler.

Adding Login Support

173.1.69.1 TEndUserSessionAdapter Members

The following tables list the members exposed by TEndUserSessionAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.

	CanExecuteLoginForm (see page 24106)	Determines if there is a static login page.
	CanExecuteLogout (see page 24107)	Determines if the user is logged in.
	CanProduceLoginPage (see page 24107)	Determines whether there is a static login page or an automatically produced login page.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoOnHasRights (see page 24107)	Determines whether the user has view rights.
	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	ExecuteLogin (see page 24108)	Starts the server-side login process.
	ExecuteLogin (see page 24342)	Logs in an end user.
	ExecuteLoginForm (see page 24108)	Creates the HTML login page.
	ExecuteLogout (see page 24108)	Performs server-side logout.
	ExecuteLogout (see page 24342)	Logs out the current user.
	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 24109)	Retrieves the display name string.
	GetDisplayNameValue (see page 24109)	Gets the display name of the end user.
	GetDisplayNameValue (see page 24343)	Returns the name of the current end user.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 24109)	Gets the end-user adapter.

	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 24110)	Determines if the user is logged in
	GetLoggedInValue (see page 24110)	Determines if the user is logged in.
	GetLoggedInValue (see page 24343)	Indicates whether the current end user has logged in.
	GetLoginFormAction (see page 24110)	Gets the action component for the login form.
	GetLogoutAction (see page 24111)	Gets the action component for the logout form.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetUserID (see page 24111)	Gets the UserID from this TBaseEndUserAdapter (see page 24097).
	GetUserID (see page 24343)	Returns the user ID of the current user.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 24111)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 24097).
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 24112)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 24097).
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 24112)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 24097).
	ImplCanAddActionClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24113)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24113)	Lists supported end-user adapter actions.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetDisplayName (see page 24114)	Gets the display name for this TBaseEndUserAdapter (see page 24097).
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 24114)	Returns this TBaseEndUserAdapter (see page 24097).
	ImplGetFieldsList (see page 24114)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 24114)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 24115)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 24097).
	ImplGetLogoutAction (see page 24115)	Gets the Logout action component for this TBaseEndUserAdapter (see page 24097).

	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 24115)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 24116)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplHasViewRights (see page 24116)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplLogIn (see page 24116)	Processes the login for the given user.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 24117)	Generate the HTML login page.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LogIn (see page 24117)	Logs in a specified user.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24117)	Generates the login page.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24118)	Gets the user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LogIn (see page 24677)	Logs in a specified user.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	UserID (see page 24344)	Specifies the user ID of the current end user.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24469)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24469)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24470)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24470)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24470)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 24471)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 24471)	Allows implementation of a customized login page.

Published Properties

	Name	Description
	Actions (see page 24468)	Container for adapter actions components.
	Data (see page 24468)	Container for adapter field components.
	LoginPage (see page 24468)	Specifies the name of the page that acts as the login page.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.69.2 TEndUserSessionAdapter Properties

The properties of the TEndUserSessionAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 24468)	Container for adapter actions components.

	Data (see page 24468)	Container for adapter field components.
	LoginPage (see page 24468)	Specifies the name of the page that acts as the login page.

173.1.69.2.1 TEndUserSessionAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.69.2.2 TEndUserSessionAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.69.2.3 TEndUserSessionAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property AnsiString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter. The name of the login page is the name of the Web page module that generates the login page.

173.1.69.3 TEndUserSessionAdapter Events

The events of the TEndUserSessionAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24469)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24469)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24470)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24470)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24470)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 24471)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 24471)	Allows implementation of a customized login page.

173.1.69.3.1 TEndUserSessionAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.69.3.2 TEndUserSessionAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.69.3.3 TEndUserSessionAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.69.3.4 TEndUserSessionAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.69.3.5 TEndUserSessionAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.69.3.6 TEndUserSessionAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 24107)

ImplHasExecuteRights (see page 24115)

ImplHasModifyRights (see page 24116)

ImplHasViewRights (see page 24116)

173.1.69.3.7 TEndUserSessionAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage. If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 24117)

ProduceLoginPage (see page 24117)

CanProduceLoginPage (see page 24107)

173.1.70 TFieldValuesAdapter Class

TFieldValuesAdapter is an adapter that includes a single field value.

Class Hierarchy

Pascal

```
TFieldValuesAdapter = class(TAbstractFieldValuesAdapter);
```

C++

```
class TFieldValuesAdapter : public TAbstractFieldValuesAdapter;
```

File

WebAdapt

Description

Use TFieldValuesAdapter to represent a single field value, which is available as a field with the name 'ValueField'. The single field is represented by an adapter field object that is of type TFieldValuesValueField (see page 24483), or one of its descendants. This adapter field object is supplied to the TFieldValuesAdapter constructor.

The 'ValueField' field can have multiple values, such as when it represents a value in the column of a table. For example, the following server-side script iterates over the values of the 'ValueField' field and adds them to a table:

```
<table border=1>
<%
   var e = new Enumerator(FieldValuesAdapter1)
```

```
    for (; !e.atEnd(); e.moveNext())
    {
%>
  <tr><td><%=e.item().ValueField%></td></tr>
<%
    }
%>
</table>
```

See Also

TStringsValuesList (see page 24540)

TPagedAdapter (see page 24525)

TDataSetValuesList (see page 8079)

TFieldValuesValueField (see page 24483)

173.1.70.1 TFieldValuesAdapter Members

The following tables list the members exposed by TFieldValuesAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.

	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetField (see page 23708)	Returns the object that represents the single field of this adapter.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValueFieldClass (see page 24480)	Returns the class of the object that represents this adapter's ValueField field.
	GetValueIndex (see page 23709)	Returns an index that identifies the current adapter field value.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 23710)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24480)	Provides the underlying implementation for the EndIterator (see page 24152) method.

	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetField (see page 24481)	Provides the underlying implementation for the GetField (see page 23708) method.
	ImplGetFieldsList (see page 23711)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetValueIndex (see page 24481)	Provides the underlying implementation for the GetValueIndex (see page 23709) method.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24481)	Provides the underlying implementation for the NextIteration (see page 24173) method.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24482)	Provides the underlying implementation for the StartIterator (see page 24176) method.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Field (see page 24483)	Indicates the object that represents this adapter's single field.
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.

	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 24479)	This is Create, a member of class TFieldValuesAdapter.
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetField (see page 19684)	This is GetField, a member of class IFieldValuesAdapter.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetValueIndex (see page 19684)	This is GetValueIndex, a member of class IFieldValuesAdapter.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.70.2 TFieldValuesAdapter.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent; AField: TObject); virtual; reintroduce;
```

C++

```
virtual __fastcall TFieldValuesAdapter(TComponent * AOwner, TObject * AField);
```

Description

This is Create, a member of class TFieldValuesAdapter.

173.1.70.3 TFieldValuesAdapter Methods

The methods of the TFieldValuesAdapter class are listed here.

Protected Methods

	Name	Description
V	GetValueFieldClass (see page 24480)	Returns the class of the object that represents this adapter's ValueField field.
V	ImplEndIterator (see page 24480)	Provides the underlying implementation for the EndIterator (see page 24152) method.
V	ImplGetField (see page 24481)	Provides the underlying implementation for the GetField (see page 23708) method.

	ImplGetValueIndex (see page 24481)	Provides the underlying implementation for the GetValueIndex (see page 23709) method.
	ImplNextIteration (see page 24481)	Provides the underlying implementation for the NextIteration (see page 24173) method.
	ImplStartIterator (see page 24482)	Provides the underlying implementation for the StartIterator (see page 24176) method.

173.1.70.3.1 TFieldValuesAdapter.GetValueFieldClass Method

Returns the class of the object that represents this adapter's ValueField field.

Pascal

```
function GetValueFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns the class reference for the type of the single adapter field (ValueField) that is the value of the Field (see page 24483) property. This is TFieldValuesValueField (see page 24483).

See Also

Field (see page 24483)

TFieldValuesValueField (see page 24483)

173.1.70.3.2 TFieldValuesAdapter.ImplEndIterator Method

Provides the underlying implementation for the EndIterator (see page 24152) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

The EndIterator (see page 24152) method calls ImplEndIterator to stop the process of iterating through the adapter's field's possible values. This provides the underlying support that allows server-side script to iterate through adapter field values.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way.

ImplEndIterator obtains an IWebGetFieldValues interface for the adapter field that is the value of the Field (see page 24483) property and calls its EndValueIterator method, passing on the value of the OwnerData parameter.

See Also

EndIterator (see page 24152)

ImplStartIterator (see page 24482)

ImplNextIteration (see page 24481)

EndValueIterator (see page 19761)

Field (see page 24483)

173.1.70.3.3 TFieldValuesAdapter.ImplGetField Method

Provides the underlying implementation for the GetField (see page 23708) method.

Pascal

```
function ImplGetField: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetField();
```

Description

The GetField (see page 23708) method calls ImplGetField to obtain the object that represents this adapter's single field. This method returns the value of the Field (see page 24483) property.

See Also

GetField (see page 23708)

Field (see page 24483)

173.1.70.3.4 TFieldValuesAdapter.ImplGetValueIndex Method

Provides the underlying implementation for the GetValueIndex (see page 23709) method.

Pascal

```
function ImplGetValueIndex: Integer; override;
```

C++

```
virtual __fastcall int ImplGetValueIndex();
```

Description

The GetValueIndex (see page 23709) method calls ImplGetValueIndex to obtain the index of current value of the ValueField field. The first value has an index of 0, the second an index of 1, and so on.

This method returns the index of the current value, as indicated by the index that the GetIteratorIndex (see page 24160) method returns.

See Also

GetValueIndex (see page 23709)

GetIteratorIndex (see page 24160)

173.1.70.3.5 TFieldValuesAdapter.ImplNextIteration Method

Provides the underlying implementation for the NextIteration (see page 24173) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

The NextIteration (see page 24173) method calls ImplNextIteration when iterating over field values to determine whether there is another field value after the current one and if so, to change the current value to the next one.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. On entry, this value is typically the same as the value returned by the last call to NextIteration (see page 24173) or to StartIterator (see page 24176).

ImplNextIteration returns true if it moves to the next field value, false if it can't change to a new field value (usually because the field is on its last value).

In TFieldValuesAdapter (see page 24471), ImplNextIteration obtains an IWebGetFieldValues interface for the adapter field that is the value of the Field (see page 24483) property and calls its NextValueIteration method, passing on the value of the OwnerData parameter.

NextIteration (see page 24173)

ImplStartIterator (see page 24482)

ImplEndIterator (see page 24480)

NextValueIteration (see page 19762)

173.1.70.3.6 TFieldValuesAdapter.ImplStartIterator Method

Provides the underlying implementation for the StartIterator (see page 24176) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

The StartIterator (see page 24176) method calls ImplStartIterator to start the process of iterating through the adapter's field's possible values. The return value indicates whether the adapter's field has any values over which to iterate.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Depending on the adapter field object, it may be supplied by the caller, or created by the adapter field object inside this method.

ImplStartIterator returns true if it positions the ValueField field on its first value, false if the adapter field can't supply a first value.

In TFieldValuesAdapter (see page 24471), ImplStartIterator obtains an IWebGetFieldValues interface for the adapter field that is the value of the Field (see page 24483) property and calls its StartValueIterator method, passing on the value of the OwnerData parameter.

See Also

StartIterator (see page 24176)

ImplEndIterator (see page 24480)

173.1.70.4 TFieldValuesAdapter Properties

The properties of the TFieldValuesAdapter class are listed here.

Protected Properties

	Name	Description
R	Field (see page 24483)	Indicates the object that represents this adapter's single field.

173.1.70.4.1 TFieldValuesAdapter.Field Property

Indicates the object that represents this adapter's single field.

Pascal

```
property Field: TObject;
```

C++

```
__property TObject * Field;
```

Description

Read Field to access the object that represents this adapter's ValueField field. Field is an instance of TFieldValuesValueField (see page 24483) or one of its descendants.

The TFieldValuesAdapter (see page 24471) constructor supplies the value for this property.

See Also

TFieldValuesValueField (see page 24483)

create (see page 24479)

173.1.71 TFieldValuesValueField Class

TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 24471).

Class Hierarchy

Pascal

```
TFieldValuesValueField = class(TAdapterNamedField);
```

C++

```
class TFieldValuesValueField : public TAdapterNamedField;
```

File

WebAdapt

Description

The parent adapter, TFieldValuesAdapter (see page 24471), is used to iterate over the values associated with an adapter field. TFieldValuesValueField provides the value and display text of the current item.

See Also

TFieldValuesAdapter (see page 24471)

TBaseAdapterMultiValueField (see page 24086)

173.1.71.1 TFieldValuesValueField Members

The following tables list the members exposed by TFieldValuesValueField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 24489)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 24489)	Returns text used to display a read-only representation of the value associated with this adapter field.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 24490)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.

V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	Field (see page 24490)	Returns the adapter field that is using TFieldValueAdapter.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.

	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.

	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.71.2 TFieldValuesValueField Methods

The methods of the TFieldValuesValueField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 24489)	Returns the name used to access this adapter field using server-side script.
V	ImplAsFormatted (see page 24489)	Returns text used to display a read-only representation of the value associated with this adapter field.
V	ImplGetValue (see page 24490)	Returns the value associated with this adapter field.

173.1.71.2.1 TFieldValuesValueField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'ValueField'. This allows server-side script to access this adapter field using the parent adapter's ValueField property.

See Also

ImplGetVariableName (see page 23939)

ImplSetFieldName (see page 23941)

GetDefaultFieldName (see page 23932)

173.1.71.2.2 TFieldValuesValueField.ImplAsFormatted Method

Returns text used to display a read-only representation of the value associated with this adapter field.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall AnsiString ImplAsFormatted();
```

Description

ImplAsFormatted determines whether the adapter field using TFieldValuesAdapter (see page 24471) has a values list. If a values list is available, the values list is used to look up a value name to return. If there is no values list or no value name, the result of ImplGetValue (see page 24490) is returned. Server-side script accesses the result of this function using the DisplayText property of this adapter field. ImplAsFormatted overrides TAdapterNamedField (see page 23925)'s ImplAsFormatted method.

See Also

Value (see page 23945)

ImplAsFormatted (see page 23937)

GetAdapterValuesList (see page 24016)

ImplGetValue (see page 24490)

173.1.71.2.3 TFieldValuesValueField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetCurrentValue. GetCurrentValue is implemented by the adapter field using TFieldValuesAdapter (see page 24471). Server-side script accesses the result of this function using the Value (see page 23945) property of this adapter field.

See Also

GetCurrentValue (see page 24094)

Value (see page 23945)

173.1.71.3 TFieldValuesValueField Properties

The properties of the TFieldValuesValueField class are listed here.

Protected Properties

	Name	Description
R	Field (see page 24490)	Returns the adapter field that is using TFieldValueAdapter.

173.1.71.3.1 TFieldValuesValueField.Field Property

Returns the adapter field that is using TFieldValueAdapter.

Pascal

```
property Field: TObject;
```

C++

```
__property TObject * Field;
```

Description

Adapter (see page 23943) fields use the TFieldValuesAdapter (see page 24471) component to iterate over the values associated with the adapter field. The Field property returns the adapter field that is using the TFieldValuesAdapter (see page 24471).

173.1.72 TImplementedAdapterAction Class

TImplementedAdapterAction is a base class for adapter actions.

Class Hierarchy

Pascal

```
TImplementedAdapterAction = class(TCustomAdapterAction);
```

C++

```
class TImplementedAdapterAction : public TCustomAdapterAction;
```

File

WebAdapt

Description

Derive from TImplementedAdapterAction to define an adapter action component that works with specific adapter component

types. Classes (see page 2685) derived from TImplementedAdapterAction can only be added to adapter components that allow the particular class. On the other hand, classes derived from TCustomAdapterAction (see page 24188) (such as TAdapter (see page 23713)) can be added to any adapter component class.

See Also

TCustomAdapterAction (see page 24188)

TAdapter (see page 23713)

TAdapterActions (see page 23738)

173.1.73 TLogicalPageList Class

Class Hierarchy

Pascal

```
TLogicalPageList = class(TCustomStringsValuesList);
```

C++

```
class TLogicalPageList : public TCustomStringsValuesList;
```

File

WebAdapt

Description

This is class WebAdapt.TLogicalPageList.

173.1.73.1 TLogicalPageList Members

The following tables list the members exposed by TLogicalPageList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.

	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetNameFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValueFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetValueFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.

	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 24388)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 24131)	Responsible returning the name of the name/value pair.
	ImplGetListName (see page 24388)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 24132)	Looks up a name for a value.
	ImplGetListNameOfValue (see page 24388)	Looks up a name for a value.
	ImplGetListValue (see page 24132)	Responsible for returning the value of the name/value pair.
	ImplGetListValue (see page 24389)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 24389)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 24389)	Clears the iteration index.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 24390)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.

V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PrepareStrings (see page 24390)	Customizes the content of the strings list.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 24391)	This flag indicates whether the strings list has been prepared or customized.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareStrings (see page 24391)	Implement OnPrepareStrings to customize the content of the strings list.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 24500)	Create is the constructor for TCustomStringsValuesList.
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
V	Destroy (see page 24386)	Destroy is the destructor for TCustomStringsList.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.

	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.

	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 24181)	Actions is the container for adapter actions components.
R	Actions (see page 24402)	Container for adapter actions components.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 24181)	Data is the container for adapter field components.
R	Data (see page 24402)	Container for adapter field components.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Strings (see page 24390)	This string list defines the list of name/value pairs.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.73.2 TLogicalPageList.Create Constructor

Create is the constructor for TCustomStringsValuesList.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLogicalPageList(TComponent * AOwner);
```

Description

Create creates the strings list.

See Also

Strings (see page 24390)

173.1.74 TLoginFormAdapter Class

TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.

Class Hierarchy

Pascal

```
TLoginFormAdapter = class(TCustomLoginFormAdapter);
```

C++

```
class TLoginFormAdapter : public TCustomLoginFormAdapter;
```

File

WebAdapt

Description

Use TLoginFormAdapter to generate a login form. TLoginFormAdapter has default fields for user name, password, and next page. The next page field lets the user select a Web page to see after logging in. TLoginFormAdapter has a single default action for logging in. If the WebSnap application also contains an end user adapter such as TEndUserAdapter (see page 24421) or TEndUserSessionAdapter (see page 24458), TLoginFormAdapter calls the end user adapter's Login method to log the user in. You can also implement an OnLogin (see page 24512) event handler to provide custom login support.

To build a simple login form

1. Create (see page 24146) a new Web page module that contains a TAdapterPageProducer component.

2. Add a TLoginFormAdapter component to that module.
3. Right click on the TAdapterPageProducer object and display the Web page editor.
4. In the Web page editor, add an adapter form, and to that form add an adapter field group and an adapter command group.
5. Select the field group, and set its Adapter property to the TLoginFormAdapter object.
6. Select the command group, and set its display component to the adapter field group.

You can embellish this simple form as you like. When you are done, connect the form to an end user adapter by setting the end user adapter's LoginPage property to the name of the page module.

To provide complete login support, add TWebUserList, TEndUserSessionAdapter (see page 24458), and TSessionsService components to the web application module to identify user names and passwords and to keep track of end user login state.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

TAdapterPageProducer (see page 19802)

TWebUserList (see page 25625)

TSessionsService (see page 25582)

TAdapterControlGroup (see page 25070)

TAdapterFieldGroup (see page 25150)

173.1.74.1 TLoginFormAdapter Members

The following tables list the members exposed by TLoginFormAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.

	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndUser (see page 24353)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 24353)	Logs in the user after the user name and password have been validated.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetNextPage (see page 24354)	Returns the value of the NextPage (see page 24359) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.

	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 24354)	Provides the underlying implementation for the CanAddActionClass (see page 24150) method.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 24355)	Provides the underlying implementation for the CanAddFieldClass (see page 24150) method.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 24355)	Provides the underlying implementation for the GetActionsList (see page 24156) method.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetFieldsList (see page 24356)	Provides the underlying implementation for the GetFieldsList (see page 24159) method.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 24356)	Provides the underlying implementation for the NotifyDeactivate (see page 24175) method.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.

V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	RaiseBlankPassword (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied password is blank.
	RaiseBlankUserName (see page 24357)	Raises an EAdapterFieldException (see page 23698) with a message that the supplied user name is blank.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	UserList (see page 24357)	Returns the interface of the WebSnap application's Web user list.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidatePassword (see page 24358)	Validates the password that the user supplied to the login form.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateUserName (see page 24358)	Validates the name that the user supplied to the login form.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.

R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
	NextPage (see page 24359)	Names the Web page the user should see after successfully logging in.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Password (see page 24360)	Indicates the password that the user supplied to the login form.
R	UserName (see page 24360)	Indicates the name that the user supplied to the login form.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24510)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24511)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24511)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24511)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24512)	Supplies name/value pairs needed to execute an adapter action.
	OnLogin (see page 24512)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 24513)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 24513)	Occurs when the login form adapter must validate the name that the user supplied.

Published Properties

	Name	Description
	Actions (see page 24509)	Container for adapter actions components.
	Data (see page 24509)	Container for adapter field components.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	PasswordRequired (see page 24509)	Indicates whether the user must supply a password to log in.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.74.2 TLoginFormAdapter Properties

The properties of the TLoginFormAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 24509)	Container for adapter actions components.
	Data (see page 24509)	Container for adapter field components.
	PasswordRequired (see page 24509)	Indicates whether the user must supply a password to log in.

173.1.74.2.1 TLoginFormAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.74.2.2 TLoginFormAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.74.2.3 TLoginFormAdapter.PasswordRequired Property

Indicates whether the user must supply a password to log in.

Pascal

```
property PasswordRequired: Boolean;
```

C++

```
__property Boolean PasswordRequired;
```

Description

Set PasswordRequired to indicate whether users must supply a password to log in. If PasswordRequired is true and the OnValidatePassword event handler does not handle the validation of the password, then the login form adapter checks that the value of Password is not an empty string. If Password is an empty string, the login form adapter raises an EAdapterFieldException exception when it tries to validate the password. If the OnValidatePassword event handler takes care of validating the password, PasswordRequired is ignored.

Note: The login form adapter validates the password (and hence checks PasswordRequired) when the WebSnap application executes this adapter's Login action.

See Also

Password (see page 24360)

OnValidatePassword (see page 24362)

TLoginFormAdapterLoginAction (see page 24514)

EAdapterFieldException (see page 23698)

173.1.74.3 TLoginFormAdapter Events

The events of the TLoginFormAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24510)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24511)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 24511)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24511)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 24512)	Supplies name/value pairs needed to execute an adapter action.
	OnLogin (see page 24512)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 24513)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 24513)	Occurs when the login form adapter must validate the name that the user supplied.

173.1.74.3.1 TLoginFormAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.74.3.2 TLoginFormAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.74.3.3 TLoginFormAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.74.3.4 TLoginFormAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.74.3.5 TLoginFormAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.74.3.6 TLoginFormAdapter.OnLogin Event

Occurs after the password and user ID are validated.

Pascal

```
property OnLogin: TLoginUserIDEvent;
```

C++

```
__property TLoginUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to respond when a user has successfully logged in. This event allows your application to record the user login in an application-specific manner.

When the login form adapter's Login action executes, the adapter first receives an OnValidatePassword and an OnValidateUserName event. After validating the password and user name, the login form adapter receives an OnLogin event so that it can log the user in. After the OnLogin event, if the WebSnap application includes an end user adapter, the login form adapter calls the end user adapter's Login method. Thus, it may not be necessary to write an OnLogin event handler if the application includes an end user adapter.

See Also

OnValidatePassword (see page 24362)

OnValidateUserName (see page 24362)

LogIn (see page 24677)

TWebUserList (see page 25625)

UserName (see page 24360)

173.1.74.3.7 TLoginFormAdapter.OnValidatePassword Event

Occurs when the login form adapter must validate the password that the user supplied.

Pascal

```
property OnValidatePassword: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidatePassword;
```

Description

Write an OnValidatePassword event handler to validate the password that the user supplies to the login form. This event is especially important if the WebSnap application does not include a TWebUserList component for checking passwords against user names. The supplied Password is the value of the Value parameter on the event handler. You can check this against the user's name by reading the UserName property.

When the login form adapter's Login action executes, the adapter first receives an OnValidatePassword event to check the password. If the event handler sets the Handled parameter to true, indicating that the password is valid, the adapter goes on to validate the user name using an OnValidateUserName event, and then to log the user in using an OnLogin event (and, if the application includes an end user adapter, by calling the end user adapter's Login method). If the event handler finds the password to be invalid, it should raise an exception. If the event handler does not validate the supplied password (that is, if it sets the Handled parameter to false), the login form adapter validates the password by checking whether it is non-blank if the PasswordRequired property is true.

See Also

OnLogin (see page 24361)

OnValidateUserName (see page 24362)

Password (see page 24360)

UserName (see page 24360)

PasswordRequired (see page 24360)

173.1.74.3.8 TLoginFormAdapter.OnValidateUserName Event

Occurs when the login form adapter must validate the name that the user supplied.

Pascal

```
property OnValidateUserName: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidateUserName;
```

Description

Write an OnValidateUserName event handler to validate the name that the user supplies when logging in. This event occurs after the OnValidatePassword event and before the OnLogin event.

If the event handler sets the Handled parameter to true, the login form adapter assumes that the user name (which is the value of the Value parameter and of the UserName property) is valid. In this case, the adapter checks whether the WebSnap application includes a TWebUserList component, and if so, checks the user name against the password. If the event handler sets the Handled parameter to false, the adapter validates the user name by checking whether it is nonempty. In this case, the adapter raises an EAdapterFieldException exception if the value of UserName is an empty string. If the OnValidateUserName

event handler finds the user name to be invalid, it should raise an exception.

See Also

OnLogin (see page 24361)

OnValidatePassword (see page 24362)

UserName (see page 24360)

EAdapterFieldException (see page 23698)

173.1.75 TLoginFormAdapterLoginAction Class

TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 24500).

Class Hierarchy

Pascal

```
TLoginFormAdapterLoginAction = class(TCustomLoginFormAdapterAction);
```

C++

```
class TLoginFormAdapterLoginAction : public TCustomLoginFormAdapterAction;
```

File

WebAdapt

Description

Add TLoginFormAdapterLoginAction to TLoginFormAdapter (see page 24500). The login form typically contains three fields: user name, password, and next page.

See Also

TCustomLoginFormAdapter (see page 24344)

TAdapterNextPageField (see page 23957)

TAdapterUserNameField (see page 24024)

TAdapterPasswordField (see page 23971)

173.1.75.1 TLoginFormAdapterLoginAction Members

The following tables list the members exposed by TLoginFormAdapterLoginAction.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckExecuteAccess (see page 24050)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 24050)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterExecuteActionRequest (see page 24051)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 24051)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 24052)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 24052)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 24053)	Implements IIteratorSupport's EndIterator method.
	ExecuteActionRequest (see page 24053)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 24054)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 24054)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 24055)	Provides the name/value pairs needed to execute this adapter action.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 24520)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 24055)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 24055)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 24056)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 24056)	Suggests an HTML display type for this adapter action.

	GetErrors (see page 24057)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 24057)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 24057)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputStyle (see page 24058)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 24058)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 24058)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 24059)	Implements IIteratorIndex's GetIteratorIndex method.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSuccessOptions (see page 24059)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariableName (see page 24060)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 24060)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 24060)	Suggests a view mode for this adapter action.
	GetVisible (see page 24061)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 24061)	Returns the class type for this adapter field.
	HandleRequest (see page 24061)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 24062)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 24062)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 24062)	Implements IIteratorSupport's EndIterator (see page 24053) method.
	ImplExecuteActionRequest (see page 24521)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 24063)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 24195)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 24521)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 24064)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 24064)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 24065)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 24065)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 24065)	Implements IIteratorIndex's GetIteratorIndex (see page 24059) method.
	ImplGetSuccessOptions (see page 24066)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 24196)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 24066)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 24066)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 24067)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 24067)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 24067)	Implements IIteratorIndex's InIterator (see page 24069) method.
	ImplIsDefaultAction (see page 24068)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 24068)	Implements IIteratorSupport's NextIteration (see page 24070) method.
	ImplSetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 24068)	Implements IIteratorSupport's StartIterator (see page 24071) method.
	ImplWebEnabled (see page 24069)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 24197)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 24069)	Implements IIteratorIndex's InIterator method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultAction (see page 24070)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24070)	Implements IIteratorSupport's NextIteration method.
V	NextPage (see page 24522)	Identifies the name of the next page to display after login.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24070)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 24197)	Sets the name that is used to reference this adapter action with server-side script.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDisplayLabel (see page 24071)	Set the value of the DisplayLabel (see page 24073) property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	StartIterator (see page 24071)	Implements IIteratorSupport's StartIterator method.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebEnabled (see page 24071)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 24072)	Provides access to the parent adapter component.
R	Adapter (see page 24369)	Returns the adapter that acts as a parent to this action.
R	Errors (see page 24073)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 24200)	Called to execute this action using parameters passed in the HTTP request.

	OnGetEnabled (see page 24200)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	CreateRequestContext (see page 19681)	Creates an object that describes the adapter action parameters and adapter field values.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 19692)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 19700)	Returns the preferred display style for an adapter field or adapter action.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFailureOptions (see page 964)	This is GetFailureOptions, a member of class IGetAdapterActionRedirectOptions.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputStyle (see page 19700)	Returns the preferred editing style for an adapter field.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsAdapterActionList (see page 19717)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetSuccessOptions (see page 964)	This is GetSuccessOptions, a member of class IGetAdapterActionRedirectOptions.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetViewMode (see page 19701)	Returns the preferred mode of an adapter field.
	GetVisible (see page 19652)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 19681)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 19651)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultAction (see page 19768)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	WebEnabled (see page 19752)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 19755)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 24072)	Identifies the name of this action when using server-side script.
	ActionName (see page 24198)	Identifies the name of this action when using server-side script.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	ExecuteAccess (see page 24073)	Defines the rights required to execute this action.
R	FailureOptions (see page 965)	This is FailureOptions, a member of class IGetAdapterActionRedirectOptions.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 19717)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 24074)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 24074)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RedirectOptions (see page 24074)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	SuccessOptions (see page 965)	This is SuccessOptions, a member of class IGetAdapterActionRedirectOptions.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	Visible (see page 19652)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 24523)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24523)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24524)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24524)	Called before the adapter action response is generated.
	OnGetParams (see page 24525)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 24522)	Suggests a display label for this adapter action.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.75.2 TLoginFormAdapterLoginAction Methods

The methods of the TLoginFormAdapterLoginAction class are listed here.

Protected Methods

	Name	Description
V	GetDefaultActionName (see page 24520)	Gets the name used to reference this adapter action with server-side script.
V	ImplExecuteActionRequest (see page 24521)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetAdapterItemRequestParams (see page 24521)	Provides the name/value pairs needed to execute this adapter action.
V	NextPage (see page 24522)	Identifies the name of the next page to display after login.

173.1.75.2.1 TLoginFormAdapterLoginAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultActionName();
```

Description

GetDefaultActionName returns "Login".

See Also

GetActionName (see page 24054)

GetDefaultActionName (see page 24055)

173.1.75.2.2 TLoginFormAdapterLoginAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest uses the user name and password passed in the HTTP request to log the user in. Exceptions are raised if the user name or password contain invalid values or if the user name/password is not known. If an exception is raised the exception message is added to the parent adapter's error list and the echo flag is set to true. If the login is successful then ImplExecuteActionRequest causes an HTTP redirect to the page specified in the next page field.

See Also

ImplExecuteActionRequest (see page 24063)

IActionRequest (see page 935)

IActionResponse (see page 941)

ValidatePassword (see page 24358)

ValidateUserName (see page 24358)

ValidateUser (see page 19785)

Errors (see page 24182)

EchoActionFieldValues (see page 24182)

173.1.75.2.3 TLoginFormAdapterLoginAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(AnsiString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams adds a name/value pair identifying the name of the next page that should be displayed after login. When the login action is executed, the name/value specified by ImplGetAdapterItemRequestParams will be used to generate the HTTP response unless the login form contains a next page field. In that case, the value entered by the end-user will be used to the generate the HTTP response.

See Also

NextPage (see page 24359)

RequestedPageName (see page 24658)

ImplGetAdapterItemRequestParams (see page 24063)

IAdapterItemRequestParams (see page 19673)

TAdapterNextPageField (see page 23957)

173.1.75.2.4 TLoginFormAdapterLoginAction.NextPage Method

Identifies the name of the next page to display after login.

Pascal

```
function NextPage: string; virtual;
```

C++

```
virtual __fastcall AnsiString NextPage();
```

Description

This value is used when generating the login form. NextPage returns the result of TCustomLoginFormAdapter.NextPage.

See Also

NextPage (see page 24359)

173.1.75.3 TLoginFormAdapterLoginAction Properties

The properties of the TLoginFormAdapterLoginAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 24522)	Suggests a display label for this adapter action.

173.1.75.3.1 TLoginFormAdapterLoginAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property AnsiString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 24064)

SetDisplayLabel (see page 24071)

173.1.75.4 TLoginFormAdapterLoginAction Events

The events of the TLoginFormAdapterLoginAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 24523)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 24523)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 24524)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 24524)	Called before the adapter action response is generated.
	OnGetParams (see page 24525)	Specifies name/value pairs needed to execute this adapter action.

173.1.75.4.1 TLoginFormAdapterLoginAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 24051)

OnAfterExecuteAction (see page 24184)

OnBeforeExecute (see page 24076)

173.1.75.4.2 TLoginFormAdapterLoginAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.75.4.3 TLoginFormAdapterLoginAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 24052)

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.75.4.4 TLoginFormAdapterLoginAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 24052)

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.75.4.5 TLoginFormAdapterLoginAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

173.1.76 TPagedAdapter Class

TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.

Class Hierarchy

Pascal

```
TPagedAdapter = class(TCustomPagedAdapter);
```

C++

```
class TPagedAdapter : public TCustomPagedAdapter;
```

File

WebAdapt

Description

Use TPagedAdapter like TAdapter (see page 23713) to define a custom interface to application logic. Set the PageSize (see page 24534) property to indicate the number of rows that a page displays. When the PageSize (see page 24534) is not 0, the TPagedAdapter component automatically adds built-in actions called TAdapterNextPageAction (see page 23945), TAdapterPrevPageAction (see page 23979), and TAdapterGotoPageAction (see page 23849) for moving between pages. To generate HTML buttons for these actions, use TAdapterPageProducer.

The TDataSetAdapter component also supports paging.

173.1.76.1 TPagedAdapter Members

The following tables list the members exposed by TPagedAdapter.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultActions (see page 24411)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
V	EncodeActionParams (see page 24411)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 24412)	Indicates whether the record index has gone past the last record in the current page.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
V	ExtractRequestParams (see page 24412)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.

	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetEOF (see page 24412)	Indicates whether the record position has passed the last record.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetFirstRecord (see page 24413)	Set the record position to the first record.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetNextRecord (see page 24413)	Increments the record position.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPageCount (see page 24413)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 24414)	Returns the total number of records.
	GetRecordIndex (see page 24414)	Returns the index of the current record.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 24415)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 24415)	Implements IteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 24415)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.

	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 24416)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 24416)	Clears the current page variable.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 24416)	Implements IteratorSupport.StartIterator (see page 24176) to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetPageSize (see page 24417)	Updates the pagesize variable.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SkipToPage (see page 24417)	Skips records until the current record is within the current page.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.

	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.

	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	CurrentPage (see page 24418)	Sets or gets the current page index.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	PageCount (see page 24418)	Calculates the number of pages needed to display all adapter records.

R	RecordCount (see page 24419)	Returns the total number of records.
R	RecordIndex (see page 24419)	Returns the index of the current record.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24536)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24536)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24536)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24537)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24537)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24537)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24538)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24538)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24539)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 24539)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 24539)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24539)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 24540)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 24540)	Implement this event to identify the zero-based current record.

Published Properties

	Name	Description
	Actions (see page 24533)	Container for adapter actions components.
	Data (see page 24534)	Container for adapter field components.
	ModifyAccess (see page 24534)	This is ModifyAccess, a member of class TPagedAdapter.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PageSize (see page 24534)	Sets or gets the page size variable.
	Tag (see page 2808)	Stores an integer value as part of a component.
	ViewAccess (see page 24535)	Identifies the rights required to view this adapter's fields.

173.1.76.2 TPagedAdapter Properties

The properties of the TPagedAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 24533)	Container for adapter actions components.
	Data (see page 24534)	Container for adapter field components.
	ModifyAccess (see page 24534)	This is ModifyAccess, a member of class TPagedAdapter.
	PageSize (see page 24534)	Sets or gets the page size variable.
	ViewAccess (see page 24535)	Identifies the rights required to view this adapter's fields.

173.1.76.2.1 TPagedAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.76.2.2 TPagedAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.76.2.3 TPagedAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property AnsiString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TPagedAdapter.

173.1.76.2.4 TPagedAdapter.PageSize Property

Sets or gets the page size variable.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

If the page size variable is set to a value greater than zero and no actions have been explicitly added to the adapter then the

NextPage, PrevPage, and GotoPage are automatically added. If the page size variable is changed back to zero then the these actions are removed.

See Also

TAdapterNextPageAction (see page 23945)

TAdapterPrevPageAction (see page 23979)

TAdapterGotoPageAction (see page 23849)

173.1.76.2.5 TPagedAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property AnsiString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 25625)

HasViewAccess (see page 24162)

implhasviewaccess (see page 24169)

173.1.76.3 TPagedAdapter Events

The events of the TPagedAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 24536)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24536)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24536)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24537)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24537)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24537)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24538)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24538)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 24539)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 24539)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 24539)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 24539)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 24540)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 24540)	Implement this event to identify the zero-based current record.

173.1.76.3.1 TPagedAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 24075)

OnBeforeExecuteAction (see page 24186)

173.1.76.3.2 TPagedAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 24075)

OnBeforeGetActionResponse (see page 24186)

173.1.76.3.3 TPagedAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnBeforeUpdateFields (see page 24187)

Errors (see page 24182)

173.1.76.3.4 TPagedAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 24178)

OnBeforeValidateFields (see page 24187)

Errors (see page 24182)

173.1.76.3.5 TPagedAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 24076)

OnAfterExecuteAction (see page 24184)

173.1.76.3.6 TPagedAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 24076)

OnAfterGetActionResponse (see page 24185)

173.1.76.3.7 TPagedAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 24178)

OnAfterUpdateFields (see page 24185)

Errors (see page 24182)

173.1.76.3.8 TPagedAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 24178)

OnAfterValidateFields (see page 24186)

Errors (see page 24182)

173.1.76.3.9 TPagedAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 24077)

173.1.76.3.10 TPagedAdapter.OnGetEOF Event

Implement this event to indicate when the current record index has exceeded the total record count.

Pascal

```
property OnGetEOF: TGetEOFEvent;
```

C++

```
__property TGetEOFEvent OnGetEOF;
```

Description

OnGetEOF is called to determine when to stop the iteration. If OnGetEOF is not implemented, the result of the OnGetRecordCount event handler will be compared to the result of the OnGetRecordIndex event handler.

173.1.76.3.11 TPagedAdapter.OnGetFirstRecord Event

Implement this method to initialize the iteration index to zero.

Pascal

```
property OnGetFirstRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetFirstRecord;
```

Description

This method is called when the iteration is started. If there are no records then set the EOF flag.

173.1.76.3.12 TPagedAdapter.OnGetNextRecord Event

Implement this method to increment the iteration index.

Pascal

```
property OnGetNextRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetNextRecord;
```

Description

This method is called when the next record is requested. This method is not a next then set the EOF flag.

173.1.76.3.13 TPagedAdapter.OnGetRecordCount Event

Implement this event to identify the total number of records that can be iterated.

Pascal

```
property OnGetRecordCount: TGetRecordCountEvent;
```

C++

```
__property TGetRecordCountEvent OnGetRecordCount;
```

Description

OnGetRecordCount is called to calculate the number of pages.

173.1.76.3.14 TPagedAdapter.OnGetRecordIndex Event

Implement this event to identify the zero-based current record.

Pascal

```
property OnGetRecordIndex: TGetRecordIndexEvent;
```

C++

```
__property TGetRecordIndexEvent OnGetRecordIndex;
```

Description

OnGetRecordIndex is called to calculate the current page.

173.1.77 TStringsValuesList Class

TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.

Class Hierarchy

Pascal

```
TStringsValuesList = class(TCustomStringsValuesList);
```

C++

```
class TStringsValuesList : public TCustomStringsValuesList;
```

File

WebAdapt

Description

TStringsValuesList defines a list of possible values for an adapter field by assigning the TStringsValuesList component to the ValuesList property of the adapter field. Typically, the values are used to populate HTML elements, such as a select list or radio buttons, when generating HTML to edit an adapter field. The TAdapterPageProducer will automatically generate appropriate HTML/JavaScript for an editable field when the ValuesList is set.

173.1.77.1 TStringsValuesList Members

The following tables list the members exposed by TStringsValuesList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAdapterModeHiddenField (see page 24149)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 24399)	Adds default action components to this adapter.
V	AddDefaultFields (see page 24399)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 24149)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 24149)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddActionClass (see page 24150)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 24150)	Indicates whether a type of adapter field can be added to this adapter.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 24150)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 24151)	Clears adapter state information.
	ClearErrors (see page 24151)	Clears the content of the adapter's Errors (see page 24182) property.
	CreateActionRequestContext (see page 24151)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 24152)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 24400)	Notifies other components of changes to the list of default actions or fields.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EncodeActionParams (see page 24152)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 24152)	Implements IIteratorSupport's EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 24153)	Reads name/value pairs from the HTTP request.
	FindAction (see page 24153)	Returns an action component with a matching action name.
	FindField (see page 24154)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 24154)	Finds an action with a matching variable name.
	FindNamedField (see page 24154)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 24155)	Finds a field or action with a matching variable name.
	FindVariable (see page 24155)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 24155)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 24156)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 24400)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 24156)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 24156)	Returns the adapter actions container object.
	GetAdapterErrors (see page 24157)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 24157)	<insert text here>
	GetAdapterFields (see page 24157)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 24157)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 24158)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24158)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 24158)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 24400)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 24159)	Returns the value of the echo flag.
	GetFieldsList (see page 24159)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 24159)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetIteratorIndex (see page 24160)	Implements IIteratorIndex's GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 24128)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 24128)	Looks up an image for a value.
	GetListName (see page 24128)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 24128)	Looks up a name for a value.
	GetListValue (see page 24129)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetNameFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValueFieldClass (see page 24129)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetValueFieldClass (see page 24387)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 24160)	Returns an action or field.
	GetVariableCount (see page 24161)	Returns the total count of actions and fields.
	GetVariableName (see page 24161)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 24161)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 24161)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 24130)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 24162)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 24162)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 24162)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 24162)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 24163)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 24130)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 24163)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 24163)	Clears adapter state information.
	ImplEndIterator (see page 24164)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 24388)	Implements IIteratorSupport's EndIterator (see page 24152) method to support iterating over the records of the adapter.
	ImplFindVariable (see page 24164)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 24164)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 24165)	Provides a list of action types that can be added to this adapter.

	ImplGetEchoActionFieldValues (see page 24165)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 24130)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 24165)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 24166)	Implements IIteratorIndex's GetIteratorIndex (see page 24160) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 24131)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 24131)	Looks up an image for a value.
	ImplGetListName (see page 24131)	Responsible returning the name of the name/value pair.
	ImplGetListName (see page 24388)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 24132)	Looks up a name for a value.
	ImplGetListNameOfValue (see page 24388)	Looks up a name for a value.
	ImplGetListValue (see page 24132)	Responsible for returning the value of the name/value pair.
	ImplGetListValue (see page 24389)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 24166)	Returns an action or field.
	ImplGetVariableCount (see page 24167)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 24167)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 24167)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 24401)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 24167)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 24401)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 24168)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 24168)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 24169)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 24169)	Implements IIteratorIndex's InIterator (see page 24172) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 24169)	Implements IIteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 24389)	Implements IteratorSupport's NextIteration (see page 24173) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 24170)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 24170)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 24389)	Clears the iteration index.
	ImplSetActions (see page 24170)	Initializes the Actions (see page 24181) property.
	ImplSetActions (see page 24401)	Initializes the Actions (see page 24402) property.
	ImplSetData (see page 24171)	Initializes the Data (see page 24181) property.
	ImplSetData (see page 24402)	Initializes the Data (see page 24402) property.
	ImplSetEchoActionFieldValues (see page 24171)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 24171)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 24390)	Implements IIteratorSupport's StartIterator (see page 24176) method to support iterating over the records of the adapter.
	InIterator (see page 24172)	Implements IIteratorIndex's InIterator method to support iterating over the data records of the adapter.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsActionInUse (see page 24172)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 24172)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 24173)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 24173)	Specifies the HTML form hidden fields needed by the adapter.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	NextIteration (see page 24173)	Implements IIteratorSupport's NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 24174)	Clears references to deleted components.
	NotifyActivate (see page 24174)	Called when the web module is activated.
	NotifyAdapterChange (see page 24174)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 24175)	Called when the web module is deactivated.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	PrepareStrings (see page 24390)	Customizes the content of the strings list.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActions (see page 24175)	Initializes the Actions (see page 24181) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetData (see page 24175)	Initializes the Data (see page 24181) property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValues (see page 24176)	Sets the echo flag for this adapter's fields.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	StartIterator (see page 24176)	Implements IIteratorSupport's StartIterator method to support iterating over the records of the adapter.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateFieldsExecuteValues (see page 24177)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 24177)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 24178)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 24178)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 24179)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 24180)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 24180)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WebComponentsChange (see page 24180)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	NotifyList (see page 24183)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 24391)	This flag indicates whether the strings list has been prepared or customized.
R	VisibleActions (see page 24184)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 24184)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 24184)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 24185)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 24185)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 24186)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 24186)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 24186)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 24187)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 24187)	Occurs before values in the HTTP request are validated by the adapter's fields.

	OnGetActionParams (see page 24187)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 24188)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24146)	Constructor for TCustomAdapter (see page 24139).
V	Create (see page 24386)	Create is the constructor for TCustomStringsValuesList (see page 24378).
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24146)	Destructor for TCustomAdapter (see page 24139).
V	Destroy (see page 24386)	Destroy is the destructor for TCustomStringsList.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 19686)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 19688)	This is GetAdapterErrors, a member of class IGetAdapterErrors.

	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 19689)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 19690)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 19690)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIteratorIndex (see page 19721)	Returns the value of the IteratorIndex (see page 19721) property.
	GetListImage (see page 19741)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 19742)	Returns the image object associated with a specified value.
	GetListName (see page 19742)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 19742)	Returns the name associated with a specified value.
	GetListValue (see page 19743)	Returns the value of the current name/value pair.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 19650)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 19650)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasViewAccess (see page 19650)	This is HasViewAccess, a member of class IAdapterAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InIterator (see page 19721)	Indicates whether the object is iterating over its items.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
V	UpdateRecords (see page 24179)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 24182)	Modifies the adapter's echo flag.
R	Errors (see page 24182)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 24183)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 19721)	Indicates the index of the current item.
	ModifyAccess (see page 24183)	This is ModifyAccess, a member of class TCustomAdapter.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 24183)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnPrepareStrings (see page 24550)	Implement OnPrepareStrings to customize the content of the strings list.

Published Properties

	Name	Description
	Actions (see page 24549)	Container for adapter actions components.
	Data (see page 24549)	Container for adapter field components.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Strings (see page 24549)	This string list defines the list of name/value pairs.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.77.2 TStringsValuesList Properties

The properties of the TStringsValuesList class are listed here.

Published Properties

	Name	Description
	Actions (see page 24549)	Container for adapter actions components.

	Data (see page 24549)	Container for adapter field components.
	Strings (see page 24549)	This string list defines the list of name/value pairs.

173.1.77.2.1 TStringsValuesList.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 23770)

173.1.77.2.2 TStringsValuesList.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 23778)

173.1.77.2.3 TStringsValuesList.Strings Property

This string list defines the list of name/value pairs.

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

Each line in the string list represents a name/value pair. The name is optional. To specify a name/value enter a line with the name following by "=" followed by the value. For example, "Joe Smith=EMP111" is a named value. "EMP111" is an unnamed value.

173.1.77.3 TStringsValuesList Events

The events of the TStringsValuesList class are listed here.

Published Events

	Name	Description
	OnPrepareStrings (see page 24550)	Implement OnPrepareStrings to customize the content of the strings list.

173.1.77.3.1 TStringsValuesList.OnPrepareStrings Event

Implement OnPrepareStrings to customize the content of the strings list.

Pascal

```
property OnPrepareStrings: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareStrings;
```

Description

OnPrepareStrings is called before the name/value pairs are retrieved by server-side script.

See Also

TNotifyEvent (see page 3298)

PrepareStrings (see page 24390)

173.1.78 TUpdateFileList Class

TUpdateFileList is a container for uploaded files.

Class Hierarchy

WebAdapt.TUpdateFileList

Pascal

```
TUpdateFileList = class;
```

C++

```
class TUpdateFileList;
```

File

WebAdapt

Description

TUpdateFileList contains the files that are being uploaded to a particular adapter field. TUpdateFileList is passed as a parameter to event handlers that operate on a list of uploaded files.

See Also

TCustomAdapterFileField (see page 24220)

TCustomAdapterFileField (see page 24220)

173.1.78.1 TUpdateFileList Members

The following tables list the members exposed by TUpdateFileList.

Public Methods

	Name	Description
	Create (see page 24551)	Creates an instance of TUpdateFileList (see page 24550).

Public Properties

	Name	Description
R	Count (see page 24551)	Returns the count of uploaded files.
R	Files (see page 24552)	Returns a particular uploaded file.

173.1.78.2 TUpdateFileList.Create Constructor

Creates an instance of TUpdateFileList (see page 24550).

Pascal

```
constructor Create(AValue: IActionFieldValue);
```

C++

```
__fastcall TUpdateFileList(IActionFieldValue AValue);
```

Description

```
constructor Create(AValue: IActionFieldValueIActionFieldValue);
```

Create initializes an instance of TUpdateFileList (see page 24550) and calls the inherited Create method.

173.1.78.3 TUpdateFileList Properties

The properties of the TUpdateFileList class are listed here.

Public Properties

	Name	Description
R	Count (see page 24551)	Returns the count of uploaded files.
R	Files (see page 24552)	Returns a particular uploaded file.

173.1.78.3.1 TUpdateFileList.Count Property

Returns the count of uploaded files.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count with the Files (see page 24552) property to loop through the uploaded files.

See Also

Files (see page 24552)

173.1.78.3.2 TUpdateFileList.Files Property

Returns a particular uploaded file.

Pascal

```
property Files [I: Integer]: TAbstractWebRequestFile;
```

C++

```
__property TAbstractWebRequestFile Files[int I];
```

Description

173.1.79 TValuesListNameField Class

TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.

Class Hierarchy

Pascal

```
TValuesListNameField = class(TBaseValuesListField);
```

C++

```
class TValuesListNameField : public TBaseValuesListField;
```

File

WebAdapt

Description

Values list adapters such as TStringValuesList contain at least two adapter fields. One adapter field is responsible for name of the current list item. The other adapter field is responsible for providing the value of the current list item. TValuesListNameField is an adapter field that returns the name of the current list item.

173.1.79.1 TValuesListNameField Members

The following tables list the members exposed by TValuesListNameField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24138)	Retrieves the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 24557)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.

	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 24558)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	Adapter (see page 24139)	Retrieves the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.79.2 TValuesListNameField Methods

The methods of the TValuesListNameField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 24557)	Returns the name used to access this adapter field using server-side script.
V	ImplGetValue (see page 24558)	Returns the value associated with this adapter field.

173.1.79.2.1 TValuesListNameField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'NameField'. Server-side script can access this adapter field using the NameField property.

173.1.79.2.2 TValuesListNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue calls the parent adapter's GetListName function to retrieve the name of the current list item.

See Also

GetListName (see page 24128)

173.1.80 TValuesListValueField Class

TValuesListValueField is an adapter field used to access the Value (see page 23945) of the current list item of a values list adapter.

Class Hierarchy

Pascal

```
TValuesListValueField = class(TBaseValuesListField);
```

C++

```
class TValuesListValueField : public TBaseValuesListField;
```

File

WebAdapt

Description

Values list adapters such as TStringValuesList contain at least two adapter fields. One adapter field is responsible for name of the current list item. The other adapter field is responsible for providing the value of the current list item. TValuesListValueField is an adapter field that returns the value of the current list item.

173.1.80.1 TValuesListValueField Members

The following tables list the members exposed by TValuesListValueField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AsFormatted (see page 23931)	Returns text used to generate a representation of the adapter field value.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckModifyAccess (see page 23931)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 23931)	Checks end-user rights to view the adapter field value.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	FullyQualifyInputName (see page 23932)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 23932)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 24138)	Retrieves the parent adapter component.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 23932)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 24564)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 23933)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 23933)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 23933)	Returns the value of the echo flag.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetInputName (see page 23934)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 23934)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequired (see page 23934)	Indicates whether the end-user must enter a value for this adapter field.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetValue (see page 23935)	Gets the value of this adapter field as a Variant.
	GetVariableName (see page 23935)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 23935)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 23936)	Returns the class type for this adapter field.
	HasModifyAccess (see page 23936)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 23936)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 23937)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 23937)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 23937)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 23938)	Returns the value of the echo flag.
V	ImplGetInputName (see page 23938)	Identifies the name to use when generating the HTML input for this adapter field.

V	ImplGetMaxLength (see page 23938)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 23939)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 24564)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 23939)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 23940)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 23940)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 23940)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 23941)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 23941)	Sets the name that is used to reference this adapter field with server-side script.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 23941)	Handles movement of the component to a different parent.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetEchoActionFieldValue (see page 23942)	Sets the echo flag for this adapter field.
	SetFieldName (see page 23942)	Sets the name that is used to reference this adapter field with server-side script.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 23943)	Returns the parent adapter component.
R	Adapter (see page 24139)	Retrieves the parent adapter component.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AsFormatted (see page 19682)	This is AsFormatted, a member of class IAsFormatted.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDisplayLabel (see page 19756)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 19757)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInputName (see page 19767)	This is GetInputName, a member of class IWebInputName.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetMaxLength (see page 19763)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 19668)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 19759)	This is GetValue, a member of class IWebGetFieldValue.
	GetVariableName (see page 15329)	This is GetVariableName, a member of class IWebVariableName.
	GetVisible (see page 19668)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 19667)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 19667)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActionOrigValue (see page 23943)	Retrieve the original value of this adapter field.
R	ActionValue (see page 23943)	Retrieve the value for this adapter field entered by the end-user.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 23944)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.

	FieldName (see page 23944)	Identifies the name of this field when using server-side script.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 19767)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 23944)	Identifies the rights required to update this field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Required (see page 19669)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 19760)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 23945)	Provides the value of an adapter field as a variant.
R	VariableName (see page 15329)	This is VariableName, a member of class IWebVariableName.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewAccess (see page 23945)	Identifies the rights required to view this field.
R	Visible (see page 19669)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

173.1.80.2 TValuesListValueField Methods

The methods of the TValuesListValueField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 24564)	Returns the name used to access this adapter field using server-side script.
V	ImplGetValue (see page 24564)	Returns the value associated with this adapter field.

173.1.80.2.1 TValuesListValueField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'ValueField'. Server-side script can access this adapter field using the ValueField property.

173.1.80.2.2 TValuesListValueField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue calls the parent adapter's GetListValue function to retrieve the value of the current list item.

See Also

GetListValue (see page 24129)

173.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterEditor (see page 24566)	This is class WebAdapt.IAdapterEditor.
	IAdapterNotifyAdapterChange (see page 24567)	This is class WebAdapt.IAdapterNotifyAdapterChange.
	ICheckOrigValue (see page 24568)	This is class WebAdapt.ICheckOrigValue.
	ICheckValueChange (see page 24569)	This is class WebAdapt.ICheckValueChange.
	IClearAdapterValues (see page 24570)	This is class WebAdapt.IClearAdapterValues.
	ICreateActionRequestContext (see page 24571)	This is class WebAdapt.ICreateActionRequestContext.
	IEchoActionFieldValue (see page 24572)	This is class WebAdapt.IEchoActionFieldValue.
	IEchoAdapterFieldValues (see page 24574)	This is class WebAdapt.IEchoAdapterFieldValues.
	IExecuteValue (see page 24575)	IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.
	IFullyQualifyInputNames (see page 24577)	This is class WebAdapt.IFullyQualifyInputNames.
	IGetAdapterErrorsList (see page 24578)	This is class WebAdapt.IGetAdapterErrorsList.
	IGetAdapterModeNames (see page 24579)	This is class WebAdapt.IGetAdapterModeNames.
	IGetRecordKeys (see page 24580)	This is class WebAdapt.IGetRecordKeys.
	IIdentifyAdapter (see page 24581)	This is class WebAdapt.IIdentifyAdapter.
	ISetSubComponents (see page 24581)	This is class WebAdapt.ISetSubComponents.
	ISetWebFieldValue (see page 24582)	This is class WebAdapt.ISetWebFieldValue.
	IUpdateValue (see page 24583)	This is class WebAdapt.IUpdateValue.
	IValidateValue (see page 24584)	This is class WebAdapt.IValidateValue.
	IWebActionsSubcomponent (see page 24585)	This is class WebAdapt.IWebActionsSubcomponent.
	IWebFieldsSubcomponent (see page 24585)	This is class WebAdapt.IWebFieldsSubcomponent.
	IWebGetFieldPrevValue (see page 24586)	This is class WebAdapt.IWebGetFieldPrevValue.

173.2.1 IAdapterEditor Interface

Class Hierarchy

WebAdapt.IAdapterEditor

Pascal

```
IAdapterEditor = interface;
```

C++

```
__interface IAdapterEditor;
```

File

WebAdapt

Description

This is class WebAdapt.IAdapterEditor.

173.2.1.1 IAdapterEditor Members

The following tables list the members exposed by IAdapterEditor.

Public Methods

	Name	Description
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.

173.2.1.2 IAdapterEditor Methods

The methods of the IAdapterEditor class are listed here.

Public Methods

	Name	Description
	CanAddActionClass (see page 24567)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 24567)	This is CanAddFieldClass, a member of class IAdapterEditor.

173.2.1.2.1 IAdapterEditor.CanAddActionClass Method

Pascal

```
function CanAddActionClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddActionClass, a member of class IAdapterEditor.

173.2.1.2.2 IAdapterEditor.CanAddFieldClass Method

Pascal

```
function CanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddFieldClass, a member of class IAdapterEditor.

173.2.2 IAdapterNotifyAdapterChange Interface

Class Hierarchy

WebAdapt.IAdapterNotifyAdapterChange

Pascal

```
IAdapterNotifyAdapterChange = interface;
```

C++

```
__interface IAdapterNotifyAdapterChange;
```

File

WebAdapt

Description

This is class WebAdapt.IAdapterNotifyAdapterChange.

173.2.2.1 IAdapterNotifyAdapterChange Members

The following tables list the members exposed by IAdapterNotifyAdapterChange.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

173.2.2.2 IAdapterNotifyAdapterChange Methods

The methods of the IAdapterNotifyAdapterChange class are listed here.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 24568)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

173.2.2.2.1 IAdapterNotifyAdapterChange.NotifyAdapterChange Method

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

173.2.3 ICheckOrigValue Interface

Class Hierarchy

WebAdapt.ICheckOrigValue

Pascal

```
ICheckOrigValue = interface;
```

C++

```
__interface ICheckOrigValue;
```

File

WebAdapt

Description

This is class WebAdapt.ICheckOrigValue.

173.2.3.1 ICheckOrigValue Members

The following tables list the members exposed by ICheckOrigValue.

Public Methods

	Name	Description
	CheckOrigValue (see page 24569)	This is CheckOrigValue, a member of class ICheckOrigValue.

173.2.3.2 ICheckOrigValue Methods

The methods of the ICheckOrigValue class are listed here.

Public Methods

	Name	Description
	CheckOrigValue (see page 24569)	This is CheckOrigValue, a member of class ICheckOrigValue.

173.2.3.2.1 ICheckOrigValue.CheckOrigValue Method

Pascal

```
procedure CheckOrigValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall CheckOrigValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is CheckOrigValue, a member of class ICheckOrigValue.

173.2.4 ICheckValueChange Interface

Class Hierarchy

WebAdapt.ICheckValueChange

Pascal

```
ICheckValueChange = interface;
```

C++

```
__interface ICheckValueChange;
```

File

WebAdapt

Description

This is class WebAdapt.ICheckValueChange.

173.2.4.1 ICheckValueChange Members

The following tables list the members exposed by ICheckValueChange.

Public Methods

	Name	Description
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.

173.2.4.2 ICheckValueChange Methods

The methods of the ICheckValueChange class are listed here.

Public Methods

	Name	Description
	CheckValueChange (see page 24570)	This is CheckValueChange, a member of class ICheckValueChange.

173.2.4.2.1 ICheckValueChange.CheckValueChange Method

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is CheckValueChange, a member of class ICheckValueChange.

173.2.5 IClearAdapterValues Interface

Class Hierarchy

Pascal

```
IClearAdapterValues = interface;
```

C++

```
__interface IClearAdapterValues;
```

File

WebAdapt

Description

This is class WebAdapt.IClearAdapterValues.

173.2.5.1 IClearAdapterValues Members

The following tables list the members exposed by IClearAdapterValues.

Public Methods

	Name	Description
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.

173.2.5.2 IClearAdapterValues Methods

The methods of the IClearAdapterValues class are listed here.

Public Methods

	Name	Description
	ClearAdapterValues (see page 24571)	This is ClearAdapterValues, a member of class IClearAdapterValues.

173.2.5.2.1 IClearAdapterValues.ClearAdapterValues Method

Pascal

```
procedure ClearAdapterValues;
```

C++

```
__fastcall ClearAdapterValues();
```

Description

This is ClearAdapterValues, a member of class IClearAdapterValues.

173.2.6 ICreateActionRequestContext Interface

Class Hierarchy

WebAdapt.ICreateActionRequestContext

Pascal

```
ICreateActionRequestContext = interface;
```

C++

```
__interface ICreateActionRequestContext;
```

File

WebAdapt

Description

This is class WebAdapt.ICreateActionRequestContext.

173.2.6.1 ICreateActionRequestContext Members

The following tables list the members exposed by ICreateActionRequestContext.

Public Methods

	Name	Description
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

173.2.6.2 ICreateActionRequestContext Methods

The methods of the ICreateActionRequestContext class are listed here.

Public Methods

	Name	Description
	CreateActionRequestContext (see page 24572)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

173.2.6.2.1 ICreateActionRequestContext.CreateActionRequestContext Method

Pascal

```
procedure CreateActionRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateActionRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

173.2.7 IEchoActionFieldValue Interface

Class Hierarchy

WebAdapt.IEchoActionFieldValue

Pascal

```
IEchoActionFieldValue = interface;
```

C++

```
__interface IEchoActionFieldValue;
```

File

WebAdapt

Description

This is class WebAdapt.IEchoActionFieldValue.

173.2.7.1 IEchoActionFieldValue Members

The following tables list the members exposed by IEchoActionFieldValue.

Public Methods

	Name	Description
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

Public Properties

	Name	Description
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.7.2 IEchoActionFieldValue Methods

The methods of the IEchoActionFieldValue class are listed here.

Public Methods

	Name	Description
	GetEchoActionFieldValue (see page 24573)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetEchoActionFieldValue (see page 24573)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.7.2.1 IEchoActionFieldValue.GetEchoActionFieldValue Method

Pascal

```
function GetEchoActionFieldValue: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValue();
```

Description

This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.7.2.2 IEchoActionFieldValue.SetEchoActionFieldValue Method

Pascal

```
procedure SetEchoActionFieldValue(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValue(Boolean AValue);
```

Description

This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.7.3 IEchoActionFieldValue Properties

The properties of the IEchoActionFieldValue class are listed here.

Public Properties

	Name	Description
	EchoActionFieldValue (see page 24574)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.7.3.1 IEchoActionFieldValue.EchoActionFieldValue Property

Pascal

```
property EchoActionFieldValue: Boolean;
```

C++

```
__property Boolean EchoActionFieldValue;
```

Description

This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

173.2.8 IEchoAdapterFieldValues Interface

Class Hierarchy

WebAdapt.IEchoAdapterFieldValues

Pascal

```
IEchoAdapterFieldValues = interface;
```

C++

```
__interface IEchoAdapterFieldValues;
```

File

WebAdapt

Description

This is class WebAdapt.IEchoAdapterFieldValues.

173.2.8.1 IEchoAdapterFieldValues Members

The following tables list the members exposed by IEchoAdapterFieldValues.

Public Methods

	Name	Description
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.8.2 IEchoAdapterFieldValues Methods

The methods of the IEchoAdapterFieldValues class are listed here.

Public Methods

	Name	Description
	GetEchoActionFieldValues (see page 24575)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

	SetEchoActionFieldValues (see page 24575)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.8.2.1 IEchoAdapterFieldValues.GetEchoActionFieldValues Method

Pascal

```
function GetEchoActionFieldValues: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValues();
```

Description

This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.8.2.2 IEchoAdapterFieldValues.SetEchoActionFieldValues Method

Pascal

```
procedure SetEchoActionFieldValues(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValues(Boolean AValue);
```

Description

This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.8.3 IEchoAdapterFieldValues Properties

The properties of the IEchoAdapterFieldValues class are listed here.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 24575)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.8.3.1 IEchoAdapterFieldValues.EchoActionFieldValues Property

Pascal

```
property EchoActionFieldValues: Boolean;
```

C++

```
__property Boolean EchoActionFieldValues;
```

Description

This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

173.2.9 IExecuteValue Interface

IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.

Class Hierarchy

WebAdapt.IExecuteValue

Pascal

```
IExecuteValue = interface;
```

C++

```
__interface IExecuteValue;
```

File

WebAdapt

Description

Adapter fields implement the IExecuteValue interface when they are executable. When a field is executable, HTTP requests can supply field values that are used to execute a command rather than update a value. For example, an HTML form may contain a check box or radio button control that indicates an action the user wants to take. When the form is submitted, the values for the field that underlies the check box or radio buttons indicate the user's choice. When the WebSnap application receives the HTTP request, it uses the IExecuteValue interface to call the field's ExecuteValue (see page 24576) method.

Note: Method declarations that use IExecuteValue use the _di_IExecuteValue type instead. This type is a DelphiInterface wrapper around the IExecuteValue interface:

Note: typedef System::DelphiInterface (see page 22167)< IExecuteValue > _di_IExecuteValue;

See Also

TCustomAdapter (see page 24139)

173.2.9.1 IExecuteValue Members

The following tables list the members exposed by IExecuteValue.

Public Methods

	Name	Description
	ExecuteValue (see page 24576)	Executes the field based on a value supplied in the current HTTP request.

173.2.9.2 IExecuteValue Methods

The methods of the IExecuteValue class are listed here.

Public Methods

	Name	Description
	ExecuteValue (see page 24576)	Executes the field based on a value supplied in the current HTTP request.

173.2.9.2.1 IExecuteValue.ExecuteValue Method

Executes the field based on a value supplied in the current HTTP request.

Pascal

```
procedure ExecuteValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ExecuteValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

An adapter calls ExecuteValue when responding to an HTTP request that supplies values from executable fields.

AActionRequest is the current request object. ExecuteValue uses this interface to extract the value to use when executing the field.

AFieldIndex is the index of the target field in the list of field values that the request object supplies.

UpdateFieldsExecuteValues (see page 24177)

173.2.10 IFullyQualifyInputNames Interface

Class Hierarchy

WebAdapt.IFullyQualifyInputNames

Pascal

```
IFullyQualifyInputNames = interface;
```

C++

```
__interface IFullyQualifyInputNames;
```

File

WebAdapt

Description

This is class WebAdapt.IFullyQualifyInputNames.

173.2.10.1 IFullyQualifyInputNames Members

The following tables list the members exposed by IFullyQualifyInputNames.

Public Methods

	Name	Description
	FullyQualifyInputNames (see page 24577)	This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

173.2.10.2 IFullyQualifyInputNames Methods

The methods of the IFullyQualifyInputNames class are listed here.

Public Methods

	Name	Description
	FullyQualifyInputNames (see page 24577)	This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

173.2.10.2.1 IFullyQualifyInputNames.FullyQualifyInputNames Method

Pascal

```
function FullyQualifyInputNames: Boolean;
```

C++

```
__fastcall Boolean FullyQualifyInputNames();
```

Description

This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

173.2.11 IGetAdapterErrorsList Interface

Class Hierarchy

WebAdapt.IGetAdapterErrorsList

Pascal

```
IGetAdapterErrorsList = interface;
```

C++

```
__interface IGetAdapterErrorsList;
```

File

WebAdapt

Description

This is class WebAdapt.IGetAdapterErrorsList.

173.2.11.1 IGetAdapterErrorsList Members

The following tables list the members exposed by IGetAdapterErrorsList.

Public Methods

	Name	Description
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

173.2.11.2 IGetAdapterErrorsList Methods

The methods of the IGetAdapterErrorsList class are listed here.

Public Methods

	Name	Description
	GetAdapterErrorsList (see page 24578)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

173.2.11.2.1 IGetAdapterErrorsList.GetAdapterErrorsList Method

Pascal

```
function GetAdapterErrorsList: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetAdapterErrorsList();
```

Description

This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

173.2.12 IGetAdapterModeNames Interface

Class Hierarchy

WebAdapt.IGetAdapterModeNames

Pascal

```
IGetAdapterModeNames = interface;
```

C++

```
__interface IGetAdapterModeNames;
```

File

WebAdapt

Description

This is class WebAdapt.IGetAdapterModeNames.

173.2.12.1 IGetAdapterModeNames Members

The following tables list the members exposed by IGetAdapterModeNames.

Public Methods

	Name	Description
	GetAdapterModeNames (see page 24579)	This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

173.2.12.2 IGetAdapterModeNames Methods

The methods of the IGetAdapterModeNames class are listed here.

Public Methods

	Name	Description
	GetAdapterModeNames (see page 24579)	This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

173.2.12.2.1 IGetAdapterModeNames.GetAdapterModeNames Method

Pascal

```
procedure GetAdapterModeNames(AStrings: TStrings);
```

C++

```
__fastcall GetAdapterModeNames(TStrings AStrings);
```

Description

This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

173.2.13 IGetRecordKeys Interface

Class Hierarchy

WebAdapt.IGetRecordKeys

Pascal

```
IGetRecordKeys = interface;
```

C++

```
__interface IGetRecordKeys;
```

File

WebAdapt

Description

This is class WebAdapt.IGetRecordKeys.

173.2.13.1 IGetRecordKeys Members

The following tables list the members exposed by IGetRecordKeys.

Public Methods

	Name	Description
	GetRecordKeys (see page 24580)	This is GetRecordKeys, a member of class IGetRecordKeys.

173.2.13.2 IGetRecordKeys Methods

The methods of the IGetRecordKeys class are listed here.

Public Methods

	Name	Description
	GetRecordKeys (see page 24580)	This is GetRecordKeys, a member of class IGetRecordKeys.

173.2.13.2.1 IGetRecordKeys.GetRecordKeys Method

Pascal

```
procedure GetRecordKeys(AParams: TStrings; var AFullyQualify: Boolean);
```

C++

```
__fastcall GetRecordKeys(TStrings AParams, Boolean AFullyQualify);
```

Description

This is GetRecordKeys, a member of class IGetRecordKeys.

173.2.14 IIdentifyAdapter Interface

Class Hierarchy

WebAdapt.IIdentifyAdapter

Pascal

```
IIdentifyAdapter = interface;
```

C++

```
__interface IIdentifyAdapter;
```

File

WebAdapt

Description

This is class WebAdapt.IIdentifyAdapter.

173.2.15 ISetSubComponents Interface

Class Hierarchy

WebAdapt.ISetSubComponents

Pascal

```
ISetSubComponents = interface;
```

C++

```
__interface ISetSubComponents;
```

File

WebAdapt

Description

This is class WebAdapt.ISetSubComponents.

173.2.15.1 ISetSubComponents Members

The following tables list the members exposed by ISetSubComponents.

Public Methods

	Name	Description
	SetActions (see page 24582)	This is SetActions, a member of class ISetSubComponents.
	SetData (see page 24582)	This is SetData, a member of class ISetSubComponents.

173.2.15.2 ISetSubComponents Methods

The methods of the ISetSubComponents class are listed here.

Public Methods

	Name	Description
	SetActions (see page 24582)	This is SetActions, a member of class ISetSubComponents.
	SetData (see page 24582)	This is SetData, a member of class ISetSubComponents.

173.2.15.2.1 ISetSubComponents.SetActions Method

Pascal

```
procedure SetActions(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetActions(const TAdapterSubComponent Value);
```

Description

This is SetActions, a member of class ISetSubComponents.

173.2.15.2.2 ISetSubComponents.SetData Method

Pascal

```
procedure SetData(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetData(const TAdapterSubComponent Value);
```

Description

This is SetData, a member of class ISetSubComponents.

173.2.16 ISetWebFieldValue Interface

Class Hierarchy

WebAdapt.ISetWebFieldValue

Pascal

```
ISetWebFieldValue = interface;
```

C++

```
__interface ISetWebFieldValue;
```

File

WebAdapt

Description

This is class WebAdapt.ISetWebFieldValue.

173.2.16.1 ISetWebFieldValue Members

The following tables list the members exposed by ISetWebFieldValue.

Public Methods

	Name	Description
	SetValue (see page 24583)	This is SetValue, a member of class ISetWebFieldValue.

173.2.16.2 ISetWebFieldValue Methods

The methods of the ISetWebFieldValue class are listed here.

Public Methods

	Name	Description
	SetValue (see page 24583)	This is SetValue, a member of class ISetWebFieldValue.

173.2.16.2.1 ISetWebFieldValue.SetValue Method

Pascal

```
procedure SetValue(const AValue: Variant);
```

C++

```
__fastcall SetValue(const Variant AValue);
```

Description

This is SetValue, a member of class ISetWebFieldValue.

173.2.17 IUpdateValue Interface

Class Hierarchy

WebAdapt.IUpdateValue

Pascal

```
IUpdateValue = interface;
```

C++

```
__interface IUpdateValue;
```

File

WebAdapt

Description

This is class WebAdapt.IUpdateValue.

173.2.17.1 IUpdateValue Members

The following tables list the members exposed by IUpdateValue.

Public Methods

	Name	Description
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.

173.2.17.2 IUpdateValue Methods

The methods of the IUpdateValue class are listed here.

Public Methods

	Name	Description
	UpdateValue (see page 24584)	This is UpdateValue, a member of class IUpdateValue.

173.2.17.2.1 IUpdateValue.UpdateValue Method

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is UpdateValue, a member of class IUpdateValue.

173.2.18 IValidateValue Interface

Class Hierarchy

WebAdapt.IValidateValue

Pascal

```
IValidateValue = interface;
```

C++

```
__interface IValidateValue;
```

File

WebAdapt

Description

This is class WebAdapt.IValidateValue.

173.2.18.1 IValidateValue Members

The following tables list the members exposed by IValidateValue.

Public Methods

	Name	Description
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

173.2.18.2 IValidateValue Methods

The methods of the IValidateValue class are listed here.

Public Methods

	Name	Description
	ValidateValue (see page 24585)	This is ValidateValue, a member of class IValidateValue.

173.2.18.2.1 IValidateValue.ValidateValue Method

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is ValidateValue, a member of class IValidateValue.

173.2.19 IWebActionsSubcomponent Interface

Class Hierarchy

WebAdapt.IWebActionsSubcomponent

Pascal

```
IWebActionsSubcomponent = interface;
```

C++

```
__interface IWebActionsSubcomponent;
```

File

WebAdapt

Description

This is class WebAdapt.IWebActionsSubcomponent.

173.2.20 IWebFieldsSubcomponent Interface

Class Hierarchy

WebAdapt.IWebFieldsSubcomponent

Pascal

```
IWebFieldsSubcomponent = interface;
```

C++

```
__interface IWebFieldsSubcomponent;
```

File

WebAdapt

Description

This is class WebAdapt.IWebFieldsSubcomponent.

173.2.21 IWebGetFieldPrevValue Interface

Class Hierarchy

WebAdapt.IWebGetFieldPrevValue

Pascal

```
IWebGetFieldPrevValue = interface;
```

C++

```
__interface IWebGetFieldPrevValue;
```

File

WebAdapt

Description

This is class WebAdapt.IWebGetFieldPrevValue.

173.2.21.1 IWebGetFieldPrevValue Members

The following tables list the members exposed by IWebGetFieldPrevValue.

Public Methods

	Name	Description
	GetNeedPrevValue (see page 24587)	This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.
	GetPrevValue (see page 24587)	This is GetPrevValue, a member of class IWebGetFieldPrevValue.

Public Properties

	Name	Description
R	NeedPrevValue (see page 24587)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
R	PrevValue (see page 24587)	This is PrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.2 IWebGetFieldPrevValue Methods

The methods of the IWebGetFieldPrevValue class are listed here.

Public Methods

	Name	Description
	GetNeedPrevValue (see page 24587)	This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.
	GetPrevValue (see page 24587)	This is GetPrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.2.1 IWebGetFieldPrevValue.GetNeedPrevValue Method

Pascal

```
function GetNeedPrevValue: Boolean;
```

C++

```
__fastcall Boolean GetNeedPrevValue();
```

Description

This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.2.2 IWebGetFieldPrevValue.GetPrevValue Method

Pascal

```
function GetPrevValue: Variant;
```

C++

```
__fastcall Variant GetPrevValue();
```

Description

This is GetPrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.3 IWebGetFieldPrevValue Properties

The properties of the IWebGetFieldPrevValue class are listed here.

Public Properties

	Name	Description
R	NeedPrevValue (see page 24587)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
R	PrevValue (see page 24587)	This is PrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.3.1 IWebGetFieldPrevValue.NeedPrevValue Property

Pascal

```
property NeedPrevValue: Boolean;
```

C++

```
__property Boolean NeedPrevValue;
```

Description

This is NeedPrevValue, a member of class IWebGetFieldPrevValue.

173.2.21.3.2 IWebGetFieldPrevValue.PrevValue Property

Pascal

```
property PrevValue: Variant;
```

C++

```
__property Variant PrevValue;
```

Description

This is PrevValue, a member of class IWebGetFieldPrevValue.

173.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddDefaultActions (see page 24589)	This is function WebAdapt.AddDefaultActions.
	AddDefaultFields (see page 24589)	This is function WebAdapt.AddDefaultFields.
	FindAdapterAction (see page 24590)	This is function WebAdapt.FindAdapterAction.
	FindAdapterField (see page 24590)	This is function WebAdapt.FindAdapterField.
	FindAdapterInParent (see page 24590)	This is function WebAdapt.FindAdapterInParent.
	MakeAdapterRequestIdentifier (see page 24591)	This is function WebAdapt.MakeAdapterRequestIdentifier.
	MakeValidAdapterFieldName (see page 24591)	This is function WebAdapt.MakeValidAdapterFieldName.
	RaiseFileUploadNotSupported (see page 24591)	This is function WebAdapt.RaiseFileUploadNotSupported.
	RaiseMultipleFilesException (see page 24592)	This is function WebAdapt.RaiseMultipleFilesException.
	RaiseMultipleValuesException (see page 24592)	This is function WebAdapt.RaiseMultipleValuesException.

173.3.1 WebAdapt.AddDefaultActions Function

Pascal

```
procedure AddDefaultActions(AList: TStrings; AComponents: TWebComponentList);
```

C++

```
AddDefaultActions(TStrings AList, TWebComponentList AComponents);
```

File

WebAdapt

Description

This is function WebAdapt.AddDefaultActions.

173.3.2 WebAdapt.AddDefaultFields Function

Pascal

```
procedure AddDefaultFields(AList: TStrings; AComponents: TWebComponentList);
```

C++

```
AddDefaultFields(TStrings AList, TWebComponentList AComponents);
```

File

WebAdapt

Description

This is function WebAdapt.AddDefaultFields.

173.3.3 WebAdapt.FindAdapterAction Function

Pascal

```
function FindAdapterAction(AWebComponents: TWebComponentList; const AName: string): TComponent;
```

C++

```
TComponent * FindAdapterAction(TWebComponentList AWebComponents, const AnsiString AName);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterAction.

173.3.4 WebAdapt.FindAdapterField Function

Pascal

```
function FindAdapterField(AWebComponents: TWebComponentList; const AName: string): TComponent;
```

C++

```
TComponent * FindAdapterField(TWebComponentList AWebComponents, const AnsiString AName);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterField.

173.3.5 WebAdapt.FindAdapterInParent Function

Pascal

```
function FindAdapterInParent(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindAdapterInParent(TComponent * AComponent);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterInParent.

173.3.6 WebAdapt.MakeAdapterRequestIdentifier Function

Pascal

```
function MakeAdapterRequestIdentifier(AComponent: TComponent): string;
```

C++

```
AnsiString MakeAdapterRequestIdentifier(TComponent * AComponent);
```

File

WebAdapt

Description

This is function WebAdapt.MakeAdapterRequestIdentifier.

173.3.7 WebAdapt.MakeValidAdapterFieldName Function

Pascal

```
function MakeValidAdapterFieldName(const AFieldName: string): string;
```

C++

```
AnsiString MakeValidAdapterFieldName(const AnsiString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.MakeValidAdapterFieldName.

173.3.8 WebAdapt.RaiseFileUploadNotSupported Function

Pascal

```
procedure RaiseFileUploadNotSupported(AFieldName: string);
```

C++

```
RaiseFileUploadNotSupported(AnsiString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseFileUploadNotSupported.

173.3.9 WebAdapt.RaiseMultipleFilesException Function

Pascal

```
procedure RaiseMultipleFilesException(AFieldName: string);
```

C++

```
RaiseMultipleFilesException(AnsiString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseMultipleFilesException.

173.3.10 WebAdapt.RaiseMultipleValuesException Function

Pascal

```
procedure RaiseMultipleValuesException(AFieldName: string);
```

C++

```
RaiseMultipleValuesException(AnsiString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseMultipleValuesException.

173.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAdapterHiddenFieldOption (see page 24593)	This is record WebAdapt.TAdapterHiddenFieldOption.
	TIteratorMethod (see page 24593)	This is record WebAdapt.TIteratorMethod.

173.4.1 WebAdapt.TAdapterHiddenFieldOption Enumeration

Pascal

```
TAdapterHiddenFieldOption = (
  hoOrigValues,
  hoMode,
  hoRecordKeys
);
```

C++

```
enum TAdapterHiddenFieldOption {
  hoOrigValues,
  hoMode,
  hoRecordKeys
};
```

File

WebAdapt

Description

This is record WebAdapt.TAdapterHiddenFieldOption.

173.4.2 WebAdapt.TIteratorMethod Enumeration

Pascal

```
TIteratorMethod = (
  itStart,
  itNext,
  itEnd
);
```

C++

```
enum TIteratorMethod {
  itStart,
  itNext,
  itEnd
};
```

File

WebAdapt

Description

This is record WebAdapt.TIteratorMethod.

173.5 Types

The following table lists types in this documentation.

Types

Name	Description
IActionFieldValue (see page 24596)	This is type WebAdapt.IActionFieldValue.
IActionRequest (see page 24596)	This is type WebAdapt.IActionRequest.
TAbstractWebRequestFile (see page 24596)	This is type WebAdapt.TAbstractWebRequestFile.
TActionExecuteEvent (see page 24597)	This is type WebAdapt.TActionExecuteEvent.
TActionExecuteHandledEvent (see page 24597)	This is type WebAdapt.TActionExecuteHandledEvent.
TActionGetEnabledEvent (see page 24597)	This is type WebAdapt.TActionGetEnabledEvent.
TActionGetParamsEvent (see page 24598)	This is type WebAdapt.TActionGetParamsEvent.
TActionRequestFieldsEvent (see page 24598)	This is type WebAdapt.TActionRequestFieldsEvent.
TActionRequestFieldsHandledEvent (see page 24598)	This is type WebAdapt.TActionRequestFieldsHandledEvent.
TAdapterActionExecuteEvent (see page 24599)	This is type WebAdapt.TAdapterActionExecuteEvent.
TAdapterActionExecuteHandledEvent (see page 24599)	This is type WebAdapt.TAdapterActionExecuteHandledEvent.
TAdapterActionGetParamsEvent (see page 24599)	This is type WebAdapt.TAdapterActionGetParamsEvent.
TAdapterActionsClass (see page 24600)	This is type WebAdapt.TAdapterActionsClass.
TAdapterFieldBooleanValueEvent (see page 24600)	This is type WebAdapt.TAdapterFieldBooleanValueEvent.
TAdapterFieldFileEvent (see page 24600)	This is type WebAdapt.TAdapterFieldFileEvent.
TAdapterFieldFileListEvent (see page 24601)	This is type WebAdapt.TAdapterFieldFileListEvent.
TAdapterFieldGetBooleanEvent (see page 24601)	This is type WebAdapt.TAdapterFieldGetBooleanEvent.
TAdapterFieldGetMultiValueEvent (see page 24601)	This is type WebAdapt.TAdapterFieldGetMultiValueEvent.
TAdapterFieldGetMultiValueStringEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetMultiValueStringEvent.
TAdapterFieldGetStringEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetStringEvent.
TAdapterFieldGetValueCountEvent (see page 24602)	This is type WebAdapt.TAdapterFieldGetValueCountEvent.
TAdapterFieldGetValueEvent (see page 24603)	This is type WebAdapt.TAdapterFieldGetValueEvent.
TAdapterFieldHasValueEvent (see page 24603)	This is type WebAdapt.TAdapterFieldHasValueEvent.
TAdapterFieldsClass (see page 24603)	This is type WebAdapt.TAdapterFieldsClass.
TAdapterFieldStringEvent (see page 24604)	This is type WebAdapt.TAdapterFieldStringEvent.
TAdapterFieldStringsEvent (see page 24604)	This is type WebAdapt.TAdapterFieldStringsEvent.
TAdapterFieldValidateValueEvent (see page 24604)	This is type WebAdapt.TAdapterFieldValidateValueEvent.
TAdapterFieldValueEvent (see page 24605)	This is type WebAdapt.TAdapterFieldValueEvent.
TAdapterHiddenFieldOptions (see page 24605)	This is type WebAdapt.TAdapterHiddenFieldOptions.
TEndUserGetNameEvent (see page 24605)	This is type WebAdapt.TEndUserGetNameEvent.
TEndUserGetUserIDEvent (see page 24606)	This is type WebAdapt.TEndUserGetUserIDEvent.
TEndUserHandledEvent (see page 24606)	This is type WebAdapt.TEndUserHandledEvent.
TEndUserIsLoggedInEvent (see page 24606)	This is type WebAdapt.TEndUserIsLoggedInEvent.
TEndUserRightsEvent (see page 24607)	This is type WebAdapt.TEndUserRightsEvent.
TEndUserUserIDEvent (see page 24607)	This is type WebAdapt.TEndUserUserIDEvent.
TGetEOFEvent (see page 24607)	This is type WebAdapt.TGetEOFEvent.
TGetRecordCountEvent (see page 24608)	This is type WebAdapt.TGetRecordCountEvent.
TGetRecordEvent (see page 24608)	This is type WebAdapt.TGetRecordEvent.
TGetRecordIndexEvent (see page 24608)	This is type WebAdapt.TGetRecordIndexEvent.
THandledEvent (see page 24609)	This is type WebAdapt.THandledEvent.
TImageFieldGetHREFEvent (see page 24609)	This is type WebAdapt.TImageFieldGetHREFEvent.
TImageFieldGetImageEvent (see page 24609)	This is type WebAdapt.TImageFieldGetImageEvent.
TImageFieldGetParamsEvent (see page 24610)	This is type WebAdapt.TImageFieldGetParamsEvent.
TIterateRecordsEvent (see page 24610)	This is type WebAdapt.TIterateRecordsEvent.

TLoginUserIDEvent (see page 24610)	This is type WebAdapt.TLoginUserIDEvent.
TObjectList (see page 24611)	This is type WebAdapt.TObjectList.
TValidateAdapterFieldEvent (see page 24611)	This is type WebAdapt.TValidateAdapterFieldEvent.
TWebFormGetPageNameEvent (see page 24611)	This is type WebAdapt.TWebFormGetPageNameEvent.

173.5.1 WebAdapt.IActionFieldValue Type

Pascal

```
IActionFieldValue = AdaptReq.IActionFieldValue;
```

C++

```
AdaptReq.IActionFieldValue IActionFieldValue;
```

File

WebAdapt

Description

This is type WebAdapt.IActionFieldValue.

173.5.2 WebAdapt.IActionRequest Type

Pascal

```
IActionRequest = AdaptReq.IActionRequest;
```

C++

```
AdaptReq.IActionRequest IActionRequest;
```

File

WebAdapt

Description

This is type WebAdapt.IActionRequest.

173.5.3 WebAdapt.TAbstractWebRequestFile Type

Pascal

```
TAbstractWebRequestFile = HTTPApp.TAbstractWebRequestFile;
```

C++

```
HTTPApp.TAbstractWebRequestFile TAbstractWebRequestFile;
```

File

WebAdapt

Description

This is type WebAdapt.TAbstractWebRequestFile.

173.5.4 WebAdapt.TActionExecuteEvent Type

Pascal

```
TActionExecuteEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TActionExecuteEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionExecuteEvent.

173.5.5 WebAdapt.TActionExecuteHandledEvent Type

Pascal

```
TActionExecuteHandledEvent = procedure (Sender: TObject; Params: TStrings; var Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; Params: TStrings; var Handled: Boolean) ( TActionExecuteHandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionExecuteHandledEvent.

173.5.6 WebAdapt.TActionGetEnabledEvent Type

Pascal

```
TActionGetEnabledEvent = procedure (Sender: TObject; var Enabled: Boolean) of object;
```

C++

```
(Sender: TObject; var Enabled: Boolean) ( TActionGetEnabledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionGetEnabledEvent.

173.5.7 WebAdapt.TActionGetParamsEvent Type

Pascal

```
TActionGetParamsEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TActionGetParamsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionGetParamsEvent.

173.5.8 WebAdapt.TActionRequestFieldsEvent Type

Pascal

```
TActionRequestFieldsEvent = procedure (Sender: TObject; ActionRequest: IActionRequest;
AdapterFields: TObjectList) of object;
```

C++

```
(Sender: TObject; ActionRequest: IActionRequest; AdapterFields: TObjectList) (
TActionRequestFieldsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionRequestFieldsEvent.

173.5.9 WebAdapt.TActionRequestFieldsHandledEvent Type

Pascal

```
TActionRequestFieldsHandledEvent = procedure (Sender: TObject; ActionRequest: IActionRequest;
AdapterFields: TObjectList; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; ActionRequest: IActionRequest; AdapterFields: TObjectList; var Handled:
Boolean) ( TActionRequestFieldsHandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TActionRequestFieldsHandledEvent.

173.5.10 WebAdapt.TAdapterActionExecuteEvent Type

Pascal

```
TAdapterActionExecuteEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings) of
object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TAdapterActionExecuteEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterActionExecuteEvent.

173.5.11 WebAdapt.TAdapterActionExecuteHandledEvent Type

Pascal

```
TAdapterActionExecuteHandledEvent = procedure (Sender: TObject; Action: TObject; Params:
TStrings; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings; var Handled: Boolean) (
TAdapterActionExecuteHandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterActionExecuteHandledEvent.

173.5.12 WebAdapt.TAdapterActionGetParamsEvent Type

Pascal

```
TAdapterActionGetParamsEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings)
of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TAdapterActionGetParamsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterActionGetParamsEvent.

173.5.13 WebAdapt.TAdapterActionsClass Type

Pascal

```
TAdapterActionsClass = class of TAdapterActions;
```

C++

```
TAdapterActions TAdapterActionsClass;
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterActionsClass.

173.5.14 WebAdapt.TAdapterFieldBooleanValueEvent Type

Pascal

```
TAdapterFieldBooleanValueEvent = procedure (Sender: TObject; Value: Boolean) of object;
```

C++

```
(Sender: TObject; Value: Boolean) ( TAdapterFieldBooleanValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldBooleanValueEvent.

173.5.15 WebAdapt.TAdapterFieldFileEvent Type

Pascal

```
TAdapterFieldFileEvent = procedure (Sender: TObject; AFile: TAbstractWebRequestFile) of object;
```

C++

```
(Sender: TObject; AFile: TAbstractWebRequestFile) ( TAdapterFieldFileEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldFileEvent.

173.5.16 WebAdapt.TAdapterFieldFileListEvent Type

Pascal

```
TAdapterFieldFileListEvent = procedure (Sender: TObject; Files: TUpdateFileList) of object;
```

C++

```
(Sender: TObject; Files: TUpdateFileList) ( TAdapterFieldFileListEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldFileListEvent.

173.5.17 WebAdapt.TAdapterFieldGetBooleanEvent Type

Pascal

```
TAdapterFieldGetBooleanEvent = procedure (Sender: TObject; var Value: Boolean) of object;
```

C++

```
(Sender: TObject; var Value: Boolean) ( TAdapterFieldGetBooleanEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetBooleanEvent.

173.5.18 WebAdapt.TAdapterFieldGetMultiValueEvent Type

Pascal

```
TAdapterFieldGetMultiValueEvent = procedure (Sender: TObject; Index: Integer; var Value:
Variant) of object;
```

C++

```
(Sender: TObject; Index: Integer; var Value: Variant) ( TAdapterFieldGetMultiValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetMultiValueEvent.

173.5.19 WebAdapt.TAdapterFieldGetMultiValueStringEvent Type

Pascal

```
TAdapterFieldGetMultiValueStringEvent = procedure (Sender: TObject; Index: Integer; var Value:
string) of object;
```

C++

```
(Sender: TObject; Index: Integer; var Value: string) (
TAdapterFieldGetMultiValueStringEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetMultiValueStringEvent.

173.5.20 WebAdapt.TAdapterFieldGetStringEvent Type

Pascal

```
TAdapterFieldGetStringEvent = procedure (Sender: TObject; var Value: string) of object;
```

C++

```
(Sender: TObject; var Value: string) ( TAdapterFieldGetStringEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetStringEvent.

173.5.21 WebAdapt.TAdapterFieldGetValueCountEvent Type

Pascal

```
TAdapterFieldGetValueCountEvent = procedure (Sender: TObject; var Count: Integer) of object;
```

C++

```
(Sender: TObject; var Count: Integer) ( TAdapterFieldGetValueCountEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetValueCountEvent.

173.5.22 WebAdapt.TAdapterFieldGetValueEvent Type

Pascal

```
TAdapterFieldGetValueEvent = procedure (Sender: TObject; var Value: Variant) of object;
```

C++

```
(Sender: TObject; var Value: Variant) ( TAdapterFieldGetValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldGetValueEvent.

173.5.23 WebAdapt.TAdapterFieldHasValueEvent Type

Pascal

```
TAdapterFieldHasValueEvent = procedure (Sender: TObject; const Value: Variant; var HasValue:
Boolean) of object;
```

C++

```
(Sender: TObject; const Value: Variant; var HasValue: Boolean) ( TAdapterFieldHasValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldHasValueEvent.

173.5.24 WebAdapt.TAdapterFieldsClass Type

Pascal

```
TAdapterFieldsClass = class of TAdapterFields;
```

C++

```
TAdapterFields TAdapterFieldsClass;
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldsClass.

173.5.25 WebAdapt.TAdapterFieldStringEvent Type

Pascal

```
TAdapterFieldStringEvent = procedure (Sender: TObject; Value: string) of object;
```

C++

```
(Sender: TObject; Value: string) ( TAdapterFieldStringEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldStringEvent.

173.5.26 WebAdapt.TAdapterFieldStringsEvent Type

Pascal

```
TAdapterFieldStringsEvent = procedure (Sender: TObject; Values: TStrings) of object;
```

C++

```
(Sender: TObject; Values: TStrings) ( TAdapterFieldStringsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldStringsEvent.

173.5.27 WebAdapt.TAdapterFieldValidateValueEvent Type

Pascal

```
TAdapterFieldValidateValueEvent = procedure (Sender: TObject; AValue: IActionFieldValue; var
Handled: Boolean) of object;
```

C++

```
(Sender: TObject; AValue: IActionFieldValue; var Handled: Boolean) (
TAdapterFieldValidateValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldValidateValueEvent.

173.5.28 WebAdapt.TAdapterFieldValueEvent Type

Pascal

```
TAdapterFieldValueEvent = procedure (Sender: TObject; Value: Variant) of object;
```

C++

```
(Sender: TObject; Value: Variant) ( TAdapterFieldValueEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldValueEvent.

173.5.29 WebAdapt.TAdapterHiddenFieldOptions Type

Pascal

```
TAdapterHiddenFieldOptions = set of TAdapterHiddenFieldOption;
```

C++

```
TAdapterHiddenFieldOption TAdapterHiddenFieldOptions;
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterHiddenFieldOptions.

173.5.30 WebAdapt.TEndUserGetNameEvent Type

Pascal

```
TEndUserGetNameEvent = procedure (Sender: TObject; var Name: string) of object;
```

C++

```
(Sender: TObject; var Name: string) ( TEndUserGetNameEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserGetNameEvent.

173.5.31 WebAdapt.TEndUserGetUserIDEvent Type

Pascal

```
TEndUserGetUserIDEvent = procedure (Sender: TObject; var UserID: Variant) of object;
```

C++

```
(Sender: TObject; var UserID: Variant) ( TEndUserGetUserIDEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserGetUserIDEvent.

173.5.32 WebAdapt.TEndUserHandledEvent Type

Pascal

```
TEndUserHandledEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( TEndUserHandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserHandledEvent.

173.5.33 WebAdapt.TEndUserIsLoggedInEvent Type

Pascal

```
TEndUserIsLoggedInEvent = procedure (Sender: TObject; var IsLoggedIn: Boolean) of object;
```

C++

```
(Sender: TObject; var IsLoggedIn: Boolean) ( TEndUserIsLoggedInEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserIsLoggedInEvent.

173.5.34 WebAdapt.TEndUserRightsEvent Type

Pascal

```
TEndUserRightsEvent = procedure (Sender: TObject; Rights: TStrings; var HasRights, Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; Rights: TStrings; var HasRights, Handled: Boolean) ( TEndUserRightsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserRightsEvent.

173.5.35 WebAdapt.TEndUserUserIDEvent Type

Pascal

```
TEndUserUserIDEvent = procedure (Sender: TObject; UserID: Variant) of object;
```

C++

```
(Sender: TObject; UserID: Variant) ( TEndUserUserIDEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TEndUserUserIDEvent.

173.5.36 WebAdapt.TGetEOFEvent Type

Pascal

```
TGetEOFEvent = procedure (Sender: TObject; var Eof: Boolean) of object;
```

C++

```
(Sender: TObject; var Eof: Boolean) ( TGetEOFEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TGetEOFEvent.

173.5.37 WebAdapt.TGetRecordCountEvent Type

Pascal

```
TGetRecordCountEvent = procedure (Sender: TObject; var Count: Integer) of object;
```

C++

```
(Sender: TObject; var Count: Integer) ( TGetRecordCountEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TGetRecordCountEvent.

173.5.38 WebAdapt.TGetRecordEvent Type

Pascal

```
TGetRecordEvent = procedure (Sender: TObject; var Eof: Boolean) of object;
```

C++

```
(Sender: TObject; var Eof: Boolean) ( TGetRecordEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TGetRecordEvent.

173.5.39 WebAdapt.TGetRecordIndexEvent Type

Pascal

```
TGetRecordIndexEvent = procedure (Sender: TObject; var Index: Integer) of object;
```

C++

```
(Sender: TObject; var Index: Integer) ( TGetRecordIndexEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TGetRecordIndexEvent.

173.5.40 WebAdapt.THandledEvent Type

Pascal

```
THandledEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( THandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.THandledEvent.

173.5.41 WebAdapt.TImageFieldGetHREFEvent Type

Pascal

```
TImageFieldGetHREFEvent = procedure (Sender: TObject; var HREF: string) of object;
```

C++

```
(Sender: TObject; var HREF: string) ( TImageFieldGetHREFEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TImageFieldGetHREFEvent.

173.5.42 WebAdapt.TImageFieldGetImageEvent Type

Pascal

```
TImageFieldGetImageEvent = procedure (Sender: TObject; Params: TStrings; var MimeType: string;
var Image: TStream; var Owned: Boolean) of object;
```

C++

```
(Sender: TObject; Params: TStrings; var MimeType: string; var Image: TStream; var Owned:
Boolean) ( TImageFieldGetImageEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TImageFieldGetImageEvent.

173.5.43 WebAdapt.TImageFieldGetParamsEvent Type

Pascal

```
TImageFieldGetParamsEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TImageFieldGetParamsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TImageFieldGetParamsEvent.

173.5.44 WebAdapt.TIterateRecordsEvent Type

Pascal

```
TIterateRecordsEvent = procedure (Sender: TObject; Action: TIteratorMethod; var Eof: Boolean)
of object;
```

C++

```
(Sender: TObject; Action: TIteratorMethod; var Eof: Boolean) ( TIterateRecordsEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TIterateRecordsEvent.

173.5.45 WebAdapt.TLoginUserIDEvent Type

Pascal

```
TLoginUserIDEvent = procedure (Sender: TObject; UserID: Variant) of object;
```

C++

```
(Sender: TObject; UserID: Variant) ( TLoginUserIDEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TLoginUserIDEvent.

173.5.46 WebAdapt.TObjectList Type

Pascal

```
TObjectList = Contnrs.TObjectList;
```

C++

```
Contnrs.TObjectList TObjectList;
```

File

WebAdapt

Description

This is type WebAdapt.TObjectList.

173.5.47 WebAdapt.TValidateAdapterFieldEvent Type

Pascal

```
TValidateAdapterFieldEvent = procedure (Sender: TObject; Value: Variant; var Handled: Boolean)
of object;
```

C++

```
(Sender: TObject; Value: Variant; var Handled: Boolean) ( TValidateAdapterFieldEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TValidateAdapterFieldEvent.

173.5.48 WebAdapt.TWebFormGetPageNameEvent Type

Pascal

```
TWebFormGetPageNameEvent = procedure (Sender: TObject; APageIndex: Integer; var Value: string)
of object;
```

C++

```
(Sender: TObject; APageIndex: Integer; var Value: string) ( TWebFormGetPageNameEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.TWebFormGetPageNameEvent.

173.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
NotifyPossibleHTMLChange (see page 24612)	This is variable WebAdapt.NotifyPossibleHTMLChange.

173.6.1 WebAdapt.NotifyPossibleHTMLChange Variable

Pascal

```
NotifyPossibleHTMLChange: procedure;
```

C++

```
procedure NotifyPossibleHTMLChange;
```

File

WebAdapt

Description

This is variable WebAdapt.NotifyPossibleHTMLChange.

173.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sActionRequestLong (see page 24613)	This is constant WebAdapt.sActionRequestLong.
sCurrentPage (see page 24613)	This is constant WebAdapt.sCurrentPage.
sGotoPageAction (see page 24614)	This is constant WebAdapt.sGotoPageAction.
sImageRequest (see page 24614)	This is constant WebAdapt.sImageRequest.
sLoginPassword (see page 24614)	This is constant WebAdapt.sLoginPassword.
sLoginUserName (see page 24615)	This is constant WebAdapt.sLoginUserName.
sNextPageAction (see page 24615)	This is constant WebAdapt.sNextPageAction.
sPrevPageAction (see page 24615)	This is constant WebAdapt.sPrevPageAction.

173.7.1 WebAdapt.sActionRequestLong Constant

Pascal

```
sActionRequestLong = '__action';
```

C++

```
sActionRequestLong = '__action';
```

File

WebAdapt

Description

This is constant WebAdapt.sActionRequestLong.

173.7.2 WebAdapt.sCurrentPage Constant

Pascal

```
sCurrentPage = '_cp';
```

C++

```
sCurrentPage = '_cp';
```

File

WebAdapt

Description

This is constant WebAdapt.sCurrentPage.

173.7.3 WebAdapt.sGotoPageAction Constant

Pascal

```
sGotoPageAction = 'GotoPage';
```

C++

```
sGotoPageAction = 'GotoPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sGotoPageAction.

173.7.4 WebAdapt.sImageRequest Constant

Pascal

```
sImageRequest = '__img';
```

C++

```
sImageRequest = '__img';
```

File

WebAdapt

Description

This is constant WebAdapt.sImageRequest.

173.7.5 WebAdapt.sLoginPassword Constant

Pascal

```
sLoginPassword = 'Password';
```

C++

```
sLoginPassword = 'Password';
```

File

WebAdapt

Description

This is constant WebAdapt.sLoginPassword.

173.7.6 WebAdapt.sLoginUserName Constant

Pascal

```
sLoginUserName = 'UserName';
```

C++

```
sLoginUserName = 'UserName';
```

File

WebAdapt

Description

This is constant WebAdapt.sLoginUserName.

173.7.7 WebAdapt.sNextPageAction Constant

Pascal

```
sNextPageAction = 'NextPage';
```

C++

```
sNextPageAction = 'NextPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sNextPageAction.

173.7.8 WebAdapt.sPrevPageAction Constant

Pascal

```
sPrevPageAction = 'PrevPage';
```

C++

```
sPrevPageAction = 'PrevPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sPrevPageAction.

174 WebBroker Namespace

This is namespace WebBroker.

Topics

Name	Description
Classes (see page 24618)	The following table lists classes in this documentation.
Types (see page 24625)	The following table lists types in this documentation.
Variables (see page 24626)	The following table lists variables in this documentation.

Classes

	Name	Description
	TWebApplication (see page 24618)	TWebApplication encapsulates a Web server application.

Types

Name	Description
THandleShutdownException (see page 24625)	This is type WebBroker.THandleShutdownException.
TServerExceptionEvent (see page 24625)	This is type WebBroker.TServerExceptionEvent.

Variables

Name	Description
Application (see page 24626)	This is variable WebBroker.Application.
HandleShutdownException (see page 24626)	This is variable WebBroker.HandleShutdownException.

174.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebApplication (see page 24618)	TWebApplication encapsulates a Web server application.

174.1.1 TWebApplication Class

TWebApplication encapsulates a Web server application.

Class Hierarchy

Pascal

```
TWebApplication = class(TWebRequestHandler);
```

C++

```
class TWebApplication : public TWebRequestHandler;
```

File

WebBroker

Description

TWebApplication provides the fundamental behavior of a Web server application. TWebApplication provides methods to create TWebRequest and TWebResponse objects that represent HTTP request messages and their responses, pass these objects to the dispatcher so that the response can be filled in, and send the response back to the Web client.

Each Web server project automatically declares an Application (see page 24626) variable of type TWebApplication as the instance of the application. For CGI applications, this variable is initialized to a TCGIApplication object in the CGIApp (see page 2553) unit. For Apache applications, this variable is initialized to a TApacheApplication object in the ApacheApp unit. For ISAPI applications, this variable is initialized to a TISAPIApplication object in the ISAPIApp (see page 15647) unit.

The Application (see page 24626) variable is added to a project by selecting File | New from the menu of the IDE main window and selecting Web Server Application (see page 24626) in the New Items dialog. Do not add the Forms (see page 13657) unit to the uses list of the project (Delphi) or include Forms.hpp in the project source file (C++). These actions declare a conflicting Application (see page 24626) variable of type TApplication.In addition, do not add the ApacheApp or ISAPIApp (see page 15647) unit to a CGI application or the CGIApp (see page 2553) unit to an Apache, ISAPI or NSAPI application. The CGIApp (see page 2553) unit, the ISAPIApp (see page 15647) unit, and the ApacheApp unit each create the initial instance of the Application (see page 24626) variable. Including more than one of these units in the uses list causes the memory for the object created in the first unit to be lost.

See Also

Application (see page 24626)

TCGIApplication (see page 2554)

TISAPIApplication (see page 15648)

TApacheApplication

TWebDispatcher (see page 15147)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

174.1.1.1 TWebApplication Members

The following tables list the members exposed by TWebApplication.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActivateWebModules (see page 25453)	Activates a Web module for the application and returns it.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DeactivateWebModules (see page 25453)	Deactivates the Web module of the application.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 25454)	Responds to an HTTP request message received by the server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property

	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddWebModuleFactory (see page 25453)	Adds a Web module factory to the request handler.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24622)	Creates an instance of TWebApplication (see page 24618).
	CreateForm (see page 24623)	Registers the single Web module with the Web application.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24622)	Destroys an instance of TWebApplication (see page 24618).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.

	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleException (see page 25454)	Responds to exceptions related to TWebRequestHandler (see page 25448) objects.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
V	Initialize (see page 24623)	Introduces an interface for a method that initializes the application.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	Run (see page 24623)	Executes the Web application.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActiveCount (see page 25455)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 25455)	Determines whether the Web modules used by the application are cached for re-use.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	InactiveCount (see page 25456)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 25457)	Sets or returns the MaxConnections used by the socket.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Title (see page 24624)	Specifies a title for the Web application.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WebModuleClass (see page 25457)	Contains a reference to a Web module.
R	WebModuleFactory (see page 25457)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 25458)	The number of Web module factories in use by the request handler.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

174.1.1.2 TWebApplication.Create Constructor

Creates an instance of TWebApplication (see page 24618).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebApplication(TComponent * AOwner);
```

Description

Do not call Create. The single Web application object named Application (see page 24626) is instantiated automatically when the CGIApp (see page 2553) unit, the ISAPIApp (see page 15647) unit, or the ApacheApp unit is included in the uses list of the project.

Create allocates the helper objects used by TWebApplication (see page 24618).

See Also

Create (see page 2766)

174.1.1.3 TWebApplication.Destroy Destructor

Destroys an instance of TWebApplication (see page 24618).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebApplication();
```

Description

Never call the Destroy or Free method. The application is freed automatically when the application stops running.

Destroy frees the helper objects that were created at startup, as well as all Web modules created by the application.

See Also

Free (see page 22300)

Run (see page 24623)

174.1.1.4 TWebApplication Methods

The methods of the TWebApplication class are listed here.

Public Methods

	Name	Description
	CreateForm (see page 24623)	Registers the single Web module with the Web application.
	Initialize (see page 24623)	Introduces an interface for a method that initializes the application.
	Run (see page 24623)	Executes the Web application.

174.1.1.4.1 TWebApplication.CreateForm Method

Registers the single Web module with the Web application.

Pascal

```
procedure CreateForm(InstanceClass: TComponentClass; var Reference); virtual;
```

C++

```
virtual __fastcall CreateForm(TComponentClass InstanceClass,  Reference);
```

Description

Do not call CreateForm in an application. The module manager calls CreateForm internally to register the Web module for the Web application.

CreateForm registers the class of the Web module for the application.

See Also

TWebModule (see page 15154)

174.1.1.4.2 TWebApplication.Initialize Method

Introduces an interface for a method that initializes the application.

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

The Initialize method for TWebApplication (see page 24618) does nothing. Initialize is the first method called for every project. Descendants of TWebApplication (see page 24618) that must perform any initialization before the application starts running override this method for that purpose.

Note: Although Initialize is the first method called in the project source code, it is not the first code that is executed in an application.

See Also

Run (see page 24623)

174.1.1.4.3 TWebApplication.Run Method

Executes the Web application.

Pascal

```
procedure Run; virtual;
```

C++

```
virtual __fastcall Run();
```

Description

When the application is executed, the application's Run method is calledautomatically.

The Run method for TWebApplication (see page 24618) sets up the default error handler and shut down sequence for the

application. Descendants of TWebApplication (see page 24618) override the Run method to receive HTTP request messages, create the TWebRequest and TWebResponse objects for incoming requests, and call the HandleRequest method to process those requests.

See Also

TWebRequest (see page 15161)

TWebResponse (see page 15191)

174.1.1.5 TWebApplication Properties

The properties of the TWebApplication class are listed here.

Public Properties

	Name	Description
	Title (see page 24624)	Specifies a title for the Web application.

174.1.1.5.1 TWebApplication.Title Property

Specifies a title for the Web application.

Pascal

```
property Title: string;
```

C++

```
__property AnsiString Title;
```

Description

Use the Title property to assign a title to your Web application. This title can be used in HTTP messages that the application sends to identify the application. The default value is taken from the executable DLL/EXE .so filename at runtime.

Do not confuse Title with the Name property. Name is the identifier for the Web application when it is referred to in code.

See Also

Name (see page 2805)

174.2 Types

The following table lists types in this documentation.

Types

Name	Description
THandleShutdownException (see page 24625)	This is type WebBroker.THandleShutdownException.
TServerExceptionEvent (see page 24625)	This is type WebBroker.TServerExceptionEvent.

174.2.1 WebBroker.THandleShutdownException Type

Pascal

```
THandleShutdownException = procedure (E: Exception);
```

C++

```
(E: Exception) ( THandleShutdownException)();
```

File

WebBroker

Description

This is type WebBroker.THandleShutdownException.

174.2.2 WebBroker.TServerExceptionEvent Type

Pascal

```
TServerExceptionEvent = procedure (E: Exception; wr: TWebResponse) of object;
```

C++

```
(E: Exception; wr: TWebResponse) ( TServerExceptionEvent)();
```

File

WebBroker

Description

This is type WebBroker.TServerExceptionEvent.

174.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Application (see page 24626)	This is variable WebBroker.Application.
HandleShutdownException (see page 24626)	This is variable WebBroker.HandleShutdownException.

174.3.1 WebBroker.Application Variable

Pascal

```
Application: TWebApplication = nil;
```

C++

```
TWebApplication Application = nil;
```

File

WebBroker

Description

This is variable WebBroker.Application.

174.3.2 WebBroker.HandleShutdownException Variable

Pascal

```
HandleShutdownException: THandleShutdownException;
```

C++

```
THandleShutdownException HandleShutdownException;
```

File

WebBroker

Description

This is variable WebBroker.HandleShutdownException.

175 WebBrokerSOAP Namespace

This is namespace WebBrokerSOAP.

Topics

Name	Description
Classes (see page 24628)	The following table lists classes in this documentation.
Functions (see page 24636)	The following table lists functions in this documentation.

Classes

	Name	Description
	THTTPSoapDispatcher (see page 24628)	THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

Functions

	Name	Description
	GetSOAPWebModule (see page 24636)	Returns the Web module that contains the SOAP dispatcher that is processing the current request.

175.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	THTTPSoapDispatcher (see page 24628)	THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

175.1.1 THTTPSoapDispatcher Class

THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

Class Hierarchy

Pascal

```
THTTPSoapDispatcher = class(THTTPSoapDispatchNode, IWebDispatch);
```

C++

```
class THTTPSoapDispatcher : public THTTPSoapDispatchNode, public IWebDispatch;
```

File

WebBrokerSOAP

Description

Use THTTPSoapDispatcher in an application that publishes a Web Service using SOAP. THTTPSoapDispatcher responds to all SOAP-based calls made to the invokable interfaces that are registered in the application. These interfaces are registered by calling the RegisterInterface method of the invocation registry (InvRegistry).

THTTPSoapDispatcher only acts as a dispatcher, receiving incoming messages and forwarding them on to another component that handles the task of interpreting and executing them. The component that interprets and executes SOAP message is identified by the Dispatcher property. Dispatcher is the interface of an invoker component, which interprets the SOAP message, identifies the invokable interface that is the target of the call, executes the call, and assembles the content of the response message.

THTTPSoapDispatcher automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the SOAP dispatcher without requiring the use of Web action items.

175.1.1.1 THTTPSoapDispatcher Members

The following tables list the members exposed by THTTPSoapDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.
	FSoapDispatcher (see page 19943)	This is FSoapDispatcher, a member of class THTTPSoapDispatchNode.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchEnabled (see page 24632)	Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.
	DispatchMask (see page 24633)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 24633)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 24634)	Responds to an incoming message and generates the appropriate response message.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 19944)	Responds when objects are added or removed from the Web module.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24631)	Creates a new THTTPSoapDispatcher (see page 24628) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24632)	Frees the memory associated with the THTTPSoapDispatcher (see page 24628) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchSOAP (see page 19944)	Forwards the SOAP message on to the invoker for interpretation and execution.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Enabled (see page 15232)	
R	Mask (see page 15233)	
R	MethodType (see page 15233)	This is MethodType, a member of class IWebDispatch.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Dispatcher (see page 19945)	Specifies the interface of the component that interprets SOAP messages.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	WebDispatch (see page 24634)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

175.1.1.2 THTTPSoapDispatcher.Create Constructor

Creates a new THTTPSoapDispatcher (see page 24628) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THTTPSoapDispatcher(TComponent * AOwner);
```

Description

Most applications do not need to call the THTTPSoapDispatcher (see page 24628) constructor. Typically the HTTP SOAP dispatcher is added to a Web module at design time, so that the constructor is called automatically.

The Owner parameter specifies the component (usually the Web module) that is responsible for freeing the THTTPSoapDispatcher (see page 24628) instance.

See Also

Owner (see page 2807)

175.1.1.3 THTTPSoapDispatcher.Destroy Destructor

Frees the memory associated with the THTTPSoapDispatcher (see page 24628) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTTPSoapDispatcher();
```

Description

Do not call Destroy directly. Instead,call Free, which verifies that the THTTPSoapDispatcher (see page 24628) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

175.1.1.4 THTTPSoapDispatcher Methods

The methods of the THTTPSoapDispatcher class are listed here.

Protected Methods

	Name	Description
	DispatchEnabled (see page 24632)	Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.
	DispatchMask (see page 24633)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 24633)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 24634)	Responds to an incoming message and generates the appropriate response message.

175.1.1.4.1 THTTPSoapDispatcher.DispatchEnabled Method

Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

Description

The DispatchEnabled method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to determine whether it can receive incoming messages. In THTTPSoapDispatcher (see page 24628), DispatchEnabled always returns true, because the HTTP SOAP dispatcher can't be disabled.

See Also

WebDispatch (see page 24634)

175.1.1.4.2 THTTPSoapDispatcher.DispatchMask Method

Returns a mask that matches the path portion of any URL to which this object responds.

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

Description

The DispatchMask method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns the Mask (see page 15797) property of the TWebDispatch object specified by the WebDispatch (see page 24634) property.

See Also

WebDispatch (see page 24634)

Mask (see page 1482)

175.1.1.4.3 THTTPSoapDispatcher.DispatchMethodType Method

Returns the method type of all HTTP messages to which this component responds.

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

Description

The DispatchMethodType method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns the MethodType property of the TWebDispatch object specified by the WebDispatch (see page 24634) property.

See Also

MethodType

WebDispatch (see page 24634)

175.1.1.4.4 THTTPSoapDispatcher.DispatchRequest Method

Responds to an incoming message and generates the appropriate response message.

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

The Web Module (or Web Dispatcher) calls DispatchRequest when it identifies an HTTP message that matches the properties of the WebDispatch (see page 24634) property. DispatchRequest passes the request on to the component whose interface is the value of the Dispatcher property. That object interprets the request message, calls the appropriate invokable interface, and returns the content of the response message.

Sender is not used in the DispatchRequest method.

Request contains information about the incoming SOAP message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

DispatchRequest returns true if it successfully passes the request on to an invoker and that invoker handles the request and fills out the Response parameter. It returns false if it could not handle the request.

See Also

Dispatcher (see page 19945)

WebDispatch (see page 24634)

175.1.1.5 THTTPSoapDispatcher Properties

The properties of the THTTPSoapDispatcher class are listed here.

Published Properties

	Name	Description
	WebDispatch (see page 24634)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

175.1.1.5.1 THTTPSoapDispatcher.WebDispatch Property

Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

Use WebDispatch to specify the SOAP messages to which this component responds.

The TWebDispatch object that implements WebDispatch includes properties that let you specify the path portion of URLs to

which the Web Service application responds, as well as the values allowed in the types of messages it accepts. By default, WebDispatch enables the HTTP SOAP dispatcher to respond to any URL whose path portion begins with the string "soap".

Note: You can't use WebDispatch to disable the THTTPSoapDispatcher (see page 24628) object. Setting its Enabled property to false does nothing.

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

175.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetSOAPWebModule (see page 24636)	Returns the Web module that contains the SOAP dispatcher that is processing the current request.

175.2.1 WebBrokerSOAP.GetSOAPWebModule Function

Returns the Web module that contains the SOAP dispatcher that is processing the current request.

Pascal

```
function GetSOAPWebModule: TWebModule;
```

C++

```
TWebModule GetSOAPWebModule();
```

File

WebBrokerSOAP

Description

Call GetSOAPWebModule to access the application Web module of a Web Services application. This is the Web module that contains the SOAP dispatcher (THTTPSoapDispatcher (see page 24628)).

See Also

THTTPSOAPDispatcher

176 WebCntxt Namespace

This is namespace WebCntxt.

Topics

Name	Description
Classes (see page 24639)	The following table lists classes in this documentation.
Interfaces (see page 24672)	The following table lists interfaces in this documentation.
Functions (see page 24687)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 24688)	The following table lists structs, records, enums in this documentation.
Types (see page 24689)	The following table lists types in this documentation.
Variables (see page 24691)	The following table lists variables in this documentation.

Classes

	Name	Description
	TAbstractAdapterRequest (see page 24639)	TAbstractAdapterRequest is the base class for adapter request objects.
	TAbstractAdapterResponse (see page 24642)	TAbstractAdapterResponse is the base class for adapter response objects.
	TAbstractWebContext (see page 24644)	TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.
	TWebContext (see page 24660)	TWebContext represents the current state of a WebSnap application.

Functions

	Name	Description
	WebContext (see page 24687)	Returns the current Web context

Interfaces

	Name	Description
	IWebEndUser (see page 24672)	IWebEndUser provides access information about the current end user in a WebSnap application.
	IWebPageInfo (see page 24680)	IWebPageInfo describes a Web page in a WebSnap application.

Structs, Records, Enums

	Name	Description
	TFindPageOption (see page 24688)	This is record WebCntxt.TFindPageOption.

Types

Name	Description
TFindPageOptions (see page 24689)	This is type WebCntxt.TFindPageOptions.

TGetWebContextProc (see page 24689)	This is type WebCntxt.TGetWebContextProc.
TGetWebEndUserProc (see page 24690)	This is type WebCntxt.TGetWebEndUserProc.
TSetWebContextProc (see page 24690)	This is type WebCntxt.TSetWebContextProc.

Variables

Name	Description
GetModuleFileNameProc (see page 24691)	This is variable WebCntxt.GetModuleFileNameProc.
GetWebContextProc (see page 24691)	This is variable WebCntxt.GetWebContextProc.
GetWebEndUserProc (see page 24692)	This is variable WebCntxt.GetWebEndUserProc.
SetWebContextProc (see page 24692)	This is variable WebCntxt.SetWebContextProc.

176.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractAdapterRequest (see page 24639)	TAbstractAdapterRequest is the base class for adapter request objects.
	TAbstractAdapterResponse (see page 24642)	TAbstractAdapterResponse is the base class for adapter response objects.
	TAbstractWebContext (see page 24644)	TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.
	TWebContext (see page 24660)	TWebContext represents the current state of a WebSnap application.

176.1.1 TAbstractAdapterRequest Class

TAbstractAdapterRequest is the base class for adapter request objects.

Class Hierarchy

Pascal

```
TAbstractAdapterRequest = class(TInterfacedObject);
```

C++

```
class TAbstractAdapterRequest : public TInterfacedObject;
```

File

WebCntxt

Description

TAbstractAdapterRequest is the base class for the object that adapters use to obtain information about the current HTTP request message. An application interacts with an adapter request object through interfaces implemented by various descendants of TAbstractAdapterRequest. These descendant classes are considered internal to WebSnap and are not documented.

176.1.1.1 TAbstractAdapterRequest Members

The following tables list the members exposed by TAbstractAdapterRequest.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24641)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

176.1.1.2 TAbstractAdapterRequest.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractAdapterRequest();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

176.1.1.3 TAbstractAdapterRequest Properties

The properties of the TAbstractAdapterRequest class are listed here.

Protected Properties

	Name	Description
R	Request (see page 24642)	This is Request, a member of class TAbstractAdapterRequest.

176.1.1.3.1 TAbstractAdapterRequest.Request Property

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

This is Request, a member of class TAbstractAdapterRequest.

176.1.2 TAbstractAdapterResponse Class

TAbstractAdapterResponse is the base class for adapter response objects.

Class Hierarchy

Pascal

```
TAbstractAdapterResponse = class(TInterfacedObject);
```

C++

```
class TAbstractAdapterResponse : public TInterfacedObject;
```

File

WebCntxt

Description

TAbstractAdapterResponse is the base class for the object that adapters use to obtain information about the current HTTP response message. An application interacts with an adapter response object through interfaces implemented by various descendants of TAbstractAdapterResponse. These descendant classes are considered internal to WebSnap and are not documented.

TAbstractWebContext (see page 24644)

IActionResponse (see page 941)

176.1.2.1 TAbstractAdapterResponse Members

The following tables list the members exposed by TAbstractAdapterResponse.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Response (see page 24644)	This is Response, a member of class TAbstractAdapterResponse.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24644)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

176.1.2.2 TAbstractAdapterResponse.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractAdapterResponse();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

176.1.2.3 TAbstractAdapterResponse Properties

The properties of the TAbstractAdapterResponse class are listed here.

Protected Properties

	Name	Description
R	Response (see page 24644)	This is Response, a member of class TAbstractAdapterResponse.

176.1.2.3.1 TAbstractAdapterResponse.Response Property

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

This is Response, a member of class TAbstractAdapterResponse.

176.1.3 TAbstractWebContext Class

TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.

Class Hierarchy

System::TObject → WebCntxt.TAbstractWebContext

Pascal

```
TAbstractWebContext = class(TObject);
```

C++

```
class TAbstractWebContext : public TObject;
```

File

WebCntxt

Description

A Web context stores information about the components that are available in a WebSnap application and about the current request that is being processed. Applications do not create instances of the Web context. Rather, they access the current Web context object by calling the global WebContext (see page 24687) function.

See Also

WebContext (see page 24687)

TWebContext (see page 24660)

176.1.3.1 TAbstractWebContext Members

The following tables list the members exposed by TAbstractWebContext.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 24651)	This is GetAdapterRequest, a member of class TAbstractWebContext.
	GetAdapterResponse (see page 24652)	This is GetAdapterResponse, a member of class TAbstractWebContext.
	GetDispatchedPageName (see page 24652)	This is GetDispatchedPageName, a member of class TAbstractWebContext.
	GetEndUser (see page 24652)	This is GetEndUser, a member of class TAbstractWebContext.
	GetPageCount (see page 24652)	
	GetPageInfo (see page 24653)	
	GetRequestedPageName (see page 24653)	
	GetSession (see page 24653)	
	GetWebModules (see page 24653)	
	GetWebRequest (see page 24654)	
	GetWebResponse (see page 24654)	
	SetAdapterRequest (see page 24654)	This is SetAdapterRequest, a member of class TAbstractWebContext.
	SetAdapterResponse (see page 24654)	This is SetAdapterResponse, a member of class TAbstractWebContext.
	SetDispatchedPageName (see page 24655)	This is SetDispatchedPageName, a member of class TAbstractWebContext.
	SetRequestedPageName (see page 24655)	This is SetRequestedPageName, a member of class TAbstractWebContext.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24646)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24647)	Frees an instance of TAbstractWebContext (see page 24644).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
A	FindApplicationModule (see page 24648)	Returns the application module instance.
A	FindDefaultPageInfo (see page 24648)	Retrieves the Web page information object for a specified class of Web module.
A	FindModuleClass (see page 24649)	Returns an instance of a Web module, given its class reference.
A	FindModuleName (see page 24649)	Returns an instance of a Web module, given its class name.
A	FindPage (see page 24650)	Retrieves a Web page module given its name.
A	FindPageInfo (see page 24650)	Retrieves a Web page information object given the name of the corresponding Web page module.
A	FindVariableContainer (see page 24651)	Returns an instance of a Web data module, given its class name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AdapterRequest (see page 24655)	Provides access to the adapter request object that manages access to the current request.
R	AdapterResponse (see page 24656)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 24656)	Specifies the name of the Web page module that is producing content to respond to the current request.
R	EndUser (see page 24657)	Provides access to information about the end user that sent the current request.
R	PageCount (see page 24657)	Indicates the number of registered Web pages available in the WebSnap application.
R	Pages (see page 24658)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
R	Request (see page 24658)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 24658)	Indicates the name of the Web page module to which the current request is addressed.
R	Response (see page 24659)	Represents the current HTTP response that the application is assembling.
R	Session (see page 24659)	Provides access to the current Web session.
R	WebModules (see page 24660)	Lists all the Modules in the WebSnap application.

176.1.3.2 TAbstractWebContext.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractWebContext();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

176.1.3.3 TAbstractWebContext.Destroy Destructor

Frees an instance of TAbstractWebContext (see page 24644).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractWebContext();
```

Description

Do not free the global Web context object. This object is automatically maintained by the WebSnap application.

The TAbstractWebContext (see page 24644) destructor unregisters itself with the global WebContext (see page 24687) function so that the WebContext (see page 24687) function never returns a Web context that no longer exists.

See Also

WebContext (see page 24687)

176.1.3.4 TAbstractWebContext Methods

The methods of the TAbstractWebContext class are listed here.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 24651)	This is GetAdapterRequest, a member of class TAbstractWebContext.
	GetAdapterResponse (see page 24652)	This is GetAdapterResponse, a member of class TAbstractWebContext.
	GetDispatchedPageName (see page 24652)	This is GetDispatchedPageName, a member of class TAbstractWebContext.
	GetEndUser (see page 24652)	This is GetEndUser, a member of class TAbstractWebContext.
	GetPageCount (see page 24652)	
	GetPageInfo (see page 24653)	
	GetRequestedPageName (see page 24653)	
	GetSession (see page 24653)	
	GetWebModules (see page 24653)	

	GetWebRequest (see page 24654)	
	GetWebResponse (see page 24654)	
	SetAdapterRequest (see page 24654)	This is SetAdapterRequest, a member of class TAbstractWebContext.
	SetAdapterResponse (see page 24654)	This is SetAdapterResponse, a member of class TAbstractWebContext.
	SetDispatchedPageName (see page 24655)	This is SetDispatchedPageName, a member of class TAbstractWebContext.
	SetRequestedPageName (see page 24655)	This is SetRequestedPageName, a member of class TAbstractWebContext.

Public Methods

	Name	Description
	FindApplicationModule (see page 24648)	Returns the application module instance.
	FindDefaultPageInfo (see page 24648)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 24649)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 24649)	Returns an instance of a Web module, given its class name.
	FindPage (see page 24650)	Retrieves a Web page module given its name.
	FindPageInfo (see page 24650)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 24651)	Returns an instance of a Web data module, given its class name.

176.1.3.4.1 TAbstractWebContext.FindApplicationModule Method

Returns the application module instance.

Pascal

```
function FindApplicationModule(WebModuleContext: TWebModuleContext): TComponent; virtual;
abstract;
```

C++

```
virtual __fastcall TComponent * FindApplicationModule(TWebModuleContext WebModuleContext) = 0;
```

Description

Call FindApplicationModule to access the main Web module in the WebSnap application. FindApplicationModule returns a reference to the module that the WebSnap application wizard creates. This can be an instance of TWebAppPageModule or TWebAppDataModule.

The Application module is the module that holds the application-wide components such as the page dispatcher, end user adapter, application adapter, and so on.

WebModuleContext is a context object that holds design-time information about the application modules. It is only used at design time.

See Also

WebModules (see page 24660)

TWebAppPageModule (see page 25394)

TWebAppDataModule (see page 25388)

176.1.3.4.2 TAbstractWebContext.FindDefaultPageInfo Method

Retrieves the Web page information object for a specified class of Web module.

Pascal

```
function FindDefaultPageInfo(AComponentClass: TComponentClass; out APageInfo:
TAbstractWebPageInfo): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindDefaultPageInfo(TComponentClass AComponentClass,
TAbstractWebPageInfo APageInfo) = 0;
```

Description

Call FindDefaultPageInfo to obtain the Web page information object for a Web module. FindDefaultPageInfo retrieves the information object that is registered for the Web page module class specified by AComponentClass. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

AComponentClass is a class reference to the class that implements the Web page module. This class is declared in code that the Web page module wizard generates.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindDefaultPageInfo returns false if it can't return a value for the APageInfo parameter. FindDefaultPageInfo returns true if it locates a registered Web page module for the class specified by AComponentClass.

See Also

FindPageInfo (see page 24650)

176.1.3.4.3 TAbstractWebContext.FindModuleClass Method

Returns an instance of a Web module, given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass) = 0;
```

Description

Call FindModuleClass to obtain a reference to a Web module given its class reference. If an instance of the specified class already exists, FindModuleClass returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass creates an instance of the specified class and returns the new instance.

AClass is the class reference to a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleName (see page 24649)

FindPage (see page 24650)

176.1.3.4.4 TAbstractWebContext.FindModuleName Method

Returns an instance of a Web module, given its class name.

Pascal

```
function FindModuleName(const AClass: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const AnsiString AClass) = 0;
```

Description

Call FindModuleName to obtain a reference to a Web module given the name of its implementation class. If an instance of the specified class already exists, FindModuleName returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass (see page 24649) creates an instance of the specified class and returns the new instance.

AClass is the name of a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleClass (see page 24649)

FindPage (see page 24650)

FindVariableContainer (see page 24651)

176.1.3.4.5 TAbstractWebContext.FindPage Method

Retrieves a Web page module given its name.

Pascal

```
function FindPage(const APage: string; AOptions: TFindPageOptions; out AComponent: TObject):
Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindPage(const AnsiString APage, TFindPageOptions AOptions, TObject
* AComponent) = 0;
```

Description

Call FindPage to obtain an instance of a registered Web page module given its name. If an instance of the specified Web page module already exists, FindPage returns that instance. Otherwise, if the named Web page module is registered, FindPage creates an instance of the module and returns the new instance.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPage considers. For any option included in this set, FindPage only considers Web page modules that have the corresponding attribute.

AComponent returns the instance of the specified Web page module.

FindPage returns true if it can find or create an instance of the specified Web page module, false otherwise.

See Also

FindModuleName (see page 24649)

FindPageInfo (see page 24650)

FindModuleClass (see page 24649)

176.1.3.4.6 TAbstractWebContext.FindPageInfo Method

Retrieves a Web page information object given the name of the corresponding Web page module.

Pascal

```
function FindPageInfo(const APage: string; AOptions: TFindPageOptions; out APageInfo:
TAbstractWebPageInfo): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindPageInfo(const AnsiString APage, TFindPageOptions AOptions,
TAbstractWebPageInfo APageInfo) = 0;
```

Description

Call FindPageInfo to obtain the Web page information object for a Web page module. FindPageInfo retrieves the information object that is registered for the Web page module that has a specified name. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPageInfo considers. For any option included in this set, FindPageInfo only considers Web page modules that have the corresponding attribute.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindPageInfo returns false if it can't return a value for the APageInfo parameter. FindPageInfo returns true if it locates a registered Web page module with the specified name and attributes.

See Also

FindPage (see page 24650)

FindDefaultPageInfo (see page 24648)

Pages (see page 24658)

176.1.3.4.7 TAbstractWebContext.FindVariableContainer Method

Returns an instance of a Web data module, given its class name.

Pascal

```
function FindVariableContainer(const AIdent: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindVariableContainer(const AnsiString AIdent) = 0;
```

Description

Call FindVariableContainer to obtain a reference to a Web data module given the name of its implementation class. If an instance of the specified class already exists, FindVariableContainer returns that instance. Otherwise, if the specified class represents a registered Web module class, FindVariableContainer creates an instance of the specified class and returns the new instance.

AIdent is the name of a registered Web data module class. This class is declared in code that the Web data module wizard generates.

See Also

FindModuleName (see page 24649)

176.1.3.4.8 TAbstractWebContext.GetAdapterRequest Method

Pascal

```
function GetAdapterRequest: IUnknown; virtual; abstract;
```

C++

```
virtual __fastcall IUnknown GetAdapterRequest() = 0;
```

Description

This is GetAdapterRequest, a member of class TAbstractWebContext.

176.1.3.4.9 TAbstractWebContext.GetAdapterResponse Method

Pascal

```
function GetAdapterResponse: IUnknown; virtual; abstract;
```

C++

```
virtual __fastcall IUnknown GetAdapterResponse() = 0;
```

Description

This is GetAdapterResponse, a member of class TAbstractWebContext.

176.1.3.4.10 TAbstractWebContext.GetDispatchedPageName Method

Pascal

```
function GetDispatchedPageName: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetDispatchedPageName() = 0;
```

Description

This is GetDispatchedPageName, a member of class TAbstractWebContext.

176.1.3.4.11 TAbstractWebContext.GetEndUser Method

Pascal

```
function GetEndUser: IWebEndUser; virtual; abstract;
```

C++

```
virtual __fastcall IWebEndUser GetEndUser() = 0;
```

Description

This is GetEndUser, a member of class TAbstractWebContext.

176.1.3.4.12 TAbstractWebContext.GetPageCount Method

Pascal

```
function GetPageCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetPageCount() = 0;
```

See Also

GetPageCount

GetPageInfo (see page 24653)

PageCount (see page 24657)

176.1.3.4.13 TAbstractWebContext.GetPageInfo Method

Pascal

```
function GetPageInfo(I: Integer): IWebPageInfo; virtual; abstract;
```

C++

```
virtual __fastcall IWebPageInfo GetPageInfo(int I) = 0;
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.3.4.14 TAbstractWebContext.GetRequestedPageName Method

Pascal

```
function GetRequestedPageName: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString GetRequestedPageName() = 0;
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.3.4.15 TAbstractWebContext.GetSession Method

Pascal

```
function GetSession: TAbstractWebSession; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebSession GetSession() = 0;
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.3.4.16 TAbstractWebContext.GetWebModules Method

Pascal

```
function GetWebModules: TAbstractWebModuleList; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebModuleList GetWebModules() = 0;
```

See Also

WebModules (see page 24660)

176.1.3.4.17 TAbstractWebContext.GetWebRequest Method

Pascal

```
function GetWebRequest: TWebRequest; virtual; abstract;
```

C++

```
virtual __fastcall TWebRequest GetWebRequest() = 0;
```

See Also

GetWebResponse (see page 24654)

Request (see page 24658)

176.1.3.4.18 TAbstractWebContext.GetWebResponse Method

Pascal

```
function GetWebResponse: TWebResponse; virtual; abstract;
```

C++

```
virtual __fastcall TWebResponse GetWebResponse() = 0;
```

See Also

GetWebRequest (see page 24654)

Response (see page 24659)

176.1.3.4.19 TAbstractWebContext.SetAdapterRequest Method

Pascal

```
procedure SetAdapterRequest(Intf: IUnknown); virtual; abstract;
```

C++

```
virtual __fastcall SetAdapterRequest(IUnknown Intf) = 0;
```

Description

This is SetAdapterRequest, a member of class TAbstractWebContext.

176.1.3.4.20 TAbstractWebContext.SetAdapterResponse Method

Pascal

```
procedure SetAdapterResponse(Intf: IUnknown); virtual; abstract;
```

C++

```
virtual __fastcall SetAdapterResponse(IUnknown Intf) = 0;
```

Description

This is SetAdapterResponse, a member of class TAbstractWebContext.

176.1.3.4.21 TAbstractWebContext.SetDispatchedPageName Method

Pascal

```
procedure SetDispatchedPageName(const APageName: string); virtual; abstract;
```

C++

```
virtual __fastcall SetDispatchedPageName(const AnsiString APageName) = 0;
```

Description

This is SetDispatchedPageName, a member of class TAbstractWebContext.

176.1.3.4.22 TAbstractWebContext.SetRequestedPageName Method

Pascal

```
procedure SetRequestedPageName(const APageName: string); virtual; abstract;
```

C++

```
virtual __fastcall SetRequestedPageName(const AnsiString APageName) = 0;
```

Description

This is SetRequestedPageName, a member of class TAbstractWebContext.

176.1.3.5 TAbstractWebContext Properties

The properties of the TAbstractWebContext class are listed here.

Public Properties

	Name	Description
R	AdapterRequest (see page 24655)	Provides access to the adapter request object that manages access to the current request.
R	AdapterResponse (see page 24656)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 24656)	Specifies the name of the Web page module that is producing content to respond to the current request.
R	EndUser (see page 24657)	Provides access to information about the end user that sent the current request.
R	PageCount (see page 24657)	Indicates the number of registered Web pages available in the WebSnap application.
R	Pages (see page 24658)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
R	Request (see page 24658)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 24658)	Indicates the name of the Web page module to which the current request is addressed.
R	Response (see page 24659)	Represents the current HTTP response that the application is assembling.
R	Session (see page 24659)	Provides access to the current Web session.
R	WebModules (see page 24660)	Lists all the Modules in the WebSnap application.

176.1.3.5.1 TAbstractWebContext.AdapterRequest Property

Provides access to the adapter request object that manages access to the current request.

Pascal

```
property AdapterRequest: IUnknown;
```

C++

```
__property IUnknown AdapterRequest;
```

Description

AdapterRequest is the interface of the object that adapters use to obtain information about the current HTTP request message. The adapter request object obtains its information from the TWebRequest object that is the value of the Request (see page 24658) property.

Note: In Delphi, this interface can typically be cast to an IActionRequest interface.

Note: In C++, you can generally obtain an IActionRequest interface from this interface.

See Also

AdapterResponse (see page 24656)

TAbstractAdapterRequest (see page 24639)

Request (see page 24658)

IActionRequest (see page 935)

176.1.3.5.2 TAbstractWebContext.AdapterResponse Property

Provides access to the adapter response object that manages access to the current response.

Pascal

```
property AdapterResponse: IUnknown;
```

C++

```
__property IUnknown AdapterResponse;
```

Description

AdapterResponse is the interface of the object that adapters use to obtain information about the current HTTP response message. The adapter response object obtains its information from the TWebResponse object that is the value of the Response (see page 24659) property.

Note: In Delphi, this interface can typically be cast to an IActionResponse interface.

Note: In C++, you can generally obtain an IActionResponse interface from this interface.

See Also

AdapterRequest (see page 24655)

TAbstractAdapterResponse (see page 24642)

Response (see page 24659)

IActionResponse (see page 941)

176.1.3.5.3 TAbstractWebContext.DispatchedPageName Property

Specifies the name of the Web page module that is producing content to respond to the current request.

Pascal

```
property DispatchedPageName: string;
```

C++

```
__property AnsiString DispatchedPageName;
```

Description

Read DispatchedPageName to determine the Web page module that is handling the current HTTP request message. Although this is typically the same as the page that the RequestedPageName (see page 24658) property specifies, it can differ if the request was redirected to another Web page or if its use was delayed because the caller had not yet logged in.

See Also

RequestedPageName (see page 24658)

FindPageInfo (see page 24650)

pagename

176.1.3.5.4 TAbstractWebContext.EndUser Property

Provides access to information about the end user that sent the current request.

Pascal

```
property EndUser: IWebEndUser;
```

C++

```
__property IWebEndUser EndUser;
```

Description

Use EndUser to obtain information about the caller that sent the current request. You can use the IWebEndUser (see page 24672) interface to determine whether the end user has logged in, whether the user has access rights to perform specified operations on pages that have a specified access string, the display name for the end user, and so on.

EndUser is nil (Delphi) or NULL (C++) if the WebSnap application does not include an end user adapter such as TEndUserAdapter or TEndUserSessionAdapter.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

176.1.3.5.5 TAbstractWebContext.PageCount Property

Indicates the number of registered Web pages available in the WebSnap application.

Pascal

```
property PageCount: Integer;
```

C++

```
__property int PageCount;
```

Description

PageCount indicates the number of entries in the Pages (see page 24658) property array. Use this value as an upper bound for the index when iterating over all the pages in the WebSnap application.

See Also

Pages (see page 24658)

176.1.3.5.6 TAbstractWebContext.Pages Property

Lists the page information interfaces of the registered Web pages available in the WebSnap application.

Pascal

```
property Pages [I: Integer]: IWebPageInfo;
```

C++

```
__property IWebPageInfo Pages[int I];
```

Description

Use Pages to obtain an IWebPageInfo (see page 24680) interface for a registered Web page module. The IWebPageInfo (see page 24680) interface describes the characteristics of a Web page, including its name, title, HREF, description, an indication of whether users must log in to access the page, an indication of whether the current user has access rights to view the page, and so on.

Pages provides indexed access to page information interfaces. To access the information about a Web page given its name, use the FindPageInfo (see page 24650) method instead. To access the information given the class of the Web page module, use the FindDefaultPageInfo (see page 24648) method instead. To access the page module itself (rather than the page information interface), use the WebModules (see page 24660) property instead.

See Also

PageCount (see page 24657)

FindPageInfo (see page 24650)

WebModules (see page 24660)

FindDefaultPageInfo (see page 24648)

176.1.3.5.7 TAbstractWebContext.Request Property

Represents the current HTTP request that the application is handling.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 24659)

176.1.3.5.8 TAbstractWebContext.RequestedPageName Property

Indicates the name of the Web page module to which the current request is addressed.

Pascal

```
property RequestedPageName: string;
```

C++

```
__property AnsiString RequestedPageName;
```

Description

When the page dispatcher receives an HTTP request message, it sets RequestedPageName to the name of the target Web page module. This is taken from the pathinfo portion of the request message's target URL.

Note: There is no guarantee that RequestedPageName refers to a registered Web page module, because this property is set before the dispatcher verifies that the requested page exists.

See Also

DispatchedPageName (see page 24656)

FindPageInfo (see page 24650)

Request (see page 24658)

TPageDispatcher (see page 24949)

176.1.3.5.9 TAbstractWebContext.Response Property

Represents the current HTTP response that the application is assembling.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 24658) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 24658)

176.1.3.5.10 TAbstractWebContext.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Use Session to get or set information about the current session. Sessions store information about an end user that is needed for a short period of time. This can be used for such tasks as login/logout support, recording user preferences, and so on.

Note: If you want to use a session to store end user information, the WebSnap application should include a TSessionsService

component.

See Also

TSessionsService (see page 25582)

176.1.3.5.11 TAbstractWebContext.WebModules Property

Lists all the Modules in the WebSnap application.

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

Use WebModules to access one of the Web modules that make up the WebSnap application. WebModules lists all of the currently instantiated Web modules. It also provides access to the factory objects for all Web modules in the application, including those that are not yet instantiated.

See Also

Pages (see page 24658)

FindModuleClass (see page 24649)

FindModuleName (see page 24649)

FindApplicationModule (see page 24648)

FindModuleClass (see page 24649)

176.1.4 TWebContext Class

TWebContext represents the current state of a WebSnap application.

Class Hierarchy

Pascal

```
TWebContext = class(TAbstractWebContext);
```

C++

```
class TWebContext : public TAbstractWebContext;
```

File

WebCntxt

Description

A Web context stores information about the components that are available in a WebSnap application and about the current request that is being processed. Applications do not create instances of the Web context. Rather, they access the current Web context object by calling the global WebContext (see page 24687) function.

TWebContext provides the implementation of the abstract or (in C++ terminology) pure virtual methods introduced by its

immediate ancestor, TAbstractWebContext (see page 24644).

See Also

WebContext (see page 24687)

Dispatching Requests and Responses

176.1.4.1 TWebContext Members

The following tables list the members exposed by TWebContext.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 24667)	This is GetAdapterRequest, a member of class TWebContext.
	GetAdapterResponse (see page 24668)	This is GetAdapterResponse, a member of class TWebContext.
	GetDispatchedPageName (see page 24668)	This is GetDispatchedPageName, a member of class TWebContext.
	GetEndUser (see page 24668)	This is GetEndUser, a member of class TWebContext.
	GetPageCount (see page 24668)	
	GetPageInfo (see page 24669)	
	GetRequestedPageName (see page 24669)	
	GetSession (see page 24669)	
	GetWebModules (see page 24669)	
	GetWebRequest (see page 24670)	
	GetWebResponse (see page 24670)	
	SetAdapterRequest (see page 24670)	This is SetAdapterRequest, a member of class TWebContext.
	SetAdapterResponse (see page 24670)	This is SetAdapterResponse, a member of class TWebContext.
	SetDispatchedPageName (see page 24671)	This is SetDispatchedPageName, a member of class TWebContext.
	SetRequestedPageName (see page 24671)	This is SetRequestedPageName, a member of class TWebContext.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24662)	Creates an initializes an instance of TWebContext (see page 24660).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24663)	Frees an instance of TWebContext (see page 24660).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindApplicationModule (see page 24664)	Returns the application module instance.
	FindDefaultPageInfo (see page 24664)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 24665)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 24665)	Returns an instance of a Web module, given its class name.
	FindPage (see page 24666)	Retrieves a Web page module given its name.
	FindPageInfo (see page 24666)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 24667)	Returns an instance of a Web data module, given its class name.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AdapterRequest (see page 24655)	Provides access to the adapter request object that manages access to the current request.
R	AdapterResponse (see page 24656)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 24656)	Specifies the name of the Web page module that is producing content to respond to the current request.
R	EndUser (see page 24657)	Provides access to information about the end user that sent the current request.
R	PageCount (see page 24657)	Indicates the number of registered Web pages available in the WebSnap application.
R	Pages (see page 24658)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
R	Request (see page 24658)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 24658)	Indicates the name of the Web page module to which the current request is addressed.
R	Response (see page 24659)	Represents the current HTTP response that the application is assembling.
R	Session (see page 24659)	Provides access to the current Web session.
R	WebModules (see page 24660)	Lists all the Modules in the WebSnap application.

176.1.4.2 TWebContext.Create Constructor

Creates an initializes an instance of TWebContext (see page 24660).

Pascal

```
constructor Create(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest; AResponse:
TWebResponse; ASession: TAbstractWebSession);
```

C++

```
__fastcall TWebContext(TAbstractWebModuleList AWebModuleList, TWebRequest ARequest,
TWebResponse AResponse, TAbstractWebSession ASession);
```

Description

Do not create instances of TWebContext (see page 24660). WebSnap applications create a global Web context automatically to represent the current state of the application. To access this global Web context object, use the global WebContext (see page 24687) function.

The TWebContext (see page 24660) constructor registers itself with the global WebContext (see page 24687) function so that the application can access the Web context using that function, and initializes the properties of the Web context to the values passed in as parameters.

AWebModuleList is the component that manages the Web modules in the application. It becomes the value of the WebModules (see page 24660) property.

ARequest is the current HTTP request message. It becomes the value of the Request (see page 24658) property.

AResponse is the current response object that the application is filling out. It becomes the value of the Response (see page 24659) property.

ASession is the Session (see page 24659) object associated with ARequest. It becomes the value of the Session (see page 24659) property.

See Also

WebContext (see page 24687)

WebModules (see page 24660)

Request (see page 24658)

Response (see page 24659)

Session (see page 24659)

176.1.4.3 TWebContext.Destroy Destructor

Frees an instance of TWebContext (see page 24660).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContext();
```

Description

Do not free the global Web context object. This object is automatically maintained by the WebSnap application.

The TWebContext (see page 24660) destructor unregisters itself with the global WebContext (see page 24687) function so that the WebContext (see page 24687) function never returns a Web context that no longer exists.

See Also

WebContext (see page 24687)

176.1.4.4 TWebContext Methods

The methods of the TWebContext class are listed here.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 24667)	This is GetAdapterRequest, a member of class TWebContext.
	GetAdapterResponse (see page 24668)	This is GetAdapterResponse, a member of class TWebContext.
	GetDispatchedPageName (see page 24668)	This is GetDispatchedPageName, a member of class TWebContext.
	GetEndUser (see page 24668)	This is GetEndUser, a member of class TWebContext.
	GetPageCount (see page 24668)	
	GetPageInfo (see page 24669)	
	GetRequestedPageName (see page 24669)	
	GetSession (see page 24669)	

	GetWebModules (see page 24669)	
	GetWebRequest (see page 24670)	
	GetWebResponse (see page 24670)	
	SetAdapterRequest (see page 24670)	This is SetAdapterRequest, a member of class TWebContext.
	SetAdapterResponse (see page 24670)	This is SetAdapterResponse, a member of class TWebContext.
	SetDispatchedPageName (see page 24671)	This is SetDispatchedPageName, a member of class TWebContext.
	SetRequestedPageName (see page 24671)	This is SetRequestedPageName, a member of class TWebContext.

Public Methods

	Name	Description
	FindApplicationModule (see page 24664)	Returns the application module instance.
	FindDefaultPageInfo (see page 24664)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 24665)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 24665)	Returns an instance of a Web module, given its class name.
	FindPage (see page 24666)	Retrieves a Web page module given its name.
	FindPageInfo (see page 24666)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 24667)	Returns an instance of a Web data module, given its class name.

176.1.4.4.1 TWebContext.FindApplicationModule Method

Returns the application module instance.

Pascal

```
function FindApplicationModule(WebModuleContext: TWebModuleContext): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindApplicationModule(TWebModuleContext WebModuleContext);
```

Description

Call FindApplicationModule to access the main Web module in the WebSnap application. FindApplicationModule returns a reference to the module that the WebSnap application wizard creates. This can be an instance of TWebAppPageModule or TWebAppDataModule.

The Application module is the module that holds the application-wide components such as the page dispatcher, end user adapter, application adapter, and so on.

WebModuleContext is a context object that holds design-time information about the application modules. It is only used at design time.

See Also

WebModules (see page 24660)

TWebAppPageModule (see page 25394)

TWebAppDataModule (see page 25388)

176.1.4.4.2 TWebContext.FindDefaultPageInfo Method

Retrieves the Web page information object for a specified class of Web module.

Pascal

```
function FindDefaultPageInfo(AComponentClass: TComponentClass; out APageInfo:
TAbstractWebPageInfo): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindDefaultPageInfo(TComponentClass AComponentClass,
TAbstractWebPageInfo APageInfo);
```

Description

Call FindDefaultPageInfo to obtain the Web page information object for a Web module. FindDefaultPageInfo retrieves the information object that is registered for the Web page module class specified by AComponentClass. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

AComponentClass is a class reference to the class that implements the Web page module. This class is declared in code that the Web page module wizard generates.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindDefaultPageInfo returns false if it can't return a value for the APageInfo parameter. FindDefaultPageInfo returns true if it locates a registered Web page module for the class specified by AComponentClass.

See Also

FindPageInfo (see page 24666)

176.1.4.4.3 TWebContext.FindModuleClass Method

Returns an instance of a Web module, given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass);
```

Description

Call FindModuleClass to obtain a reference to a Web module given its class reference. If an instance of the specified class already exists, FindModuleClass returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass creates an instance of the specified class and returns the new instance.

AClass is the class reference to a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleName (see page 24665)

FindPage (see page 24666)

176.1.4.4.4 TWebContext.FindModuleName Method

Returns an instance of a Web module, given its class name.

Pascal

```
function FindModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const AnsiString AName);
```

Description

Call FindModuleName to obtain a reference to a Web module given the name of its implementation class. If an instance of the specified class already exists, FindModuleName returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass (see page 24665) creates an instance of the specified class and returns the new instance.

AClass is the name of a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleClass (see page 24665)

FindPage (see page 24666)

FindVariableContainer (see page 24667)

176.1.4.4.5 TWebContext.FindPage Method

Retrieves a Web page module given its name.

Pascal

```
function FindPage(const APage: string; AOptions: TFindPageOptions; out AComponent: TObject):
Boolean; override;
```

C++

```
virtual __fastcall Boolean FindPage(const AnsiString APage, TFindPageOptions AOptions, TObject
* AComponent);
```

Description

Call FindPage to obtain an instance of a registered Web page module given its name. If an instance of the specified Web page module already exists, FindPage returns that instance. Otherwise, if the named Web page module is registered, FindPage creates an instance of the module and returns the new instance.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPage considers. For any option included in this set, FindPage only considers Web page modules that have the corresponding attribute.

AComponent returns the instance of the specified Web page module.

FindPage returns true if it can find or create an instance of the specified Web page module, false otherwise.

See Also

FindModuleName (see page 24665)

FindPageInfo (see page 24666)

FindModuleClass (see page 24665)

176.1.4.4.6 TWebContext.FindPageInfo Method

Retrieves a Web page information object given the name of the corresponding Web page module.

Pascal

```
function FindPageInfo(const APage: string; AOptions: TFindPageOptions; out APageInfo:
TAbstractWebPageInfo): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindPageInfo(const AnsiString APage, TFindPageOptions AOptions,
TAbstractWebPageInfo APageInfo);
```

Description

Call FindPageInfo to obtain the Web page information object for a Web page module. FindPageInfo retrieves the information object that is registered for the Web page module that has a specified name. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPageInfo considers. For any option included in this set, FindPageInfo only considers Web page modules that have the corresponding attribute.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindPageInfo returns false if it can't return a value for the APageInfo parameter. FindPageInfo returns true if it locates a registered Web page module with the specified name and attributes.

See Also

FindPage (see page 24666)

FindDefaultPageInfo (see page 24664)

Pages (see page 24658)

176.1.4.4.7 TWebContext.FindVariableContainer Method

Returns an instance of a Web data module, given its class name.

Pascal

```
function FindVariableContainer(const AIdent: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindVariableContainer(const AnsiString AIdent);
```

Description

Call FindVariableContainer to obtain a reference to a Web data module given the name of its implementation class. If an instance of the specified class already exists, FindVariableContainer returns that instance. Otherwise, if the specified class represents a registered Web module class, FindVariableContainer creates an instance of the specified class and returns the new instance.

AIdent is the name of a registered Web data module class. This class is declared in code that the Web data module wizard generates.

See Also

FindModuleName (see page 24665)

176.1.4.4.8 TWebContext.GetAdapterRequest Method

Pascal

```
function GetAdapterRequest: IUnknown; override;
```

C++

```
virtual __fastcall IUnknown GetAdapterRequest();
```

Description

This is GetAdapterRequest, a member of class TWebContext.

176.1.4.4.9 TWebContext.GetAdapterResponse Method

Pascal

```
function GetAdapterResponse: IUnknown; override;
```

C++

```
virtual __fastcall IUnknown GetAdapterResponse();
```

Description

This is GetAdapterResponse, a member of class TWebContext.

176.1.4.4.10 TWebContext.GetDispatchedPageName Method

Pascal

```
function GetDispatchedPageName: string; override;
```

C++

```
virtual __fastcall AnsiString GetDispatchedPageName();
```

Description

This is GetDispatchedPageName, a member of class TWebContext.

176.1.4.4.11 TWebContext.GetEndUser Method

Pascal

```
function GetEndUser: IWebEndUser; override;
```

C++

```
virtual __fastcall IWebEndUser GetEndUser();
```

Description

This is GetEndUser, a member of class TWebContext.

176.1.4.4.12 TWebContext.GetPageCount Method

Pascal

```
function GetPageCount: Integer; override;
```

C++

```
virtual __fastcall int GetPageCount();
```

See Also

GetPageCount (see page 24652)

GetPageInfo (see page 24653)

PageCount (see page 24657)

176.1.4.4.13 TWebContext.GetPageInfo Method

Pascal

```
function GetPageInfo(I: Integer): IWebPageInfo; override;
```

C++

```
virtual __fastcall IWebPageInfo GetPageInfo(int I);
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.4.4.14 TWebContext.GetRequestedPageName Method

Pascal

```
function GetRequestedPageName: string; override;
```

C++

```
virtual __fastcall AnsiString GetRequestedPageName();
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.4.4.15 TWebContext.GetSession Method

Pascal

```
function GetSession: TAbstractWebSession; override;
```

C++

```
virtual __fastcall TAbstractWebSession GetSession();
```

See Also

GetPageCount (see page 24652)

Pages (see page 24658)

176.1.4.4.16 TWebContext.GetWebModules Method

Pascal

```
function GetWebModules: TAbstractWebModuleList; override;
```

C++

```
virtual __fastcall TAbstractWebModuleList GetWebModules();
```

See Also

WebModules (see page 24660)

176.1.4.4.17 TWebContext.GetWebRequest Method

Pascal

```
function GetWebRequest: TWebRequest; override;
```

C++

```
virtual __fastcall TWebRequest GetWebRequest();
```

See Also

GetWebResponse (see page 24654)

Request (see page 24658)

176.1.4.4.18 TWebContext.GetWebResponse Method

Pascal

```
function GetWebResponse: TWebResponse; override;
```

C++

```
virtual __fastcall TWebResponse GetWebResponse();
```

See Also

GetWebRequest (see page 24654)

Response (see page 24659)

176.1.4.4.19 TWebContext.SetAdapterRequest Method

Pascal

```
procedure SetAdapterRequest(Intf: IUnknown); override;
```

C++

```
virtual __fastcall SetAdapterRequest(IUnknown Intf);
```

Description

This is SetAdapterRequest, a member of class TWebContext.

176.1.4.4.20 TWebContext.SetAdapterResponse Method

Pascal

```
procedure SetAdapterResponse(Intf: IUnknown); override;
```

C++

```
virtual __fastcall SetAdapterResponse(IUnknown Intf);
```

Description

This is SetAdapterResponse, a member of class TWebContext.

176.1.4.4.21 TWebContext.SetDispatchedPageName Method

Pascal

```
procedure SetDispatchedPageName(const APageName: string); override;
```

C++

```
virtual __fastcall SetDispatchedPageName(const AnsiString APageName);
```

Description

This is SetDispatchedPageName, a member of class TWebContext.

176.1.4.4.22 TWebContext.SetRequestedPageName Method

Pascal

```
procedure SetRequestedPageName(const APageName: string); override;
```

C++

```
virtual __fastcall SetRequestedPageName(const AnsiString APageName);
```

Description

This is SetRequestedPageName, a member of class TWebContext.

176.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebEndUser (see page 24672)	IWebEndUser provides access information about the current end user in a WebSnap application.
	IWebPageInfo (see page 24680)	IWebPageInfo describes a Web page in a WebSnap application.

176.2.1 IWebEndUser Interface

IWebEndUser provides access information about the current end user in a WebSnap application.

Class Hierarchy

WebCntxt.IWebEndUser

Pascal

```
IWebEndUser = interface;
```

C++

```
__interface IWebEndUser;
```

File

WebCntxt

Description

Use IWebEndUser to obtain information about the current end user, such as the user name, user ID, and whether the user is logged in. In addition to properties that provide information about the current end user, IWebEndUser has methods to log in an end user.

End user adapter components such as TEndUserAdapter and TEndUserSessionAdapter implement the IWebEndUser interface. If a WebSnap application includes an end user adapter, you can access its IWebEndUser interface by reading the EndUser property of the Web context.

Note: In C++, method declarations that use IWebEndUser use the _di_IWebEndUser type instead. This type is a DelphiInterface wrapper around the IWebEndUser interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebEndUser > _di_IWebEndUser;

See Also

TAbstractWebContext (see page 24644)

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

176.2.1.1 IWebEndUser Members

The following tables list the members exposed by IWebEndUser.

Public Methods

	Name	Description
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	LogIn (see page 24677)	Logs in a specified user.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.

Public Properties

	Name	Description
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.

176.2.1.2 IWebEndUser Methods

The methods of the IWebEndUser class are listed here.

Public Methods

	Name	Description
	GetDisplayName (see page 24673)	Returns the value of the DisplayName (see page 24678) property.
	GetEndUserAdapter (see page 24674)	Returns the value of the EndUserAdapter (see page 24678) property.
	GetLoggedIn (see page 24674)	Returns the value of the LoggedIn (see page 24678) property.
	GetLoginFormAction (see page 24674)	Returns the value of the LoginFormAction (see page 24679) property.
	GetLogoutAction (see page 24675)	Returns the value of the LogoutAction (see page 24680) property.
	HasExecuteRights (see page 24675)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyRights (see page 24676)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewRights (see page 24676)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	LogIn (see page 24677)	Logs in a specified user.
	ProduceLoginPage (see page 24677)	Generates the Web page for logging in users.

176.2.1.2.1 IWebEndUser.GetDisplayName Method

Returns the value of the DisplayName (see page 24678) property.

Pascal

```
function GetDisplayName: string;
```

C++

```
__fastcall AnsiString GetDisplayName();
```

Description

GetDisplayName is the read implementation of the DisplayName (see page 24678) property.

See Also

DisplayName (see page 24678)

176.2.1.2.2 IWebEndUser.GetEndUserAdapter Method

Returns the value of the EndUserAdapter (see page 24678) property.

Pascal

```
function GetEndUserAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetEndUserAdapter();
```

Description

GetEndUserAdapter is the read implementation of the EndUserAdapter (see page 24678) property.

See Also

EndUserAdapter (see page 24678)

176.2.1.2.3 IWebEndUser.GetLoggedIn Method

Returns the value of the LoggedIn (see page 24678) property.

Pascal

```
function GetLoggedIn: Boolean;
```

C++

```
__fastcall Boolean GetLoggedIn();
```

Description

GetLoggedIn is the read implementation of the LoggedIn (see page 24678) property.

See Also

LoggedIn (see page 24678)

176.2.1.2.4 IWebEndUser.GetLoginFormAction Method

Returns the value of the LoginFormAction (see page 24679) property.

Pascal

```
function GetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * GetLoginFormAction();
```

Description

GetLoginFormAction is the read implementation of the LoginFormAction (see page 24679) property.

See Also

LoginFormAction (see page 24679)

176.2.1.2.5 IWebEndUser.GetLogoutAction Method

Returns the value of the LogoutAction (see page 24680) property.

Pascal

```
function GetLogoutAction: TComponent;
```

C++

```
__fastcall TComponent * GetLogoutAction();
```

Description

GetLogoutAction is the read implementation of the LogoutAction (see page 24680) property.

See Also

LogoutAction (see page 24680)

176.2.1.2.6 IWebEndUser.HasExecuteRights Method

Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.

Pascal

```
function HasExecuteRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasExecuteRights(AnsiString ARights);
```

Description

Call HasExecuteRights to determine whether the current end user is authorized to execute Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasExecuteRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasExecuteRights can determine the user's access rights.

See Also

LoggedIn (see page 24678)

HasViewRights (see page 24676)

HasModifyRights (see page 24676)

ViewAccess (see page 15069)

ViewAccess (see page 24183)

TWebUserList (see page 25625)

AccessRightsStrings (see page 25619)

176.2.1.2.7 IWebEndUser.HasModifyRights Method

Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.

Pascal

```
function HasModifyRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasModifyRights(AnsiString ARights);
```

Description

Call HasModifyRights to determine whether the current end user is authorized to modify Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasModifyRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasModifyRights can determine the user's access rights.

See Also

LoggedIn (see page 24678)

HasViewRights (see page 24676)

HasExecuteRights (see page 24675)

ViewAccess (see page 15069)

ViewAccess (see page 24183)

TWebUserList (see page 25625)

AccessRightsStrings (see page 25619)

176.2.1.2.8 IWebEndUser.HasViewRights Method

Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.

Pascal

```
function HasViewRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasViewRights(AnsiString ARights);
```

Description

Call HasViewRights to determine whether the current end user is authorized to view Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasViewRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasViewRights can determine the user's access rights.

See Also

LoggedIn (see page 24678)

HasExecuteRights (see page 24675)

HasModifyRights (see page 24676)

ViewAccess (see page 15069)

ViewAccess (see page 24183)

TWebUserList (see page 25625)

AccessRightsStrings (see page 25619)

176.2.1.2.9 IWebEndUser.LogIn Method

Logs in a specified user.

Pascal

```
procedure LogIn(UserID: Variant);
```

C++

```
__fastcall LogIn(Variant UserID);
```

Description

Call LogIn to record a user as logged in. Typically, LogIn is called in response to a message from the login page that ProduceLoginPage (see page 24677) generates.

UserID is the identifier of the user that logged in. It is the value of the UserID property of the entry for the user in a WebUserList component, or, in applications that implement their own login scheme, any other Variant that identifies an end user.

See Also

LoggedIn (see page 24678)

ProduceLoginPage (see page 24677)

TWebUserList (see page 25625)

UserID (see page 25619)

TLoginFormAdapter (see page 24500)

176.2.1.2.10 IWebEndUser.ProduceLoginPage Method

Generates the Web page for logging in users.

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

Call ProduceLoginPage to generate a Web page for logging in users.

ProduceLoginPage returns true if it generates a login form page and updates the current response message so that it will be displayed to the user. ProduceLoginPage returns false if the end user adapter is unable to generate a login page.

See Also

LoggedIn (see page 24678)

LogIn (see page 24677)

LoginFormAction (see page 24679)

176.2.1.3 IWebEndUser Properties

The properties of the IWebEndUser class are listed here.

Public Properties

	Name	Description
R	DisplayName (see page 24678)	Indicates the name of the end user as it should be used for display in Web pages.
R	EndUserAdapter (see page 24678)	Provides access to the end user adapter that implements this interface.
R	LoggedIn (see page 24678)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 24679)	Indicates the action component for the login form.
R	LogoutAction (see page 24680)	Indicates the action component for logging a user out.

176.2.1.3.1 IWebEndUser.DisplayName Property

Indicates the name of the end user as it should be used for display in Web pages.

Pascal

```
property DisplayName: string;
```

C++

```
__property AnsiString DisplayName;
```

Description

Read DisplayName to obtain a string that can be added to Web pages to refer to the current user.

See Also

UserName (see page 25620)

176.2.1.3.2 IWebEndUser.EndUserAdapter Property

Provides access to the end user adapter that implements this interface.

Pascal

```
property EndUserAdapter: TComponent;
```

C++

```
__property TComponent * EndUserAdapter;
```

Description

Read EndUserAdapter to obtain access to the end user adapter. This is the component that implements this interface. Typically, it is a TEndUserAdapter or TEndUserSessionAdapter instance.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

176.2.1.3.3 IWebEndUser.LoggedIn Property

Indicates whether the current user is logged in.

Pascal

```
property LoggedIn: Boolean;
```

C++

```
__property Boolean LoggedIn;
```

Description

Read LoggedIn to determine whether the current user has logged in to the WebSnap application. By logging in, a caller can be identified as one of the users that a TWebUserList component lists.

Once the user has logged in, the HasViewRights (see page 24676), HasExecuteRights (see page 24675), and HasModifyRights (see page 24676) methods can be used to determine whether the user is authorized to view, execute actions, and modify data on restricted Web pages.

To log in a user that is not logged in, call the ProduceLoginPage (see page 24677) method to display a login Web page. That page should allow the user to provide some sort of UserID, which can then be used to log the user in by a call to the LogIn (see page 24677) method.

See Also

LogIn (see page 24677)

ProduceLoginPage (see page 24677)

TWebUserList (see page 25625)

HasExecuteRights (see page 24675)

HasModifyRights (see page 24676)

HasViewRights (see page 24676)

176.2.1.3.4 IWebEndUser.LoginFormAction Property

Indicates the action component for the login form.

Pascal

```
property LoginFormAction: TComponent;
```

C++

```
__property TComponent * LoginFormAction;
```

Description

Read LoginFormAction to access the login form action component. The login form action component can be called from server-side scripts to display a login form Web page.

Note: To display the login form Web page using the IWebEndUser (see page 24672) interface (rather than from a server-side script), call the ProduceLoginPage (see page 24677) method.

See Also

ProduceLoginPage (see page 24677)

TEndUserAdapterLoginFormAction (see page 24436)

LogoutAction (see page 24680)

176.2.1.3.5 IWebEndUser.LogoutAction Property

Indicates the action component for logging a user out.

Pascal

```
property LogoutAction: TComponent;
```

C++

```
__property TComponent * LogoutAction;
```

Description

Read LogoutAction to access the logout action component. The logout action component can be called from server-side scripts to perform any necessary tasks when the user logs out.

See Also

LoginFormAction (see page 24679)

TEndUserAdapterLogoutAction (see page 24447)

176.2.2 IWebPageInfo Interface

IWebPageInfo describes a Web page in a WebSnap application.

Class Hierarchy

Pascal

```
IWebPageInfo = interface;
```

C++

```
__interface IWebPageInfo;
```

File

WebCntxt

Description

Use IWebPageInfo to obtain information about a Web page, including its page name, page title, descriptive text, publish status, and access rights. This information is taken from a TWebPageInfo object that is stored with the Web page module factory.

Note: VCL Method declarations that use IWebPageInfo use the _di_IWebPageInfo type instead. This type is a DelphiInterface wrapper around the IWebPageInfo interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWebPageInfo >  _di_IWebPageInfo;
```

See Also

TWebPageInfo (see page 25016)

TAbstractWebContext (see page 24644)

176.2.2.1 IWebPageInfo Members

The following tables list the members exposed by IWebPageInfo.

Public Methods

	Name	Description
	GetHasViewAccess (see page 24681)	Returns the value of the HasViewAccess (see page 24684) property.
	GetLoginRequired (see page 24682)	Returns the value of the LoginRequired (see page 24684) property.
	GetPageDescription (see page 24682)	Returns the value of the PageDescription (see page 24684) property.
	GetPageHREF (see page 24682)	Returns the value of the PageHREF (see page 24685) property.
	GetPageIsPublished (see page 24683)	Returns the value of the PageIsPublished (see page 24685) property.
	GetPageName (see page 24683)	Returns the value of the PageName (see page 24686) property.
	GetPageTitle (see page 24683)	Returns the value of the PageTitle (see page 24686) property.

Public Properties

	Name	Description
R	HasViewAccess (see page 24684)	Indicates whether the current user has access rights to view the Web page.
R	LoginRequired (see page 24684)	Indicates whether callers must log in before accessing this Web page.
R	PageDescription (see page 24684)	Describes the Web page.
R	PageHREF (see page 24685)	Identifies the HREF to use for references to the associated Web page.
R	PageIsPublished (see page 24685)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 24686).
R	PageName (see page 24686)	Denotes the logical name for the Web page.
R	PageTitle (see page 24686)	Indicates the title that appears on the Web page.

176.2.2.2 IWebPageInfo Methods

The methods of the IWebPageInfo class are listed here.

Public Methods

	Name	Description
	GetHasViewAccess (see page 24681)	Returns the value of the HasViewAccess (see page 24684) property.
	GetLoginRequired (see page 24682)	Returns the value of the LoginRequired (see page 24684) property.
	GetPageDescription (see page 24682)	Returns the value of the PageDescription (see page 24684) property.
	GetPageHREF (see page 24682)	Returns the value of the PageHREF (see page 24685) property.
	GetPageIsPublished (see page 24683)	Returns the value of the PageIsPublished (see page 24685) property.
	GetPageName (see page 24683)	Returns the value of the PageName (see page 24686) property.
	GetPageTitle (see page 24683)	Returns the value of the PageTitle (see page 24686) property.

176.2.2.2.1 IWebPageInfo.GetHasViewAccess Method

Returns the value of the HasViewAccess (see page 24684) property.

Pascal

```
function GetHasViewAccess: Boolean;
```

C++

```
__fastcall Boolean GetHasViewAccess();
```

Description

GetHasViewAccess is the read implementation of the HasViewAccess (see page 24684) property.

See Also

HasViewAccess (see page 24684)

176.2.2.2.2 IWebPageInfo.GetLoginRequired Method

Returns the value of the LoginRequired (see page 24684) property.

Pascal

```
function GetLoginRequired: Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired();
```

Description

GetLoginRequired is the read implementation of the LoginRequired (see page 24684) property.

See Also

LoginRequired (see page 24684)

176.2.2.2.3 IWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription (see page 24684) property.

Pascal

```
function GetPageDescription: string;
```

C++

```
__fastcall AnsiString GetPageDescription();
```

Description

GetPageDescription is the read implementation of the PageDescription (see page 24684) property.

See Also

PageDescription (see page 24684)

176.2.2.2.4 IWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF (see page 24685) property.

Pascal

```
function GetPageHREF: string;
```

C++

```
__fastcall AnsiString GetPageHREF();
```

Description

GetPageHREF is the read implementation of the PageHREF (see page 24685) property.

See Also

PageHREF (see page 24685)

176.2.2.2.5 IWebPageInfo.GetPageIsPublished Method

Returns the value of the PageIsPublished (see page 24685) property.

Pascal

```
function GetPageIsPublished: Boolean;
```

C++

```
__fastcall Boolean GetPageIsPublished();
```

Description

GetPageIsPublished is the read implementation of the PageIsPublished (see page 24685) property.

See Also

PageIsPublished (see page 24685)

176.2.2.2.6 IWebPageInfo.GetPageName Method

Returns the value of the PageName (see page 24686) property.

Pascal

```
function GetPageName: string;
```

C++

```
__fastcall AnsiString GetPageName();
```

Description

GetPageName is the read implementation of the PageName (see page 24686) property.

See Also

PageName (see page 24686)

176.2.2.2.7 IWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle (see page 24686) property.

Pascal

```
function GetPageTitle: string;
```

C++

```
__fastcall AnsiString GetPageTitle();
```

Description

GetPageTitle is the read implementation of the PageTitle (see page 24686) property.

See Also

PageTitle (see page 24686)

176.2.2.3 IWebPageInfo Properties

The properties of the IWebPageInfo class are listed here.

Public Properties

	Name	Description
R	HasViewAccess (see page 24684)	Indicates whether the current user has access rights to view the Web page.
R	LoginRequired (see page 24684)	Indicates whether callers must log in before accessing this Web page.
R	PageDescription (see page 24684)	Describes the Web page.
R	PageHREF (see page 24685)	Identifies the HREF to use for references to the associated Web page.
R	PageIsPublished (see page 24685)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 24686).
R	PageName (see page 24686)	Denotes the logical name for the Web page.
R	PageTitle (see page 24686)	Indicates the title that appears on the Web page.

176.2.2.3.1 IWebPageInfo.HasViewAccess Property

Indicates whether the current user has access rights to view the Web page.

Pascal

```
property HasViewAccess: Boolean;
```

C++

```
__property Boolean HasViewAccess;
```

Description

HasViewAccess is true if the current end user has view rights for the associated Web page, false otherwise.

See Also

HasViewRights (see page 24676)

176.2.2.3.2 IWebPageInfo.LoginRequired Property

Indicates whether callers must log in before accessing this Web page.

Pascal

```
property LoginRequired: Boolean;
```

C++

```
__property Boolean LoginRequired;
```

Description

Read LoginRequired to determine whether users must log in before they can access this Web page. The application can overrule the LoginRequired property by supplying an OnIsLoginRequired event handler to the page dispatcher.

See Also

OnIsLoginRequired (see page 24904)

TPageDispatcher (see page 24949)

176.2.2.3.3 IWebPageInfo.PageDescription Property

Describes the Web page.

Pascal

```
property PageDescription: string;
```

C++

```
__property AnsiString PageDescription;
```

Description

Read PageDescription to obtain a brief description of the Web page.

See Also

PageName (see page 24686)

PageTitle (see page 24686)

176.2.2.3.4 IWebPageInfo.PageHREF Property

Identifies the HREF to use for references to the associated Web page.

Pascal

```
property PageHREF: string;
```

C++

```
__property AnsiString PageHREF;
```

Description

Read PageHREF to obtain the HTTP path string that should be inserted in HTML code to create a hypertext link to the associated Web page.

See Also

PageName (see page 24686)

176.2.2.3.5 IWebPageInfo.PageIsPublished Property

Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 24686).

Pascal

```
property PageIsPublished: Boolean;
```

C++

```
__property Boolean PageIsPublished;
```

Description

Read PageIsPublished to determine whether the page dispatcher (TPageDispatcher) automatically calls on the associated Web page module when it receives HTTP request messages that address this Web page by name. HTTP request messages address a Web page when the pathinfo portion of their target URL matches the value of the PageName (see page 24686) property.

When IsPublished is false, the WebSnap application must explicitly retrieve the content for the Web page and add it to a response message.

See Also

PageName (see page 24686)

TPageDispatcher (see page 24949)

176.2.2.3.6 IWebPageInfo.PageName Property

Denotes the logical name for the Web page.

Pascal

```
property PageName: string;
```

C++

```
__property AnsiString PageName;
```

Description

Read PageName to determine the name of the Web page. This name is used to identify the page in server-side scripts, and as the pathinfo portion of the URL for the page when the PageIsPublished (see page 24685) property is true.

See Also

PageTitle (see page 24686)

PageHREF (see page 24685)

PageIsPublished (see page 24685)

176.2.2.3.7 IWebPageInfo.PageTitle Property

Indicates the title that appears on the Web page.

Pascal

```
property PageTitle: string;
```

C++

```
__property AnsiString PageTitle;
```

Description

Read PageTitle to determine the title that appears on the Web page when viewed from a user's browser.

See Also

PageName (see page 24686)

176.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WebContext (see page 24687)	Returns the current Web context

176.3.1 WebCntxt.WebContext Function

Returns the current Web context

Pascal

```
function WebContext: TAbstractWebContext;
```

C++

```
TAbstractWebContext WebContext();
```

File

WebCntxt

Description

Use the WebContext function to obtain a reference to the global Web context. This object stores information about the components that are available in the Web application as well as about the current request that is being processed.

176.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFindPageOption (see page 24688)	This is record WebCntxt.TFindPageOption.

176.4.1 WebCntxt.TFindPageOption Enumeration

Pascal

```
TFindPageOption = (
  fpPublished,
  fpLoginRequired
);
```

C++

```
enum TFindPageOption {
  fpPublished,
  fpLoginRequired
};
```

File

WebCntxt

Description

This is record WebCntxt.TFindPageOption.

176.5 Types

The following table lists types in this documentation.

Types

Name	Description
TFindPageOptions (see page 24689)	This is type WebCntxt.TFindPageOptions.
TGetWebContextProc (see page 24689)	This is type WebCntxt.TGetWebContextProc.
TGetWebEndUserProc (see page 24690)	This is type WebCntxt.TGetWebEndUserProc.
TSetWebContextProc (see page 24690)	This is type WebCntxt.TSetWebContextProc.

176.5.1 WebCntxt.TFindPageOptions Type

Pascal

```
TFindPageOptions = set of TFindPageOption;
```

C++

```
TFindPageOption TFindPageOptions;
```

File

WebCntxt

Description

This is type WebCntxt.TFindPageOptions.

176.5.2 WebCntxt.TGetWebContextProc Type

Pascal

```
TGetWebContextProc = function : TAbstractWebContext;
```

C++

```
: TAbstractWebContext ( TGetWebContextProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TGetWebContextProc.

176.5.3 WebCntxt.TGetWebEndUserProc Type

Pascal

```
TGetWebEndUserProc = function : IWebEndUser;
```

C++

```
: IWebEndUser ( TGetWebEndUserProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TGetWebEndUserProc.

176.5.4 WebCntxt.TSetWebContextProc Type

Pascal

```
TSetWebContextProc = procedure (AWebContext: TAbstractWebContext);
```

C++

```
(AWebContext: TAbstractWebContext) ( TSetWebContextProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TSetWebContextProc.

176.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
GetModuleFileNameProc (see page 24691)	This is variable WebCntxt.GetModuleFileNameProc.
GetWebContextProc (see page 24691)	This is variable WebCntxt.GetWebContextProc.
GetWebEndUserProc (see page 24692)	This is variable WebCntxt.GetWebEndUserProc.
SetWebContextProc (see page 24692)	This is variable WebCntxt.SetWebContextProc.

176.6.1 WebCntxt.GetModuleFileNameProc Variable

Pascal

```
GetModuleFileNameProc: function: string = nil;
```

C++

```
function: string GetModuleFileNameProc = nil;
```

File

WebCntxt

Description

This is variable WebCntxt.GetModuleFileNameProc.

176.6.2 WebCntxt.GetWebContextProc Variable

Pascal

```
GetWebContextProc: TGetWebContextProc;
```

C++

```
TGetWebContextProc GetWebContextProc;
```

File

WebCntxt

Description

This is variable WebCntxt.GetWebContextProc.

176.6.3 WebCntxt.GetWebEndUserProc Variable

Pascal

```
GetWebEndUserProc: TGetWebEndUserProc;
```

C++

```
TGetWebEndUserProc GetWebEndUserProc;
```

File

WebCntxt

Description

This is variable WebCntxt.GetWebEndUserProc.

176.6.4 WebCntxt.SetWebContextProc Variable

Pascal

```
SetWebContextProc: TSetWebContextProc;
```

C++

```
TSetWebContextProc SetWebContextProc;
```

File

WebCntxt

Description

This is variable WebCntxt.SetWebContextProc.

177 WebComp Namespace

This is namespace WebComp.

Topics

Name	Description
Classes (see page 24695)	The following table lists classes in this documentation.
Interfaces (see page 24769)	The following table lists interfaces in this documentation.
Functions (see page 24796)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 24799)	The following table lists structs, records, enums in this documentation.
Types (see page 24801)	The following table lists types in this documentation.
Constants (see page 24804)	The following table lists constants in this documentation.

Classes

	Name	Description
	TLayoutAttributes (see page 24695)	TLayoutAttributes describes how an HTML control should be laid out.
	TLayoutWebContent (see page 24698)	TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	TWebComponentClassDescription (see page 24706)	This is class WebComp.TWebComponentClassDescription.
	TWebComponentList (see page 24708)	TWebComponentList maintains a list of Web item components.
	TWebComponentsEditorHelper (see page 24719)	This is class WebComp.TWebComponentsEditorHelper.
	TWebContainedComponent (see page 24722)	TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.
	TWebContainedComponentHelper (see page 24731)	TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.
	TWebContainedContainerComponent (see page 24738)	TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.
	TWebContainerComponent (see page 24751)	TWebContainerComponent is the base class for components that use Web items to generate HTML.
	TWebContainerComponentHelper (see page 24758)	TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.
	TWebContentOptions (see page 24766)	TWebContentOptions controls what a Web item can include in its generated HTML.

Constants

Name	Description
EnumRegisteredWebComponentsProc (see page 24804)	This is constant WebComp.EnumRegisteredWebComponentsProc.
FindWebComponentEditorHelperProc (see page 24804)	This is constant WebComp.FindWebComponentEditorHelperProc.

RegisterWebComponentsProc (see page 24805)	This is constant WebComp.RegisterWebComponentsProc.
UnRegisterWebComponentsProc (see page 24805)	This is constant WebComp.UnRegisterWebComponentsProc.

Functions

	Name	Description
	DesigningComponent (see page 24796)	This is function WebComp.DesigningComponent.
	EnumRegisteredWebComponents (see page 24796)	This is function WebComp.EnumRegisteredWebComponents.
	FindWebComponentEditorHelper (see page 24797)	This is function WebComp.FindWebComponentEditorHelper.
	QualifyFileName (see page 24797)	This is function WebComp.QualifyFileName.
	RegisterWebComponents (see page 24797)	This is function WebComp.RegisterWebComponents.
	UnRegisterWebComponents (see page 24798)	This is function WebComp.UnRegisterWebComponents.
	ValidateWebParent (see page 24798)	This is function WebComp.ValidateWebParent.

Interfaces

	Name	Description
	IAddFieldsEditor (see page 24769)	This is class WebComp.IAddFieldsEditor.
	IGetWebComponentList (see page 24771)	This is class WebComp.IGetWebComponentList.
	IGetWebComponentNodeName (see page 24772)	This is class WebComp.IGetWebComponentNodeName.
	IGetXMLStream (see page 24773)	This is class WebComp.IGetXMLStream.
	ILayoutWebContent (see page 24774)	ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	INotifyActivateModule (see page 24776)	This is class WebComp.INotifyActivateModule.
	INotifyWebActivate (see page 24777)	This is class WebComp.INotifyWebActivate.
	IProducerEditorViewSupport (see page 24779)	This is class WebComp.IProducerEditorViewSupport.
	ISetWebContentOptions (see page 24781)	This is class WebComp.ISetWebContentOptions.
	ITopLevelWebComponent (see page 24782)	This is class WebComp.ITopLevelWebComponent.
	IWebComponent (see page 24782)	IWebComponent is the interface supported by components that TWebComponentList (see page 24708) manages.
	IWebComponentCommands (see page 24786)	This is class WebComp.IWebComponentCommands.
	IWebComponentContainer (see page 24788)	This is class WebComp.IWebComponentContainer.
	IWebComponentEditor (see page 24790)	IWebComponentEditor enables a Web item to be assigned children in the IDE.
	IWebComponentEditorHelper (see page 24791)	This is class WebComp.IWebComponentEditorHelper.
	IWebContent (see page 24792)	IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.
	IWebVariablesContainerName (see page 24794)	This is class WebComp.IWebVariablesContainerName.

Structs, Records, Enums

	Name	Description
	TLabelPosition (see page 24799)	This is record WebComp.TLabelPosition.
	TWebContentFlag (see page 24799)	This is record WebComp.TWebContentFlag.

Types

Name	Description
TEnumWebComponentsProc (see page 24801)	This is type WebComp.TEnumWebComponentsProc.
TGetComponentListEvent (see page 24801)	This is type WebComp.TGetComponentListEvent.
TLayout (see page 24802)	TLayout is the type for helper objects that generate layout code for a Web item.
TSetComponentListEvent (see page 24802)	This is type WebComp.TSetComponentListEvent.
TWebComponentContainer (see page 24802)	TWebComponentContainer is the type for components that maintain a list of Web items.
TWebContentFlags (see page 24803)	This is type WebComp.TWebContentFlags.

177.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TLayoutAttributes (see page 24695)	TLayoutAttributes describes how an HTML control should be laid out.
	TLayoutWebContent (see page 24698)	TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	TWebComponentClassDescription (see page 24706)	This is class WebComp.TWebComponentClassDescription.
	TWebComponentList (see page 24708)	TWebComponentList maintains a list of Web item components.
	TWebComponentsEditorHelper (see page 24719)	This is class WebComp.TWebComponentsEditorHelper.
	TWebContainedComponent (see page 24722)	TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.
	TWebContainedComponentHelper (see page 24731)	TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.
	TWebContainedContainerComponent (see page 24738)	TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.
	TWebContainerComponent (see page 24751)	TWebContainerComponent is the base class for components that use Web items to generate HTML.
	TWebContainerComponentHelper (see page 24758)	TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.
	TWebContentOptions (see page 24766)	TWebContentOptions controls what a Web item can include in its generated HTML.

177.1.1 TLayoutAttributes Class

TLayoutAttributes describes how an HTML control should be laid out.

Class Hierarchy

Pascal

```
TLayoutAttributes = class(TObject);
```

C++

```
class TLayoutAttributes : public TObject;
```

File

WebComp

Description

TLayoutAttributes embodies a set of flags that describe how an HTML control should be laid out. These flags form the value of several public fields of the object, including

LabelAttributes (see page 24697): a string that describes style attributes that apply to the control's label (if any).

LabelPosition (see page 24697): an enumerated value describing the the position of the label (if any) relative to the control. Possible values are lposLeft (to the left of the control), lposRight (to the right of the control), lposAbove (above the control) and lposBelow (below the control).

ControlAttributes (see page 24697): a string that describes style attributes that apply to the control.

IWebContent (see page 24792)

177.1.1.1 TLayoutAttributes Members

The following tables list the members exposed by TLayoutAttributes.

Public Fields

	Name	Description
	ControlAttributes (see page 24697)	This is ControlAttributes, a member of class TLayoutAttributes.
	LabelAttributes (see page 24697)	This is LabelAttributes, a member of class TLayoutAttributes.
	LabelPosition (see page 24697)	This is LabelPosition, a member of class TLayoutAttributes.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24696)	Creates a new TLayoutAttributes (see page 24695) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

177.1.1.2 TLayoutAttributes.Create Constructor

Creates a new TLayoutAttributes (see page 24695) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TLayoutAttributes();
```

Description

Typically, applications do not instantiate TLayoutAttributes (see page 24695). Instead, each Web item that generates HTML for an InternetExpress application instantiates an internal TLayoutAttributes (see page 24695) object and uses it to encode property values that affect the layout of its generated HTML.

177.1.1.3 TLayoutAttributes Fields

The fields of the TLayoutAttributes class are listed here.

Public Fields

	Name	Description
	ControlAttributes (see page 24697)	This is ControlAttributes, a member of class TLayoutAttributes.
	LabelAttributes (see page 24697)	This is LabelAttributes, a member of class TLayoutAttributes.
	LabelPosition (see page 24697)	This is LabelPosition, a member of class TLayoutAttributes.

177.1.1.3.1 TLayoutAttributes.ControlAttributes Field

Pascal

```
ControlAttributes: string;
```

C++

```
AnsiString ControlAttributes;
```

Description

This is ControlAttributes, a member of class TLayoutAttributes.

177.1.1.3.2 TLayoutAttributes.LabelAttributes Field

Pascal

```
LabelAttributes: string;
```

C++

```
AnsiString LabelAttributes;
```

Description

This is LabelAttributes, a member of class TLayoutAttributes.

177.1.1.3.3 TLayoutAttributes.LabelPosition Field

Pascal

```
LabelPosition: TLabelPosition;
```

C++

```
TLabelPosition LabelPosition;
```

Description

This is LabelPosition, a member of class TLayoutAttributes.

177.1.2 TLayoutWebContent Class

TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

Pascal

```
TLayoutWebContent = class(TObject, ILayoutWebContent);
```

C++

```
class TLayoutWebContent : public TObject, public ILayoutWebContent;
```

File

WebComp

Description

TLayoutWebContent is the base class for objects that implement the ILayoutWebContent (see page 24774) interface. Parent components pass a TLayoutWebContent descendant to child Web items as the ParentLayout (see page 24706) parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure (typically a <TABLE> tag). For example, the TLayoutWebContent methods may add <TD> tags around generated HTML that fills the cells of a parent's HTML table.

Do not create instances of TLayoutWebContent. This implementation of the ILayoutWebContent (see page 24774) methods consists of abstract or, in C++ terminology, pure virtual methods. Instead, use a TLayoutWebContent descendant such as TFormLayout or TAdapterFormLayout, which supplies an implementation for those methods.

See Also

TLayout (see page 24802)

IWebContent (see page 24792)

ILayoutWebContent (see page 24774)

TFormLayout (see page 16656)

TAdapterFormLayout

177.1.2.1 TLayoutWebContent Members

The following tables list the members exposed by TLayoutWebContent.

Protected Methods

	Name	Description
	_AddRef (see page 24700)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 24701)	Responds when the caller releases a reference to this object's interface.

	ImplLayoutButton (see page 24701)	Provides the underlying implementation for the LayoutButton (see page 24703) method.
	ImplLayoutField (see page 24702)	Provides the underlying implementation for the LayoutField (see page 24704) method.
	ImplLayoutLabelAndField (see page 24702)	Provides the underlying implementation for the LayoutLabelAndField (see page 24704) method.
	ImplLayoutTable (see page 24703)	Provides the underlying implementation for the LayoutTable (see page 24705) method.
	LayoutButton (see page 24703)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 24704)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 24704)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 24705)	This is LayoutTable, a member of class TLayoutWebContent.
	QueryInterface (see page 24705)	Returns a reference to a specified interface if the object supports that interface.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24700)	Creates a new TLayoutWebContent (see page 24698) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	ParentLayout (see page 24706)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

177.1.2.2 TLayoutWebContent.Create Constructor

Creates a new TLayoutWebContent (see page 24698) object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TLayoutWebContent(TLayout AParentLayout);
```

Description

Call Create to instantiate a TLayoutWebContent (see page 24698) descendant to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout (see page 24706) property.

See Also

ParentLayout (see page 24706)

177.1.2.3 TLayoutWebContent Methods

The methods of the TLayoutWebContent class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 24700)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 24701)	Responds when the caller releases a reference to this object's interface.
A	ImplLayoutButton (see page 24701)	Provides the underlying implementation for the LayoutButton (see page 24703) method.
A	ImplLayoutField (see page 24702)	Provides the underlying implementation for the LayoutField (see page 24704) method.
A	ImplLayoutLabelAndField (see page 24702)	Provides the underlying implementation for the LayoutLabelAndField (see page 24704) method.
A	ImplLayoutTable (see page 24703)	Provides the underlying implementation for the LayoutTable (see page 24705) method.
	LayoutButton (see page 24703)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 24704)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 24704)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 24705)	This is LayoutTable, a member of class TLayoutWebContent.
V	QueryInterface (see page 24705)	Returns a reference to a specified interface if the object supports that interface.

177.1.2.3.1 TLayoutWebContent._AddRef Method

Responds when the caller acquires a reference to this object's interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

In Delphi, when an application uses an interface that is implemented by TLayoutWebContent (see page 24698) or one of its descendants, it automatically calls __AddRef. Typically, interfaced objects use the __AddRef method to increment a reference count, which is then decremented when the application releases the interface. In this typical scenario, when the reference count drops to zero, the object frees itself.

TLayoutWebContent (see page 24698) implements its own version of the interface methods __AddRef and _Release (see page 24701) that avoid this typical behavior. This prevents the object from being freed when its reference count drops to zero. In TLayoutWebContent (see page 24698), __AddRef always returns –1.

See Also

_Release (see page 24701)

_AddRef (see page 22397)

177.1.2.3.2 TLayoutWebContent._Release Method

Responds when the caller releases a reference to this object's interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

In Delphi, when an application releases an interface that is implemented by TLayoutWebContent (see page 24698) or one of its descendants, it automatically calls __Release. Typically, interfaced objects use the __Release method to decrement a reference count. When the reference count drops to zero, the object is automatically freed.

TLayoutWebContent (see page 24698) implements its own version of the interface methods _AddRef (see page 24700) and __Release that avoid this typical behavior. This prevents the object from being freed when its reference count drops to zero. In TLayoutWebContent (see page 24698), __Release always returns –1.

See Also

_AddRef (see page 24700)

_Release (see page 22397)

177.1.2.3.3 TLayoutWebContent.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton (see page 24703) method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplLayoutButton(const AnsiString HTMLButton, TLayoutAttributes
Attributes) = 0;
```

Description

The LayoutButton (see page 24703) method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton (see page 24703) returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent (see page 24698), ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton (see page 24703) method.

See Also

LayoutButton (see page 24703)

177.1.2.3.4 TLayoutWebContent.ImplLayoutField Method

Provides the underlying implementation for the LayoutField (see page 24704) method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplLayoutField(const AnsiString HTMLField, TLayoutAttributes
Attributes) = 0;
```

Description

The LayoutField (see page 24704) method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField (see page 24704) returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent (see page 24698), ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField (see page 24704) method.

See Also

LayoutField (see page 24704)

177.1.2.3.5 TLayoutWebContent.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField (see page 24704) method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplLayoutLabelAndField(const AnsiString HTMLLabel, const
AnsiString HTMLField, TLayoutAttributes Attributes) = 0;
```

Description

The LayoutLabelAndField (see page 24704) method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField (see page 24704) returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent (see page 24698), ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField (see page 24704) method.

See Also

LayoutLabelAndField (see page 24704)

177.1.2.3.6 TLayoutWebContent.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable (see page 24705) method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall AnsiString ImplLayoutTable(const AnsiString HTMLTable, TLayoutAttributes
Attributes) = 0;
```

Description

The LayoutTable (see page 24705) method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable (see page 24705) returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent (see page 24698), ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable (see page 24705) method.

See Also

layouttable (see page 24705)

177.1.2.3.7 TLayoutWebContent.LayoutButton Method

Converts the HTML declaring a button into a form the associated Web item can use.

Pascal

```
function LayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutButton(const AnsiString HTMLButton, TLayoutAttributes Attributes);
```

Description

Call LayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

LayoutButton delegates the task of converting the HTML for the button to the ImplLayoutButton (see page 24701) method.

See Also

ImplLayoutButton (see page 24701)

177.1.2.3.8 TLayoutWebContent.LayoutField Method

Converts the HTML declaring a field into a form the associated Web item can use.

Pascal

```
function LayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutField(const AnsiString HTMLField, TLayoutAttributes Attributes);
```

Description

Call LayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

LayoutField delegates the task of converting the HTML for the field to the ImplLayoutField (see page 24702) method.

See Also

ImplLayoutField (see page 24702)

177.1.2.3.9 TLayoutWebContent.LayoutLabelAndField Method

Converts the HTML declaring a labeled field into a form the associated Web item can use.

Pascal

```
function LayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutLabelAndField(const AnsiString HTMLLabel, const AnsiString
HTMLField, TLayoutAttributes Attributes);
```

Description

Call LayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

LayoutLabelAndField delegates the task of converting the HTML for the label and field to the ImplLayoutLabelAndField (see page 24702) method.

See Also

ImplLayoutLabelAndField (see page 24702)

177.1.2.3.10 TLayoutWebContent.LayoutTable Method

Pascal

```
function LayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutTable(const AnsiString HTMLTable, TLayoutAttributes Attributes);
```

Description

This is LayoutTable, a member of class TLayoutWebContent.

177.1.2.3.11 TLayoutWebContent.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the TLayoutWebContent (see page 24698) object supports the interface specified by IID. If so, QueryInterface sets the Obj parameter so that it points to an instance of the specified interface and returns 0 to indicate success.

If the layout object does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

IID is the desired interface.

Obj returns a reference to the interface if the TLayoutWebContent (see page 24698) object supports it.

See Also

_AddRef (see page 24700)

_Release (see page 24701)

177.1.2.4 TLayoutWebContent Properties

The properties of the TLayoutWebContent class are listed here.

Public Properties

	Name	Description
R	ParentLayout (see page 24706)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

177.1.2.4.1 TLayoutWebContent.ParentLayout Property

Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

Pascal

```
property ParentLayout: TLayout;
```

C++

```
__property TLayout ParentLayout;
```

Description

Web items form a hierarchy, where each child Web item generates its content on behalf of a parent object. This TLayoutWebContent (see page 24698) object is associated with a Web item, and supplies methods to help lay out the content of its child Web items. The associated Web item, in turn, may be the child Web item of another Web item. ParentLayout is the layout object of the associated Web item's parent item.

The TLayoutWebContent (see page 24698) object uses ParentLayout in the implementation of its methods so that they reflect the needs of the parent item as well as the needs of the associated Web item.

ParentLayout supports the ILayoutWebContent (see page 24774) interface. Typically, it is another TLayoutWebContent (see page 24698) descendant.

177.1.3 TWebComponentClassDescription Class

Class Hierarchy

Pascal

```
TWebComponentClassDescription = class(TObject);
```

C++

```
class TWebComponentClassDescription : public TObject;
```

File

WebComp

Description

This is class WebComp.TWebComponentClassDescription.

177.1.3.1 TWebComponentClassDescription Members

The following tables list the members exposed by TWebComponentClassDescription.

Public Fields

	Name	Description
	ComponentClass (see page 24708)	This is ComponentClass, a member of class TWebComponentClassDescription.
	ComponentClassName (see page 24708)	This is ComponentClassName, a member of class TWebComponentClassDescription.
	Editor (see page 24708)	This is Editor, a member of class TWebComponentClassDescription.
	FrameClass (see page 24708)	This is FrameClass, a member of class TWebComponentClassDescription.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

177.1.3.2 TWebComponentClassDescription Fields

The fields of the TWebComponentClassDescription class are listed here.

Public Fields

	Name	Description
	ComponentClass (see page 24708)	This is ComponentClass, a member of class TWebComponentClassDescription.
	ComponentClassName (see page 24708)	This is ComponentClassName, a member of class TWebComponentClassDescription.
	Editor (see page 24708)	This is Editor, a member of class TWebComponentClassDescription.
	FrameClass (see page 24708)	This is FrameClass, a member of class TWebComponentClassDescription.

177.1.3.2.1 TWebComponentClassDescription.ComponentClass Field

Pascal

```
ComponentClass: TComponentClass;
```

C++

```
TComponentClass ComponentClass;
```

Description

This is ComponentClass, a member of class TWebComponentClassDescription.

177.1.3.2.2 TWebComponentClassDescription.ComponentClassName Field

Pascal

```
ComponentClassName: string;
```

C++

```
AnsiString ComponentClassName;
```

Description

This is ComponentClassName, a member of class TWebComponentClassDescription.

177.1.3.2.3 TWebComponentClassDescription.Editor Field

Pascal

```
Editor: TObject;
```

C++

```
TObject * Editor;
```

Description

This is Editor, a member of class TWebComponentClassDescription.

177.1.3.2.4 TWebComponentClassDescription.FrameClass Field

Pascal

```
FrameClass: Boolean;
```

C++

```
Boolean FrameClass;
```

Description

This is FrameClass, a member of class TWebComponentClassDescription.

177.1.4 TWebComponentList Class

TWebComponentList maintains a list of Web item components.

Class Hierarchy

Pascal

```
TWebComponentList = class(TPersistent, IWebComponentContainer);
```

C++

```
class TWebComponentList : public TPersistent, public IWebComponentContainer;
```

File

WebComp

Description

TWebComponentList provides the structure for the hierarchy of Web items that generate HTML documents in a WebSnap or InternetExpress application. At the top of the hierarchy is a page producer (TINetXPageProducer or TAdapterPageProducer) or an adapter. The page producer assembles an HTML document, or the adapter provides information and performs tasks on behalf of an adapter page producer or server-side script. To perform their tasks, the root objects use a set of helper components. Each of these components, in turn, uses one or more helper components, and so on. Each component that uses helper components maintains a list of its helper components. That list is a TWebComponentList object.

Each component in the list must support the IWebComponent (see page 24782) interface. TWebComponentList uses this interface to coordinate the objects it manages. In addition, children of a page producer should support the IWebContent (see page 24792) interface. IWebContent (see page 24792) allows the parent component to extract HTML generated by its children.

Use the properties and methods of TWebComponentList to

Add (see page 24713) or delete the components in the list.

Locate and access components in the list.

Rearrange components in the list.

Access the parent component that uses the list.

See Also

IWebContent (see page 24792)

TBasePageItemsProducer (see page 18376)

TWebControlGroup (see page 16872)

TWebForm (see page 16922)

TInetXPageProducer (see page 17145)

IWebComponent (see page 24782)

TAdapterPageProducer (see page 19802)

177.1.4.1 TWebComponentList Members

The following tables list the members exposed by TWebComponentList.

Protected Methods

	Name	Description
	_AddRef (see page 24712)	This is _AddRef, a member of class TWebComponentList.
	_Release (see page 24712)	This is _Release, a member of class TWebComponentList.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 24713)	This is Changed, a member of class TWebComponentList.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetComponent (see page 24714)	This is GetComponent, a member of class TWebComponentList.
	GetCount (see page 24714)	This is GetCount, a member of class TWebComponentList.
V	GetOwner (see page 24714)	Returns the owner of an object.
V	NewComponent (see page 24715)	This is NewComponent, a member of class TWebComponentList.
V	QueryInterface (see page 24716)	This is QueryInterface, a member of class TWebComponentList.
	WebComponentContainer_GetComponent (see page 24717)	This is WebComponentContainer_GetComponent, a member of class TWebComponentList.
	WebComponentContainer_GetComponentCount (see page 24717)	This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

Public Events

	Name	Description
	OnChange (see page 24719)	Occurs when a change occurs in the web component list.

Public Methods

	Name	Description
	Add (see page 24713)	Inserts a new component at the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 24713)	Deletes all components from the list.
	Create (see page 24711)	Creates and initializes new TWebComponentList (see page 24708) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24711)	Frees an instance of TWebComponentList (see page 24708).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetComponentCount (see page 24789)	This is GetComponentCount, a member of class IWebComponentContainer.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	IndexOf (see page 24715)	Returns the index of a specified component in the WebComponents (see page 24718) array.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LockNotify (see page 24715)	This is LockNotify, a member of class TWebComponentList.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyLocked (see page 24715)	This is NotifyLocked, a member of class TWebComponentList.
	Remove (see page 24716)	Removes a component from the WebComponents (see page 24718) array.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentIndex (see page 24716)	Moves a component to a new position in the WebComponents (see page 24718) array.
	UnlockNotify (see page 24717)	This is UnlockNotify, a member of class TWebComponentList.

Public Properties

	Name	Description
R	ComponentCount (see page 24789)	This is ComponentCount, a member of class IWebComponentContainer.
R	Components (see page 24790)	This is Components, a member of class IWebComponentContainer.
R	Count (see page 24718)	Indicates the number of components in the list.
R	ParentComponent (see page 24718)	Identifies the component that uses this Web component list to maintain its Web Items.
R	WebComponents (see page 24718)	Lists the Web items in the list.

177.1.4.2 TWebComponentList.Create Constructor

Creates and initializes new TWebComponentList (see page 24708) object.

Pascal

```
constructor Create(AParentComponent: TComponent);
```

C++

```
__fastcall TWebComponentList(TComponent * AParentComponent);
```

Description

Call Create to instantiate TWebComponentList (see page 24708) at runtime. Most applications do not need to instantiate TWebComponentList (see page 24708). Instead, the Web items that use TWebComponentList (see page 24708) to manage their own Web items instantiate a TWebComponentList (see page 24708) from their constructors.

177.1.4.3 TWebComponentList.Destroy Destructor

Frees an instance of TWebComponentList (see page 24708).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebComponentList();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the TWebComponentList (see page 24708) reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store the list of WebComponents (see page 24718).

Note: Destroy does not free the components in the list.

See Also

Free (see page 22300)

177.1.4.4 TWebComponentList Methods

The methods of the TWebComponentList class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 24712)	This is _AddRef, a member of class TWebComponentList.
	_Release (see page 24712)	This is _Release, a member of class TWebComponentList.
	Changed (see page 24713)	This is Changed, a member of class TWebComponentList.
	GetComponent (see page 24714)	This is GetComponent, a member of class TWebComponentList.
	GetCount (see page 24714)	This is GetCount, a member of class TWebComponentList.
V	GetOwner (see page 24714)	Returns the owner of an object.
V	NewComponent (see page 24715)	This is NewComponent, a member of class TWebComponentList.
V	QueryInterface (see page 24716)	This is QueryInterface, a member of class TWebComponentList.
	WebComponentContainer_GetComponent (see page 24717)	This is WebComponentContainer_GetComponent, a member of class TWebComponentList.
	WebComponentContainer_GetComponentCount (see page 24717)	This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

Public Methods

	Name	Description
	Add (see page 24713)	Inserts a new component at the end of the list.
	Clear (see page 24713)	Deletes all components from the list.
	IndexOf (see page 24715)	Returns the index of a specified component in the WebComponents (see page 24718) array.
	LockNotify (see page 24715)	This is LockNotify, a member of class TWebComponentList.
	NotifyLocked (see page 24715)	This is NotifyLocked, a member of class TWebComponentList.
	Remove (see page 24716)	Removes a component from the WebComponents (see page 24718) array.
	SetComponentIndex (see page 24716)	Moves a component to a new position in the WebComponents (see page 24718) array.
	UnlockNotify (see page 24717)	This is UnlockNotify, a member of class TWebComponentList.

177.1.4.4.1 TWebComponentList._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TWebComponentList.

177.1.4.4.2 TWebComponentList._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TWebComponentList.

177.1.4.4.3 TWebComponentList.Add Method

Inserts a new component at the end of the list.

Pascal

```
procedure Add(Component: TComponent);
```

C++

```
__fastcall Add(TComponent * Component);
```

Description

Call Add to insert a component at the end of the WebComponents (see page 24718) array.

Add increments the Count (see page 24718) property. After calling Add, the value of Count (see page 24718) is one greater than the index of the inserted component in the WebComponents (see page 24718) array. To move this component to another position, use the SetComponentIndex (see page 24716) method.

See Also

WebComponents (see page 24718)

Count (see page 24718)

SetComponentIndex (see page 24716)

Remove (see page 24716)

177.1.4.4.4 TWebComponentList.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TWebComponentList.

177.1.4.4.5 TWebComponentList.Clear Method

Deletes all components from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the WebComponents (see page 24718) array and set Count (see page 24718) to 0.

See Also

Count (see page 24718)

Remove (see page 24716)

WebComponents (see page 24718)

177.1.4.4.6 TWebComponentList.GetComponent Method

Pascal

```
function GetComponent(Index: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(int Index);
```

Description

This is GetComponent, a member of class TWebComponentList.

177.1.4.4.7 TWebComponentList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TWebComponentList.

177.1.4.4.8 TWebComponentList.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

177.1.4.4.9 TWebComponentList.IndexOf Method

Returns the index of a specified component in the WebComponents (see page 24718) array.

Pascal

```
function IndexOf(Component: TComponent): Integer;
```

C++

```
__fastcall int IndexOf(TComponent * Component);
```

Description

Call IndexOf to get the index for a component in the WebComponents (see page 24718) array. Specify the desired component as the Component parameter.

The first component in the array has index 0, the second component has index 1, and so on. If a component is not in the list, IndexOf returns -1. If a component appears more than once in the array, IndexOf returns the index of the first appearance.

See Also

WebComponents (see page 24718)

177.1.4.4.10 TWebComponentList.LockNotify Method

Pascal

```
procedure LockNotify;
```

C++

```
__fastcall LockNotify();
```

Description

This is LockNotify, a member of class TWebComponentList.

177.1.4.4.11 TWebComponentList.NewComponent Method

Pascal

```
function NewComponent(AOwner: TComponent): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * NewComponent(TComponent * AOwner);
```

Description

This is NewComponent, a member of class TWebComponentList.

177.1.4.4.12 TWebComponentList.NotifyLocked Method

Pascal

```
function NotifyLocked: Boolean;
```

C++

```
__fastcall Boolean NotifyLocked();
```

Description

This is NotifyLocked, a member of class TWebComponentList.

177.1.4.4.13 TWebComponentList.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TWebComponentList.

177.1.4.4.14 TWebComponentList.Remove Method

Removes a component from the WebComponents (see page 24718) array.

Pascal

```
procedure Remove(Component: TComponent);
```

C++

```
__fastcall Remove(TComponent * Component);
```

Description

Call Remove to remove a specific component from the WebComponents (see page 24718) array. After a component is removed, all the WebComponents (see page 24718) that follow it are moved up in index position and Count (see page 24718) is reduced by one.

See Also

Add (see page 24713)

Count (see page 24718)

Clear (see page 24713)

WebComponents (see page 24718)

177.1.4.4.15 TWebComponentList.SetComponentIndex Method

Moves a component to a new position in the WebComponents (see page 24718) array.

Pascal

```
procedure SetComponentIndex(Component: TComponent; Value: Integer);
```

C++

```
__fastcall SetComponentIndex(TComponent * Component, int Value);
```

Description

Call SetComponentIndex to move a component to a new position in the list. Component specifies the component to move. Value specifies the index it should have after it is moved. If Value is less than 0, the component is moved to the first position. If Value is greater than or equal to count, the component is moved to the last position.

See Also

WebComponents (see page 24718)

177.1.4.4.16 TWebComponentList.UnlockNotify Method

Pascal

```
procedure UnlockNotify;
```

C++

```
__fastcall UnlockNotify();
```

Description

This is UnlockNotify, a member of class TWebComponentList.

177.1.4.4.17 TWebComponentList.WebComponentContainer_GetComponent Method

Pascal

```
function WebComponentContainer_GetComponent(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * WebComponentContainer_GetComponent(int I);
```

Description

This is WebComponentContainer_GetComponent, a member of class TWebComponentList.

177.1.4.4.18 TWebComponentList.WebComponentContainer_GetComponentCount Method

Pascal

```
function WebComponentContainer_GetComponentCount: Integer;
```

C++

```
__fastcall int WebComponentContainer_GetComponentCount();
```

Description

This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

177.1.4.5 TWebComponentList Properties

The properties of the TWebComponentList class are listed here.

Public Properties

	Name	Description
R	Count (see page 24718)	Indicates the number of components in the list.
R	ParentComponent (see page 24718)	Identifies the component that uses this Web component list to maintain its Web Items.
R	WebComponents (see page 24718)	Lists the Web items in the list.

177.1.4.5.1 TWebComponentList.Count Property

Indicates the number of components in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of components in the WebComponents (see page 24718) array. Count is a read-only property. To change the size of the WebComponents (see page 24718) array, add or remove components using the Add (see page 24713) and Remove (see page 24716) methods.

See Also

WebComponents (see page 24718)

Add (see page 24713)

Remove (see page 24716)

177.1.4.5.2 TWebComponentList.ParentComponent Property

Identifies the component that uses this Web component list to maintain its Web Items.

Pascal

```
property ParentComponent: TComponent;
```

C++

```
__property TComponent * ParentComponent;
```

Description

Read ParentComponent to access the parent of the Web Items in the list. The value of ParentComponent is assigned in the constructor when the parent first instantiates the Web component list.

See Also

Create (see page 24711)

177.1.4.5.3 TWebComponentList.WebComponents Property

Lists the Web items in the list.

Pascal

```
property WebComponents [Index: Integer]: TComponent;
```

C++

```
__property TComponent * WebComponents[int Index];
```

Description

Use WebComponents to access the Web components listed by TWebComponentList (see page 24708). Use WebComponents with the Count (see page 24718) property to iterate through all of the components in the list. Use the Add (see page 24713) or Remove (see page 24716) method to add or remove components from the list.

WebComponents is the default property for TWebComponentList (see page 24708). This means that the property name can be omitted when accessing a component in the list. Thus, the line

```
WebItem := InetXPageProducer1.WebPageItems.WebComponents[0];
WebItem = InetXPageProducer1->WebPageItems->WebComponents[0];
```

can be written

```
WebItem := InetXPageProducer1.WebPageItems[0];
WebItem = (*(InetXPageProducer1->WebPageItems))[0];
```

See Also

Count (see page 24718)

Add (see page 24713)

Remove (see page 24716)

operator_sb

177.1.4.6 TWebComponentList Events

The events of the TWebComponentList class are listed here.

Public Events

	Name	Description
	OnChange (see page 24719)	Occurs when a change occurs in the web component list.

177.1.4.6.1 TWebComponentList.OnChange Event

Occurs when a change occurs in the web component list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Use OnChange to write an event handler to process an action when a change occurs in the web component list, such as when a new component is added.

177.1.5 TWebComponentsEditorHelper Class

Class Hierarchy

Pascal

```
TWebComponentsEditorHelper = class(TObject, IWebComponentEditorHelper);
```

C++

```
class TWebComponentsEditorHelper : public TObject, public IWebComponentEditorHelper;
```

File

WebComp

Description

This is class WebComp.TWebComponentsEditorHelper.

177.1.5.1 TWebComponentsEditorHelper Members

The following tables list the members exposed by TWebComponentsEditorHelper.

Protected Methods

	Name	Description
	_AddRef (see page 24721)	This is _AddRef, a member of class TWebComponentsEditorHelper.
	_Release (see page 24721)	This is _Release, a member of class TWebComponentsEditorHelper.
	CanAddClassHelper (see page 24721)	This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.
V	ImplCanAddClassHelper (see page 24721)	This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.
V	QueryInterface (see page 24722)	This is QueryInterface, a member of class TWebComponentsEditorHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

177.1.5.2 TWebComponentsEditorHelper Methods

The methods of the TWebComponentsEditorHelper class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 24721)	This is _AddRef, a member of class TWebComponentsEditorHelper.
	_Release (see page 24721)	This is _Release, a member of class TWebComponentsEditorHelper.
	CanAddClassHelper (see page 24721)	This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.
V	ImplCanAddClassHelper (see page 24721)	This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.
V	QueryInterface (see page 24722)	This is QueryInterface, a member of class TWebComponentsEditorHelper.

177.1.5.2.1 TWebComponentsEditorHelper._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TWebComponentsEditorHelper.

177.1.5.2.2 TWebComponentsEditorHelper._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TWebComponentsEditorHelper.

177.1.5.2.3 TWebComponentsEditorHelper.CanAddClassHelper Method

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass
AClass);
```

Description

This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.

177.1.5.2.4 TWebComponentsEditorHelper.ImplCanAddClassHelper Method

Pascal

```
function ImplCanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass):
```

```
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClassHelper(TComponent * AEditor, TComponent * AParent,
TClass AClass);
```

Description

This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.

177.1.5.2.5 TWebComponentsEditorHelper.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TWebComponentsEditorHelper.

177.1.6 TWebContainedComponent Class

TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.

Class Hierarchy

Pascal

```
TWebContainedComponent = class(TComponent, IWebComponent);
```

C++

```
class TWebContainedComponent : public TComponent, public IWebComponent;
```

File

WebComp

Description

Use TWebContainedComponent as a base class for Web items. Web items are items that generate HTML statements on behalf of another component. The component that uses the generated HTML has a property whose type is a TWebComponentList (see page 24708) object that lists a set of its Web items.

TWebContainedComponent implements the logic that fits a component into the hierarchy of Web items. TWebContainedComponent descendants act as leaf nodes in this hierarchy. That is, they do not have their own Web items that they use to generate HTML.

In order to allow TWebComponentList (see page 24708) to manage the Web item, TWebContainedComponent implements the IWebComponent (see page 24782) interface.

Do not create instances of TWebContainedComponent. TWebContainedComponent does not produce any HTML, but merely

handles the relationship to a managing TWebComponentList (see page 24708) object.

See Also

TWebComponentList (see page 24708)

IWebComponent (see page 24782)

177.1.6.1 TWebContainedComponent Members

The following tables list the members exposed by TWebContainedComponent.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	Tag (see page 2808)	Stores an integer value as part of a component.

177.1.6.2 TWebContainedComponent.Create Constructor

Creates and initializes an instance of TWebContainedComponent (see page 24722).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainedComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime. Web items added at design time are instantiated automatically.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainedComponent (see page 24722) instance.

See Also

Owner (see page 2807)

177.1.6.3 TWebContainedComponent.Destroy Destructor

Frees an instance of TWebContainedComponent (see page 24722).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedComponent();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TWebContainedComponent (see page 24722).

177.1.6.4 TWebContainedComponent Methods

The methods of the TWebContainedComponent class are listed here.

Protected Methods

	Name	Description
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.

Public Methods

	Name	Description
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.

177.1.6.4.1 TWebContainedComponent.GetContainerList Method

Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.

Pascal

```
function GetContainerList: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetContainerList();
```

Description

Applications can't access the protected GetContainerList method. It is used internally to access the object manages this item along with the other Web items of the Web parent.

See Also

IsDefaultField (see page 24728)

WebParent (see page 24731)

177.1.6.4.2 TWebContainedComponent.GetParentComponent Method

Returns the object that uses this component to generate HTML.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TWebContainedComponent (see page 24722) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the WebParent (see page 24731) property (the object that uses the HTML generated by this component when assembling its own portion of an HTML document.)

See Also

GetParentComponent

HasParent (see page 24727)

WebParent (see page 24731)

177.1.6.4.3 TWebContainedComponent.HasParent Method

Indicates whether this component appears in another component's list of Web items.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TWebContainedComponent (see page 24722) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the WebParent (see page 24731) property is not nil (Delphi) or NULL (C++).

If the contained component has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 24727)

WebParent (see page 24731)

177.1.6.4.4 TWebContainedComponent.IsDefaultField Method

Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponent (see page 24722) uses IsDefaultField internally to locate the property on the Web parent that lists this item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 24708) that contains this item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if this component does not belong to such a default list.

See Also

GetContainerList (see page 24727)

WebParent (see page 24731)

TWebComponentList (see page 24708)

177.1.6.4.5 TWebContainedComponent.ParentChanged Method

Responds when the WebParent (see page 24731) property changes.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

The protected ParentChanged method is called automatically when the WebParent (see page 24731) property changes. As

implemented in TWebContainedComponent (see page 24722), ParentChanged does nothing. Descendant classes can override this method to perform any necessary updates in response to the change in Web parent.

See Also

WebParent (see page 24731)

177.1.6.4.6 TWebContainedComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TWebContainedComponent (see page 24722) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the WebParent (see page 24731) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 24727)

WebParent (see page 24731)

177.1.6.4.7 TWebContainedComponent.SetParentComponent Method

Sets the WebParent (see page 24731) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TWebContainedComponent (see page 24722) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the WebParent (see page 24731) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 24727)

WebParent (see page 24731)

177.1.6.4.8 TWebContainedComponent.SetWebParent Method

Sets the value of the WebParent (see page 24731) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent is used internally to set the read-only WebParent (see page 24731) property. To assign a Web parent in an application, add this component to the TWebComponentList (see page 24708) object that implements a property on the new Web parent.

See Also

WebParent (see page 24731)

Add (see page 24713)

177.1.6.5 TWebContainedComponent Properties

The properties of the TWebContainedComponent class are listed here.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

177.1.6.5.1 TWebContainedComponent.WebContainedComponentHelper Property

Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

Pascal

```
property WebContainedComponentHelper: TWebContainedComponentHelper;
```

C++

```
__property TWebContainedComponentHelper WebContainedComponentHelper;
```

Description

TWebContainedComponent (see page 24722) uses WebContainedComponentHelper internally to access the separate helper object that implements the IWebComponent (see page 24782) interface. In addition to providing the implementation for the IWebComponent (see page 24782) interface, WebContainedComponentHelper provides the underlying implementation for most of the other properties and methods that are common to components that appear in a list of Web items.

See Also

IWebComponent (see page 24782)

177.1.6.5.2 TWebContainedComponent.WebParent Property

Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

TWebContainedComponent (see page 24722) uses WebParent to access the component on whose behalf it generates HTML. WebParent uses a TWebComponentList (see page 24708) object that includes this TWebContainedComponent (see page 24722) object to represent its Web items.

See Also

TWebComponentList (see page 24708)

177.1.7 TWebContainedComponentHelper Class

TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.

Class Hierarchy

Pascal

```
TWebContainedComponentHelper = class(TObject);
```

C++

```
class TWebContainedComponentHelper : public TObject;
```

File

WebComp

Description

Components that generate HTML for another component use TWebContainedComponentHelper to provide the underlying implementation of many of their properties and methods. TWebContainedComponentHelper implements the IWebComponent (see page 24782) interface, which allows a TWebComponentList (see page 24708) object manage a list of child components. In addition, it implements a number of properties and methods that allow a child Web item to interact with its parent item.

See Also

IWebComponent (see page 24782)

TWebContainedComponent (see page 24722)

TWebContainedContainerComponent (see page 24738)

177.1.7.1 TWebContainedComponentHelper Members

The following tables list the members exposed by TWebContainedComponentHelper.

Protected Events

	Name	Description
	OnParentChanged (see page 24738)	Occurs when the WebParent (see page 24737) property changes.

Protected Methods

	Name	Description
	GetContainer (see page 24734)	Returns the value of the WebParent (see page 24737) property.
	GetIndex (see page 24734)	Returns the position of the associated Web item in the parent item's array of Web items.
V	ParentChanged (see page 24735)	Generates an OnParentChanged (see page 24738) event.
	SetComponentList (see page 24735)	Sets the value of the ContainerList (see page 24737) property.
	SetContainer (see page 24736)	Sets the value of the WebParent (see page 24737) property.
	SetIndex (see page 24736)	Sets the position of the associated component in the list specified by ContainerList (see page 24737).
	SetWebParent (see page 24736)	Sets the value of the WebParent (see page 24737) property.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24733)	Creates an instance of TWebContainedComponentHelper (see page 24731).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24733)	Destroys an instance of TWebContainedComponentHelper (see page 24731).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsDefaultField (see page 24735)	Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ContainerList (see page 24737)	Indicates the list that contains the associated component.
R	WebParent (see page 24737)	Indicates the component that uses the list of Web items that includes the associated component.

177.1.7.2 TWebContainedComponentHelper.Create Constructor

Creates an instance of TWebContainedComponentHelper (see page 24731).

Pascal

```
constructor Create(AComponent: TComponent; AOnParentChanged: TNotifyEvent);
```

C++

```
__fastcall TWebContainedComponentHelper(TComponent * AComponent, TNotifyEvent
AOnParentChanged);
```

Description

Applications do not create instances of TWebContainedComponentHelper (see page 24731). The component that uses TWebContainedComponentHelper (see page 24731) so that it can appear as a child item in a TWebComponentList (see page 24708) object instantiates TWebContainedComponentHelper (see page 24731).

AComponent is the component that uses TWebContainedComponentHelper (see page 24731) to implement those properties and methods that allow it to appear in a TWebComponentList (see page 24708) object.

AOnParentChanged is an event handler that AComponent supplies so that it can update itself when it is moved to the list of a different parent component. This becomes the event handler for the OnParentChanged (see page 24738) event.

See Also

OnParentChanged (see page 24738)

177.1.7.3 TWebContainedComponentHelper.Destroy Destructor

Destroys an instance of TWebContainedComponentHelper (see page 24731).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedComponentHelper();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWebContainedComponentHelper (see page 24731) object is not nil and only then calls Destroy.

See Also

Free (see page 22300)

177.1.7.4 TWebContainedComponentHelper Methods

The methods of the TWebContainedComponentHelper class are listed here.

Protected Methods

	Name	Description
	GetContainer (see page 24734)	Returns the value of the WebParent (see page 24737) property.
	GetIndex (see page 24734)	Returns the position of the associated Web item in the parent item's array of Web items.
V	ParentChanged (see page 24735)	Generates an OnParentChanged (see page 24738) event.
	SetComponentList (see page 24735)	Sets the value of the ContainerList (see page 24737) property.
	SetContainer (see page 24736)	Sets the value of the WebParent (see page 24737) property.
	SetIndex (see page 24736)	Sets the position of the associated component in the list specified by ContainerList (see page 24737).
	SetWebParent (see page 24736)	Sets the value of the WebParent (see page 24737) property.

Public Methods

	Name	Description
	IsDefaultField (see page 24735)	Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

177.1.7.4.1 TWebContainedComponentHelper.GetContainer Method

Returns the value of the WebParent (see page 24737) property.

Pascal

```
function GetContainer: TWebComponentContainer;
```

C++

```
__fastcall TWebComponentContainer GetContainer();
```

Description

Use GetContainer to access the component that uses this helper object's associated component to assemble its HTML output. The component that this method returns uses the list specified by ContainerList (see page 24737) to manage its list of Web items.

See Also

WebParent (see page 24737)

ContainerList (see page 24737)

177.1.7.4.2 TWebContainedComponentHelper.GetIndex Method

Returns the position of the associated Web item in the parent item's array of Web items.

Pascal

```
function GetIndex: Integer;
```

C++

```
__fastcall int GetIndex();
```

Description

GetIndex returns the index of the associated component in the list that is the value of the ContainerList (see page 24737) property. The index of the first item is 0, the index of the second item is 1, and so on.

See Also

ContainerList (see page 24737)

177.1.7.4.3 TWebContainedComponentHelper.IsDefaultField Method

Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean;
```

C++

```
__fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponentHelper (see page 24731) uses IsDefaultField internally to locate the property on the Web parent that lists the associated item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 24708) that contains the associated item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if the associated component does not belong to such a default list.

See Also

ContainerList (see page 24737)

WebParent (see page 24737)

TWebComponentList (see page 24708)

177.1.7.4.4 TWebContainedComponentHelper.ParentChanged Method

Generates an OnParentChanged (see page 24738) event.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called automatically when the WebParent (see page 24737) property changes. It generates an OnParentChanged (see page 24738) event, which is handled by the event handler that the associated component passes to the TWebContainedComponentHelper (see page 24731) constructor.

See Also

OnParentChanged (see page 24738)

Create (see page 24733)

177.1.7.4.5 TWebContainedComponentHelper.SetComponentList Method

Sets the value of the ContainerList (see page 24737) property.

Pascal

```
procedure SetComponentList(List: TObject);
```

C++

```
__fastcall SetComponentList(TObject * List);
```

Description

SetComponentList assigns the object specified by List as the value of the ContainerList (see page 24737) property. Note that List must be an instance of TWebComponentList (see page 24708) (or nil (Delphi) or NULL (C++)).

See Also

ContainerList (see page 24737)

177.1.7.4.6 TWebContainedComponentHelper.SetContainer Method

Sets the value of the WebParent (see page 24737) property.

Pascal

```
procedure SetContainer(Container: TWebComponentContainer);
```

C++

```
__fastcall SetContainer(TWebComponentContainer Container);
```

Description

SetContainer assigns a new value to the WebParent (see page 24737) property.

Container is the new Web parent.

See Also

WebParent (see page 24737)

177.1.7.4.7 TWebContainedComponentHelper.SetIndex Method

Sets the position of the associated component in the list specified by ContainerList (see page 24737).

Pascal

```
procedure SetIndex(Value: Integer);
```

C++

```
__fastcall SetIndex(int Value);
```

Description

SetIndex moves the associated component to a specified position in the list of Web items that contains it.

Value is the new index of the associated component, where 0 specifies the first position, 1 specifies the second position, and so on.

See Also

ContainerList (see page 24737)

177.1.7.4.8 TWebContainedComponentHelper.SetWebParent Method

Sets the value of the WebParent (see page 24737) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent moves the associated component to the component list of a new parent. To do so, it removes the associated component from the current parent's list of Web items, adds it to the new Web parent's list of Web items, and then generates an OnParentChanged (see page 24738) event.

Value is the new index of the associated component, where 0 specifies the first position, 1 specifies the second position, and so on.

Value is the new Web parent.

See Also

WebParent (see page 24737)

OnParentChanged (see page 24738)

ContainerList (see page 24737)

177.1.7.5 TWebContainedComponentHelper Properties

The properties of the TWebContainedComponentHelper class are listed here.

Public Properties

	Name	Description
R	ContainerList (see page 24737)	Indicates the list that contains the associated component.
R	WebParent (see page 24737)	Indicates the component that uses the list of Web items that includes the associated component.

177.1.7.5.1 TWebContainedComponentHelper.ContainerList Property

Indicates the list that contains the associated component.

Pascal

```
property ContainerList: TWebComponentList;
```

C++

```
__property TWebComponentList ContainerList;
```

Description

Use ContainerList to access the list in which the associated component appears. The parent item uses the components in the list to generate HTML, which it then assembles into its own HTML output.

See Also

WebParent (see page 24737)

177.1.7.5.2 TWebContainedComponentHelper.WebParent Property

Indicates the component that uses the list of Web items that includes the associated component.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

WebParent specifies the component on whose behalf the associated component generates HTML. WebParent is the component that uses the list that is the value of the ContainerList (see page 24737) property.

See Also

ContainerList (see page 24737)

177.1.7.6 TWebContainedComponentHelper Events

The events of the TWebContainedComponentHelper class are listed here.

Protected Events

	Name	Description
	OnParentChanged (see page 24738)	Occurs when the WebParent (see page 24737) property changes.

177.1.7.6.1 TWebContainedComponentHelper.OnParentChanged Event

Occurs when the WebParent (see page 24737) property changes.

Pascal

```
property OnParentChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnParentChanged;
```

Description

Components that use TWebContainedComponentHelper (see page 24731) so that they can act as a child Web item in a hierarchy of Web items assign an event handler to OnParentChanged.

The associated component uses TWebContainedComponentHelper (see page 24731) to implement the IWebComponent (see page 24782) interface. This interface can be used to change the value of WebParent (see page 24737). By assigning an OnParentChanged event handler, the associated component can update itself when it moves from one parent item to another.

See Also

WebParent (see page 24737)

IWebComponent (see page 24782)

177.1.8 TWebContainedContainerComponent Class

TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainedContainerComponent = class(TComponent, IGetWebComponentList, IWebComponent);
```

C++

```
class TWebContainedContainerComponent : public TComponent, public IGetWebComponentList, public
IWebComponent;
```

File

WebComp

Description

Use TWebContainedContainerComponent as a base class for Web items that have their own subitems. Web items are items that generate HTML statements on behalf of another component. The component that uses the generated HTML has a property whose type is a TWebComponentList (see page 24708) object that lists a set of its Web items. In addition, the TWebContainedContainerComponent descendant uses a TWebComponentList (see page 24708) object to store a set of Web items that it uses.

TWebContainedContainerComponent implements the logic that fits a component into the hierarchy of Web items. TWebContainedContainerComponent descendants act as internal nodes in this hierarchy. That is, they have both a Web parent and a set of child Web items.

In order to allow the parent's TWebComponentList (see page 24708) object to manage this Web item, TWebContainedContainerComponent implements the IWebComponent (see page 24782) interface.

Do not create instances of TWebContainedContainerComponent. TWebContainedContainerComponent does not produce any HTML, but merely handles the relationships to parent and child TWebComponentList (see page 24708) objects.

See Also

TWebComponentList (see page 24708)

IWebComponent (see page 24782)

177.1.8.1 TWebContainedContainerComponent Members

The following tables list the members exposed by TWebContainedContainerComponent.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.

	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

177.1.8.2 TWebContainedContainerComponent.Create Constructor

Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainedContainerComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime. Web items added at design time using the Web Page editor are instantiated automatically.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainedContainerComponent (see page 24738)

instance.

See Also

Owner (see page 2807)

177.1.8.3 TWebContainedContainerComponent.Destroy Destructor

Frees an instance of TWebContainedContainerComponent (see page 24738).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedContainerComponent();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TWebContainedContainerComponent (see page 24738).

177.1.8.4 TWebContainedContainerComponent Methods

The methods of the TWebContainedContainerComponent class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.

Public Methods

	Name	Description
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.

177.1.8.4.1 TWebContainedContainerComponent.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TWebContainedContainerComponent (see page 24738) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It executes the Proc procedure for each child that in the list that GetWebComponents (see page 24745) returns, as long as that component has Root for an Owner. This allows the sub Web items to be loaded and saved with the TWebContainedContainerComponent (see page 24738) object.

See Also

GetWebComponents (see page 24745)

GetParentComponent

SetChildOrder (see page 24748)

177.1.8.4.2 TWebContainedContainerComponent.GetContainerList Method

Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.

Pascal

```
function GetContainerList: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetContainerList();
```

Description

Applications can't access the protected GetContainerList method. It is used internally to access the object manages this item along with the other Web items of the Web parent.

See Also

IsDefaultField (see page 24746)

WebParent (see page 24750)

177.1.8.4.3 TWebContainedContainerComponent.GetDefaultWebComponents Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this Web item. As implemented in TWebContainedContainerComponent (see page 24738), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++). Descendant classes override this method to supply a set of default items.

See Also

GetWebComponents (see page 24745)

IsDefaultField (see page 24746)

177.1.8.4.4 TWebContainedContainerComponent.GetParentComponent Method

Returns the object that uses this component to generate HTML.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TWebContainedContainerComponent (see page 24738) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the WebParent (see page 24750) property (the object that uses the HTML generated by this component when assembling its own portion of an HTML document.)

See Also

GetParentComponent

HasParent (see page 24745)

WebParent (see page 24750)

177.1.8.4.5 TWebContainedContainerComponent.GetWebComponents Method

Returns the list of Web items that this item uses to generate its HTML.

Pascal

```
function GetWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetWebComponents();
```

Description

GetWebComponents returns the TWebComponentList (see page 24708) object that manages all of the child items of this component.

See Also

GetDefaultWebComponents (see page 24744)

177.1.8.4.6 TWebContainedContainerComponent.HasParent Method

Indicates whether this component appears in another component's list of Web items.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TWebContainedContainerComponent (see page 24738) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the WebParent (see page 24750) property is not nil (Delphi) or NULL (C++).

If the contained component has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 24745)

WebParent (see page 24750)

177.1.8.4.7 TWebContainedContainerComponent.ImplGetDefaultComponentList Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function ImplGetDefaultComponentList: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetDefaultComponentList();
```

Description

ImplGetDefaultComponentList supplies the default set of child items for this Web item. ImplGetDefaultComponentList calls the virtual GetDefaultWebComponents (see page 24744) method, which descendant classes override to return this list.

See Also

GetDefaultWebComponents (see page 24744)

IsDefaultField (see page 24746)

177.1.8.4.8 TWebContainedContainerComponent.IsDefaultField Method

Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponent (see page 24722) uses IsDefaultField internally to locate the property on the Web parent that lists this item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 24708) that contains this item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if this component does not belong to such a default list.

See Also

GetContainerList (see page 24744)

WebParent (see page 24750)

TWebComponentList (see page 24708)

GetDefaultWebComponents (see page 24744)

GetWebComponents (see page 24745)

177.1.8.4.9 TWebContainedContainerComponent.ParentChanged Method

Responds when the WebParent (see page 24750) property changes.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

The protected ParentChanged method is called automatically when the WebParent (see page 24750) property changes. As implemented in TWebContainedContainerComponent (see page 24738), ParentChanged does nothing. Descendant classes can override this method to perform any necessary updates in response to the change in Web parent.

See Also

WebParent (see page 24750)

177.1.8.4.10 TWebContainedContainerComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TWebContainedContainerComponent (see page 24738) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the WebParent (see page 24750) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 24745)

WebParent (see page 24750)

177.1.8.4.11 TWebContainedContainerComponent.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder is part of the streaming system that loads and saves components. It positions a newly loaded child component in the list that GetWebComponents (see page 24745) returns.

Child is the newly loaded child component.

Order indicates its position in the list of child Web items, where 0 is the first position, 1 is the second position, and so on.

See Also

GetWebComponents (see page 24745)

SetChildOrder

177.1.8.4.12 TWebContainedContainerComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); virtual;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents assigns the default set of child items for this Web item. This default list can be retrieved by calling the GetDefaultWebComponents (see page 24744) method.

As implemented in TWebContainedContainerComponent (see page 24738), SetDefaultWebComponents does nothing. Descendant classes override this method to store the list of default items in a class-specific manner.

See Also

GetDefaultWebComponents (see page 24744)

IsDefaultField (see page 24746)

177.1.8.4.13 TWebContainedContainerComponent.SetParentComponent Method

Sets the WebParent (see page 24750) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TWebContainedContainerComponent (see page 24738) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the WebParent (see page 24750) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 24745)

WebParent (see page 24750)

177.1.8.4.14 TWebContainedContainerComponent.SetWebParent Method

Sets the value of the WebParent (see page 24750) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent is used internally to set the read-only WebParent (see page 24750) property. To assign a Web parent in an application, add this component to the TWebComponentList (see page 24708) object that implements a property on the new Web parent.

See Also

WebParent (see page 24750)

Add (see page 24713)

177.1.8.5 TWebContainedContainerComponent Properties

The properties of the TWebContainedContainerComponent class are listed here.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

177.1.8.5.1 TWebContainedContainerComponent.WebContainedComponentHelper Property

Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained

component.

Pascal

```
property WebContainedComponentHelper: TWebContainedComponentHelper;
```

C++

```
__property TWebContainedComponentHelper WebContainedComponentHelper;
```

Description

TWebContainedContainerComponent (see page 24738) uses WebContainedComponentHelper internally to access the separate helper object that implements the IWebComponent (see page 24782) interface. In addition to providing the implementation for the IWebComponent (see page 24782) interface, WebContainedComponentHelper provides the underlying implementation for other properties and methods that are common to components that appear in a list of Web items.

See Also

IWebComponent (see page 24782)

177.1.8.5.2 TWebContainedContainerComponent.WebContainerComponentHelper Property

Provides access to the helper object that allows this object to manage sub Web items.

Pascal

```
property WebContainerComponentHelper: TWebContainerComponentHelper;
```

C++

```
__property TWebContainerComponentHelper WebContainerComponentHelper;
```

Description

TWebContainedContainerComponent (see page 24738) uses WebContainerComponentHelper internally to handle two lists of child Web items:

One list contains the default Web items that this component uses if the application does not explicitly assign sub Web items. The GetDefaultWebComponents (see page 24744) method returns this list.

The other list contains explicitly assigned Web items that this component uses. The GetWebComponents (see page 24745) method returns this list.

See Also

GetDefaultWebComponents (see page 24744)

GetWebComponents (see page 24745)

177.1.8.5.3 TWebContainedContainerComponent.WebParent Property

Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

TWebContainedContainerComponent (see page 24738) uses WebParent to access the component on whose behalf it generates HTML. WebParent uses a TWebComponentList (see page 24708) object that includes this TWebContainedContainerComponent (see page 24738) object to represent its child Web items.

See Also

TWebComponentList (see page 24708)

177.1.9 TWebContainerComponent Class

TWebContainerComponent is the base class for components that use Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainerComponent = class(TComponent, IGetWebComponentList);
```

C++

```
class TWebContainerComponent : public TComponent, public IGetWebComponentList;
```

File

WebComp

Description

Use TWebContainerComponent as a base class for objects that maintain a collection of Web items but that do not have a parent Web item. TWebContainerComponent uses a TWebComponentList (see page 24708) object to store the set of child items that it manages.

Do not create instances of TWebContainerComponent, it is intended only as a base class. It only provides support for storing and retrieving child Web items.

See Also

TWebComponentList (see page 24708)

IWebComponent (see page 24782)

TWebContainedContainerComponent (see page 24738)

177.1.9.1 TWebContainerComponent Members

The following tables list the members exposed by TWebContainerComponent.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
V	GetChildren (see page 24755)	Executes a callback for each child Web item.
V	GetDefaultWebComponents (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
V	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 24757)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 24754)	Creates and initializes an instance of TWebContainerComponent (see page 24751).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24755)	Frees an instance of TWebContainerComponent (see page 24751).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

177.1.9.2 TWebContainerComponent.Create Constructor

Creates and initializes an instance of TWebContainerComponent (see page 24751).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainerComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainerComponent (see page 24751) instance.

See Also

Owner (see page 2807)

177.1.9.3 TWebContainerComponent.Destroy Destructor

Frees an instance of TWebContainerComponent (see page 24751).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainerComponent();
```

Description

Destroy frees the memory used by TWebContainerComponent (see page 24751).

177.1.9.4 TWebContainerComponent Methods

The methods of the TWebContainerComponent class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 24755)	Executes a callback for each child Web item.
	GetDefaultWebComponents (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 24756)	Returns the list of Web items that this item manages.
	ImplGetDefaultComponentList (see page 24756)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetChildOrder (see page 24757)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 24757)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

177.1.9.4.1 TWebContainerComponent.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TWebContainerComponent (see page 24751) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It executes the Proc procedure for each child that in the list that GetWebComponents (see page 24756) returns, as long as that component has Root for an Owner. This allows the child Web items to be loaded and saved with the TWebContainerComponent (see page 24751) object.

See Also

GetWebComponents (see page 24756)

GetParentComponent

SetChildOrder (see page 24757)

177.1.9.4.2 TWebContainerComponent.GetDefaultWebComponents Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TWebContainerComponent (see page 24751), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++). Descendant classes override this method to supply a set of default items.

See Also

GetWebComponents (see page 24756)

IsDefaultField (see page 24728)

177.1.9.4.3 TWebContainerComponent.GetWebComponents Method

Returns the list of Web items that this item manages.

Pascal

```
function GetWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetWebComponents();
```

Description

GetWebComponents returns the TWebComponentList (see page 24708) object that manages all of the child items of this component.

See Also

GetDefaultWebComponents (see page 24756)

177.1.9.4.4 TWebContainerComponent.ImplGetDefaultComponentList Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function ImplGetDefaultComponentList: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetDefaultComponentList();
```

Description

ImplGetDefaultComponentList supplies the default set of child items for this Web item. ImplGetDefaultComponentList calls the virtual GetDefaultWebComponents (see page 24756) method, which descendant classes override to return this list.

See Also

GetDefaultWebComponents (see page 24756)

IsDefaultField (see page 24728)

177.1.9.4.5 TWebContainerComponent.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder is part of the streaming system that loads and saves components. It positions a newly loaded child component in the list that GetWebComponents (see page 24756) returns.

Child is the newly loaded child component.

Order indicates its position in the list of child Web items, where 0 is the first position, 1 is the second position, and so on.

See Also

GetWebComponents (see page 24756)

SetChildOrder

177.1.9.4.6 TWebContainerComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); virtual;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents assigns the default set of child items for this Web item. This default list can be retrieved by calling the GetDefaultWebComponents (see page 24756) method.

As implemented in TWebContainerComponent (see page 24751), SetDefaultWebComponents does nothing. Descendant classes override this method to store the list of default items in a class-specific manner.

See Also

GetDefaultWebComponents (see page 24756)

IsDefaultField (see page 24728)

177.1.9.5 TWebContainerComponent Properties

The properties of the TWebContainerComponent class are listed here.

Protected Properties

	Name	Description
R	WebContainerComponentHelper (see page 24758)	Provides access to the helper object that allows this object to manage its Web items.

177.1.9.5.1 TWebContainerComponent.WebContainerComponentHelper Property

Provides access to the helper object that allows this object to manage its Web items.

Pascal

```
property WebContainerComponentHelper: TWebContainerComponentHelper;
```

C++

```
__property TWebContainerComponentHelper WebContainerComponentHelper;
```

Description

TWebContainerComponent (see page 24751) uses WebContainerComponentHelper internally to handle two lists of child Web items:

One list contains the default Web items that this component uses if the application does not explicitly assign child Web items. The GetDefaultWebComponents (see page 24756) method returns this list.

The other list contains explicitly assigned Web items that this component uses. The GetWebComponents (see page 24756) method returns this list.

See Also

GetDefaultWebComponents (see page 24756)

GetWebComponents (see page 24756)

177.1.10 TWebContainerComponentHelper Class

TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainerComponentHelper = class(TObject);
```

C++

```
class TWebContainerComponentHelper : public TObject;
```

File

WebComp

Description

Components that maintain a list of Web items to help them generate HTML use TWebContainerComponentHelper to provide the common implementation of properties and methods for managing the list of sub components. This includes

The logic for handling two lists of Web items: one that represents the Web items that the application assigns, and one that represents a set of default items that can be used when the application does not explicitly assign Web items.

The logic for interacting with the component streaming system, so that child Web items are correctly loaded and saved with the component that uses TWebContainerComponentHelper.

See Also

TWebContainedContainerComponent (see page 24738)

TWebContainerComponent (see page 24751)

TWebComponentList (see page 24708)

177.1.10.1 TWebContainerComponentHelper Members

The following tables list the members exposed by TWebContainerComponentHelper.

Protected Events

	Name	Description
	OnGetDefaultComponentList (see page 24765)	Occurs when TWebContainerComponentHelper (see page 24758) needs to access the value of DefaultWebComponents (see page 24764).
	OnSetDefaultComponentList (see page 24765)	Occurs when TWebContainerComponentHelper (see page 24758) needs to assign the value of DefaultWebComponents (see page 24764).

Protected Methods

	Name	Description
	GetComponentList (see page 24762)	Returns the value of the WebComponents property.
	GetDefaultComponentList (see page 24762)	Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.
	GetDefaultWebComponents (see page 24762)	Generates an OnGetDefaultComponentList (see page 24765) event.
	SetDefaultWebComponents (see page 24763)	Generates an OnSetDefaultComponentList (see page 24765) event.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24760)	Creates an instance of TWebContainerComponentHelper (see page 24758).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 24760)	Destroys an instance of TWebContainerComponentHelper (see page 24758).
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetChildren (see page 24761)	Executes a callback for each child Web item.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetChildOrder (see page 24763)	Positions a child component in the list of child Web items.

Public Properties

	Name	Description
	DefaultWebComponents (see page 24764)	Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.
R	Webcomponents (see page 24764)	This is Webcomponents, a member of class TWebContainerComponentHelper.

177.1.10.2 TWebContainerComponentHelper.Create Constructor

Creates an instance of TWebContainerComponentHelper (see page 24758).

Pascal

```
constructor Create(AComponent: TComponent; AOnGetDefaultComponentList: TGetComponentListEvent;
AOnSetDefaultComponentList: TSetComponentListEvent);
```

C++

```
__fastcall TWebContainerComponentHelper(TComponent * AComponent, TGetComponentListEvent
AOnGetDefaultComponentList, TSetComponentListEvent AOnSetDefaultComponentList);
```

Description

Applications do not create instances of TWebContainerComponentHelper (see page 24758). The component that uses TWebContainerComponentHelper (see page 24758) so that it can manage a set of Web items instantiates TWebContainerComponentHelper (see page 24758).

AComponent is the component that uses TWebContainerComponentHelper (see page 24758) to manage its list of Web items and to interact with the component streaming system.

AOnGetDefaultComponentList is an event handler that AComponent supplies to provide the read implementation of the DefaultWebComponents (see page 24764) property. It is assigned as the event handler for OnGetDefaultComponentList (see page 24765).

AOnSetDefaultComponentList is an event handler that AComponent supplies to provide the write implementation of the DefaultWebComponents (see page 24764) property. It is assigned as the event handler for OnSetDefaultComponentList (see page 24765).

See Also

OnGetDefaultComponentList (see page 24765)

OnSetDefaultComponentList (see page 24765)

DefaultWebComponents (see page 24764)

177.1.10.3 TWebContainerComponentHelper.Destroy Destructor

Destroys an instance of TWebContainerComponentHelper (see page 24758).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainerComponentHelper();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWebContainerComponentHelper (see page 24758) object is not nil and only then calls Destroy.

See Also

Free (see page 22300)

177.1.10.4 TWebContainerComponentHelper Methods

The methods of the TWebContainerComponentHelper class are listed here.

Protected Methods

	Name	Description
	GetComponentList (see page 24762)	Returns the value of the WebComponents property.
	GetDefaultComponentList (see page 24762)	Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.
	GetDefaultWebComponents (see page 24762)	Generates an OnGetDefaultComponentList (see page 24765) event.
	SetDefaultWebComponents (see page 24763)	Generates an OnSetDefaultComponentList (see page 24765) event.

Public Methods

	Name	Description
	GetChildren (see page 24761)	Executes a callback for each child Web item.
	SetChildOrder (see page 24763)	Positions a child component in the list of child Web items.

177.1.10.4.1 TWebContainerComponentHelper.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent);
```

C++

```
__fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren provides the underlying implementation of the associated component's GetChildren method. GetChildren is introduced in TComponent for the streaming system that loads and saves components.

GetChildren executes the Proc procedure for each child that in the list specified by the WebComponents property, as long as that component has Root for an Owner. This allows the sub Web items to be loaded and saved with the component that uses TWebContainerComponentHelper (see page 24758).

See Also

WebComponents (see page 24764)

SetChildOrder (see page 24763)

GetChildren

177.1.10.4.2 TWebContainerComponentHelper.GetComponentList Method

Returns the value of the WebComponents property.

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

GetComponentList returns the list of Web items that have been assigned to the associated component. The return value is an instance of TWebComponentList (see page 24708).

See Also

WebComponents (see page 24764)

GetDefaultComponentList (see page 24762)

TWebComponentList (see page 24708)

177.1.10.4.3 TWebContainerComponentHelper.GetDefaultComponentList Method

Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

GetComponentList (see page 24762) returns the value of the DefaultWebComponents (see page 24764) property. The return value is an instance of TWebComponentList (see page 24708).

See Also

DefaultWebComponents (see page 24764)

WebComponents (see page 24764)

TWebComponentList (see page 24708)

177.1.10.4.4 TWebContainerComponentHelper.GetDefaultWebComponents Method

Generates an OnGetDefaultComponentList (see page 24765) event.

Pascal

```
function GetDefaultWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents is the read implementation of the DefaultWebComponents (see page 24764) property. It generates an OnGetDefaultComponentList (see page 24765) event, so that the associated component can supply this list of default items. If there is no OnGetDefaultComponentList (see page 24765) event handler, GetDefaultWebComponents returns nil (Delphi) or NULL (C++).

See Also

OnGetDefaultComponentList (see page 24765)

DefaultWebComponents (see page 24764)

177.1.10.4.5 TWebContainerComponentHelper.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer);
```

C++

```
__fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder provides the underlying implementation of the associated component's SetChildOrder method. SetChildOrder is introduced in TComponent for the streaming system that loads and saves components. It positions a newly loaded child component in the list specified by WebComponents.

Child is the newly loaded child component.

Order indicates its position in WebComponents, where 0 is the first position, 1 is the second position, and so on.

See Also

WebComponents (see page 24764)

SetChildOrder

GetChildren (see page 24761)

177.1.10.4.6 TWebContainerComponentHelper.SetDefaultWebComponents Method

Generates an OnSetDefaultComponentList (see page 24765) event.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList);
```

C++

```
__fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents (see page 24762) is the write implementation of the DefaultWebComponents (see page 24764) property. It generates an OnSetDefaultComponentList (see page 24765) event, so that the associated component can assign the new list of default items.

See Also

Create (see page 24760)

OnSetDefaultComponentList (see page 24765)

DefaultWebComponents (see page 24764)

177.1.10.5 TWebContainerComponentHelper Properties

The properties of the TWebContainerComponentHelper class are listed here.

Public Properties

	Name	Description
	DefaultWebComponents (see page 24764)	Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.
R	Webcomponents (see page 24764)	This is Webcomponents, a member of class TWebContainerComponentHelper.

177.1.10.5.1 TWebContainerComponentHelper.DefaultWebComponents Property

Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Use DefaultWebComponents to access the list of default Web items that can be used when no items have been explicitly assigned.

TWebContainerComponentHelper (see page 24758) does not actually store this list. It leaves that task to the component that uses TWebContainerComponentHelper (see page 24758). Instead, TWebContainerComponentHelper (see page 24758) uses two events, OnGetDefaultComponentList (see page 24765) and OnSetDefaultComponentList (see page 24765) for reading and writing this list. The associated component that uses TWebContainerComponentHelper (see page 24758) assigns event handlers to these two events, thereby providing the implementation for this property.

See Also

WebComponents (see page 24764)

OnGetDefaultComponentList (see page 24765)

OnGetDefaultComponentList (see page 24765)

177.1.10.5.2 TWebContainerComponentHelper.Webcomponents Property

Pascal

```
property Webcomponents: TWebComponentList;
```

C++

```
__property TWebComponentList Webcomponents;
```

Description

This is Webcomponents, a member of class TWebContainerComponentHelper.

177.1.10.6 TWebContainerComponentHelper Events

The events of the TWebContainerComponentHelper class are listed here.

Protected Events

	Name	Description
	OnGetDefaultComponentList (see page 24765)	Occurs when TWebContainerComponentHelper (see page 24758) needs to access the value of DefaultWebComponents (see page 24764).
	OnSetDefaultComponentList (see page 24765)	Occurs when TWebContainerComponentHelper (see page 24758) needs to assign the value of DefaultWebComponents (see page 24764).

177.1.10.6.1 TWebContainerComponentHelper.OnGetDefaultComponentList Event

Occurs when TWebContainerComponentHelper (see page 24758) needs to access the value of DefaultWebComponents (see page 24764).

Pascal

```
property OnGetDefaultComponentList: TGetComponentListEvent;
```

C++

```
__property TGetComponentListEvent OnGetDefaultComponentList;
```

Description

The component that uses TWebContainerComponentHelper (see page 24758) assigns an event handler for OnGetDefaultComponentList when it creates the TWebContainerComponentHelper (see page 24758) instance. This event handler provides the underlying read implementation of the DefaultWebComponents (see page 24764) property.

If the component that uses TWebContainerComponentHelper (see page 24758) does not provide an OnGetDefaultComponentList event handler, then the value of the DefaultWebComponents (see page 24764) property is nil (Delphi) or NULL (C++).

See Also

OnSetDefaultComponentList (see page 24765)

DefaultWebComponents (see page 24764)

Create (see page 24760)

177.1.10.6.2 TWebContainerComponentHelper.OnSetDefaultComponentList Event

Occurs when TWebContainerComponentHelper (see page 24758) needs to assign the value of DefaultWebComponents (see page 24764).

Pascal

```
property OnSetDefaultComponentList: TSetComponentListEvent;
```

C++

```
__property TSetComponentListEvent OnSetDefaultComponentList;
```

Description

The component that uses TWebContainerComponentHelper (see page 24758) assigns an event handler for OnSetDefaultComponentList when it creates the TWebContainerComponentHelper (see page 24758) instance. This event handler provides the underlying write implementation of the DefaultWebComponents (see page 24764) property.

If the component that uses TWebContainerComponentHelper (see page 24758) does not provide an OnSetDefaultComponentList event handler, then the value of the DefaultWebComponents (see page 24764) can't be changed.

See Also

OnGetDefaultComponentList (see page 24765)

DefaultWebComponents (see page 24764)

Create (see page 24760)

177.1.11 TWebContentOptions Class

TWebContentOptions controls what a Web item can include in its generated HTML.

Class Hierarchy

Pascal

```
TWebContentOptions = class(TObject);
```

C++

```
class TWebContentOptions : public TObject;
```

File

WebComp

Description

Use TWebContentOptions to influence the HTML generated by a component that supports the IWebContent (see page 24792) interface. Each TWebContentOptions represents a set of flags that are passed to the constructor.

See Also

IWebContent (see page 24792)

177.1.11.1 TWebContentOptions Members

The following tables list the members exposed by TWebContentOptions.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24767)	Creates a new TWebContentOptions (see page 24766) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Flags (see page 24768)	Lists the flags that indicate what type of generated HTML is permitted.

177.1.11.2 TWebContentOptions.Create Constructor

Creates a new TWebContentOptions (see page 24766) object.

Pascal

```
constructor Create(AFlags: TWebContentFlags);
```

C++

```
__fastcall TWebContentOptions(TWebContentFlags AFlags);
```

Description

Call Create to create a TWebContentOptions (see page 24766) instance at runtime. Pass the flags that the object should represent as the value of the AFlags parameter. This value initializes the Flags (see page 24768) property.

See Also

Flags (see page 24768)

177.1.11.3 TWebContentOptions Properties

The properties of the TWebContentOptions class are listed here.

Public Properties

	Name	Description
R	Flags (see page 24768)	Lists the flags that indicate what type of generated HTML is permitted.

177.1.11.3.1 TWebContentOptions.Flags Property

Lists the flags that indicate what type of generated HTML is permitted.

Pascal

```
property Flags: TWebContentFlags;
```

C++

```
__property TWebContentFlags Flags;
```

Description

Read Flags to determine what types of HTML a Web item can generate.

See Also

Create (see page 24767)

177.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAddFieldsEditor (see page 24769)	This is class WebComp.IAddFieldsEditor.
	IGetWebComponentList (see page 24771)	This is class WebComp.IGetWebComponentList.
	IGetWebComponentNodeName (see page 24772)	This is class WebComp.IGetWebComponentNodeName.
	IGetXMLStream (see page 24773)	This is class WebComp.IGetXMLStream.
	ILayoutWebContent (see page 24774)	ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	INotifyActivateModule (see page 24776)	This is class WebComp.INotifyActivateModule.
	INotifyWebActivate (see page 24777)	This is class WebComp.INotifyWebActivate.
	IProducerEditorViewSupport (see page 24779)	This is class WebComp.IProducerEditorViewSupport.
	ISetWebContentOptions (see page 24781)	This is class WebComp.ISetWebContentOptions.
	ITopLevelWebComponent (see page 24782)	This is class WebComp.ITopLevelWebComponent.
	IWebComponent (see page 24782)	IWebComponent is the interface supported by components that TWebComponentList (see page 24708) manages.
	IWebComponentCommands (see page 24786)	This is class WebComp.IWebComponentCommands.
	IWebComponentContainer (see page 24788)	This is class WebComp.IWebComponentContainer.
	IWebComponentEditor (see page 24790)	IWebComponentEditor enables a Web item to be assigned children in the IDE.
	IWebComponentEditorHelper (see page 24791)	This is class WebComp.IWebComponentEditorHelper.
	IWebContent (see page 24792)	IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.
	IWebVariablesContainerName (see page 24794)	This is class WebComp.IWebVariablesContainerName.

177.2.1 IAddFieldsEditor Interface

Class Hierarchy

WebComp.IAddFieldsEditor

Pascal

```
IAddFieldsEditor = interface;
```

C++

```
__interface IAddFieldsEditor;
```

File

WebComp

Description

This is class WebComp.IAddFieldsEditor.

177.2.1.1 IAddFieldsEditor Members

The following tables list the members exposed by IAddFieldsEditor.

Public Methods

	Name	Description
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

177.2.1.2 IAddFieldsEditor Methods

The methods of the IAddFieldsEditor class are listed here.

Public Methods

	Name	Description
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

177.2.1.2.1 IAddFieldsEditor.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.

177.2.1.2.2 IAddFieldsEditor.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.

177.2.1.2.3 IAddFieldsEditor.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class IAddFieldsEditor.

177.2.1.2.4 IAddFieldsEditor.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

177.2.2 IGetWebComponentList Interface

Class Hierarchy

WebComp.IGetWebComponentList

Pascal

```
IGetWebComponentList = interface;
```

C++

```
__interface IGetWebComponentList;
```

File

WebComp

Description

This is class WebComp.IGetWebComponentList.

177.2.2.1 IGetWebComponentList Members

The following tables list the members exposed by IGetWebComponentList.

Public Methods

	Name	Description
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

177.2.2.2 IGetWebComponentList Methods

The methods of the IGetWebComponentList class are listed here.

Public Methods

	Name	Description
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

177.2.2.2.1 IGetWebComponentList.GetComponentList Method

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

This is GetComponentList, a member of class IGetWebComponentList.

177.2.2.2.2 IGetWebComponentList.GetDefaultComponentList Method

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

This is GetDefaultComponentList, a member of class IGetWebComponentList.

177.2.3 IGetWebComponentNodeName Interface

Class Hierarchy

WebComp.IGetWebComponentNodeName

Pascal

```
IGetWebComponentNodeName = interface;
```

C++

```
__interface IGetWebComponentNodeName;
```

File

WebComp

Description

This is class WebComp.IGetWebComponentNodeName.

177.2.3.1 IGetWebComponentNodeName Members

The following tables list the members exposed by IGetWebComponentNodeName.

Public Methods

	Name	Description
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

177.2.3.2 IGetWebComponentNodeName Methods

The methods of the IGetWebComponentNodeName class are listed here.

Public Methods

	Name	Description
	GetWebComponentNodeName (see page 24773)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

177.2.3.2.1 IGetWebComponentNodeName.GetWebComponentNodeName Method

Pascal

```
function GetWebComponentNodeName: string;
```

C++

```
__fastcall AnsiString GetWebComponentNodeName();
```

Description

This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

177.2.4 IGetXMLStream Interface

Class Hierarchy

WebComp.IGetXMLStream

Pascal

```
IGetXMLStream = interface;
```

C++

```
__interface IGetXMLStream;
```

File

WebComp

Description

This is class WebComp.IGetXMLStream.

177.2.4.1 IGetXMLStream Members

The following tables list the members exposed by IGetXMLStream.

Public Methods

	Name	Description
	GetXMLStream (see page 24774)	This is GetXMLStream, a member of class IGetXMLStream.

177.2.4.2 IGetXMLStream Methods

The methods of the IGetXMLStream class are listed here.

Public Methods

	Name	Description
	GetXMLStream (see page 24774)	This is GetXMLStream, a member of class IGetXMLStream.

177.2.4.2.1 IGetXMLStream.GetXMLStream Method

Pascal

```
function GetXMLStream(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLStream(Boolean Owned);
```

Description

This is GetXMLStream, a member of class IGetXMLStream.

177.2.5 ILayoutWebContent Interface

ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

WebComp.ILayoutWebContent

Pascal

```
ILayoutWebContent = interface;
```

C++

```
__interface ILayoutWebContent;
```

File

WebComp

Description

The Content method, implemented by all Web items to return the generated HTML, takes as a parameter an object of type TLayout (see page 24802). TLayout (see page 24802) is any object that implements the ILayoutWebContent interface. Typically, this is a descendant of TLayoutWebContent (see page 24698).

Parent components pass the TLayout (see page 24802) object to child Web items to provide helper functions that the child items use to fit their generated content into the parent object's HTML structure (typically a <TABLE> tag). For example, the ILayoutWebContent methods may add <TD> tags around generated HTML that fills the cells of a parent's HTML table.

See Also

TLayout (see page 24802)

IWebContent (see page 24792)

TLayoutWebContent (see page 24698)

177.2.5.1 ILayoutWebContent Members

The following tables list the members exposed by ILayoutWebContent.

Public Methods

	Name	Description
	LayoutButton (see page 24775)	This is LayoutButton, a member of class ILayoutWebContent.
	LayoutField (see page 24775)	This is LayoutField, a member of class ILayoutWebContent.
	LayoutLabelAndField (see page 24775)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 24776)	This is LayoutTable, a member of class ILayoutWebContent.

177.2.5.2 ILayoutWebContent Methods

The methods of the ILayoutWebContent class are listed here.

Public Methods

	Name	Description
	LayoutButton (see page 24775)	This is LayoutButton, a member of class ILayoutWebContent.
	LayoutField (see page 24775)	This is LayoutField, a member of class ILayoutWebContent.
	LayoutLabelAndField (see page 24775)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 24776)	This is LayoutTable, a member of class ILayoutWebContent.

177.2.5.2.1 ILayoutWebContent.LayoutButton Method

Pascal

```
function LayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutButton(const AnsiString HTMLButton, TLayoutAttributes Attributes);
```

Description

This is LayoutButton, a member of class ILayoutWebContent.

177.2.5.2.2 ILayoutWebContent.LayoutField Method

Pascal

```
function LayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutField(const AnsiString HTMLField, TLayoutAttributes Attributes);
```

Description

This is LayoutField, a member of class ILayoutWebContent.

177.2.5.2.3 ILayoutWebContent.LayoutLabelAndField Method

Converts the HTML declaring a labeled field into a form the Web item's parent can use.

Pascal

```
function LayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutLabelAndField(const AnsiString HTMLLabel, const AnsiString
HTMLField, TLayoutAttributes Attributes);
```

Description

Call LayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form required by the Web item's parent.

HTMLLabel is the HTML that declares the label. This is produced by the Web item.

HTMLField is the HTML that declares the field. This is produced by the Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that can be used by the Web item's parent.

177.2.5.2.4 ILayoutWebContent.LayoutTable Method

Pascal

```
function LayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall AnsiString LayoutTable(const AnsiString HTMLTable, TLayoutAttributes Attributes);
```

Description

This is LayoutTable, a member of class ILayoutWebContent.

177.2.6 INotifyActivateModule Interface

Class Hierarchy

Pascal

```
INotifyActivateModule = interface;
```

C++

```
__interface INotifyActivateModule;
```

File

WebComp

Description

This is class WebComp.INotifyActivateModule.

177.2.6.1 INotifyActivateModule Members

The following tables list the members exposed by INotifyActivateModule.

Public Methods

	Name	Description
	NotifyActivateModule (see page 24777)	This is NotifyActivateModule, a member of class INotifyActivateModule.
	NotifyDeactivateModule (see page 24777)	This is NotifyDeactivateModule, a member of class INotifyActivateModule.

177.2.6.2 INotifyActivateModule Methods

The methods of the INotifyActivateModule class are listed here.

Public Methods

	Name	Description
	NotifyActivateModule (see page 24777)	This is NotifyActivateModule, a member of class INotifyActivateModule.
	NotifyDeactivateModule (see page 24777)	This is NotifyDeactivateModule, a member of class INotifyActivateModule.

177.2.6.2.1 INotifyActivateModule.NotifyActivateModule Method

Pascal

```
procedure NotifyActivateModule(AWebModule: TComponent);
```

C++

```
__fastcall NotifyActivateModule(TComponent * AWebModule);
```

Description

This is NotifyActivateModule, a member of class INotifyActivateModule.

177.2.6.2.2 INotifyActivateModule.NotifyDeactivateModule Method

Pascal

```
procedure NotifyDeactivateModule(AWebModule: TComponent);
```

C++

```
__fastcall NotifyDeactivateModule(TComponent * AWebModule);
```

Description

This is NotifyDeactivateModule, a member of class INotifyActivateModule.

177.2.7 INotifyWebActivate Interface

Class Hierarchy

WebComp.INotifyWebActivate

Pascal

```
INotifyWebActivate = interface;
```

C++

```
__interface INotifyWebActivate;
```

File

WebComp

Description

This is class WebComp.INotifyWebActivate.

177.2.7.1 INotifyWebActivate Members

The following tables list the members exposed by INotifyWebActivate.

Public Methods

	Name	Description
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.

177.2.7.2 INotifyWebActivate Methods

The methods of the INotifyWebActivate class are listed here.

Public Methods

	Name	Description
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.

177.2.7.2.1 INotifyWebActivate.NotifyActivate Method

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

This is NotifyActivate, a member of class INotifyWebActivate.

177.2.7.2.2 INotifyWebActivate.NotifyDeactivate Method

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

This is NotifyDeactivate, a member of class INotifyWebActivate.

177.2.8 IProducerEditorViewSupport Interface

Class Hierarchy

WebComp.IProducerEditorViewSupport

Pascal

```
IProducerEditorViewSupport = interface;
```

C++

```
__interface IProducerEditorViewSupport;
```

File

WebComp

Description

This is class WebComp.IProducerEditorViewSupport.

177.2.8.1 IProducerEditorViewSupport Members

The following tables list the members exposed by IProducerEditorViewSupport.

Public Methods

	Name	Description
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

177.2.8.2 IProducerEditorViewSupport Methods

The methods of the IProducerEditorViewSupport class are listed here.

Public Methods

	Name	Description
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

177.2.8.2.1 IProducerEditorViewSupport.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall AnsiString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class IProducerEditorViewSupport.

177.2.8.2.2 IProducerEditorViewSupport.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class IProducerEditorViewSupport.

177.2.8.2.3 IProducerEditorViewSupport.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class IProducerEditorViewSupport.

177.2.8.2.4 IProducerEditorViewSupport.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.

177.2.8.2.5 IProducerEditorViewSupport.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class IProducerEditorViewSupport.

177.2.8.2.6 IProducerEditorViewSupport.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.

177.2.8.2.7 IProducerEditorViewSupport.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

177.2.9 ISetWebContentOptions Interface

Class Hierarchy

WebComp.ISetWebContentOptions

Pascal

```
ISetWebContentOptions = interface;
```

C++

```
__interface ISetWebContentOptions;
```

File

WebComp

Description

This is class WebComp.ISetWebContentOptions.

177.2.9.1 ISetWebContentOptions Members

The following tables list the members exposed by ISetWebContentOptions.

Public Methods

	Name	Description
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

177.2.9.2 ISetWebContentOptions Methods

The methods of the ISetWebContentOptions class are listed here.

Public Methods

	Name	Description
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

177.2.9.2.1 ISetWebContentOptions.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class ISetWebContentOptions.

177.2.10 ITopLevelWebComponent Interface

Class Hierarchy

WebComp.ITopLevelWebComponent

Pascal

```
ITopLevelWebComponent = interface;
```

C++

```
__interface ITopLevelWebComponent;
```

File

WebComp

Description

This is class WebComp.ITopLevelWebComponent.

177.2.11 IWebComponent Interface

IWebComponent is the interface supported by components that TWebComponentList (see page 24708) manages.

Class Hierarchy

WebComp.IWebComponent

Pascal

```
IWebComponent = interface;
```

C++

```
__interface IWebComponent;
```

File

WebComp

Description

TWebComponentList (see page 24708) uses IWebComponent to ensure that all components in its list have access to information about how they fit in the hierarchy of Web items.

Note: VCL methods that work with the IWebComponent interface wrap it using the DelphiInterface class:

Note: typedef System::DelphiInterface (see page 22167)< IWebComponent > _di_IWebComponent;

See Also

TWebComponentList (see page 24708)

177.2.11.1 IWebComponent Members

The following tables list the members exposed by IWebComponent.

Public Methods

	Name	Description
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.

Public Properties

	Name	Description
	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

177.2.11.2 IWebComponent Methods

The methods of the IWebComponent class are listed here.

Public Methods

	Name	Description
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.

177.2.11.2.1 IWebComponent.GetContainer Method

Returns the value of the Container (see page 24786) property.

Pascal

```
function GetContainer: TWebComponentContainer;
```

C++

```
__fastcall TWebComponentContainer GetContainer();
```

Description

GetContainer is the read method for the Container (see page 24786) property.

See Also

Container (see page 24786)

177.2.11.2.2 IWebComponent.GetIndex Method

Returns the value of the Index (see page 24786) property.

Pascal

```
function GetIndex: Integer;
```

C++

```
__fastcall int GetIndex();
```

Description

GetIndex is the read method for the Index (see page 24786) property.

See Also

Index (see page 24786)

177.2.11.2.3 IWebComponent.SetComponentList Method

Sets the value of the ComponentList (see page 24785) property.

Pascal

```
procedure SetComponentList(List: TObject);
```

C++

```
__fastcall SetComponentList(TObject * List);
```

Description

SetComponentList is the write method for the ComponentList (see page 24785) property. The List parameter specifies the value to assign to ComponentList (see page 24785).

See Also

ComponentList (see page 24785)

177.2.11.2.4 IWebComponent.SetContainer Method

Sets the value of the Container (see page 24786) property.

Pascal

```
procedure SetContainer(Container: TWebComponentContainer);
```

C++

```
__fastcall SetContainer(TWebComponentContainer Container);
```

Description

SetContainer is the write method for the Container (see page 24786) property. The Container (see page 24786) parameter specifies the value to assign to Container (see page 24786).

See Also

Container (see page 24786)

177.2.11.2.5 IWebComponent.SetIndex Method

Sets the value of the Index (see page 24786) property.

Pascal

```
procedure SetIndex(Value: Integer);
```

C++

```
__fastcall SetIndex(int Value);
```

Description

SetIndex is the write method for the Index (see page 24786) property. The Value parameter specifies the value to assign to Index (see page 24786).

See Also

Index (see page 24786)

177.2.11.3 IWebComponent Properties

The properties of the IWebComponent class are listed here.

Public Properties

	Name	Description
	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.

177.2.11.3.1 IWebComponent.ComponentList Property

Indicates the component list that contains the Web item.

Pascal

```
property ComponentList: TObject;
```

C++

```
__property TObject * ComponentList;
```

Description

The Web component list assigns a value to ComponentList when the component is added to it. The component can use this

value to access the list and obtain information about the other components in the list.

Note that the IWebComponent (see page 24782) interface does not include any methods for reading the value of ComponentList.

See Also

Container (see page 24786)

Index (see page 24786)

TWebComponentList (see page 24708)

177.2.11.3.2 IWebComponent.Container Property

Specifies the component that uses content generated by this Web item.

Pascal

```
property Container: TWebComponentContainer;
```

C++

```
__property TWebComponentContainer Container;
```

Description

Web items are arranged in a hierarchy, where each item generates its content using content produced by its children. Container specifies the parent that uses the content of this Web item. Container maintains a list of all its children using a TWebComponentList (see page 24708) object.

See Also

ComponentList (see page 24785)

ParentComponent (see page 24718)

177.2.11.3.3 IWebComponent.Index Property

Indicates where the Web item appears in the Web component list's array of Web items.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

The Web component list sets Index to indicate where the component sits in its WebComponents property array.

See Also

WebComponents (see page 24718)

177.2.12 IWebComponentCommands Interface

Class Hierarchy

Pascal

```
IWebComponentCommands = interface;
```

C++

```
__interface IWebComponentCommands;
```

File

WebComp

Description

This is class WebComp.IWebComponentCommands.

177.2.12.1 IWebComponentCommands Members

The following tables list the members exposed by IWebComponentCommands.

Public Methods

	Name	Description
	ExecuteVerb (see page 24787)	This is ExecuteVerb, a member of class IWebComponentCommands.
	GetVerb (see page 24787)	This is GetVerb, a member of class IWebComponentCommands.
	GetVerbCount (see page 24788)	This is GetVerbCount, a member of class IWebComponentCommands.

177.2.12.2 IWebComponentCommands Methods

The methods of the IWebComponentCommands class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 24787)	This is ExecuteVerb, a member of class IWebComponentCommands.
	GetVerb (see page 24787)	This is GetVerb, a member of class IWebComponentCommands.
	GetVerbCount (see page 24788)	This is GetVerbCount, a member of class IWebComponentCommands.

177.2.12.2.1 IWebComponentCommands.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(AComponent: TComponent; Index: Integer);
```

C++

```
__fastcall ExecuteVerb(TComponent * AComponent, int Index);
```

Description

This is ExecuteVerb, a member of class IWebComponentCommands.

177.2.12.2.2 IWebComponentCommands.GetVerb Method

Pascal

```
function GetVerb(AComponent: TComponent; Index: Integer): string;
```

C++

```
__fastcall AnsiString GetVerb(TComponent * AComponent, int Index);
```

Description

This is GetVerb, a member of class IWebComponentCommands.

177.2.12.2.3 IWebComponentCommands.GetVerbCount Method

Pascal

```
function GetVerbCount(AComponent: TComponent): Integer;
```

C++

```
__fastcall int GetVerbCount(TComponent * AComponent);
```

Description

This is GetVerbCount, a member of class IWebComponentCommands.

177.2.13 IWebComponentContainer Interface

Class Hierarchy

WebComp.IWebComponentContainer

Pascal

```
IWebComponentContainer = interface;
```

C++

```
__interface IWebComponentContainer;
```

File

WebComp

Description

This is class WebComp.IWebComponentContainer.

177.2.13.1 IWebComponentContainer Members

The following tables list the members exposed by IWebComponentContainer.

Public Methods

	Name	Description
	GetComponent (see page 24789)	This is GetComponent, a member of class IWebComponentContainer.
	GetComponentCount (see page 24789)	This is GetComponentCount, a member of class IWebComponentContainer.

Public Properties

	Name	Description
R	ComponentCount (see page 24789)	This is ComponentCount, a member of class IWebComponentContainer.
R	Components (see page 24790)	This is Components, a member of class IWebComponentContainer.

177.2.13.2 IWebComponentContainer Methods

The methods of the IWebComponentContainer class are listed here.

Public Methods

	Name	Description
	GetComponent (see page 24789)	This is GetComponent, a member of class IWebComponentContainer.
	GetComponentCount (see page 24789)	This is GetComponentCount, a member of class IWebComponentContainer.

177.2.13.2.1 IWebComponentContainer.GetComponent Method

Pascal

```
function GetComponent(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(int I);
```

Description

This is GetComponent, a member of class IWebComponentContainer.

177.2.13.2.2 IWebComponentContainer.GetComponentCount Method

Pascal

```
function GetComponentCount: Integer;
```

C++

```
__fastcall int GetComponentCount();
```

Description

This is GetComponentCount, a member of class IWebComponentContainer.

177.2.13.3 IWebComponentContainer Properties

The properties of the IWebComponentContainer class are listed here.

Public Properties

	Name	Description
R	ComponentCount (see page 24789)	This is ComponentCount, a member of class IWebComponentContainer.
R	Components (see page 24790)	This is Components, a member of class IWebComponentContainer.

177.2.13.3.1 IWebComponentContainer.ComponentCount Property

Pascal

```
property ComponentCount: Integer;
```

C++

```
__property int ComponentCount;
```

Description

This is ComponentCount, a member of class IWebComponentContainer.

177.2.13.3.2 IWebComponentContainer.Components Property

Pascal

```
property Components [I: Integer]: TComponent;
```

C++

```
__property TComponent * Components[int I];
```

Description

This is Components, a member of class IWebComponentContainer.

177.2.14 IWebComponentEditor Interface

IWebComponentEditor enables a Web item to be assigned children in the IDE.

Class Hierarchy

Pascal

```
IWebComponentEditor = interface;
```

C++

```
__interface IWebComponentEditor;
```

File

WebComp

Description

When the Web Page editor builds the list of new items that can be added as the child of a Web item, it calls the IWebComponentEditor interface. Components that contain child items for generating portions of their HTML content must implement this interface so that the Web Page editor can display the appropriate list of components to add.

IWebComponentEditor defines a single method, CanAddClass (see page 24791), which indicates whether a specified class can be used for a child Web item by the Web item that implements the interface.

See Also

IRestoreDefaults

TAdapterPageProducer (see page 19802)

TInetXPageProducer (see page 17145)

TWebForm (see page 16922)

;TWebControlGroup

TAdapterSubComponent (see page 23991)

177.2.14.1 IWebComponentEditor Members

The following tables list the members exposed by IWebComponentEditor.

Public Methods

	Name	Description
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.

177.2.14.2 IWebComponentEditor Methods

The methods of the IWebComponentEditor class are listed here.

Public Methods

	Name	Description
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.

177.2.14.2.1 IWebComponentEditor.CanAddClass Method

Indicates whether a specified class can be used as a child Web item.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the Web item that implements this interface.

AParent is the Web item that will act as a parent to the added Web item.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web item can use content generated by a component of type AClass, false otherwise.

177.2.15 IWebComponentEditorHelper Interface

Class Hierarchy

Pascal

```
IWebComponentEditorHelper = interface;
```

C++

```
__interface IWebComponentEditorHelper;
```

File

WebComp

Description

This is class WebComp.IWebComponentEditorHelper.

177.2.15.1 IWebComponentEditorHelper Members

The following tables list the members exposed by IWebComponentEditorHelper.

Public Methods

	Name	Description
	CanAddClassHelper (see page 24792)	This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

177.2.15.2 IWebComponentEditorHelper Methods

The methods of the IWebComponentEditorHelper class are listed here.

Public Methods

	Name	Description
	CanAddClassHelper (see page 24792)	This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

177.2.15.2.1 IWebComponentEditorHelper.CanAddClassHelper Method

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass
AClass);
```

Description

This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

177.2.16 IWebContent Interface

IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.

Class Hierarchy

Pascal

```
IWebContent = interface;
```

C++

```
__interface IWebContent;
```

File

WebComp

Description

TInetXPageProducer, TAdapterPageProducer, and TComponentsPageProducer create HTML documents that include content generated by other components, called Web items. Similarly, the Web items that generate content can make use of other Web items when producing their content.

For a component to act as a Web item, it must support the IWebContent interface. This interface defines one new method, Content (see page 24793), which returns the HTML generated by the Web item.

Note: The only other required interface for Web items is IWebComponent (see page 24782).

See Also

TAdapterPageProducer (see page 19802)

TInetXPageProducer (see page 17145)

TBasePageItemsProducer (see page 18376)

TWebComponentList (see page 24708)

IWebComponent (see page 24782)

Customizing the InternetExpress Page Producer Template

177.2.16.1 IWebContent Members

The following tables list the members exposed by IWebContent.

Public Methods

	Name	Description
	Content (see page 24793)	Returns the HTML that the Web item generates.

177.2.16.2 IWebContent Methods

The methods of the IWebContent class are listed here.

Public Methods

	Name	Description
	Content (see page 24793)	Returns the HTML that the Web item generates.

177.2.16.2.1 IWebContent.Content Method

Returns the HTML that the Web item generates.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Call Content to access the HTML produced by the Web item.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web item should lay out its constituent parts. This object supports the ILayoutWebContent (see page 24774) interface, which the Web item uses to fit its own content into the parent's HTML structures.

Content returns a string of HTML produced by the Web item.

See Also

ILayoutWebContent (see page 24774)

177.2.17 IWebVariablesContainerName Interface

Class Hierarchy

WebComp.IWebVariablesContainerName

Pascal

```
IWebVariablesContainerName = interface;
```

C++

```
__interface IWebVariablesContainerName;
```

File

WebComp

Description

This is class WebComp.IWebVariablesContainerName.

177.2.17.1 IWebVariablesContainerName Members

The following tables list the members exposed by IWebVariablesContainerName.

Public Methods

	Name	Description
	GetContainerName (see page 24794)	This is GetContainerName, a member of class IWebVariablesContainerName.

Public Properties

	Name	Description
R	ContainerName (see page 24795)	This is ContainerName, a member of class IWebVariablesContainerName.

177.2.17.2 IWebVariablesContainerName Methods

The methods of the IWebVariablesContainerName class are listed here.

Public Methods

	Name	Description
	GetContainerName (see page 24794)	This is GetContainerName, a member of class IWebVariablesContainerName.

177.2.17.2.1 IWebVariablesContainerName.GetContainerName Method

Pascal

```
function GetContainerName: string;
```

C++

```
__fastcall AnsiString GetContainerName();
```

Description

This is GetContainerName, a member of class IWebVariablesContainerName.

177.2.17.3 IWebVariablesContainerName Properties

The properties of the IWebVariablesContainerName class are listed here.

Public Properties

	Name	Description
R	ContainerName (see page 24795)	This is ContainerName, a member of class IWebVariablesContainerName.

177.2.17.3.1 IWebVariablesContainerName.ContainerName Property

Pascal

```
property ContainerName: string;
```

C++

```
__property AnsiString ContainerName;
```

Description

This is ContainerName, a member of class IWebVariablesContainerName.

177.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DesigningComponent (see page 24796)	This is function WebComp.DesigningComponent.
	EnumRegisteredWebComponents (see page 24796)	This is function WebComp.EnumRegisteredWebComponents.
	FindWebComponentEditorHelper (see page 24797)	This is function WebComp.FindWebComponentEditorHelper.
	QualifyFileName (see page 24797)	This is function WebComp.QualifyFileName.
	RegisterWebComponents (see page 24797)	This is function WebComp.RegisterWebComponents.
	UnRegisterWebComponents (see page 24798)	This is function WebComp.UnRegisterWebComponents.
	ValidateWebParent (see page 24798)	This is function WebComp.ValidateWebParent.

177.3.1 WebComp.DesigningComponent Function

Pascal

```
function DesigningComponent(AComponent: TComponent): Boolean;
```

C++

```
Boolean DesigningComponent(TComponent * AComponent);
```

File

WebComp

Description

This is function WebComp.DesigningComponent.

177.3.2 WebComp.EnumRegisteredWebComponents Function

Pascal

```
procedure EnumRegisteredWebComponents(Proc: TEnumWebComponentsProc; Info: Pointer);
```

C++

```
EnumRegisteredWebComponents(TEnumWebComponentsProc Proc, void * Info);
```

File

WebComp

Description

This is function WebComp.EnumRegisteredWebComponents.

177.3.3 WebComp.FindWebComponentEditorHelper Function

Pascal

```
function FindWebComponentEditorHelper(AClass: TClass): TObject;
```

C++

```
TObject * FindWebComponentEditorHelper(TClass AClass);
```

File

WebComp

Description

This is function WebComp.FindWebComponentEditorHelper.

177.3.4 WebComp.QualifyFileName Function

Pascal

```
function QualifyFileName(const AFileName: string): string;
```

C++

```
AnsiString QualifyFileName(const AnsiString AFileName);
```

File

WebComp

Description

This is function WebComp.QualifyFileName.

177.3.5 WebComp.RegisterWebComponents Function

Pascal

```
procedure RegisterWebComponents(const AClasses: array of TComponentClass; Editor: TObject =
nil);
```

C++

```
RegisterWebComponents(const array of TComponentClass AClasses, TObject * Editor = nil);
```

File

WebComp

Description

This is function WebComp.RegisterWebComponents.

177.3.6 WebComp.UnRegisterWebComponents Function

Pascal

```
procedure UnRegisterWebComponents(const AClasses: array of TComponentClass);
```

C++

```
UnRegisterWebComponents(const array of TComponentClass AClasses);
```

File

WebComp

Description

This is function WebComp.UnRegisterWebComponents.

177.3.7 WebComp.ValidateWebParent Function

Pascal

```
procedure ValidateWebParent(AComponent: TComponent; AParent: TComponent);
```

C++

```
ValidateWebParent(TComponent * AComponent, TComponent * AParent);
```

File

WebComp

Description

This is function WebComp.ValidateWebParent.

177.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TLabelPosition (see page 24799)	This is record WebComp.TLabelPosition.
	TWebContentFlag (see page 24799)	This is record WebComp.TWebContentFlag.

177.4.1 WebComp.TLabelPosition Enumeration

Pascal

```
TLabelPosition = (
  lposLeft,
  lposRight,
  lposAbove,
  lposBelow
);
```

C++

```
enum TLabelPosition {
  lposLeft,
  lposRight,
  lposAbove,
  lposBelow
};
```

File

WebComp

Description

This is record WebComp.TLabelPosition.

177.4.2 WebComp.TWebContentFlag Enumeration

Pascal

```
TWebContentFlag = (
  coNoScript,
  coLocalPaths,
  coNoExecuteScript
);
```

C++

```
enum TWebContentFlag {
  coNoScript,
  coLocalPaths,
  coNoExecuteScript
};
```

File

WebComp

Description

This is record WebComp.TWebContentFlag.

177.5 Types

The following table lists types in this documentation.

Types

Name	Description
TEnumWebComponentsProc (see page 24801)	This is type WebComp.TEnumWebComponentsProc.
TGetComponentListEvent (see page 24801)	This is type WebComp.TGetComponentListEvent.
TLayout (see page 24802)	TLayout is the type for helper objects that generate layout code for a Web item.
TSetComponentListEvent (see page 24802)	This is type WebComp.TSetComponentListEvent.
TWebComponentContainer (see page 24802)	TWebComponentContainer is the type for components that maintain a list of Web items.
TWebContentFlags (see page 24803)	This is type WebComp.TWebContentFlags.

177.5.1 WebComp.TEnumWebComponentsProc Type

Pascal

```
TEnumWebComponentsProc = procedure (WebComponentClass: TWebComponentClassDescription; Info:
Pointer) of object;
```

C++

```
(WebComponentClass: TWebComponentClassDescription; Info: Pointer) ( TEnumWebComponentsProc)();
```

File

WebComp

Description

This is type WebComp.TEnumWebComponentsProc.

177.5.2 WebComp.TGetComponentListEvent Type

Pascal

```
TGetComponentListEvent = procedure (Sender: TObject; var AList: TWebComponentList) of object;
```

C++

```
(Sender: TObject; var AList: TWebComponentList) ( TGetComponentListEvent)();
```

File

WebComp

Description

This is type WebComp.TGetComponentListEvent.

177.5.3 WebComp.TLayout Type

TLayout is the type for helper objects that generate layout code for a Web item.

Pascal

```
TLayout = TObject;
```

C++

```
TObject * TLayout;
```

File

WebComp

Description

TLayout is the type for objects that Web items use to transmit common functions that control the layout of HTML controls. When a Web item generates content that includes HTML produced by child components, it passes a TLayout object to those children. The TLayout object implements an interface (ILayoutWebContent (see page 24774)) that generates HTML to lay out the controls which the child components generate.

Note: Typically, TLayout objects are descendants of TLayoutWebContent (see page 24698).

See Also

IWebContent (see page 24792)

ILayoutWebContent (see page 24774)

TLayoutWebContent (see page 24698)

177.5.4 WebComp.TSetComponentListEvent Type

Pascal

```
TSetComponentListEvent = procedure (Sender: TObject; AList: TWebComponentList) of object;
```

C++

```
(Sender: TObject; AList: TWebComponentList) ( TSetComponentListEvent)();
```

File

WebComp

Description

This is type WebComp.TSetComponentListEvent.

177.5.5 WebComp.TWebComponentContainer Type

TWebComponentContainer is the type for components that maintain a list of Web items.

Pascal

```
TWebComponentContainer = TObject;
```

C++

```
TObject * TWebComponentContainer;
```

File

WebComp

Description

TWebComponentContainer is the type for objects that make use of Web items (components that generate HTML and support the IWebContent (see page 24792) interface). Each TWebComponentContainer has a property of type TWebComponentList (see page 24708) that lists its Web items. The TWebComponentContainer uses these Web items to generate constituent parts of the HTML that it generates.

See Also

TWebComponentList (see page 24708)

IWebContent (see page 24792)

177.5.6 WebComp.TWebContentFlags Type

Pascal

```
TWebContentFlags = set of TWebContentFlag;
```

C++

```
TWebContentFlag TWebContentFlags;
```

File

WebComp

Description

This is type WebComp.TWebContentFlags.

177.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
EnumRegisteredWebComponentsProc (see page 24804)	This is constant WebComp.EnumRegisteredWebComponentsProc.
FindWebComponentEditorHelperProc (see page 24804)	This is constant WebComp.FindWebComponentEditorHelperProc.
RegisterWebComponentsProc (see page 24805)	This is constant WebComp.RegisterWebComponentsProc.
UnRegisterWebComponentsProc (see page 24805)	This is constant WebComp.UnRegisterWebComponentsProc.

177.6.1 WebComp.EnumRegisteredWebComponentsProc Constant

Pascal

```
EnumRegisteredWebComponentsProc: procedure (Proc: TEnumWebComponentsProc; Info: Pointer) = nil;
```

C++

```
procedure (Proc: TEnumWebComponentsProc; Info: Pointer) EnumRegisteredWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.EnumRegisteredWebComponentsProc.

177.6.2 WebComp.FindWebComponentEditorHelperProc Constant

Pascal

```
FindWebComponentEditorHelperProc: function (AClass: TClass): TObject = nil;
```

C++

```
function (AClass: TClass): TObject FindWebComponentEditorHelperProc = nil;
```

File

WebComp

Description

This is constant WebComp.FindWebComponentEditorHelperProc.

177.6.3 WebComp.RegisterWebComponentsProc Constant

Pascal

```
RegisterWebComponentsProc: procedure ( const AClasses: array of TComponentClass; Editor:
TObject) = nil;
```

C++

```
procedure ( const AClasses: array of TComponentClass; Editor: TObject)
RegisterWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.RegisterWebComponentsProc.

177.6.4 WebComp.UnRegisterWebComponentsProc Constant

Pascal

```
UnRegisterWebComponentsProc: procedure (const AClasses: array of TComponentClass) = nil;
```

C++

```
procedure (const AClasses: array of TComponentClass) UnRegisterWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.UnRegisterWebComponentsProc.

178 WebContnrs Namespace

This is namespace WebContnrs.

Topics

Name	Description
Classes (see page 24808)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 24832)	The following table lists structs, records, enums in this documentation.
Types (see page 24833)	The following table lists types in this documentation.

Classes

	Name	Description
	ENamedVariantsError (see page 24808)	ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 24824) object.
	TAbstractNamedVariants (see page 24808)	TAbstractNamedVariants is the base class for persistent lists of Variant values.
	TNamedVariantsList (see page 24824)	TNamedVariantsList is a persistent list of name/Variant pairs.

Structs, Records, Enums

	Name	Description
	TNamedVariantItem (see page 24832)	This is record WebContnrs.TNamedVariantItem.

Types

Name	Description
PNamedVariantItem (see page 24833)	This is type WebContnrs.PNamedVariantItem.
PNamedVariantList (see page 24833)	This is type WebContnrs.PNamedVariantList.
TNamedVariantList (see page 24833)	This is type WebContnrs.TNamedVariantList.

178.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ENamedVariantsError (see page 24808)	ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 24824) object.
	TAbstractNamedVariants (see page 24808)	TAbstractNamedVariants is the base class for persistent lists of Variant values.
	TNamedVariantsList (see page 24824)	TNamedVariantsList is a persistent list of name/Variant pairs.

178.1.1 ENamedVariantsError Class

ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 24824) object.

Class Hierarchy

System::TObject → SysUtils.Exception → WebContnrs.ENamedVariantsError

Pascal

```
ENamedVariantsError = class(Exception);
```

C++

```
class ENamedVariantsError : public Exception;
```

File

WebContnrs

Description

ENamedVariantsError is raised when an error occurs in TNamedVariantsList (see page 24824). For example, when an application supplies an invalid index to one of the TNamedVariantsList (see page 24824) methods, it raises an ENamedVariantsError exception.

See Also

TNamedVariantsList (see page 24824)

178.1.2 TAbstractNamedVariants Class

TAbstractNamedVariants is the base class for persistent lists of Variant values.

Class Hierarchy

System::TObject → Classes.TPersistent → WebContnrs.TAbstractNamedVariants

Pascal

```
TAbstractNamedVariants = class(TPersistent);
```

C++

```
class TAbstractNamedVariants : public TPersistent;
```

File

WebContnrs

Description

Use TAbstractNamedVariants as a base class for objects that represents a set of name/value pairs where the values are all Variants (see page 24824). TAbstractNamedVariants is a descendant of TPersistent, which means that if it is the type of a published property on a component, the named variants list is saved with the component.

Do not create instances of TAbstractNamedVariants: This class contains abstract or, in C++ terminology, pure virtual methods. Instead, use a descendant of TAbstractNamedVariants such as TNamedVariantsList (see page 24824). TNamedVariantsList (see page 24824) provides an implementation for the abstract or pure virtual methods introduced in TAbstractNamedVariants.

See Also

TStrings (see page 3029)

TCollection (see page 2731)

TList (see page 2868)

TNamedVariantsList (see page 24824)

178.1.2.1 TAbstractNamedVariants Members

The following tables list the members exposed by TAbstractNamedVariants.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 24814)	Compares two strings.
V	DefineProperties (see page 24814)	Allows the list of names and their corresponding Variant values to be saved with the named Variants (see page 24824) list.
	Error (see page 24816)	Raises an ENamedVariantsError (see page 24808) exception.
A	Get (see page 24817)	Retrieves the name and Variant stored at a specified position in the list.
V	GetCapacity (see page 24817)	Returns the value of the Capacity (see page 24821) property.
A	GetCount (see page 24818)	Returns the value of the Count (see page 24822) property.
	GetOwner (see page 2932)	Returns the owner of an object.
A	Put (see page 24820)	Stores a name/Variant pair at a specified position in the list.
V	SetCapacity (see page 24820)	Sets the value of the Capacity (see page 24821) property.
V	SetUpdateState (see page 24821)	Responds when an update operation begins or ends.

Protected Properties

	Name	Description
R	UpdateCount (see page 24823)	Indicates the number of calls to BeginUpdate (see page 24813) that have not been matched by a corresponding call to EndUpdate (see page 24815).

Public Methods

	Name	Description
V	Add (see page 24812)	Adds a named Variant to the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 24812)	Adds a named Variant to the end of the list.
V	Assign (see page 24813)	Copies the list of named Variants (see page 24824) from another object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	BeginUpdate (see page 24813)	Signals the start of an update operation.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
A	Clear (see page 24813)	Empties the list of all its name/Variant pairs.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
A	Delete (see page 24815)	Deletes an entry from the list.
V	Destroy (see page 24810)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 24815)	Signals the end of an update operation.
	Equals (see page 24816)	Compares this named Variants (see page 24824) list with another one.
V	Exchange (see page 24817)	Swaps the positions of two items in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOfName (see page 24818)	Returns the index of the first item in the list with a specified name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
A	Insert (see page 24819)	Inserts a name/Variant pair at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 24819)	Moves a name/Variant pair to a new position in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 24821)	Specifies the allocated size of the named variants list.
R	Count (see page 24822)	Indicates the number of name/value pairs in the list.
R	Names (see page 24822)	Lists the names of all the Variants (see page 24824) in the list.
	Values (see page 24823)	Lists the Variants (see page 24824) in the list by name.
	Variants (see page 24824)	Lists the Variants in the list by position.

178.1.2.2 TAbstractNamedVariants.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractNamedVariants();
```

Description

Do not call ~Destroy directly. Instead, use the delete keyword when destroying VCL objects.

~Destroy deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

See Also

delete

178.1.2.3 TAbstractNamedVariants Methods

The methods of the TAbstractNamedVariants class are listed here.

Protected Methods

	Name	Description
V	CompareStrings (see page 24814)	Compares two strings.
V	DefineProperties (see page 24814)	Allows the list of names and their corresponding Variant values to be saved with the named Variants (see page 24824) list.
	Error (see page 24816)	Raises an ENamedVariantsError (see page 24808) exception.
A	Get (see page 24817)	Retrieves the name and Variant stored at a specified position in the list.
V	GetCapacity (see page 24817)	Returns the value of the Capacity (see page 24821) property.
A	GetCount (see page 24818)	Returns the value of the Count (see page 24822) property.
A	Put (see page 24820)	Stores a name/Variant pair at a specified position in the list.
V	SetCapacity (see page 24820)	Sets the value of the Capacity (see page 24821) property.
V	SetUpdateState (see page 24821)	Responds when an update operation begins or ends.

Public Methods

	Name	Description
V	Add (see page 24812)	Adds a named Variant to the end of the list.
	Append (see page 24812)	Adds a named Variant to the end of the list.
V	Assign (see page 24813)	Copies the list of named Variants (see page 24824) from another object.
	BeginUpdate (see page 24813)	Signals the start of an update operation.
A	Clear (see page 24813)	Empties the list of all its name/Variant pairs.
A	Delete (see page 24815)	Deletes an entry from the list.
	EndUpdate (see page 24815)	Signals the end of an update operation.
	Equals (see page 24816)	Compares this named Variants (see page 24824) list with another one.
V	Exchange (see page 24817)	Swaps the positions of two items in the list.
V	IndexOfName (see page 24818)	Returns the index of the first item in the list with a specified name.
A	Insert (see page 24819)	Inserts a name/Variant pair at a specified position.

	Move (see page 24819)	Moves a name/Variant pair to a new position in the list.

178.1.2.3.1 TAbstractNamedVariants.Add Method

Adds a named Variant to the end of the list.

Pascal

```
function Add(const S: string; const AValue: Variant): Integer; virtual;
```

C++

```
virtual __fastcall int Add(const AnsiString S, const Variant AValue);
```

Description

Call Add to add a name/Variant pair to the end of the list. Add adds a new name/Variant pair to the list with a position index equal to the value of the Count (see page 24822) property.

S is the name of the Variant value. This can be used to look up the value using the Values (see page 24823) property.

AValue is the Variant value to associate with S.

Note: Unlike setting the Values (see page 24823) property, calling Add adds a duplicate name/Variant pair to the list if S matches the name of a Variant that is already in the list.

See Also

Values (see page 24823)

Append (see page 24812)

Insert (see page 24819)

Delete (see page 24815)

Count (see page 24822)

178.1.2.3.2 TAbstractNamedVariants.Append Method

Adds a named Variant to the end of the list.

Pascal

```
procedure Append(const S: string; const AValue: Variant);
```

C++

```
__fastcall Append(const AnsiString S, const Variant AValue);
```

Description

Call Append to add a name/Variant pair to the end of the list. Append simply calls the Add (see page 24812) method to add the specified name and its associated Variant value.

S is the name of the Variant value. This can be used to look up the value using the Values (see page 24823) property.

AValue is the Variant value to associate with S.

See Also

Values (see page 24823)

Add (see page 24812)

Insert (see page 24819)

Delete (see page 24815)

178.1.2.3.3 TAbstractNamedVariants.Assign Method

Copies the list of named Variants (see page 24824) from another object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy another list to this named Variants (see page 24824) list. If the source object is another named Variants (see page 24824) list, Assign discards any name/Variant pairs currently in the list and replaces them with the name/Variant pairs in the source list. If the source is any other type of object, Assign calls the inherited method, which copies the list from any object that implements the AssignTo method so that it copies its items to a named Variants (see page 24824) list.

Source is the object from which to copy the list.

See Also

Values (see page 24823)

AssignTo (see page 2931)

178.1.2.3.4 TAbstractNamedVariants.BeginUpdate Method

Signals the start of an update operation.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before starting an operation that makes multiple changes to the named Variants (see page 24824) list. After completing all of the changes, call the EndUpdate (see page 24815) method to signal the end of the operation.

Every call to BeginUpdate must be matched by a corresponding call to the EndUpdate (see page 24815) method.

Note: TAbstractNamedVariants (see page 24808) calls BeginUpdate and EndUpdate (see page 24815) internally when performing operations that affect multiple entries in the list.

See Also

EndUpdate (see page 24815)

178.1.2.3.5 TAbstractNamedVariants.Clear Method

Empties the list of all its name/Variant pairs.

Pascal

```
procedure Clear; virtual; abstract;
```

C++

```
virtual __fastcall Clear() = 0;
```

Description

Call Clear to empty the named Variants (see page 24824) list. After a call to Clear, the value of the Count (see page 24822) property is zero.

TAbstractNamedVariants (see page 24808) declares Clear as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Count (see page 24822)

Delete (see page 24815)

178.1.2.3.6 TAbstractNamedVariants.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: string; const S2: string): Integer; virtual;
```

C++

```
virtual __fastcall int CompareStrings(const AnsiString S1, const AnsiString S2);
```

Description

TAbstractNamedVariants (see page 24808) calls CompareStrings internally to locate names in the list (for example, in the implementation of the Values (see page 24823) property). Descendant classes can use this method to sort the list entries by name.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 = S2, and a value greater than 0 if S1 > S2.

In TAbstractNamedVariants (see page 24808), CompareStrings calls the AnsiCompareText function. This performs a locale-based case-insensitive comparison. Override this method in a descendant class to change the way the named Variants (see page 24824) list compares names. For example, by changing CompareStrings to a case sensitive function, the Values (see page 24823) property would distinguish two names that differed only in case.

See Also

AnsiCompareText (see page 22790)

Values (see page 24823)

Equals (see page 24816)

178.1.2.3.7 TAbstractNamedVariants.DefineProperties Method

Allows the list of names and their corresponding Variant values to be saved with the named Variants (see page 24824) list.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

The component streaming system calls DefineProperties when it loads or saves the named Variants (see page 24824) list. TAbstractNamedVariants (see page 24808) overrides the inherited method to specify how to load and save the list of names and Variant values.

Filer is the current TReader or TWriter object that is loading or saving the named Variants (see page 24824) list.

See Also

Values (see page 24823)

DefineProperties (see page 2931)

TReader (see page 2933)

TWriter (see page 3175)

178.1.2.3.8 TAbstractNamedVariants.Delete Method

Deletes an entry from the list.

Pascal

```
procedure Delete(Index: Integer); virtual; abstract;
```

C++

```
virtual __fastcall Delete(int Index) = 0;
```

Description

Call Delete to remove a specified name/Variant pair from the list. After a call to Delete, any name/Variant pairs that appeared after the deleted item in the list move up by one (getting a new index).

Index is the position of the item to delete.

TAbstractNamedVariants (see page 24808) declares Delete as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 24822)

Variants (see page 24824)

Clear (see page 24813)

178.1.2.3.9 TAbstractNamedVariants.EndUpdate Method

Signals the end of an update operation.

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after completing an operation that was preceded by a call to the BeginUpdate (see page 24813) method. Every call to BeginUpdate (see page 24813) must be matched by a corresponding call to the EndUpdate method. Calls to BeginUpdate (see page 24813) and EndUpdate can be nested.

Note: TAbstractNamedVariants (see page 24808) calls BeginUpdate (see page 24813) and EndUpdate internally when performing operations that affect multiple entries in the list.

See Also

BeginUpdate (see page 24813)

178.1.2.3.10 TAbstractNamedVariants.Equals Method

Compares this named Variants (see page 24824) list with another one.

Pascal

```
function Equals(ANamedVariants: TAbstractNamedVariants): Boolean;
```

C++

```
__fastcall Boolean Equals(TAbstractNamedVariants ANamedVariants);
```

Description

Call Equals to determine whether another named Variants (see page 24824) list contains the same name/Variant pairs as this one.

ANamedVariants is the named Variants (see page 24824) list to compare to this one.

Equals returns true if every entry in ANamedVariants has the same name and Variant value as the corresponding entry in this list. Equals returns false if ANamedVariants has a different number of entries, if its entries appear in a different order, or if it contains different entries.

Equals considers two name to be the same if they differ only by case.

178.1.2.3.11 TAbstractNamedVariants.Error Method

Raises an ENamedVariantsError (see page 24808) exception.

Pascal

```
procedure Error(const Msg: string; Data: Integer); overload;
```

C++

```
__fastcall Error(const AnsiString Msg, int Data);
```

Description

TAbstractNamedVariants (see page 24808) calls Error internally when it encounters an invalid index. For example, if an application tries to delete or change a name/Variant pair and supplies an index that is greater than Count (see page 24822), TAbstractNamedVariants (see page 24808) calls Error to generate the exception about the out-of-bounds index.

Msg is the error message for the exception. This message contains a format specifier for the integer that represents the index that caused the problem.

Data is the index that caused the problem.

See Also

ENamedVariantsError (see page 24808)

Count (see page 24822)

178.1.2.3.12 TAbstractNamedVariants.Exchange Method

Swaps the positions of two items in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); virtual;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to interchange the positions of two name/Variant pairs.

Index1 and Index2 are the indexes of the two entries to swap. Exchange copies the name and Variant stored at Index1 to the position specified by Index2, and the name and Variant from Index2 to the position specified by Index1.

See Also

Move (see page 24819)

178.1.2.3.13 TAbstractNamedVariants.Get Method

Retrieves the name and Variant stored at a specified position in the list.

Pascal

```
function Get(Index: Integer; out AName: string; out AValue: Variant): Boolean; virtual;
abstract;
```

C++

```
virtual __fastcall Boolean Get(int Index, AnsiString AName, Variant AValue) = 0;
```

Description

Get provides the underlying implementation of all methods that extract information from the named Variants (see page 24824) list based on item position. For example, the property read methods for the Names (see page 24822) and Variants (see page 24824) properties both call Get to extract the relevant information from the list.

Index is the index of the name and Variant to read.

AName returns the name stored at the specified position.

AValue returns the Variant value stored at the specified position.

Get returns true if Index is the index of an item in the list, false if there is no name/Variant pair at the specified position.

TAbstractNamedVariants (see page 24808) declares Get as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 24822)

Variants (see page 24824)

Put (see page 24820)

178.1.2.3.14 TAbstractNamedVariants.GetCapacity Method

Returns the value of the Capacity (see page 24821) property.

Pascal

```
function GetCapacity: Integer; virtual;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity (see page 24821) property.

In TAbstractNamedVariants (see page 24808), GetCapacity always returns the value of the Count (see page 24822) property, because TAbstractNamedVariants (see page 24808) does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override GetCapacity to reflect the capacity of the list.

See Also

Capacity (see page 24821)

Count (see page 24822)

178.1.2.3.15 TAbstractNamedVariants.GetCount Method

Returns the value of the Count (see page 24822) property.

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCapacity (see page 24817) is the protected read implementation of the Count (see page 24822) property.

TAbstractNamedVariants (see page 24808) declares GetCount as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 24822) property.

See Also

Count (see page 24822)

178.1.2.3.16 TAbstractNamedVariants.IndexOfName Method

Returns the index of the first item in the list with a specified name.

Pascal

```
function IndexOfName(const Name: string): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfName(const AnsiString Name);
```

Description

Call IndexOfName to determine where a name appears in the list, if it appears at all.

Name is the name to locate in the list.

If Name appears as the name part of a name/Variant pair in the list, IndexOfName returns the index of the first item with that

name. If there are no items with the specified name, IndexOfName returns –1.

Note: In TAbstractNamedVariants (see page 24808), IndexOfName uses a case-insensitive comparison to locate the name. In descendant classes that treat strings case sensitively, IndexOfName makes a case sensitive comparison.

See Also

Names (see page 24822)

178.1.2.3.17 TAbstractNamedVariants.Insert Method

Inserts a name/Variant pair at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall Insert(int Index, const AnsiString S, const Variant AValue) = 0;
```

Description

Call Insert to add a name/Variant pair to the list at a specified position. After a call to Insert, any name/Variant pairs that appeared at or after the specified position move down by one (getting a new index).

Index is the position where the new name and Variant should be added.

S is the name of the new entry.

AValue is the Variant value of the new entry.

TAbstractNamedVariants (see page 24808) declares Insert as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Values (see page 24823)

Append (see page 24812)

Add (see page 24812)

Delete (see page 24815)

Count (see page 24822)

178.1.2.3.18 TAbstractNamedVariants.Move Method

Moves a name/Variant pair to a new position in the list.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer); virtual;
```

C++

```
virtual __fastcall Move(int CurIndex, int NewIndex);
```

Description

Call move to reposition an item in the list. Move removes the item from its current position and inserts it in the new position, readjusting the positions (indexes) of other items as necessary.

CurIndex is the current position of the item to move.

NewIndex is the position to which the item is moved.

See Also

Exchange (see page 24817)

178.1.2.3.19 TAbstractNamedVariants.Put Method

Stores a name/Variant pair at a specified position in the list.

Pascal

```
procedure Put(Index: Integer; const AName: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall Put(int Index, const AnsiString AName, const Variant AValue) = 0;
```

Description

Put provides the underlying implementation of all methods that change the information stored in the named Variants (see page 24824) list based on item position. For example, the property write methods for the Names (see page 24822) and Variants (see page 24824) properties both call Put to assign new values to items in the list.

Index is the index of the name and Variant to write.

AName is the name to store at the specified position.

AValue is the Variant value to store at the specified position.

TAbstractNamedVariants (see page 24808) declares Put as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 24822)

Variants (see page 24824)

Get (see page 24817)

178.1.2.3.20 TAbstractNamedVariants.SetCapacity Method

Sets the value of the Capacity (see page 24821) property.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); virtual;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected write implementation of the Capacity (see page 24821) property.

In TAbstractNamedVariants (see page 24808), SetCapacity does nothing, because TAbstractNamedVariants (see page 24808) does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override SetCapacity to reallocate the memory used to hold list items.

See Also

Capacity (see page 24821)

GetCapacity (see page 24817)

178.1.2.3.21 TAbstractNamedVariants.SetUpdateState Method

Responds when an update operation begins or ends.

Pascal

```
procedure SetUpdateState(Updating: Boolean); virtual;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

The BeginUpdate (see page 24813) and EndUpdate (see page 24815) methods call SetUpdate state when an update operation first starts or finally stops. If the calls to BeginUpdate (see page 24813) and EndUpdate (see page 24815) are nested, SetUpdate is only called by the first BeginUpdate (see page 24813) call and the last EndUpdate (see page 24815) call.

In TAbstractNamedVariants (see page 24808), SetUpdateState does nothing. Descendant classes can override this method to respond in some way (such as enabling or suppressing repaints of a control that displays the values in the list) when an update operation begins or ends.

See Also

BeginUpdate (see page 24813)

EndUpdate (see page 24815)

178.1.2.4 TAbstractNamedVariants Properties

The properties of the TAbstractNamedVariants class are listed here.

Protected Properties

	Name	Description
R	UpdateCount (see page 24823)	Indicates the number of calls to BeginUpdate (see page 24813) that have not been matched by a corresponding call to EndUpdate (see page 24815).

Public Properties

	Name	Description
	Capacity (see page 24821)	Specifies the allocated size of the named variants list.
R	Count (see page 24822)	Indicates the number of name/value pairs in the list.
R	Names (see page 24822)	Lists the names of all the Variants (see page 24824) in the list.
	Values (see page 24823)	Lists the Variants (see page 24824) in the list by name.
	Variants (see page 24824)	Lists the Variants in the list by position.

178.1.2.4.1 TAbstractNamedVariants.Capacity Property

Specifies the allocated size of the named variants list.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Set Capacity to the number of named Variants (see page 24824) the list will need to contain. When a value is added to a list that is already filled to capacity, the Capacity property is automatically increased. Setting Capacity before adding values can reduce the number of memory reallocations and thereby improve performance. In addition, in descendants that allocate memory in chunks, setting Capacity can ensure that you do not allocate more memory for the list than your application needs.

Read Capacity to learn number of values the list can hold without reallocating memory. Do not confuse Capacity with the Count (see page 24822) property, which is the number of entries in the list that are in use. The value of Capacity is always greater than or equal to the value of Count (see page 24822). When Capacity is greater than Count (see page 24822), the unused memory can be reclaimed by setting Capacity to Count (see page 24822).

See Also

Count (see page 24822)

Insert (see page 24819)

178.1.2.4.2 TAbstractNamedVariants.Count Property

Indicates the number of name/value pairs in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of values the list contains. Count acts as an upper bound to the index that you can use for the Names (see page 24822) and Variants (see page 24824) properties.

See Also

Capacity (see page 24821)

Names (see page 24822)

Variants (see page 24824)

178.1.2.4.3 TAbstractNamedVariants.Names Property

Lists the names of all the Variants (see page 24824) in the list.

Pascal

```
property Names [Index: Integer]: string;
```

C++

```
__property AnsiString Names[int Index];
```

Description

Read Names to obtain the name of a Variant in the list.

Index is the position of the name (and its corresponding Variant) in the named Variants (see page 24824) list. The value of Index falls in the range from 0 to Count (see page 24822) – 1.

See Also

Count (see page 24822)

Values (see page 24823)

Variants (see page 24824)

178.1.2.4.4 TAbstractNamedVariants.UpdateCount Property

Indicates the number of calls to BeginUpdate (see page 24813) that have not been matched by a corresponding call to EndUpdate (see page 24815).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether the named Variants (see page 24824) list is in the middle of an update operation (an operation that makes several changes to the list). Every time the application calls BeginUpdate (see page 24813), the value of UpdateCount is incremented. Every call to EndUpdate (see page 24815) decrements the value of UpdateCount.

When UpdateCount changes from 0 to 1, and when it changes from 1 to 0, TAbstractNamedVariants (see page 24808) calls the SetUpdateState (see page 24821) method. This allows TAbstractNamedVariants (see page 24808) descendants to respond in some way (such as enabling or suppressing repaints of a control that displays the values in the list) when an update operation begins or ends.

See Also

BeginUpdate (see page 24813)

EndUpdate (see page 24815)

SetUpdateState (see page 24821)

178.1.2.4.5 TAbstractNamedVariants.Values Property

Lists the Variants (see page 24824) in the list by name.

Pascal

```
property Values [const Name: string]: Variant;
```

C++

```
__property Variant Values[AnsiString const Name];
```

Description

Read Values to look up the Variant that is stored under a particular name. Set Values to change the Variant associated with a name, or to add a new name and Variant to the list.

Name is the name of the Variant. If there is no Variant in the list with the specified name, reading Values gives an unassigned Variant, and setting Values adds a new name and Variant to the list.

See Also

Count (see page 24822)

Values

Variants (see page 24824)

178.1.2.4.6 TAbstractNamedVariants.Variants Property

Lists the Variants in the list by position.

Pascal

```
property Variants [Index: Integer]: Variant;
```

C++

```
__property Variant Variants[int Index];
```

Description

Read Variants to look up the Variant that is stored at a particular position. Set Variants to change the Variant stored in a particular position.

Index is the position of the Variant in the named Variants list. The value of Index falls in the range from 0 to Count (see page 24822) – 1. If you specify a value of Index that is out of range, TAbstractNamedVariants (see page 24808) raises an ENamedVariantsError (see page 24808) exception.

See Also

Count (see page 24822)

Values (see page 24823)

Names (see page 24822)

ENamedVariantsError (see page 24808)

178.1.3 TNamedVariantsList Class

TNamedVariantsList is a persistent list of name/Variant pairs.

Class Hierarchy

Pascal

```
TNamedVariantsList = class(TAbstractNamedVariants);
```

C++

```
class TNamedVariantsList : public TAbstractNamedVariants;
```

File

WebContnrs

Description

Use TNamedVariantsList to represent a set of name/value pairs where the values are all Variants (see page 23567). Because TNamedVariantsList is a descendant of TPersistent, it can be used as the type of a published property on a component.

TNamedVariantsList has properties and methods that let you:

Look up Variant values by name or by index.

Locate a name in the list.

Add (see page 24812) or delete name/Variant pairs.

Rearrange the items in the list.

Compare this list to another named variants list.

Note: TNamedVariantsList treats the names it stores in a case-insensitive manner. When locating a name in the list or assigning a Variant value to an existing name, TNamedVariantsList treats names that differ only by case as the same.

See Also

TStringList (see page 3006)

THashedStringList (see page 15450)

TCollection (see page 2731)

TList (see page 2868)

TInterfaceList (see page 2855)

178.1.3.1 TNamedVariantsList Members

The following tables list the members exposed by TNamedVariantsList.

Protected Methods

	Name	Description
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 24814)	Compares two strings.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 24814)	Allows the list of names and their corresponding Variant values to be saved with the named Variants (see page 24824) list.
	Error (see page 24816)	Raises an ENamedVariantsError (see page 24808) exception.
V	Get (see page 24828)	Retrieves the name and Variant stored at a specified position in the list.
V	GetCapacity (see page 24828)	Returns the value of the Capacity property.
V	GetCount (see page 24829)	Returns the value of the Count property.
	GetOwner (see page 2932)	Returns the owner of an object.
V	Put (see page 24830)	Stores a name/Variant pair at a specified position in the list.
V	SetCapacity (see page 24830)	Sets the value of the Capacity property.
V	SetUpdateState (see page 24821)	Responds when an update operation begins or ends.

Protected Properties

	Name	Description
R	UpdateCount (see page 24823)	Indicates the number of calls to BeginUpdate (see page 24813) that have not been matched by a corresponding call to EndUpdate (see page 24815).

Public Methods

	Name	Description
V	Add (see page 24812)	Adds a named Variant to the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Append (see page 24812)	Adds a named Variant to the end of the list.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	Assign (see page 24813)	Copies the list of named Variants (see page 24824) from another object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeginUpdate (see page 24813)	Signals the start of an update operation.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 24827)	Deletes all the name/Variant pairs from the list.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Delete (see page 24827)	Removes a specified Variant specified by the Index parameter.
V	Destroy (see page 24826)	Frees an instance of TNamedVariantsList (see page 24824).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndUpdate (see page 24815)	Signals the end of an update operation.
	Equals (see page 24816)	Compares this named Variants (see page 24824) list with another one.
V	Exchange (see page 24817)	Swaps the positions of two items in the list.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	IndexOfName (see page 24818)	Returns the index of the first item in the list with a specified name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
V	Insert (see page 24829)	Inserts a name/Variant pair at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	Move (see page 24819)	Moves a name/Variant pair to a new position in the list.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 24821)	Specifies the allocated size of the named variants list.
R	Count (see page 24822)	Indicates the number of name/value pairs in the list.
R	Names (see page 24822)	Lists the names of all the Variants (see page 24824) in the list.
	Values (see page 24823)	Lists the Variants (see page 24824) in the list by name.
	Variants (see page 24824)	Lists the Variants in the list by position.

178.1.3.2 TNamedVariantsList.Destroy Destructor

Frees an instance of TNamedVariantsList (see page 24824).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNamedVariantsList();
```

Description

Do not call the TNamedVariantsList (see page 24824) destructor directly. Instead, use the Free method, which first checks

whether the reference to the object is nil before calling Destroy.

See Also

Free (see page 22300)

178.1.3.3 TNamedVariantsList Methods

The methods of the TNamedVariantsList class are listed here.

Protected Methods

	Name	Description
	Get (see page 24828)	Retrieves the name and Variant stored at a specified position in the list.
	GetCapacity (see page 24828)	Returns the value of the Capacity property.
	GetCount (see page 24829)	Returns the value of the Count property.
	Put (see page 24830)	Stores a name/Variant pair at a specified position in the list.
	SetCapacity (see page 24830)	Sets the value of the Capacity property.

Public Methods

	Name	Description
	Clear (see page 24827)	Deletes all the name/Variant pairs from the list.
	Delete (see page 24827)	Removes a specified Variant specified by the Index parameter.
	Insert (see page 24829)	Inserts a name/Variant pair at a specified position.

178.1.3.3.1 TNamedVariantsList.Clear Method

Deletes all the name/Variant pairs from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call Clear to empty the list. Clear frees the memory that the Variants (see page 23567) in the list use to store their values as well as the memory used to store the list itself.

After a call to Clear, the value of the Count (see page 24822) property is zero.

See Also

Delete (see page 24827)

Variants (see page 24824)

Count

178.1.3.3.2 TNamedVariantsList.Delete Method

Removes a specified Variant specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a specified name/Variant pair from the list. Delete frees the Variant when it removes the item from the list.

After a call to Delete, any name/Variant pairs that appeared after the deleted item in the list move up by one (getting a new index).

Index is the position of the item to delete.

See Also

Clear (see page 24827)

IndexOfName (see page 24818)

178.1.3.3.3 TNamedVariantsList.Get Method

Retrieves the name and Variant stored at a specified position in the list.

Pascal

```
function Get(Index: Integer; out AName: string; out AValue: Variant): Boolean; override;
```

C++

```
virtual __fastcall Boolean Get(int Index, AnsiString AName, Variant AValue);
```

Description

Get provides the underlying implementation of all methods that extract information from the named Variants list based on item position. For example, the property read methods for the Names and Variants properties both call Get to extract the relevant information from the list.

Index is the index of the name and Variant to read.

AName returns the name stored at the specified position.

AValue returns the Variant value stored at the specified position.

Get returns true if Index is the index of an item in the list, false if there is no name/Variant pair at the specified position.

TAbstractNamedVariants declares Get as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 24822)

Variants (see page 24824)

Put (see page 24820)

178.1.3.3.4 TNamedVariantsList.GetCapacity Method

Returns the value of the Capacity property.

Pascal

```
function GetCapacity: Integer; override;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity property.

In TAbstractNamedVariants, GetCapacity always returns the value of the Count property, because TAbstractNamedVariants does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override GetCapacity to reflect the capacity of the list.

See Also

Capacity (see page 24821)

Count (see page 24822)

178.1.3.3.5 TNamedVariantsList.GetCount Method

Returns the value of the Count property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCapacity is the protected read implementation of the Count property.

TAbstractNamedVariants declares GetCount as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation for the Count property.

See Also

Count (see page 24822)

178.1.3.3.6 TNamedVariantsList.Insert Method

Inserts a name/Variant pair at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall Insert(int Index, const AnsiString S, const Variant AValue);
```

Description

Call Insert to add a name/Variant pair to the list at a specified position. After a call to Insert, any name/Variant pairs that appeared at or after the specified position move down by one (getting a new index).

Index is the position where the new name and Variant should be added.

S is the name of the new entry.

AValue is the Variant value of the new entry.

See Also

Values (see page 24823)

Append (see page 24812)

Add (see page 24812)

Delete (see page 24827)

Count

178.1.3.3.7 TNamedVariantsList.Put Method

Stores a name/Variant pair at a specified position in the list.

Pascal

```
procedure Put(Index: Integer; const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall Put(int Index, const AnsiString AName, const Variant AValue);
```

Description

Put provides the underlying implementation of all methods that change the information stored in the named Variants list based on item position. For example, the property write methods for the Names and Variants properties both call Put to assign new values to items in the list.

Index is the index of the name and Variant to write.

AName is the name to store at the specified position.

AValue is the Variant value to store at the specified position.

TAbstractNamedVariants declares Put as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 24822)

Variants (see page 24824)

Get (see page 24817)

178.1.3.3.8 TNamedVariantsList.SetCapacity Method

Sets the value of the Capacity property.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); override;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected write implementation of the Capacity property.

In TAbstractNamedVariants, SetCapacity does nothing, because TAbstractNamedVariants does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override SetCapacity to reallocate the memory used to hold list items.

See Also

Capacity (see page 24821)

GetCapacity (see page 24817)

178.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TNamedVariantItem (see page 24832)	This is record WebContnrs.TNamedVariantItem.

178.2.1 WebContnrs.TNamedVariantItem Record

Pascal

```
TNamedVariantItem = record
  FString: string;
  FVariant: Variant;
end;
```

C++

```
struct TNamedVariantItem {
  AnsiString FString;
  Variant FVariant;
};
```

File

WebContnrs

Description

This is record WebContnrs.TNamedVariantItem.

178.3 Types

The following table lists types in this documentation.

Types

Name	Description
PNamedVariantItem (see page 24833)	This is type WebContnrs.PNamedVariantItem.
PNamedVariantList (see page 24833)	This is type WebContnrs.PNamedVariantList.
TNamedVariantList (see page 24833)	This is type WebContnrs.TNamedVariantList.

178.3.1 WebContnrs.PNamedVariantItem Type

Pascal

```
PNamedVariantItem = ^TNamedVariantItem;
```

C++

```
^TNamedVariantItem PNamedVariantItem;
```

File

WebContnrs

Description

This is type WebContnrs.PNamedVariantItem.

178.3.2 WebContnrs.PNamedVariantList Type

Pascal

```
PNamedVariantList = ^TNamedVariantList;
```

C++

```
^TNamedVariantList PNamedVariantList;
```

File

WebContnrs

Description

This is type WebContnrs.PNamedVariantList.

178.3.3 WebContnrs.TNamedVariantList Type

Pascal

```
TNamedVariantList = array[0..2000000000 div sizeof(TNamedVariantItem)] of TNamedVariantItem;
```

C++

```
array[0..2000000000 div sizeof(TNamedVariantItem)] of TNamedVariantItem TNamedVariantList;
```

File

WebContnrs

Description

This is type WebContnrs.TNamedVariantList.

179 WebDisp Namespace

This is namespace WebDisp.

Topics

Name	Description
Classes (see page 24838)	The following table lists classes in this documentation.
Interfaces (see page 24975)	The following table lists interfaces in this documentation.
Functions (see page 24977)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 24983)	The following table lists structs, records, enums in this documentation.
Types (see page 24984)	The following table lists types in this documentation.
Constants (see page 24991)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAdapterDispatcherException (see page 24838)	eadapterdispatcherexception is the exception class for WebSnap actions and image requests that can't be serviced.
	EPageDispatcherException (see page 24839)	EPageDispatcherException raises an exception when a page dispatcher encounters an error.
	ESessionException (see page 24840)	ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.
	TAdapterDispatcher (see page 24840)	TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TAdapterDispatchParams (see page 24848)	TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.
	TAdapterItemRequestParams (see page 24855)	TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.
	TBaseRequestHandler (see page 24860)	The TBaseRequestHandler component is a base class for WebSnap dispatcher components.
	TCustomAdapterDispatcher (see page 24865)	TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TCustomLocateFileService (see page 24880)	TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.
	TCustomPageDispatcher (see page 24889)	Dispatches incoming HTTP request messages in a WebSnap application.
	TCustomWebAppComponents (see page 24906)	TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.
	TInvalidWebSession (see page 24923)	Serves as a placeholder when an HTTP request could not be given a session.
	TLocateFileService (see page 24928)	TLocateFileService controls the access of templates and server-side script include files at runtime.

	TMultiModuleWebAppServices (see page 24933)	TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.
	TPageDispatcher (see page 24949)	TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.
	TWebAppComponents (see page 24958)	TWebAppComponents holds the application components that provide the WebSnap application's functionality.
	TWebSession (see page 24968)	TWebSession stores temporary information associated with the user in a WebSnap application.

Constants

Name	Description
sFailurePageParamName (see page 24991)	This is constant WebDisp.sFailurePageParamName.
sPageParamName (see page 24991)	This is constant WebDisp.sPageParamName.
sRequestIDParamName (see page 24992)	This is constant WebDisp.sRequestIDParamName.
sSessionCookieName (see page 24992)	This is constant WebDisp.sSessionCookieName.
sSuccessPageParamName (see page 24992)	This is constant WebDisp.sSuccessPageParamName.

Functions

	Name	Description
	AdapterRequestParamsAsStrings (see page 24977)	This is function WebDisp.AdapterRequestParamsAsStrings.
	DispatchPageName (see page 24977)	This is function WebDisp.DispatchPageName.
	EncodeParamNameValues (see page 24978)	This is function WebDisp.EncodeParamNameValues.
	EncodeParamsAsHTTPQuery (see page 24978)	This is function WebDisp.EncodeParamsAsHTTPQuery.
	ExpandScriptException (see page 24978)	This is function WebDisp.ExpandScriptException.
	ExtractParamNameValues (see page 24979)	This is function WebDisp.ExtractParamNameValues.
	FindDefaultAppPageName (see page 24979)	This is function WebDisp.FindDefaultAppPageName.
	PageNameOfRequest (see page 24979)	This is function WebDisp.PageNameOfRequest.
	RaiseDispatchBlankPageNameException (see page 24980)	This is function WebDisp.RaiseDispatchBlankPageNameException.
	RaisePageDoesNotProvideContent (see page 24980)	This is function WebDisp.RaisePageDoesNotProvideContent.
	RaisePageNotFound (see page 24980)	This is function WebDisp.RaisePageNotFound.
	RedirectToPageName (see page 24981)	This is function WebDisp.RedirectToPageName.
	RegisterAdapterRequestIdentifier (see page 24981)	This is function WebDisp.RegisterAdapterRequestIdentifier.
	SafeRedirect (see page 24981)	Redirects a browser to another specified page.

Interfaces

	Name	Description
	IWebSessionAccess (see page 24975)	This is class WebDisp.IWebSessionAccess.

Structs, Records, Enums

	Name	Description
	TPageAccessDenied (see page 24983)	This is record WebDisp.TPageAccessDenied.

Types

Name	Description
TActivateWebModuleEvent (see page 24984)	This is type WebDisp.TActivateWebModuleEvent.
TCanViewPageEvent (see page 24984)	This is type WebDisp.TCanViewPageEvent.
TDispatchActionEvent (see page 24985)	This is type WebDisp.TDispatchActionEvent.
TDispatchActionHandledEvent (see page 24985)	This is type WebDisp.TDispatchActionHandledEvent.
TDispatchImageEvent (see page 24985)	This is type WebDisp.TDispatchImageEvent.
TDispatchImageHandledEvent (see page 24986)	This is type WebDisp.TDispatchImageHandledEvent.
TDispatchPageEvent (see page 24986)	This is type WebDisp.TDispatchPageEvent.
TDispatchPageHandledEvent (see page 24986)	This is type WebDisp.TDispatchPageHandledEvent.
TDispatchPageParamsHandledEvent (see page 24987)	This is type WebDisp.TDispatchPageParamsHandledEvent.
TGetAdapterRequestParamsEvent (see page 24987)	This is type WebDisp.TGetAdapterRequestParamsEvent.
TLocateFileServiceFindFileEvent (see page 24987)	This is type WebDisp.TLocateFileServiceFindFileEvent.
TLocateFileServiceFindStreamEvent (see page 24988)	This is type WebDisp.TLocateFileServiceFindStreamEvent.

TLoginPagedHandledEvent (see page 24988)	This is type WebDisp.TLoginPagedHandledEvent.
TLoginRequiredEvent (see page 24988)	This is type WebDisp.TLoginRequiredEvent.
TPageAccessDeniedEvent (see page 24989)	This is type WebDisp.TPageAccessDeniedEvent.
TWebRequest (see page 24989)	This is type WebDisp.TWebRequest.
TWebResponse (see page 24989)	This is type WebDisp.TWebResponse.

179.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAdapterDispatcherException (see page 24838)	eadapterdispatcherexception is the exception class for WebSnap actions and image requests that can't be serviced.
	EPageDispatcherException (see page 24839)	EPageDispatcherException raises an exception when a page dispatcher encounters an error.
	ESessionException (see page 24840)	ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.
	TAdapterDispatcher (see page 24840)	TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TAdapterDispatchParams (see page 24848)	TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.
	TAdapterItemRequestParams (see page 24855)	TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.
	TBaseRequestHandler (see page 24860)	The TBaseRequestHandler component is a base class for WebSnap dispatcher components.
	TCustomAdapterDispatcher (see page 24865)	TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TCustomLocateFileService (see page 24880)	TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.
	TCustomPageDispatcher (see page 24889)	Dispatches incoming HTTP request messages in a WebSnap application.
	TCustomWebAppComponents (see page 24906)	TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.
	TInvalidWebSession (see page 24923)	Serves as a placeholder when an HTTP request could not be given a session.
	TLocateFileService (see page 24928)	TLocateFileService controls the access of templates and server-side script include files at runtime.
	TMultiModuleWebAppServices (see page 24933)	TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.
	TPageDispatcher (see page 24949)	TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.
	TWebAppComponents (see page 24958)	TWebAppComponents holds the application components that provide the WebSnap application's functionality.
	TWebSession (see page 24968)	TWebSession stores temporary information associated with the user in a WebSnap application.

179.1.1 EAdapterDispatcherException Class

eadapterdispatcherexception is the exception class for WebSnap actions and image requests that can't be serviced.

Class Hierarchy

Pascal

```
EAdapterDispatcherException = class(EWebBrokerException);
```

C++

```
class EAdapterDispatcherException : public EWebBrokerException;
```

File

WebDisp

Description

When the TAdapterDispatcher (see page 24840) component can't successfully dispatch an action or obtain a dynamic image in response to a request, it generates an OnActionRequestNotHandled or an OnImageRequestNotHandled event. If there is no event handler for that event, or if the event handler does not handle the situation, TAdapterDispatcher (see page 24840) raises an eadapterdispatcherexception exception.

See Also

TCustomAdapterDispatcher (see page 24865)

TCustomAdapterDispatcher (see page 24865)

179.1.2 EPageDispatcherException Class

EPageDispatcherException raises an exception when a page dispatcher encounters an error.

Class Hierarchy

Pascal

```
EPageDispatcherException = class(EWebBrokerException);
```

C++

```
class EPageDispatcherException : public EWebBrokerException;
```

File

WebDisp

Description

EPageDispatcherException represents exceptions that occur when a page dispatcher tries to obtain the content of a Web page in response to an incoming HTTP request. These exceptions include

The incoming request does not request a specific Web page and the application does not provide a default Web page to handle this situation.

The current user does not have access rights for the requested page.

The page dispatcher could not locate a Web page module to provide the requested page.

The Web module with the same name as the requested page can't produce a Web page.

The application is attempting to send a response that redirects the user to a page that the dispatcher can't locate.

See Also

TPageDispatcher (see page 24949)

179.1.3 ESessionException Class

ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.

Class Hierarchy

Pascal

```
ESessionException = class(EWebBrokerException);
```

C++

```
class ESessionException : public EWebBrokerException;
```

File

WebDisp

Description

The TInvalidWebSession (see page 24923) class raises ESessionException when the application tries to use the current session and that session could not be created. This includes attempts to change the properties of the current session (such as setting the time-out period), attempts to get or set values, or attempts to terminate the current session.

See Also

TInvalidWebSession (see page 24923)

179.1.4 TAdapterDispatcher Class

TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.

Class Hierarchy

Pascal

```
TAdapterDispatcher = class(TCustomAdapterDispatcher);
```

C++

```
class TAdapterDispatcher : public TCustomAdapterDispatcher;
```

File

WebDisp

Description

TAdapterDispatcher is one of the default application components that is added when creating a WebSnap application. Events

are triggered before and after dispatching an action or image, when adapter parameters are requested, and in cases when the action or image request was not handled.

Note: Your web application will be unable to execute adapter actions or obtain images from adapter fields unless it includes a TAdapterDispatcher component.

See Also

TAdapter (see page 23713)

TCustomWebAppComponents (see page 24906)

179.1.4.1 TAdapterDispatcher Members

The following tables list the members exposed by TAdapterDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddSpecialParams (see page 24870)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAdapterRequestNotHandled (see page 24870)	Generates an OnActionRequestNotHandled (see page 24877) and an OnImageRequestNotHandled (see page 24879) event.
	DoAfterDispatchAdapterRequest (see page 24871)	Generates an OnAfterDispatchAction (see page 24877) and an OnAfterDispatchImage (see page 24878) event.
	DoBeforeDispatchAdapterRequest (see page 24871)	Generates an OnBeforeDispatchAction (see page 24878) and an OnBeforeDispatchImage (see page 24878) event.
	EncodeAdapterItemRequestAsFieldValue (see page 24872)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 24872)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 24873)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDispatchParams (see page 24873)	Parses a request to determine the adapter to which it is directed.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 24864)	Handles an HTTP request.

	ImplEncodeAdapterItemRequestAsFieldValue (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 24872) method.
	ImplEncodeAdapterItemRequestAsHREF (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 24872) method.
	ImplGetAdapterItemRequestParams (see page 24875)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 24873) method.
	ImplHandleRequest (see page 24864)	Handles application-specific processing of an HTTP request.
	ImplHandleRequest (see page 24876)	Provides the underlying implementation for the HandleRequest (see page 24864) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EncodeAdapterItemRequestAsFieldValue (see page 19654)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 19654)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterItemRequestParams (see page 19655)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActionRequestNotHandled (see page 24844)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 24845)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 24845)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 24846)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 24846)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 24847)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 24847)	Occurs when the WebSnap application could not provide a requested image.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.4.2 TAdapterDispatcher Events

The events of the TAdapterDispatcher class are listed here.

Published Events

	Name	Description
	OnActionRequestNotHandled (see page 24844)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 24845)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 24845)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 24846)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 24846)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 24847)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 24847)	Occurs when the WebSnap application could not provide a requested image.

179.1.4.2.1 TAdapterDispatcher.OnActionRequestNotHandled Event

Occurs when the WebSnap application could not execute a requested action.

Pascal

```
property OnActionRequestNotHandled: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnActionRequestNotHandled;
```

Description

Write an OnActionRequestNotHandled event handler to provide a response to actions that the adapter components in the application can't execute. This may occur because the adapter dispatcher could not find an adapter to handle the action, or it may occur because the identified adapter was unable to execute the action.

If the OnActionRequestNotHandled event handler does not set its Handled parameter to true, the adapter dispatcher generates an OnImageRequestNotHandled. If the OnImageRequestNotHandled event handler also does not handle the event, the dispatcher raises an EAdapterDispatcherException exception.

Tip: Use the Response property of the current Web context to access the response message from the OnActionRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnAfterDispatchAction (see page 24877)

OnBeforeDispatchAction (see page 24878)

EAdapterDispatcherException (see page 24838)

WebContext (see page 24687)

Response (see page 24659)

OnImageRequestNotHandled (see page 24879)

179.1.4.2.2 TAdapterDispatcher.OnAfterDispatchAction Event

Occurs after the target adapter has finished executing an action.

Pascal

```
property OnAfterDispatchAction: TDispatchActionEvent;
```

C++

```
__property TDispatchActionEvent OnAfterDispatchAction;
```

Description

Write an OnAfterDispatchAction event handler to take specific action after an adapter has executed an action. Note that this event can occur even if the request does not request the execution of an action or if the adapter was not successful in its attempt to execute the action.

See Also

OnActionRequestNotHandled (see page 24877)

OnBeforeDispatchAction (see page 24878)

179.1.4.2.3 TAdapterDispatcher.OnAfterDispatchImage Event

Occurs after the target adapter has finished handling an image request.

Pascal

```
property OnAfterDispatchImage: TDispatchImageEvent;
```

C++

```
__property TDispatchImageEvent OnAfterDispatchImage;
```

Description

Write an OnAfterDispatchImage event handler to take specific action after an adapter has responded to an image request. Note that this event can occur even if the request does not request the value of an image field or if the adapter was not successful in its attempt to honor that request.

See Also

OnImageRequestNotHandled (see page 24879)

OnBeforeDispatchImage (see page 24878)

179.1.4.2.4 TAdapterDispatcher.OnBeforeDispatchAction Event

Occurs before the dispatcher forwards an action to an adapter for execution.

Pascal

```
property OnBeforeDispatchAction: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnBeforeDispatchAction;
```

Description

Write an OnBeforeDispatchAction event handler to respond to action requests before they are forwarded to the associated adapter for execution. Note that if the request does not request the execution of an action, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchAction event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Action parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for execution, and does not generate an OnAfterDispatchAction event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchAction event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnActionRequestNotHandled (see page 24877)

OnAfterDispatchAction (see page 24877)

WebContext (see page 24687)

Response (see page 24659)

179.1.4.2.5 TAdapterDispatcher.OnBeforeDispatchImage Event

Occurs before the dispatcher forwards an image request to an adapter for handling.

Pascal

```
property OnBeforeDispatchImage: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnBeforeDispatchImage;
```

Description

Write an OnBeforeDispatchImage event handler to respond to image requests before they are forwarded to the associated adapter for handling. Note that if the request does not ask for the value of an image field, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchImage event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Image parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for handling, and does not generate an OnAfterDispatchImage event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchImage event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnImageRequestNotHandled (see page 24879)

OnAfterDispatchImage (see page 24878)

WebContext (see page 24687)

Response (see page 24659)

179.1.4.2.6 TAdapterDispatcher.OnGetAdapterRequestParams Event

Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

Pascal

```
property OnGetAdapterRequestParams: TGetAdapterRequestParamsEvent;
```

C++

```
__property TGetAdapterRequestParamsEvent OnGetAdapterRequestParams;
```

Description

Write an OnGetAdapterRequestParams event handler to modify the list of parameters for an action or image request before they are used. The OnGetAdapterRequestParams event handler can modify the current parameters or add its own parameters to the list. This event occurs both when the dispatcher formats parameters that are added to HTML forms and when it is dispatching a request message that contains an action or image request.

See Also

GetAdapterItemRequestParams (see page 24873)

EncodeAdapterItemRequestAsFieldValue (see page 24872)

EncodeAdapterItemRequestAsHREF (see page 24872)

AddSpecialParams (see page 24870)

179.1.4.2.7 TAdapterDispatcher.OnImageRequestNotHandled Event

Occurs when the WebSnap application could not provide a requested image.

Pascal

```
property OnImageRequestNotHandled: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnImageRequestNotHandled;
```

Description

Write an OnImageRequestNotHandled event handler to provide a response to image requests that the adapter components in the application can't honor. This may occur because the adapter dispatcher could not find an adapter to handle the request, or it may occur because the identified adapter was unable to provide the requested image.

If the OnImageRequestNotHandled event handler exits with its Handled parameter set to false, the dispatcher raises an EAdapterDispatcherException exception.

Tip: Use the Response property of the current Web context to access the response message from the OnImageRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnAfterDispatchImage (see page 24878)

OnBeforeDispatchImage (see page 24878)

EAdapterDispatcherException (see page 24838)

WebContext (see page 24687)

Response (see page 24659)

OnActionRequestNotHandled (see page 24877)

179.1.5 TAdapterDispatchParams Class

TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.

Class Hierarchy

Pascal

```
TAdapterDispatchParams = class(TInterfacedObject, IAdapterDispatchParams,
IGetAdapterRequestDefaultResponse);
```

C++

```
class TAdapterDispatchParams : public TInterfacedObject, public IAdapterDispatchParams, public
IGetAdapterRequestDefaultResponse;
```

File

WebDisp

Description

TAdapterDispatcher (see page 24840) uses TAdapterDispatchParams as a helper object for locating the adapter that can handle a request message. The TAdapterDispatchParams constructor takes a request message as an argument, and parses the request to determine the adapter, if any, that should handle it and the parameters that the adapter needs to handle the request.

The TAdapterDispatchParms properties identify the adapter that can process the request, the name of the action or field that the

adapter uses to process the request, and the type of request (an action to execute or a field value to retrieve).

See Also

TAdapterDispatcher (see page 24840)

IAdapterDispatchParams (see page 19655)

179.1.5.1 TAdapterDispatchParams Members

The following tables list the members exposed by TAdapterDispatchParams.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetFailurePage (see page 24851)	This is GetFailurePage, a member of class TAdapterDispatchParams.
	GetHandler (see page 24852)	Returns the value of the Handler property.
	GetObjectIdentifier (see page 24852)	Returns the value of the ObjectIdentifier property.
	GetParams (see page 24852)	Returns the value of the Params property.
	GetRequestIdentifier (see page 24853)	Returns the value of the RequestIdentifier property.
	GetSuccessPage (see page 24853)	This is GetSuccessPage, a member of class TAdapterDispatchParams.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24850)	Creates and initializes a TAdapterDispatchParams (see page 24848) object based on the information in an HTTP request.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24851)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	FailurePage (see page 19694)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	Handler (see page 24853)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 24854)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 19659)	Indicates the parameter values to use when executing the action or looking up the image.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	RequestIdentifier (see page 24854)	Identifies the type of the request identified by the ObjectIdentifier (see page 24854) property.
R	SuccessPage (see page 19694)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

179.1.5.2 TAdapterDispatchParams.Create Constructor

Creates and initializes a TAdapterDispatchParams (see page 24848) object based on the information in an HTTP request.

Pascal

```
constructor Create(ARequest: TWebRequest);
```

C++

```
__fastcall TAdapterDispatchParams(TWebRequest ARequest);
```

Description

Call Create to create a new TAdapterDispatchParams (see page 24848) object and use it to obtain information encoded in an HTTP request message.

The TAdapterDispatchParams (see page 24848) constructor parses the request message that is supplied as ARequest, locating the values that identify the adapter that must be used to handle the request, and the name and type of the information that that adapter supplies. Create uses this information to initialize the Handler (see page 24853), ObjectIdentifier (see page 24854), and RequestIdentifier (see page 24854) properties.

See Also

Handler (see page 24853)

ObjectIdentifier (see page 24854)

RequestIdentifier (see page 24854)

179.1.5.3 TAdapterDispatchParams.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDispatchParams();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

179.1.5.4 TAdapterDispatchParams Methods

The methods of the TAdapterDispatchParams class are listed here.

Protected Methods

	Name	Description
	GetFailurePage (see page 24851)	This is GetFailurePage, a member of class TAdapterDispatchParams.
	GetHandler (see page 24852)	Returns the value of the Handler property.
	GetObjectIdentifier (see page 24852)	Returns the value of the ObjectIdentifier property.
	GetParams (see page 24852)	Returns the value of the Params property.
	GetRequestIdentifier (see page 24853)	Returns the value of the RequestIdentifier property.
	GetSuccessPage (see page 24853)	This is GetSuccessPage, a member of class TAdapterDispatchParams.

179.1.5.4.1 TAdapterDispatchParams.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

This is GetFailurePage, a member of class TAdapterDispatchParams.

179.1.5.4.2 TAdapterDispatchParams.GetHandler Method

Returns the value of the Handler property.

Pascal

```
function GetHandler: TObject;
```

C++

```
__fastcall TObject * GetHandler();
```

Description

GetHandler is the read implementation of the Handler property.

See Also

Handler (see page 19658)

179.1.5.4.3 TAdapterDispatchParams.GetObjectIdentifier Method

Returns the value of the ObjectIdentifier property.

Pascal

```
function GetObjectIdentifier: string;
```

C++

```
__fastcall AnsiString GetObjectIdentifier();
```

Description

GetObjectIdentifier is the read implementation of the ObjectIdentifier property.

See Also

ObjectIdentifier (see page 19658)

179.1.5.4.4 TAdapterDispatchParams.GetParams Method

Returns the value of the Params property.

Pascal

```
function GetParams: TStrings;
```

C++

```
__fastcall TStrings GetParams();
```

Description

GetParams is the read implementation of the Params property.

See Also

Params (see page 19659)

179.1.5.4.5 TAdapterDispatchParams.GetRequestIdentifier Method

Returns the value of the RequestIdentifier property.

Pascal

```
function GetRequestIdentifier: string;
```

C++

```
__fastcall AnsiString GetRequestIdentifier();
```

Description

GetRequestIdentifier is the read implementation of the RequestIdentifier property.

See Also

RequestIdentifier (see page 19659)

179.1.5.4.6 TAdapterDispatchParams.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class TAdapterDispatchParams.

179.1.5.5 TAdapterDispatchParams Properties

The properties of the TAdapterDispatchParams class are listed here.

Public Properties

	Name	Description
R	Handler (see page 24853)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 24854)	Specifies the name of the action to execute or the field to retrieve.
R	RequestIdentifier (see page 24854)	Identifies the type of the request identified by the ObjectIdentifier (see page 24854) property.

179.1.5.5.1 TAdapterDispatchParams.Handler Property

Indicates the adapter object that can handle the current request.

Pascal

```
property Handler: TObject;
```

C++

```
__property TObject * Handler;
```

Description

Read Handler to access the adapter that can execute the action or supply the image that is requested. The TAdapterDispatchParams (see page 24848) constructor initializes this property based on the information it parses from the current request message.

See Also

Create (see page 24850)

ObjectIdentifier (see page 24854)

RequestIdentifier (see page 24854)

179.1.5.5.2 TAdapterDispatchParams.ObjectIdentifier Property

Specifies the name of the action to execute or the field to retrieve.

Pascal

```
property ObjectIdentifier: string;
```

C++

```
__property AnsiString ObjectIdentifier;
```

Description

Read ObjectIdentifier to determine the name of the requested action or field. The TAdapterDispatchParams (see page 24848) constructor initializes this property based on the information it parses from the current request message.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 24853) parameter.

See Also

Create (see page 24850)

Handler (see page 24853)

RequestIdentifier (see page 24854)

179.1.5.5.3 TAdapterDispatchParams.RequestIdentifier Property

Identifies the type of the request identified by the ObjectIdentifier (see page 24854) property.

Pascal

```
property RequestIdentifier: string;
```

C++

```
__property AnsiString RequestIdentifier;
```

Description

Read RequestIdentifier to determine the type of processing the current request requires. For example, the RequestIdentifier may identify the request as a request for the value of an image field or a request to execute an action. The TAdapterDispatchParams (see page 24848) constructor initializes this property based on the information it parses from the current request message.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 24853) parameter.

See Also

Create (see page 24850)

Handler (see page 24853)

ObjectIdentifier (see page 24854)

179.1.6 TAdapterItemRequestParams Class

TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.

Class Hierarchy

Pascal

```
TAdapterItemRequestParams = class(TInterfacedObject, IAdapterItemRequestParams);
```

C++

```
class TAdapterItemRequestParams : public TInterfacedObject, public IAdapterItemRequestParams;
```

File

WebDisp

Description

TAdapterItemRequestParams is the default implementation of the IAdapterItemRequestParams interface. It holds the name/value pairs that should be included as request parameters to an adapter or one of its subcomponents.

The parameters, which can be accessed through the ParamValues (see page 24860) property, are a set of 'Name=Value' strings. In addition to holding these parameters, TAdapterItemRequestParams has two properties, SuccessPage (see page 24860) and FailurePage (see page 24859), which identify the Web pages that should be returned to the caller when the request succeeds or fails.

See Also

TAdapterDispatcher (see page 24840)

IAdapterItemRequestParams (see page 19673)

GetAdapterItemRequestParams

179.1.6.1 TAdapterItemRequestParams Members

The following tables list the members exposed by TAdapterItemRequestParams.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetFailurePage (see page 24857)	Returns the value of the FailurePage property.
	GetParamValues (see page 24858)	Returns the value of the ParamValues property.

	GetSuccessPage (see page 24858)	Returns the value of the SuccessPage property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetFailurePage (see page 24858)	Sets the value of the FailurePage property.
	SetSuccessPage (see page 24859)	Sets the value of the SuccessPage property.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24857)	Creates and initializes a TAdapterItemRequestParams (see page 24855) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 24857)	Frees an instance of TAdapterItemRequestParams (see page 24855).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	FailurePage (see page 24859)	Indicates the Web page that the application should return if the current request fails.
R	ParamValues (see page 24860)	Lists the parameter values that are included in requests to the adapter action or field.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	SuccessPage (see page 24860)	Indicates the Web page that the application should return if the request succeeds.

179.1.6.2 TAdapterItemRequestParams.Create Constructor

Creates and initializes a TAdapterItemRequestParams (see page 24855) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAdapterItemRequestParams();
```

Description

Typically, applications have no need to create TAdapterItemRequestParams (see page 24855) instances. The adapter dispatcher creates these objects to hold the parameters for a request.

See Also

TAdapterDispatcher (see page 24840)

179.1.6.3 TAdapterItemRequestParams.Destroy Destructor

Frees an instance of TAdapterItemRequestParams (see page 24855).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterItemRequestParams();
```

Description

Most applications have no need to create or free TAdapterItemRequestParams (see page 24855) instances. These objects are managed by the adapter dispatcher.

See Also

TAdapterDispatcher (see page 24840)

179.1.6.4 TAdapterItemRequestParams Methods

The methods of the TAdapterItemRequestParams class are listed here.

Protected Methods

	Name	Description
	GetFailurePage (see page 24857)	Returns the value of the FailurePage property.
	GetParamValues (see page 24858)	Returns the value of the ParamValues property.
	GetSuccessPage (see page 24858)	Returns the value of the SuccessPage property.
	SetFailurePage (see page 24858)	Sets the value of the FailurePage property.
	SetSuccessPage (see page 24859)	Sets the value of the SuccessPage property.

179.1.6.4.1 TAdapterItemRequestParams.GetFailurePage Method

Returns the value of the FailurePage property.

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall AnsiString GetFailurePage();
```

Description

GetFailurePage is the read implementation of the FailurePage property.

See Also

FailurePage (see page 19676)

179.1.6.4.2 TAdapterItemRequestParams.GetParamValues Method

Returns the value of the ParamValues property.

Pascal

```
function GetParamValues: TStrings;
```

C++

```
__fastcall TStrings GetParamValues();
```

Description

GetParamValues is the read implementation of the ParamValues property.

See Also

ParamValues (see page 19677)

179.1.6.4.3 TAdapterItemRequestParams.GetSuccessPage Method

Returns the value of the SuccessPage property.

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall AnsiString GetSuccessPage();
```

Description

GetSuccessPage is the read implementation of the SuccessPage property.

See Also

SuccessPage (see page 19677)

179.1.6.4.4 TAdapterItemRequestParams.SetFailurePage Method

Sets the value of the FailurePage property.

Pascal

```
procedure SetFailurePage(const AValue: string);
```

C++

```
__fastcall SetFailurePage(const AnsiString AValue);
```

Description

SetFailurePage is the write implementation of the FailurePage property.

AValue is the name of the Web page that should be returned if the adapter request fails.

See Also

FailurePage (see page 19676)

179.1.6.4.5 TAdapterItemRequestParams.SetSuccessPage Method

Sets the value of the SuccessPage property.

Pascal

```
procedure SetSuccessPage(const AValue: string);
```

C++

```
__fastcall SetSuccessPage(const AnsiString AValue);
```

Description

SetSuccessPage is the write implementation of the SuccessPage property.

AValue is the name of the Web page that should be returned when the adapter request succeeds.

See Also

SuccessPage (see page 19677)

179.1.6.5 TAdapterItemRequestParams Properties

The properties of the TAdapterItemRequestParams class are listed here.

Public Properties

	Name	Description
	FailurePage (see page 24859)	Indicates the Web page that the application should return if the current request fails.
R	ParamValues (see page 24860)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 24860)	Indicates the Web page that the application should return if the request succeeds.

179.1.6.5.1 TAdapterItemRequestParams.FailurePage Property

Indicates the Web page that the application should return if the current request fails.

Pascal

```
property FailurePage: string;
```

C++

```
__property AnsiString FailurePage;
```

Description

FailurePage is the name of the registered Web page module that should generate the content of the response message if the request to the adapter fails.

See Also

SuccessPage (see page 24860)

179.1.6.5.2 TAdapterItemRequestParams.ParamValues Property

Lists the parameter values that are included in requests to the adapter action or field.

Pascal

```
property ParamValues: TStrings;
```

C++

```
__property TStrings ParamValues;
```

Description

Use ParamValues to access the list of parameter values. Use the Names property of ParamValues to obtain the names of the parameters and the Values property to access the corresponding values.

See Also

Names (see page 3075)

Values (see page 3086)

179.1.6.5.3 TAdapterItemRequestParams.SuccessPage Property

Indicates the Web page that the application should return if the request succeeds.

Pascal

```
property SuccessPage: string;
```

C++

```
__property AnsiString SuccessPage;
```

Description

SuccessPage is the name of the registered Web page module that should generate the content of the response message when the request to the adapter succeeds.

See Also

SuccessPage

179.1.7 TBaseRequestHandler Class

The TBaseRequestHandler component is a base class for WebSnap dispatcher components.

Class Hierarchy

Pascal

```
TBaseRequestHandler = class(TComponent, IWebRequestHandler, ISetAppDispatcher);
```

C++

```
class TBaseRequestHandler : public TComponent, public IWebRequestHandler, public
ISetAppDispatcher;
```

File

WebDisp

Description

The TCustomAdapterDispatcher (see page 24865) and TCustomPageDispatcher (see page 24889) components are derived from TBaseRequestHandler.

179.1.7.1 TBaseRequestHandler Members

The following tables list the members exposed by TBaseRequestHandler.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 24864)	Handles an HTTP request.
V	ImplHandleRequest (see page 24864)	Handles application-specific processing of an HTTP request.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.7.2 TBaseRequestHandler Methods

The methods of the TBaseRequestHandler class are listed here.

Protected Methods

	Name	Description
	HandleRequest (see page 24864)	Handles an HTTP request.
V	ImplHandleRequest (see page 24864)	Handles application-specific processing of an HTTP request.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.

179.1.7.2.1 TBaseRequestHandler.HandleRequest Method

Handles an HTTP request.

Pascal

```
function HandleRequest(ARequest: TWebRequest; AResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest ARequest, TWebResponse AResponse);
```

Description

HandleRequest returns true if it handles the request specified by ARequest. This function calls the ImplHandleRequest (see page 24864) to process the request. A customized overridden function should be written for ImplHandleRequest (see page 24864) to do the necessary processing specific to the application.

See Also

ImplHandleRequest (see page 24864)

179.1.7.2.2 TBaseRequestHandler.ImplHandleRequest Method

Handles application-specific processing of an HTTP request.

Pascal

```
function ImplHandleRequest(ARequest: TWebRequest; AResponse: TWebResponse): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest ARequest, TWebResponse AResponse);
```

Description

The ImplHandleRequest function is called from HandleRequest (see page 24864) to handle the application-specific processing of the HTTP request.

This base version of the function generates an assertion failure as a reminder that a customized overridden version of this function needs to be defined in order to handle the request processing specific to the application.

See Also

HandleRequest (see page 24864)

179.1.7.2.3 TBaseRequestHandler.SetAppDispatcher Method

Sets the AppDispatcher (see page 24865) property.

Pascal

```
procedure SetAppDispatcher(const AWebAppDispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * AWebAppDispatcher);
```

Description

SetAppDispatcher provides a way to set the AppDispatcher (see page 24865) property.

See Also

AppDispatcher (see page 24865)

179.1.7.3 TBaseRequestHandler Properties

The properties of the TBaseRequestHandler class are listed here.

Protected Properties

	Name	Description
R	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

179.1.7.3.1 TBaseRequestHandler.AppDispatcher Property

Provides read-only access to the application dispatcher component.

Pascal

```
property AppDispatcher: TComponent;
```

C++

```
__property TComponent * AppDispatcher;
```

Description

The application dispatcher component is typically TWebAppComponents (see page 24958). The application dispatcher component is used to access application objects such as TWebRequest (see page 24989) and application components such as TEndUserAdapter.

See Also

TCustomAdapterDispatcher (see page 24865)

TCustomPageDispatcher (see page 24889)

TWebAppComponents (see page 24958)

179.1.8 TCustomAdapterDispatcher Class

TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.

Class Hierarchy

Pascal

```
TCustomAdapterDispatcher = class(TBaseRequestHandler, IAdapterDispatcher);
```

C++

```
class TCustomAdapterDispatcher : public TBaseRequestHandler, public IAdapterDispatcher;
```

File

WebDisp

Description

TCustomAdapterDispatcher is the base class for the adapter dispatcher. The adapter dispatcher is responsible for dispatching adapter actions and references to image fields. It also handles the encoding of parameters that must be included in HTML form submissions that invoke those adapter actions or field references. If a WebSnap application does not include an AdapterDispatcher component, then it can't execute adapter actions or obtain images from adapter fields.

See Also

TAdapter (see page 23713)

TAdapterDispatcher (see page 24840)

TCustomWebAppComponents (see page 24906)

179.1.8.1 TCustomAdapterDispatcher Members

The following tables list the members exposed by TCustomAdapterDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AddSpecialParams (see page 24870)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAdapterRequestNotHandled (see page 24870)	Generates an OnActionRequestNotHandled (see page 24877) and an OnImageRequestNotHandled (see page 24879) event.
	DoAfterDispatchAdapterRequest (see page 24871)	Generates an OnAfterDispatchAction (see page 24877) and an OnAfterDispatchImage (see page 24878) event.
	DoBeforeDispatchAdapterRequest (see page 24871)	Generates an OnBeforeDispatchAction (see page 24878) and an OnBeforeDispatchImage (see page 24878) event.
	EncodeAdapterItemRequestAsFieldValue (see page 24872)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 24872)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 24873)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetDispatchParams (see page 24873)	Parses a request to determine the adapter to which it is directed.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 24864)	Handles an HTTP request.
V	ImplEncodeAdapterItemRequestAsFieldValue (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 24872) method.
V	ImplEncodeAdapterItemRequestAsHREF (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 24872) method.
V	ImplGetAdapterItemRequestParams (see page 24875)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 24873) method.
V	ImplHandleRequest (see page 24876)	Provides the underlying implementation for the HandleRequest (see page 24864) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnActionRequestNotHandled (see page 24877)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 24877)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 24878)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 24878)	Occurs before the dispatcher forwards an action to an adapter for execution.

	OnBeforeDispatchImage (see page 24878)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 24879)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 24879)	Occurs when the WebSnap application could not provide a requested image.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.8.2 TCustomAdapterDispatcher Methods

The methods of the TCustomAdapterDispatcher class are listed here.

Protected Methods

	Name	Description
V	AddSpecialParams (see page 24870)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
	DoAdapterRequestNotHandled (see page 24870)	Generates an OnActionRequestNotHandled (see page 24877) and an OnImageRequestNotHandled (see page 24879) event.
	DoAfterDispatchAdapterRequest (see page 24871)	Generates an OnAfterDispatchAction (see page 24877) and an OnAfterDispatchImage (see page 24878) event.
	DoBeforeDispatchAdapterRequest (see page 24871)	Generates an OnBeforeDispatchAction (see page 24878) and an OnBeforeDispatchImage (see page 24878) event.
	EncodeAdapterItemRequestAsFieldValue (see page 24872)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 24872)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.

	GetAdapterItemRequestParams (see page 24873)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
V	GetDispatchParams (see page 24873)	Parses a request to determine the adapter to which it is directed.
V	ImplEncodeAdapterItemRequestAsFieldValue (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 24872) method.
V	ImplEncodeAdapterItemRequestAsHREF (see page 24874)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 24872) method.
V	ImplGetAdapterItemRequestParams (see page 24875)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 24873) method.
V	ImplHandleRequest (see page 24876)	Provides the underlying implementation for the HandleRequest (see page 24864) method.

179.1.8.2.1 TCustomAdapterDispatcher.AddSpecialParams Method

Adds parameters for the success and failure Web pages to the list of adapter parameters.

Pascal

```
procedure AddSpecialParams(AHandler: IUnknown; Params: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall AddSpecialParams(IUnknown AHandler, IAdapterItemRequestParams Params);
```

Description

The adapter dispatcher calls AddSpecialParams internally after retrieving a set of parameters from an adapter (handler) and before generating an OnGetAdapterRequestParams (see page 24879) event. This method adds parameters to the list that are not required by the adapter for handling the request.

AddSpecialParams retrieves the Web pages that should be displayed when the adapter succeeds or fails in processing the request with which the handler is associated. If the handler has any special pages to display, AddSpecialParams adds the names of these pages to the parameters, using the parameter names of '__sp' and '__fp' (for success page and failure page), or '__p' (if the same page should be used for both success and failure).

AHandler is the interface for the adapter associated with the action or image.

Params is an interface that provides access to the current list of parameters.

See Also

GetAdapterItemRequestParams (see page 24873)

OnGetAdapterRequestParams (see page 24879)

FailurePage (see page 19676)

SuccessPage (see page 19677)

179.1.8.2.2 TCustomAdapterDispatcher.DoAdapterRequestNotHandled Method

Generates an OnActionRequestNotHandled (see page 24877) and an OnImageRequestNotHandled (see page 24879) event.

Pascal

```
procedure DoAdapterRequestNotHandled(AObject: TObject; var AHandled: Boolean);
```

C++

```
__fastcall DoAdapterRequestNotHandled(TObject * AObject, Boolean AHandled);
```

Description

TCustomAdapterDispatcher (see page 24865) calls DoAdapterRequestNotHandled internally when an adapter request

remains unhandled. The request may be unhandled because the adapter could not execute the requested action or obtain the requested image, or it may be unhandled because the dispatcher could not locate an adapter to handle the request.

DoAdapterRequestNotHandled assembles the parameters for an action request and generates an OnActionRequestNotHandled (see page 24877) event. It then assembles the parameters for an image request and generates an OnImageRequestNotHandled (see page 24879) event.

AObject is the adapter that failed to handle the request (or nil (Delphi) or NULL (C++) if the dispatcher could not locate an adapter for the request).

AHandled returns true if an event handler handled the request.

See Also

OnActionRequestNotHandled (see page 24877)

OnImageRequestNotHandled (see page 24879)

179.1.8.2.3 TCustomAdapterDispatcher.DoAfterDispatchAdapterRequest Method

Generates an OnAfterDispatchAction (see page 24877) and an OnAfterDispatchImage (see page 24878) event.

Pascal

```
procedure DoAfterDispatchAdapterRequest(AObject: TObject);
```

C++

```
__fastcall DoAfterDispatchAdapterRequest(TObject * AObject);
```

Description

TCustomAdapterDispatcher (see page 24865) calls DoAfterDispatchAdapterRequest internally after calling on an adapter to handle a request. It calls this method both when the adapter indicates success and when it indicates failure in handling the request.

DoAfterDispatchAdapterRequest assembles the parameters for an action request and generates an OnAfterDispatchAction (see page 24877) event. It then assembles the parameters for an image request and generates an OnAfterDispatchImage (see page 24878) event.

AObject is the adapter that just handled the current request.

See Also

OnAfterDispatchAction (see page 24877)

OnAfterDispatchImage (see page 24878)

179.1.8.2.4 TCustomAdapterDispatcher.DoBeforeDispatchAdapterRequest Method

Generates an OnBeforeDispatchAction (see page 24878) and an OnBeforeDispatchImage (see page 24878) event.

Pascal

```
procedure DoBeforeDispatchAdapterRequest(AObject: TObject; var AHandled: Boolean);
```

C++

```
__fastcall DoBeforeDispatchAdapterRequest(TObject * AObject, Boolean AHandled);
```

Description

TCustomAdapterDispatcher (see page 24865) calls DoBeforeDispatchAdapterRequest internally before calling on an adapter to handle a request. It calls this method only after it has identified the appropriate handler for responding to the current request.

DoBeforeDispatchAdapterRequest assembles the parameters for an action request and generates an OnBeforeDispatchAction (see page 24878) event. It then assembles the parameters for an image request and generates an OnBeforeDispatchImage (see page 24878) event.

AObject is the adapter for handling the current request.

AHandled returns true if an event handler handled the request.

See Also

OnBeforeDispatchAction (see page 24878)

OnBeforeDispatchImage (see page 24878)

179.1.8.2.5 TCustomAdapterDispatcher.EncodeAdapterItemRequestAsFieldValue Method

Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.

Pascal

```
function EncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall AnsiString EncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Adapter components call EncodeAdapterItemRequestAsFieldValue to encode the action or field parameters as they should appear as field values in form submissions. The resulting parameter string has a form such as '?param1=value1&param2=value2'.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 24873)

EncodeAdapterItemRequestAsHREF (see page 24872)

179.1.8.2.6 TCustomAdapterDispatcher.EncodeAdapterItemRequestAsHREF Method

Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.

Pascal

```
function EncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
```

```
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall AnsiString EncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Adapter components call EncodeAdapterItemRequestAsHREF to encode the action or image field parameters as they should appear as parameters to an anchor tag in an HTML form.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 24873)

EncodeAdapterItemRequestAsFieldValue (see page 24872)

179.1.8.2.7 TCustomAdapterDispatcher.GetAdapterItemRequestParams Method

Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

Pascal

```
procedure GetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; Params: IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(IUnknown AHandler, TAdapterItemRequestParamOptions
AOptions, IAdapterItemRequestParams Params);
```

Description

GetAdapterItemRequestParams retrieves the parameters for a call to execute an adapter action or to fetch the value of an image field.

AHandler is the interface of the adapter that requires the parameters to execute the action or produce the image field value.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. GetAdapterItemRequestParams uses this interface to write the parameter values.

GetAdapterItemRequestParams simply calls the ImplGetAdapterItemRequestParams (see page 24875) method, which fetches the parameter values and writes them to AParams.

See Also

EncodeAdapterItemRequestAsHREF (see page 24872)

EncodeAdapterItemRequestAsFieldValue (see page 24872)

ImplGetAdapterItemRequestParams (see page 24875)

179.1.8.2.8 TCustomAdapterDispatcher.GetDispatchParams Method

Parses a request to determine the adapter to which it is directed.

Pascal

```
function GetDispatchParams(Request: TWebRequest): TAdapterDispatchParams; virtual;
```

C++

```
virtual __fastcall TAdapterDispatchParams GetDispatchParams(TWebRequest Request);
```

Description

TCustomAdapterDispatcher (see page 24865) calls GetDispatchParams internally to obtain information about the adapter to which a request is directed. GetDispatchParams creates a new TAdapterDispatchParams (see page 24848) object, which parses the current request to determine the adapter to which it is directed.

Request is the current http request object.

GetDispatchParams returns the new TAdapterDispatchParams (see page 24848) object, whose properties have been filled out to reflect the information in the current request. It is the caller's responsibility to free this object.

179.1.8.2.9
TCustomAdapterDispatcher.ImplEncodeAdapterItemRequestAsFieldValue Method

Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 24872) method.

Pascal

```
function ImplEncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplEncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

The EncodeAdapterItemRequestAsFieldValue (see page 24872) method calls ImplEncodeAdapterItemRequestAsFieldValue to retrieve a set of parameters formatted as a set of field values for an HTTP request. ImplEncodeAdapterItemRequestAsFieldValue calls GetAdapterItemRequestParams (see page 24873) to fetch the parameter values, and then formats them as a set of field values.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

EncodeAdapterItemRequestAsFieldValue (see page 24872)

GetAdapterItemRequestParams (see page 24873)

179.1.8.2.10
TCustomAdapterDispatcher.ImplEncodeAdapterItemRequestAsHREF Method

Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 24872) method.

Pascal

```
function ImplEncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplEncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

The EncodeAdapterItemRequestAsHREF (see page 24872) method calls ImplEncodeAdapterItemRequestAsFieldValue (see page 24874) to retrieve a set of parameters formatted as the parameters to an anchor tag in an HTML form. ImplEncodeAdapterItemRequestAsHREF calls GetAdapterItemRequestParams (see page 24873) to fetch the parameter values, and then formats them.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF (see page 24872) returns the parameter string.

See Also

EncodeAdapterItemRequestAsHREF (see page 24872)

GetAdapterItemRequestParams (see page 24873)

179.1.8.2.11 TCustomAdapterDispatcher.ImplGetAdapterItemRequestParams Method

Provides the underlying implementation for the GetAdapterItemRequestParams (see page 24873) method.

Pascal

```
procedure ImplGetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; Params: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions, IAdapterItemRequestParams Params);
```

Description

GetAdapterItemRequestParams (see page 24873) calls ImplGetAdapterItemRequestParams to retrieve the parameters for a call to execute an adapter action or to fetch the value of an image field. This method fetches the requested parameters from the adapter interface, calls the AddSpecialParams (see page 24870) method to add additional parameters for the return Web page, and then generates an OnGetAdapterRequestParams (see page 24879) event so that you can make your own final adjustments to the parameter list.

AHandler is the interface of the adapter that requires the parameters to execute the action or produce the image field value.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. ImplGetAdapterItemRequestParams uses this interface to write the parameter values.

See Also

GetAdapterItemRequestParams (see page 24873)

AddSpecialParams (see page 24870)

OnGetAdapterRequestParams (see page 24879)

179.1.8.2.12 TCustomAdapterDispatcher.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 24864) method.

Pascal

```
function ImplHandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

The HandleRequest (see page 24864) method calls ImplHandleRequest to process an http request message and obtain the response that should be sent back to the caller. (The HandleRequest (see page 24864) method is called using the IWebRequestHandler interface.)

ImplHandleRequest

1. Calls GetDispatchParams (see page 24873) to parse the request and identify the adapter that should handle it.
2. If it finds an adapter, calls DoBeforeDispatchAdapterRequest (see page 24871) to generate the OnBeforeDispatchAction (see page 24878) and OnBeforeDispatchImage (see page 24878) events.
3. If the event handlers do not handle the event, forwards the request to the adapter for processing.
4. Calls DoAfterDispatchAdapterRequest (see page 24871) to generate the OnAfterDispatchAction (see page 24877) and OnAfterDispatchImage (see page 24878) events.
5. Calls DoAdapterRequestNotHandled (see page 24870) to generate the OnActionRequestNotHandled (see page 24877) and OnImageRequestNotHandled (see page 24879) events if the request has not yet been handled.

See Also

IWebRequestHandler (see page 15237)

HandleRequest (see page 24864)

GetDispatchParams (see page 24873)

DoBeforeDispatchAdapterRequest (see page 24871)

DoAfterDispatchAdapterRequest (see page 24871)

DoAdapterRequestNotHandled (see page 24870)

179.1.8.3 TCustomAdapterDispatcher Events

The events of the TCustomAdapterDispatcher class are listed here.

Public Events

	Name	Description
	OnActionRequestNotHandled (see page 24877)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 24877)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 24878)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 24878)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 24878)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 24879)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

	OnImageRequestNotHandled (see page 24879)	Occurs when the WebSnap application could not provide a requested image.

179.1.8.3.1 TCustomAdapterDispatcher.OnActionRequestNotHandled Event

Occurs when the WebSnap application could not execute a requested action.

Pascal

```
property OnActionRequestNotHandled: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnActionRequestNotHandled;
```

Description

Write an OnActionRequestNotHandled event handler to provide a response to actions that the adapter components in the application can't execute. This may occur because the adapter dispatcher could not find an adapter to handle the action, or it may occur because the identified adapter was unable to execute the action.

If the OnActionRequestNotHandled event handler does not set its Handled parameter to true, the adapter dispatcher generates an OnImageRequestNotHandled (see page 24879). If the OnImageRequestNotHandled (see page 24879) event handler also does not handle the event, the dispatcher raises an EAdapterDispatcherException (see page 24838) exception.

Tip: Use the Response property of the current Web context to access the response message from the OnActionRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnAfterDispatchAction (see page 24877)

OnBeforeDispatchAction (see page 24878)

EAdapterDispatcherException (see page 24838)

WebContext (see page 24687)

Response (see page 24659)

OnImageRequestNotHandled (see page 24879)

179.1.8.3.2 TCustomAdapterDispatcher.OnAfterDispatchAction Event

Occurs after the target adapter has finished executing an action.

Pascal

```
property OnAfterDispatchAction: TDispatchActionEvent;
```

C++

```
__property TDispatchActionEvent OnAfterDispatchAction;
```

Description

Write an OnAfterDispatchAction event handler to take specific action after an adapter has executed an action. Note that this event can occur even if the request does not request the execution of an action or if the adapter was not successful in its attempt to execute the action.

See Also

OnActionRequestNotHandled (see page 24877)

OnBeforeDispatchAction (see page 24878)

179.1.8.3.3 TCustomAdapterDispatcher.OnAfterDispatchImage Event

Occurs after the target adapter has finished handling an image request.

Pascal

```
property OnAfterDispatchImage: TDispatchImageEvent;
```

C++

```
__property TDispatchImageEvent OnAfterDispatchImage;
```

Description

Write an OnAfterDispatchImage event handler to take specific action after an adapter has responded to an image request. Note that this event can occur even if the request does not request the value of an image field or if the adapter was not successful in its attempt to honor that request.

See Also

OnImageRequestNotHandled (see page 24879)

OnBeforeDispatchImage (see page 24878)

179.1.8.3.4 TCustomAdapterDispatcher.OnBeforeDispatchAction Event

Occurs before the dispatcher forwards an action to an adapter for execution.

Pascal

```
property OnBeforeDispatchAction: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnBeforeDispatchAction;
```

Description

Write an OnBeforeDispatchAction event handler to respond to action requests before they are forwarded to the associated adapter for execution. Note that if the request does not request the execution of an action, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchAction event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Action parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for execution, and does not generate an OnAfterDispatchAction (see page 24877) event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchAction event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnActionRequestNotHandled (see page 24877)

OnAfterDispatchAction (see page 24877)

WebContext (see page 24687)

Response (see page 24659)

179.1.8.3.5 TCustomAdapterDispatcher.OnBeforeDispatchImage Event

Occurs before the dispatcher forwards an image request to an adapter for handling.

Pascal

```
property OnBeforeDispatchImage: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnBeforeDispatchImage;
```

Description

Write an OnBeforeDispatchImage event handler to respond to image requests before they are forwarded to the associated adapter for handling. Note that if the request does not ask for the value of an image field, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchImage event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Image parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for handling, and does not generate an OnAfterDispatchImage (see page 24878) event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchImage event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnImageRequestNotHandled (see page 24879)

OnAfterDispatchImage (see page 24878)

WebContext (see page 24687)

Response (see page 24659)

179.1.8.3.6 TCustomAdapterDispatcher.OnGetAdapterRequestParams Event

Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

Pascal

```
property OnGetAdapterRequestParams: TGetAdapterRequestParamsEvent;
```

C++

```
__property TGetAdapterRequestParamsEvent OnGetAdapterRequestParams;
```

Description

Write an OnGetAdapterRequestParams event handler to modify the list of parameters for an action or image request before they are used. The OnGetAdapterRequestParams event handler can modify the current parameters or add its own parameters to the list. This event occurs both when the dispatcher formats parameters that are added to HTML forms and when it is dispatching a request message that contains an action or image request.

See Also

GetAdapterItemRequestParams (see page 24873)

EncodeAdapterItemRequestAsFieldValue (see page 24872)

EncodeAdapterItemRequestAsHREF (see page 24872)

AddSpecialParams (see page 24870)

179.1.8.3.7 TCustomAdapterDispatcher.OnImageRequestNotHandled Event

Occurs when the WebSnap application could not provide a requested image.

Pascal

```
property OnImageRequestNotHandled: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnImageRequestNotHandled;
```

Description

Write an OnImageRequestNotHandled event handler to provide a response to image requests that the adapter components in the application can't honor. This may occur because the adapter dispatcher could not find an adapter to handle the request, or it may occur because the identified adapter was unable to provide the requested image.

If the OnImageRequestNotHandled event handler exits with its Handled parameter set to false, the dispatcher raises an EAdapterDispatcherException (see page 24838) exception.

Tip: Use the Response property of the current Web context to access the response message from the OnImageRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnAfterDispatchImage (see page 24878)

Response (see page 24659)

OnActionRequestNotHandled (see page 24877)

179.1.9 TCustomLocateFileService Class

TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.

Class Hierarchy

Pascal

```
TCustomLocateFileService = class(TComponent, ILocateFileService, IFindIncludeFile);
```

C++

```
class TCustomLocateFileService : public TComponent, public ILocateFileService, public
IFindIncludeFile;
```

File

WebDisp

Description

TCustomLocateFileService is the base class for components that control access to files in a WebSnap application. TCustomLocateFileService defines events that indicate where to locate a requested file or that supply a stream object from which to read the contents of a file. By using a TCustomLocateFileService descendant, a WebSnap application can adjust to differences in the way files are deployed or even to use different files, depending on the current Web context.

Do not create instances of TCustomLocateFileService. All of the events it introduces are protected, and so unavailable to your application. Instead, use a TCustomLocateFileService descendant, such as TLocateFileService (see page 24928), which publishes those events.

See Also

TLocateFileService (see page 24928)

TStream (see page 2973)

179.1.9.1 TCustomLocateFileService Members

The following tables list the members exposed by TCustomLocateFileService.

Protected Events

	Name	Description
	OnFindIncludeFile (see page 24888)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 24889)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 24889)	Occurs when the WebSnap application tries to locate the template file for a content producer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindIncludeFile (see page 24884)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 24885)	Generates an OnFindStream (see page 24889) event.
	FindTemplateFile (see page 24885)	Generates an OnFindTemplateFile (see page 24889) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetFileStream (see page 24886)	Returns a stream object from which to read a specified file.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTemplateStream (see page 24886)	Returns a stream from which to read a template file.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	ImplFindIncludeFile (see page 24887)	Provides the underlying implementation for the FindIncludeFile (see page 24884) method.
V	ImplGetTemplateStream (see page 24887)	Provides the underlying implementation for the GetTemplateStream (see page 24886) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.

	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.9.2 TCustomLocateFileService Methods

The methods of the TCustomLocateFileService class are listed here.

Protected Methods

	Name	Description
	FindIncludeFile (see page 24884)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 24885)	Generates an OnFindStream (see page 24889) event.
	FindTemplateFile (see page 24885)	Generates an OnFindTemplateFile (see page 24889) event.
V	GetFileStream (see page 24886)	Returns a stream object from which to read a specified file.
	GetTemplateStream (see page 24886)	Returns a stream from which to read a template file.
V	ImplFindIncludeFile (see page 24887)	Provides the underlying implementation for the FindIncludeFile (see page 24884) method.
V	ImplGetTemplateStream (see page 24887)	Provides the underlying implementation for the GetTemplateStream (see page 24886) method.

179.1.9.2.1 TCustomLocateFileService.FindIncludeFile Method

Returns the fully-qualified path name for an include file for a server-side script.

Pascal

```
function FindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean;
```

C++

```
__fastcall Boolean FindIncludeFile(TComponent * AComponent, const AnsiString AFileName,
AnsiString AResult);
```

Description

WebSnap applications call FindIncludeFile when they encounter a reference to an include file in server-side script. This method returns the fully-qualified path name for the include file.

FindIncludeFile calls the virtual ImplFindIncludeFile (see page 24887) method to obtain the path and name of the include file. In TCustomLocateFileService (see page 24880), ImplFindIncludeFile (see page 24887) fetches the include file name by generating an OnFindIncludeFile (see page 24888) event. Component writers that which to locate include files in some other way should override the ImplFindIncludeFile (see page 24887) method.

AComponent is the Web module context object that stores the reference to the include file.

AFileName is the name of the include file to locate.

AResult returns the fully-qualified path name where the WebSnap application can find the requested file.

FindIncludeFile returns true if it locates the requested file and returns its fully-qualified name as AResult.

See Also

OnFindIncludeFile (see page 24888)

ImplFindIncludeFile (see page 24887)

WebModuleContext (see page 15279)

179.1.9.2.2 TCustomLocateFileService.FindStream Method

Generates an OnFindStream (see page 24889) event.

Pascal

```
function FindStream(AComponent: TComponent; const AFileName: string; out AResult: TStream; out
AOwned: Boolean): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean FindStream(TComponent * AComponent, const AnsiString AFileName,
TStream AResult, Boolean AOwned);
```

Description

TCustomLocateFileService (see page 24880) calls FindStream internally to generate an OnFindStream (see page 24889) event.

AComponent is the object that uses or is associated with the requested file. Typically, this is a content producer.

AFileName is the name of the file to locate. This can be a "logical" file that does not exist on disk.

AResult returns a stream from which the caller can read the contents of the requested file.

AOwned indicates whether the caller should free AResult after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

FindStream returns true if it supplies a stream as the value of the AResult parameter. It returns false if there is no OnFindStream (see page 24889) event handler or if the event handler does not return a value for AResult.

See Also

OnFindStream (see page 24889)

179.1.9.2.3 TCustomLocateFileService.FindTemplateFile Method

Generates an OnFindTemplateFile (see page 24889) event.

Pascal

```
function FindTemplateFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean;
```

C++

```
__fastcall Boolean FindTemplateFile(TComponent * AComponent, const AnsiString AFileName,
AnsiString AResult);
```

Description

TCustomLocateFileService (see page 24880) calls FindTemplateFile internally to generate an OnFindTemplateFile (see page 24889) event.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the name of the file to locate.

AResult returns the fully-qualified path name for the requested file.

FindTemplateFile returns true if it supplies a file name as the value of the AResult parameter. It returns false if there is no OnFindTemplateFile (see page 24889) event handler or if the event handler does not return a value for AResult.

See Also

OnFindTemplateFile (see page 24889)

179.1.9.2.4 TCustomLocateFileService.GetFileStream Method

Returns a stream object from which to read a specified file.

Pascal

```
function GetFileStream(const AFileName: string; out AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetFileStream(const AnsiString AFileName, Boolean AOwned);
```

Description

The GetTemplateStream (see page 24886) method calls GetFileStream internally to obtain the stream it returns when the requested file maps to a fully-qualified path name.

AFileName is the fully-qualified name of a file whose contents can be read from the returned stream.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetFileStream returns a stream object from which to read the contents of AFileName.

See Also

GetTemplateStream (see page 24886)

179.1.9.2.5 TCustomLocateFileService.GetTemplateStream Method

Returns a stream from which to read a template file.

Pascal

```
function GetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned: Boolean):
TStream;
```

C++

```
__fastcall TStream GetTemplateStream(TComponent * AComponent, AnsiString AFileName, Boolean
AOwned);
```

Description

Producer components call GetTemplateStream to read the contents of the template files they use to generate their content. GetTemplateStream locates the specified template file (which can be a logical rather than a physical file name), and returns a stream from which the caller can read the file contents.

GetTemplateStream calls the ImplGetTemplateStream (see page 24887) method, which generates first an OnFindStream (see page 24889) event, and, if OnFindStream (see page 24889) is unsuccessful, an OnFindTemplateFile (see page 24889) event.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the logical name of the file to locate.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetTemplateStream returns a stream from which to read the requested file, or, if it could not locate the file, nil (Delphi) or NULL

(C++).

See Also

ImplGetTemplateStream (see page 24887)

OnFindStream (see page 24889)

OnFindTemplateFile (see page 24889)

179.1.9.2.6 TCustomLocateFileService.ImplFindIncludeFile Method

Provides the underlying implementation for the FindIncludeFile (see page 24884) method.

Pascal

```
function ImplFindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplFindIncludeFile(TComponent * AComponent, const AnsiString
AFileName, AnsiString AResult);
```

Description

The FindIncludeFile (see page 24884) method calls ImplFindIncludeFile to locate the fully-qualified path name for an include file to a server-side script. ImplFindIncludeFile generates an OnFindIncludeFile (see page 24888) event to obtain the fully-qualified path name.

AComponent is the Web module context object that stores the reference to the include file.

AFileName is the name of the include file to locate.

AResult returns the fully-qualified path name where the WebSnap application can find the requested file.

FindIncludeFile (see page 24884) returns true if it locates the requested file and returns its fully-qualified name as AResult. It returns false if there is no OnFindIncludeFile (see page 24888) event handler or if the event handler does not return a value for AResult.

OnFindIncludeFile (see page 24888)

FindIncludeFile (see page 24884)

WebModuleContext (see page 15279)

179.1.9.2.7 TCustomLocateFileService.ImplGetTemplateStream Method

Provides the underlying implementation for the GetTemplateStream (see page 24886) method.

Pascal

```
function ImplGetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned:
Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream ImplGetTemplateStream(TComponent * AComponent, AnsiString
AFileName, Boolean AOwned);
```

Description

The GetTemplateStream (see page 24886) method calls ImplGetTemplateStream to obtain a stream from which to read a specified template. ImplGetTemplateStream generates an OnFindStream (see page 24889) event, and, if OnFindStream (

see page 24889) is unsuccessful, an OnFindTemplateFile (see page 24889) event. If it gets a file name from the OnFindTemplateFile (see page 24889) event handler, ImplGetTemplateStream calls the GetFileStream (see page 24886) method to obtain a stream object from which to read the file.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the logical name of the file to locate.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetTemplateStream (see page 24886) returns a stream from which to read the requested file, or, if it could not locate the file, nil (Delphi) or NULL (C++).

GetTemplateStream (see page 24886)

OnFindStream (see page 24889)

OnFindTemplateFile (see page 24889)

GetFileStream (see page 24886)

179.1.9.3 TCustomLocateFileService Events

The events of the TCustomLocateFileService class are listed here.

Protected Events

	Name	Description
	OnFindIncludeFile (see page 24888)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 24889)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 24889)	Occurs when the WebSnap application tries to locate the template file for a content producer.

179.1.9.3.1 TCustomLocateFileService.OnFindIncludeFile Event

Occurs when the WebSnap application tries to locate an include file for a server-side script.

Pascal

```
property OnFindIncludeFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindIncludeFile;
```

Description

Write an OnFindIncludeFile event handler to indicate the location on disk of include files for server-side scripts. In WebSnap applications that include a locate file service component, you must supply either an OnFindIncludeFile or an OnFindStream (see page 24889) event handler (or both) if the server-side scripts have include files. Otherwise the application can't locate these include files at all.

See Also

OnFindStream (see page 24889)

OnFindTemplateFile (see page 24889)

179.1.9.3.2 TCustomLocateFileService.OnFindStream Event

Occurs when the WebSnap application tries to locate a file.

Pascal

```
property OnFindStream: TLocateFileServiceFindStreamEvent;
```

C++

```
__property TLocateFileServiceFindStreamEvent OnFindStream;
```

Description

Write an OnFindStream event handler to supply the WebSnap application with the contents of a file given its name. This event is particularly useful for applications that use "logical" files that do not exist physically on disk. When the WebSnap application tries to locate a file, the locate file service generates this event, along with an OnFindTemplateFile (see page 24889). One of these event handlers must be provided in order for the application to use the requested file.

See Also

OnFindIncludeFile (see page 24888)

OnFindTemplateFile (see page 24889)

179.1.9.3.3 TCustomLocateFileService.OnFindTemplateFile Event

Occurs when the WebSnap application tries to locate the template file for a content producer.

Pascal

```
property OnFindTemplateFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindTemplateFile;
```

Description

Write an OnFindIncludeFile (see page 24888) event handler to indicate the location on disk of templates that a content producer component uses to generate its content. In WebSnap applications that include a locate file service component, you must supply either an OnFindTemplateFile or an OnFindStream (see page 24889) event handler (or both) if the application has content producers that use template files. Otherwise content producers can't locate their templates.

See Also

OnFindStream (see page 24889)

OnFindIncludeFile (see page 24888)

179.1.10 TCustomPageDispatcher Class

Dispatches incoming HTTP request messages in a WebSnap application.

Class Hierarchy

Pascal

```
TCustomPageDispatcher = class(TBaseRequestHandler, IPageDispatcher);
```

C++

```
class TCustomPageDispatcher : public TBaseRequestHandler, public IPageDispatcher;
```

File

WebDisp

Description

TCustomPageDispatcher is the base class for components that locate the appropriate page module for handling an incoming HTTP message and retrieve the content that the identified page module creates for the corresponding response message. Typically, the WebSnap application wizard adds a TCustomPageDispatcher descendant to the Web application module that it creates.

A WebSnap application only requires a single page dispatcher. The dispatcher examines all incoming HTTP request messages, checking the pathInfo portion of the URL to which a request is addressed for the name of a registered Web page module. It then forwards the request to the matching Web page module so that the page module can handle the request and produce the content of a response. If the request is not addressed to an URL with a pathinfo portion, the page dispatcher forwards the request to the Web page module identified by its DefaultPage (see page 24900) property.

See Also

TPageDispatcher (see page 24949)

179.1.10.1 TCustomPageDispatcher Members

The following tables list the members exposed by TCustomPageDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchPageName (see page 24894)	Checks whether a specified user has a given access rights string.

	EndUser (see page 24895)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 24895)	Indicates whether the current user is permitted to view a specified Web page.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDefaultPageName (see page 24895)	Returns the value of the DefaultPageName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLoginRequired (see page 24896)	Indicates whether a user must log in before accessing a specified Web page.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequestedPage (see page 24896)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 24864)	Handles an HTTP request.
	ImplDispatchPageName (see page 24896)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
V	ImplGetCanView (see page 24896)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
V	ImplGetDefaultPageName (see page 24897)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.
V	ImplGetLoginRequired (see page 24897)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
V	ImplHandleRequest (see page 24897)	Handles application-specific processing of an HTTP request.
V	ImplPageNameOfRequest (see page 24897)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 24898)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsLoggedIn (see page 24898)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PageNameOfRequest (see page 24898)	Returns the name of the Web page to which an HTTP request is addressed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24899)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RedirectToPageName (see page 24899)	Fills out a response message so that it redirects the caller to another page in the application.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidatePage (see page 24899)	This is ValidatePage, a member of class TCustomPageDispatcher.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 24901)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnAfterRedirectToPage (see page 24901)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeDispatchPage (see page 24902)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnBeforeRedirectToPage (see page 24902)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.
	OnCanViewPage (see page 24903)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 24904)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 24904)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 24905)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultPage (see page 24900)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.
R	DefaultPageName (see page 19731)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.10.2 TCustomPageDispatcher Methods

The methods of the TCustomPageDispatcher class are listed here.

Protected Methods

	Name	Description
	DispatchPageName (see page 24894)	Checks whether a specified user has a given access rights string.
	EndUser (see page 24895)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 24895)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 24895)	Returns the value of the DefaultPageName property.
	GetLoginRequired (see page 24896)	Indicates whether a user must log in before accessing a specified Web page.
	GetRequestedPage (see page 24896)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	ImplDispatchPageName (see page 24896)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
V	ImplGetCanView (see page 24896)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
V	ImplGetDefaultPageName (see page 24897)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.
V	ImplGetLoginRequired (see page 24897)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
V	ImplHandleRequest (see page 24897)	Handles application-specific processing of an HTTP request.
V	ImplPageNameOfRequest (see page 24897)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 24898)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	IsLoggedIn (see page 24898)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
	PageNameOfRequest (see page 24898)	Returns the name of the Web page to which an HTTP request is addressed.
	ProduceLoginPage (see page 24899)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
	RedirectToPageName (see page 24899)	Fills out a response message so that it redirects the caller to another page in the application.
	ValidatePage (see page 24899)	This is ValidatePage, a member of class TCustomPageDispatcher.

179.1.10.2.1 TCustomPageDispatcher.DispatchPageName Method

Checks whether a specified user has a given access rights string.

Pascal

```
function DispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean DispatchPageName(const AnsiString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

Description

Call DispatchPageName to fill out a response message with the Web page that a specified Web page module provides. DispatchPageName locates the Web page module that produces the requested Web page and uses it to fill out the content of a response object.

APageName is the name of the Web page to fetch. If APageName is an empty string, DispatchPageName uses the first Web page module that is registered with the current Web context.

AResponse is the response object whose Content property receives the requested Web page.

AFlags indicates the attributes that must be present on the Web page module. For example, if AFlags includes dpPublished, APageName must specify a published Web page module or the page dispatcher won't fetch the Web page.

DispatchPageName returns true if it successfully fetches the requested page, false if it fails to obtain the requested page.

See Also

RedirectToPageName (see page 19730)

HandleRequest (see page 15238)

Content (see page 15207)

WebContext (see page 24687)

179.1.10.2.2 TCustomPageDispatcher.EndUser Method

Pascal

```
function EndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser EndUser();
```

Description

This is EndUser, a member of class TCustomPageDispatcher.

179.1.10.2.3 TCustomPageDispatcher.GetCanView Method

Indicates whether the current user is permitted to view a specified Web page.

Pascal

```
function GetCanView(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetCanView(const AnsiString APageName);
```

Description

Call GetCanView to check whether the current user should be allowed to view a specified Web page. Typically, this method is called after the user logs in.

APageName is the name of the Web page the user wants to view.

See Also

GetLoginRequired (see page 19729)

HasViewRights (see page 24676)

OnCanViewPage (see page 24903)

179.1.10.2.4 TCustomPageDispatcher.GetDefaultPageName Method

Returns the value of the DefaultPageName property.

Pascal

```
function GetDefaultPageName: string;
```

C++

```
__fastcall AnsiString GetDefaultPageName();
```

Description

GetDefaultPageName is the read implementation of the DefaultPageName property.

See Also

DefaultPageName (see page 19731)

179.1.10.2.5 TCustomPageDispatcher.GetLoginRequired Method

Indicates whether a user must log in before accessing a specified Web page.

Pascal

```
function GetLoginRequired(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired(const AnsiString APageName);
```

Description

Call GetLoginRequired to check whether users must log in before accessing a specified Web page. GetLoginRequired can check the Web page information object for the target Web page, but can also use other means (such as an event handler) to obtain this information.

APageName is the name of the Web page to check whether it requires users to first log in.

See Also

GetCanView (see page 19729)

IsLoginRequired

OnIsLoginRequired (see page 24904)

179.1.10.2.6 TCustomPageDispatcher.GetRequestedPage Method

Pascal

```
function GetRequestedPage(const APageName: string; AFlags: TDispatchPageFlags): TObject;
```

C++

```
__fastcall TObject * GetRequestedPage(const AnsiString APageName, TDispatchPageFlags AFlags);
```

Description

This is GetRequestedPage, a member of class TCustomPageDispatcher.

179.1.10.2.7 TCustomPageDispatcher.ImplDispatchPageName Method

Pascal

```
function ImplDispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean ImplDispatchPageName(const AnsiString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

Description

This is ImplDispatchPageName, a member of class TCustomPageDispatcher.

179.1.10.2.8 TCustomPageDispatcher.ImplGetCanView Method

Pascal

```
function ImplGetCanView(const APageName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetCanView(const AnsiString APageName);
```

Description

This is ImplGetCanView, a member of class TCustomPageDispatcher.

179.1.10.2.9 TCustomPageDispatcher.ImplGetDefaultPageName Method

Pascal

```
function ImplGetDefaultPageName: string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplGetDefaultPageName();
```

Description

This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.

179.1.10.2.10 TCustomPageDispatcher.ImplGetLoginRequired Method

Pascal

```
function ImplGetLoginRequired(const APageName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetLoginRequired(const AnsiString APageName);
```

Description

This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.

179.1.10.2.11 TCustomPageDispatcher.ImplHandleRequest Method

Handles application-specific processing of an HTTP request.

Pascal

```
function ImplHandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

The ImplHandleRequest function is called from HandleRequest to handle the application-specific processing of the HTTP request.

This base version of the function generates an assertion failure as a reminder that a customized overridden version of this function needs to be defined in order to handle the request processing specific to the application.

See Also

HandleRequest (see page 24864)

179.1.10.2.12 TCustomPageDispatcher.ImplPageNameOfRequest Method

Pascal

```
function ImplPageNameOfRequest(Request: TWebRequest): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplPageNameOfRequest(TWebRequest Request);
```

Description

This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.

179.1.10.2.13 TCustomPageDispatcher.ImplRedirectToPageName Method

Pascal

```
function ImplRedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean ImplRedirectToPageName(const AnsiString APageName, TStrings AParams,
TWebResponse AResponse, TDispatchPageFlags AFlags);
```

Description

This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.

179.1.10.2.14 TCustomPageDispatcher.IsLoggedIn Method

Pascal

```
function IsLoggedIn: Boolean;
```

C++

```
__fastcall Boolean IsLoggedIn();
```

Description

This is IsLoggedIn, a member of class TCustomPageDispatcher.

179.1.10.2.15 TCustomPageDispatcher.PageNameOfRequest Method

Returns the name of the Web page to which an HTTP request is addressed.

Pascal

```
function PageNameOfRequest(Request: TWebRequest): string;
```

C++

```
__fastcall AnsiString PageNameOfRequest(TWebRequest Request);
```

Description

Call PageNameOfRequest to obtain the name of the Web page that a request message is trying to fetch.

ARequest is the request object that describes the HTTP request message.

PageNameOfRequest returns the last string in the path info portion of the request message's target URL.

See Also

DefaultPageName (see page 19731)

179.1.10.2.16 TCustomPageDispatcher.ProduceLoginPage Method

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

This is ProduceLoginPage, a member of class TCustomPageDispatcher.

179.1.10.2.17 TCustomPageDispatcher.RedirectToPageName Method

Fills out a response message so that it redirects the caller to another page in the application.

Pascal

```
function RedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean RedirectToPageName(const AnsiString APageName, TStrings AParams,
TWebResponse AResponse, TDispatchPageFlags AFlags);
```

Description

Call RedirectToPageName to generate a response that redirects the caller to another Web page in the WebSnap application.

APageName is the name of the Web page to which the request should be redirected. If APageName is an empty string, RedirectToPageName uses the first Web page module that is registered with the current Web context.

AParams is a string list containing application-defined name-value pairs. These name-value pairs supply the query fields of the redirected request message, and are added to the URL that is the target of the SendRedirect call.

AResponse is the response object that the WebSnap uses to make the SendRedirect call.

AFlags indicates the attributes that must be present on the Web page module to which the current request is redirected. For example, if AFlags includes dpPublished, APageName must specify a published Web page module.

RedirectToPageName returns true if it successfully redirects to the specified page.

DispatchPageName (see page 19728)

HandleRequest (see page 15238)

Content (see page 15207)

WebContext (see page 24687)

179.1.10.2.18 TCustomPageDispatcher.ValidatePage Method

Pascal

```
function ValidatePage(const APage: string; var AHandled: Boolean): Boolean;
```

C++

```
__fastcall Boolean ValidatePage(const AnsiString APage, Boolean AHandled);
```

Description

This is ValidatePage, a member of class TCustomPageDispatcher.

179.1.10.3 TCustomPageDispatcher Properties

The properties of the TCustomPageDispatcher class are listed here.

Public Properties

	Name	Description
	DefaultPage (see page 24900)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

179.1.10.3.1 TCustomPageDispatcher.DefaultPage Property

Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Pascal

```
property DefaultPage: string;
```

C++

```
__property AnsiString DefaultPage;
```

Description

DefaultPage is the name of the registered Web page module that should handle incoming request messages that do not have a pathinfo portion on their target URL. This is the name that is supplied to the Web page module wizard when you created the default Web page module. It forms the basis of that Web page module's class name. For example, if the default Web page module has the name MyDefaultPage, the Web page module class is of type TMyDefaultPage.

If DefaultPage is an empty string, the page dispatcher uses the Web application module as a default Web page module, as long as it is a Web Page module.

179.1.10.4 TCustomPageDispatcher Events

The events of the TCustomPageDispatcher class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 24901)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnAfterRedirectToPage (see page 24901)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeDispatchPage (see page 24902)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnBeforeRedirectToPage (see page 24902)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.
	OnCanViewPage (see page 24903)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 24904)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 24904)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 24905)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

179.1.10.4.1 TCustomPageDispatcher.OnAfterDispatchPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take specific action after an HTTP request has been successfully handled by a Web page module. For example, an OnAfterDispatchPage event handler can maintain a log of all Web traffic handled by the WebSnap application.

OnAfterDispatchPage occurs only if the target Web page module succeeds in handling the request. If the target Web page module could not be validated, an OnPageAccessDenied (see page 24904) event occurs instead. If the page could not be located, an OnPageNotFound (see page 24905) event occurs instead.

See Also

OnBeforeDispatchPage (see page 24902)

OnPageNotFound (see page 24905)

OnCanViewPage (see page 24903)

OnIsLoginRequired (see page 24904)

OnPageAccessDenied (see page 24904)

179.1.10.4.2 TCustomPageDispatcher.OnAfterRedirectToPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

Write an OnAfterRedirectToPage event handler to take specific action after an HTTP request has been successfully redirected to a Web page module. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost), and the new target Web page module succeeds in handling the request.

See Also

OnBeforeRedirectToPage (see page 24902)

OnAfterDispatchPage (see page 24901)

RedirectOptions (see page 24074)

179.1.10.4.3 TCustomPageDispatcher.OnBeforeDispatchPage Event

Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the dispatcher forwards it to the target Web page module for processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the page dispatcher from locating the target Web page module, verifying that it can handle the request, and forwarding the request to that Web page module.

If the event handler does not handle the request (for example, if it is merely maintaining a log of incoming requests), it can leave the Handled parameter as false and the dispatcher will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

See Also

OnAfterDispatchPage (see page 24901)

OnPageNotFound (see page 24905)

OnCanViewPage (see page 24903)

OnIsLoginRequired (see page 24904)

OnPageAccessDenied (see page 24904)

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

179.1.10.4.4 TCustomPageDispatcher.OnBeforeRedirectToPage Event

Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

Write an OnBeforeRedirectToPage event handler to take specific action before an HTTP request is redirected to a Web page module. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

If the event handler sets Handled to true, the dispatcher assumes it has handled the request and performs no further processing. Otherwise, after the event handler exits, the page dispatcher calls on the Web Module to set up the response message and call

SendRedirect.

Tip: To access the Web request and response objects from within an OnBeforeRedirectToPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

See Also

OnAfterRedirectToPage (see page 24901)

OnBeforeDispatchPage (see page 24902)

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

SendRedirect (see page 15201)

179.1.10.4.5 TCustomPageDispatcher.OnCanViewPage Event

Occurs just before the dispatcher passes a request message to a Web page module.

Pascal

```
property OnCanViewPage: TCanViewPageEvent;
```

C++

```
__property TCanViewPageEvent OnCanViewPage;
```

Description

Write an OnCanViewPage event handler to customize the way the WebSnap application determines whether a given request can be passed to a Web page module for processing. This event is part of the mechanism by which the dispatcher validates a Web page for viewing. The validation process, which occurs after the OnBeforeDispatchPage (see page 24902) event, occurs as follows:

1. If the caller has not already logged in, the dispatcher generates an OnIsLoginRequired (see page 24904) event to check whether the specified Web page requires the caller to log in.
2. If a login is required, the dispatcher does not validate the page (and so does not forward the request to the specified Web page module). Rather, it initiates the process of creating a response to allow the user to log in.

a. First, the dispatcher generates an OnPageAccessDenied (see page 24904) event, where the application can handle the login process.

b. If the OnPageAccessDenied (see page 24904) event handler does not handle the login process, the dispatcher forwards the request to the login page specified by the end user adapter's LoginPage property.

3. If a login is not required (either because the caller already logged in or because there is no need to log in), the dispatcher generates an OnCanViewPage event. This event can validate a caller that has logged in, or provide any other type of validation that governs access to the requested page.
4. If there is no OnCanViewPage event handler, or if the OnCanViewPage event handler does not handle the validation, the dispatcher calls on a TEndUserAdapter component to check the user's access rights.

   Tip: To access the Web request and response objects from within an OnCanViewPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties. To access information about the access rights that the target page requires, call the Web context's FindPageInfo method to obtain a Web page info object for the target page and check its ViewAccess property.

Request (see page 24658)

Response (see page 24659)

ViewAccess (see page 15069)

FindPageInfo (see page 24650)

179.1.10.4.6 TCustomPageDispatcher.OnIsLoginRequired Event

Occurs when a request arrives from a caller that has not yet logged in.

Pascal

```
property OnIsLoginRequired: TLoginRequiredEvent;
```

C++

```
__property TLoginRequiredEvent OnIsLoginRequired;
```

Description

Write an OnIsLoginRequired event handler to customize the way the WebSnap application determines whether a caller must log in before obtaining access to a requested page. This event occurs after the OnBeforeDispatchPage (see page 24902) event if the caller has not already logged in to the WebSnap application.

If there is no OnPageAccessDenied (see page 24904) event handler, or if the OnPageAccessDenied (see page 24904) event handler does not handle the login process, the dispatcher obtains a response message from the login page specified by the end user adapter.

See Also

OnCanViewPage (see page 24903)

OnBeforeDispatchPage (see page 24902)

OnPageAccessDenied (see page 24904)

LoginPage (see page 24118)

179.1.10.4.7 TCustomPageDispatcher.OnPageAccessDenied Event

Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.

Pascal

```
property OnPageAccessDenied: TPageAccessDeniedEvent;
```

C++

```
__property TPageAccessDeniedEvent OnPageAccessDenied;
```

Description

Write an OnPageAccessDenied event handler to customize the response when a request for a specific Web page fails to be

validated.

Tip: To access the Web request and response objects from within an OnPageAccessDenied event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

See Also

OnIsLoginRequired (see page 24904)

OnCanViewPage (see page 24903)

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

LoginPage (see page 24118)

179.1.10.4.8 TCustomPageDispatcher.OnPageNotFound Event

Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Pascal

```
property OnPageNotFound: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnPageNotFound;
```

Description

Write an OnPageNotFound event handler to generate a response when the dispatcher can't locate the Web page module to which an HTTP request message is addressed. For example, an OnPageNotFound event handler can provide the response object with content that indicates that the requested page does not exist or that represents simple content for a page that does not have an associated Web page module.

If the OnPageNotFound event handler sets its Handled parameter to true, the page dispatcher assumes it has updated the response message and returns it. If the OnPageNotFound leaves the Handled parameter set to false, the dispatcher raises an EPageDispatcherException (see page 24839) exception after the event handler exits.

Tip: To access the Web request and response objects from within an OnPageNotFound event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

179.1.11 TCustomWebAppComponents Class

TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.

Class Hierarchy

Pascal

```
TCustomWebAppComponents = class(TMultiModuleWebAppServices, IGetWebAppComponents,
IGetLocateFileService);
```

C++

```
class TCustomWebAppComponents : public TMultiModuleWebAppServices, public
IGetWebAppComponents, public IGetLocateFileService;
```

File

WebDisp

Description

Use TCustomWebAppComponents as a base class for the component that centralizes access to the main WebSnap components. It keeps track of the current request and response objects, maintains a list of the available Web modules, and locates the appropriate components to handle incoming request messages. TCustomWebAppComponents introduces properties that provide access to the components that perform many common tasks in a WebSnap application. These properties include:

PageDispatcher (see page 24921), which locates the Web page modules to process incoming request messages.

AdapterDispatcher (see page 24919), which encodes calls to adapter actions and fields, and which handles HTML form submissions and requests for dynamic images by calling adapter actions and fields.

Sessions (see page 24921), which manages the sessions for each caller.

ApplicationAdapter (see page 24919), which implements the fields and actions of the Application variable in server-side scripts.

EndUserAdapter (see page 24920), which implements the fields and actions of the EndUser variable in server-side scripts.

UserListService (see page 24922), which maintains a list of end users and their passwords and access privileges.

LocateFileService (see page 24920), which controls access to the templates and server-side script include files that are used while processing requests.

DispatchActions (see page 24919), which maintains a list of action items that can respond to request messages.

The components these properties reference are optional. The WebSnap Application wizard automatically creates components and fill in these properties for any components that you select.

TWebUserList (see page 25625)

WebContext

179.1.11.1 TCustomWebAppComponents Members

The following tables list the members exposed by TCustomWebAppComponents.

Protected Events

	Name	Description
	OnAfterDispatch (see page 24948)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 24948)	Occurs before TMultiModuleWebAppServices (see page 24933) passes an HTTP request onto the other components in the application for processing.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 24937)	Returns the value of the Access_Request property.
	Access_Response (see page 24938)	Returns the value of the Access_Response property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateContext (see page 24911)	Creates the Web context for the current request message.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterDispatch (see page 24939)	Generates an OnAfterDispatch (see page 24948) event.
	DoBeforeDispatch (see page 24939)	Generates an OnBeforeDispatch (see page 24948) event.
V	DoneModule (see page 24939)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 24940)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetAdapterDispatcher (see page 24912)	Returns the value of the AdapterDispatcher (see page 24919) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetExceptionHandler (see page 24940)	Returns the object that handles exceptions that arise in the WebSnap application.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLocateFileService (see page 24912)	Returns the value of the LocateFileService (see page 24920) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPageDispatcher (see page 24912)	Returns the value of the PageDispatcher (see page 24921) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebApplicationInfo (see page 24913)	Returns the value of the ApplicationAdapter (see page 24919) property.
	GetWebEndUser (see page 24913)	Returns the value of the EndUserAdapter (see page 24920) property.
	GetWebUserList (see page 24913)	Returns the value of the UserListService (see page 24922) property.
	HandleException (see page 24941)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 24941)	Directs the processing of the current request message.
	ImplFinishContext (see page 24914)	Provides the underlying implementation of the FinishContext (see page 24940) method.
	ImplHandleException (see page 24914)	Provides the underlying implementation of the HandleException (see page 24941) method.
	ImplHandleRequest (see page 24915)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
	ImplInitContext (see page 24915)	Provides the underlying implementation for the InitContext (see page 24944) method.
	InitContext (see page 24944)	Creates and initializes the Web context for the current Web request.
	InitModule (see page 24916)	Initializes a Web module before the WebSnap application uses it to handle the current request.
	InitModules (see page 24917)	Initializes all the currently active Web modules.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	ListRequestHandlers (see page 24917)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	ModuleAdded (see page 24946)	Initializes a Web module when it is activated while processing the current request.
	Notification (see page 24918)	Updates the TCustomWebAppComponents (see page 24906) properties when components are added to or removed from the application.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Request (see page 24946)	Provides access to the current request object.
R	Response (see page 24947)	Provides access to the current response object.
R	WebModules (see page 24947)	Lists the Web modules available in the WebSnap application.

Public Events

	Name	Description
	OnException (see page 24922)	Occurs when an exception escapes all try blocks in the WebSnap application.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FinishContext (see page 15228)	Performs any final tasks after the WebSnap application has finished processing a request.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetExceptionHandler (see page 15229)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 15229)	Directs the processing of the current request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitContext (see page 15229)	Creates and initializes the Web context for the current Web request.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AdapterDispatcher (see page 24919)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 24919)	Provides access to the application adapter.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DispatchActions (see page 24919)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 24920)	Provides access to an end-user adapter.
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.
	LocateFileService (see page 24920)	Provides access to the file location service.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PageDispatcher (see page 24921)	Provides access to the current page dispatcher object.
	Sessions (see page 24921)	Provides access to the sessions service.
	UserListService (see page 24922)	Provides access to the file location service.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebApplicationInfo (see page 19707)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
R	WebEndUser (see page 19707)	This is WebEndUser, a member of class IGetWebAppComponents.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.11.2 TCustomWebAppComponents Methods

The methods of the TCustomWebAppComponents class are listed here.

Protected Methods

	Name	Description
	CreateContext (see page 24911)	Creates the Web context for the current request message.
	GetAdapterDispatcher (see page 24912)	Returns the value of the AdapterDispatcher (see page 24919) property.
	GetLocateFileService (see page 24912)	Returns the value of the LocateFileService (see page 24920) property.
	GetPageDispatcher (see page 24912)	Returns the value of the PageDispatcher (see page 24921) property.
	GetWebApplicationInfo (see page 24913)	Returns the value of the ApplicationAdapter (see page 24919) property.
	GetWebEndUser (see page 24913)	Returns the value of the EndUserAdapter (see page 24920) property.
	GetWebUserList (see page 24913)	Returns the value of the UserListService (see page 24922) property.
	ImplFinishContext (see page 24914)	Provides the underlying implementation of the FinishContext (see page 24940) method.
	ImplHandleException (see page 24914)	Provides the underlying implementation of the HandleException (see page 24941) method.
	ImplHandleRequest (see page 24915)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
	ImplInitContext (see page 24915)	Provides the underlying implementation for the InitContext (see page 24944) method.
	InitModule (see page 24916)	Initializes a Web module before the WebSnap application uses it to handle the current request.
	InitModules (see page 24917)	Initializes all the currently active Web modules.
	ListRequestHandlers (see page 24917)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
	Notification (see page 24918)	Updates the TCustomWebAppComponents (see page 24906) properties when components are added to or removed from the application.

179.1.11.2.1 TCustomWebAppComponents.CreateContext Method

Creates the Web context for the current request message.

Pascal

```
function CreateContext: TAbstractWebContext; override;
```

C++

```
virtual __fastcall TAbstractWebContext CreateContext();
```

Description

The ImplInitContext (see page 24915) method calls CreateContext to instantiate the Web context object for the current request. This context can then be accessed by the WebSnap application using the global WebContext function.

In TCustomWebAppComponents (see page 24906), CreateContext creates a TWebContext object, creating a new session object for the current request and passing the session object along with the values of the protected Request (see page 24946), Response (see page 24947), and WebModules (see page 24947) properties to the TWebContext constructor.

See Also

WebContext (see page 24687)

ImplInitContext (see page 24915)

Create (see page 24662)

Request (see page 24946)

Response (see page 24947)

WebModules (see page 24947)

179.1.11.2.2 TCustomWebAppComponents.GetAdapterDispatcher Method

Returns the value of the AdapterDispatcher (see page 24919) property.

Pascal

```
function GetAdapterDispatcher: IAdapterDispatcher;
```

C++

```
__fastcall IAdapterDispatcher GetAdapterDispatcher();
```

Description

The protected GetAdapterDispatcher method is used internally to fetch the value of the AdapterDispatcher (see page 24919) property.

See Also

AdapterDispatcher (see page 24919)

179.1.11.2.3 TCustomWebAppComponents.GetLocateFileService Method

Returns the value of the LocateFileService (see page 24920) property.

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

The protected GetLocateFileService method is used internally to fetch the value of the LocateFileService (see page 24920) property.

See Also

LocateFileService (see page 24920)

179.1.11.2.4 TCustomWebAppComponents.GetPageDispatcher Method

Returns the value of the PageDispatcher (see page 24921) property.

Pascal

```
function GetPageDispatcher: IPageDispatcher;
```

C++

```
__fastcall IPageDispatcher GetPageDispatcher();
```

Description

The protected GetPageDispatcher method is used internally to fetch the value of the PageDispatcher (see page 24921) property.

See Also

PageDispatcher (see page 24921)

179.1.11.2.5 TCustomWebAppComponents.GetWebApplicationInfo Method

Returns the value of the ApplicationAdapter (see page 24919) property.

Pascal

```
function GetWebApplicationInfo: IWebApplicationInfo;
```

C++

```
__fastcall IWebApplicationInfo GetWebApplicationInfo();
```

Description

The protected GetWebApplicationInfo method is used internally to fetch the value of the ApplicationAdapter (see page 24919) property.

See Also

ApplicationAdapter (see page 24919)

179.1.11.2.6 TCustomWebAppComponents.GetWebEndUser Method

Returns the value of the EndUserAdapter (see page 24920) property.

Pascal

```
function GetWebEndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser GetWebEndUser();
```

Description

The protected GetWebEndUser method is used internally to fetch the value of the EndUserAdapter (see page 24920) property.

See Also

EndUserAdapter (see page 24920)

179.1.11.2.7 TCustomWebAppComponents.GetWebUserList Method

Returns the value of the UserListService (see page 24922) property.

Pascal

```
function GetWebUserList: IWebUserList;
```

C++

```
__fastcall IWebUserList GetWebUserList();
```

Description

The protected GetWebUserList method is used internally to fetch the value of the UserListService (see page 24922) property.

See Also

UserListService (see page 24922)

179.1.11.2.8 TCustomWebAppComponents.ImplFinishContext Method

Provides the underlying implementation of the FinishContext (see page 24940) method.

Pascal

```
procedure ImplFinishContext; override;
```

C++

```
virtual __fastcall ImplFinishContext();
```

Description

ImplFinishContext performs any final tasks and cleanup after the WebSnap application has finished processing a request message.

ImplFinishContext

1. Instructs the Web dispatcher that implements the DispatchActions (see page 24919) property to perform any final tasks.
2. Calls the DoneModule (see page 24939) method for every active Web module so that it can be freed or deactivated.
3. Frees the Web context for the current request.
4. Adds the session ID of the current session to the response message so that subsequent requests from the same caller can use the same session.

See Also

FinishContext (see page 24940)

DoneModule (see page 24939)

WebContext (see page 24687)

DispatchActions (see page 24919)

Sessions (see page 24921)

179.1.11.2.9 TCustomWebAppComponents.ImplHandleException Method

Provides the underlying implementation of the HandleException (see page 24941) method.

Pascal

```
procedure ImplHandleException(E: Exception; var Handled: Boolean); override;
```

C++

```
virtual __fastcall ImplHandleException(Exception E, Boolean Handled);
```

Description

The HandleException (see page 24941) method calls ImplHandleException to handle any exception that passes through all the try blocks in the application code.

ImplHandleException generates an OnException (see page 24922) event, so that an event handler can take care of the exception. If the OnException (see page 24922) event handler does not handle the exception, ImplHandleException checks whether the response message has not yet been sent. If not, it adds the exception error message to the response.

E is the exception object for the exception that occurred.

Handled returns true if the OnException (see page 24922) event handler handled the exception or if ImplHandleException added the error message to the response object. If Handled returns false, the WebSnap application displays a dialog box that indicates an error occurred.

See Also

HandleException (see page 24941)

OnException (see page 24922)

179.1.11.2.10 TCustomWebAppComponents.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 24941) method.

Pascal

```
function ImplHandleRequest: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest();
```

Description

The HandleRequest (see page 24941) method calls ImplHandleRequest to handle the current HTTP request message.

ImpleHandleRequest

1.Generates an OnBeforeDispatch (see page 24948) event.

2.If the OnBeforeDispatch (see page 24948) event handler does not handle the request, checks the PageDispatcher (see page 24921), AdapterDispatcher (see page 24919), and DispatchActions (see page 24919) properties to find a dispatcher that can handle the request. If it finds one, the dispatcher forwards the request to the appropriate components for handling.

3.If the request was handled by the OnBeforeDispatch (see page 24948) event or by one of the dispatchers, and if the response was not already sent to the caller, generates an OnAfterDispatch (see page 24948) event.

ImplHandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

HandleRequest (see page 24941)

OnBeforeDispatch (see page 24948)

OnAfterDispatch (see page 24948)

PageDispatcher (see page 24921)

AdapterDispatcher (see page 24919)

DispatchActions (see page 24919)

179.1.11.2.11 TCustomWebAppComponents.ImplInitContext Method

Provides the underlying implementation for the InitContext (see page 24944) method.

Pascal

```
procedure ImplInitContext(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest;
AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall ImplInitContext(TAbstractWebModuleList AWebModuleList, TWebRequest
ARequest, TWebResponse AResponse);
```

Description

The InitContext (see page 24944) method, which is called when the WebSnap application first receives a request, calls ImplInitContext to perform any initializations and to create the Web context for the new request message.

ImplInitContext performs the following tasks:

1. If the DispatchActions (see page 24919) property is set, instructs the Web dispatcher to initialize itself.
2. Calls the CreateContext (see page 24911) method to create a Web context for the current request, supplying it with the values of the AWebModuleList, ARequest, and AResponse parameters. This Web context can then be accessed using the global WebContext function.
3. Calls the InitModules (see page 24917) method to initialize all the Web modules that the AWebModuleList parameter indicates are currently instantiated. (These are the Web modules that are created for every request message)
4. Hooks up the InitModule (see page 24916) method so that it can initialize any Web modules that are instantiated in the course of processing the current request.

See Also

InitContext (see page 24944)

CreateContext (see page 24911)

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

WebModules (see page 24660)

InitModules (see page 24917)

DispatchActions (see page 24919)

InitModule (see page 24916)

179.1.11.2.12 TCustomWebAppComponents.InitModule Method

Initializes a Web module before the WebSnap application uses it to handle the current request.

Pascal

```
procedure InitModule(AModule: TComponent); override;
```

C++

```
virtual __fastcall InitModule(TComponent * AModule);
```

Description

InitModule is called whenever the WebSnap application instantiates a Web module to handle the current request. InitModule handles any initializations, including assigning itself as the Web dispatcher to any content producers in the Web module, generating an OnActivate event on the Web module, and allowing the Web dispatcher that is the value of the DispatchActions (see page 24919) property to perform its own initializations.

AWebModule is the Web module component to initialize.

See Also

InitModules (see page 24917)

Dispatcher (see page 15109)

DispatchActions (see page 24919)

OnActivate (see page 25356)

179.1.11.2.13 TCustomWebAppComponents.InitModules Method

Initializes all the currently active Web modules.

Pascal

```
procedure InitModules; override;
```

C++

```
virtual __fastcall InitModules();
```

Description

InitModules is called to initialize the currently active Web modules when the WebSnap application first sets up the Web context for a new request. It iterates over all the active Web modules that the WebModules (see page 24947) property lists, calling the InitModule (see page 24916) method to initialize each one. It then checks whether the session for the request is new (rather than a continuation of the session from a previous request), and if so, generates an OnStartSession event on the sessions service.

See Also

InitModule (see page 24916)

WebModules (see page 24947)

InitContext (see page 24944)

OnStartSession (see page 25582)

179.1.11.2.14 TCustomWebAppComponents.ListRequestHandlers Method

Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.

Pascal

```
procedure ListRequestHandlers(L: IInterfaceList); virtual;
```

C++

```
virtual __fastcall ListRequestHandlers(IInterfaceList L);
```

Description

The ImplHandleRequest (see page 24915) method calls ListRequestHandlers to obtain a list of all interfaces it can call to dispatch the request. ListRequestHandlers adds the interfaces that are the values of the PageDispatcher (see page 24921), AdapterDispatcher (see page 24919), and DispatchActions (see page 24919) properties to the list.

L is the interface list to which the dispatcher interfaces should be added.

See Also

ImplHandleRequest (see page 24915)

PageDispatcher (see page 24921)

AdapterDispatcher (see page 24919)

DispatchActions (see page 24919)

179.1.11.2.15 TCustomWebAppComponents.Notification Method

Updates the TCustomWebAppComponents (see page 24906) properties when components are added to or removed from the application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. It checks whether AComponent supports one of the interfaces that is the type of a TCustomWebAppComponents (see page 24906) property, and if so, sets that property to nil (Delphi) or NULL (C++) if the object is about to be removed, or sets the property to the AComponent interface if the object was just added.

See Also

Notification (see page 2783)

AdapterDispatcher (see page 24919)

ApplicationAdapter (see page 24919)

DispatchActions (see page 24919)

EndUserAdapter (see page 24920)

LocateFileService (see page 24920)

Sessions (see page 24921)

PageDispatcher (see page 24921)

UserListService (see page 24922)

179.1.11.3 TCustomWebAppComponents Properties

The properties of the TCustomWebAppComponents class are listed here.

Public Properties

	Name	Description
	AdapterDispatcher (see page 24919)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 24919)	Provides access to the application adapter.
	DispatchActions (see page 24919)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 24920)	Provides access to an end-user adapter.
	LocateFileService (see page 24920)	Provides access to the file location service.
	PageDispatcher (see page 24921)	Provides access to the current page dispatcher object.
	Sessions (see page 24921)	Provides access to the sessions service.
	UserListService (see page 24922)	Provides access to the file location service.

179.1.11.3.1 TCustomWebAppComponents.AdapterDispatcher Property

Provides access to the current adapter dispatcher object.

Pascal

```
property AdapterDispatcher: IAdapterDispatcher;
```

C++

```
__property IAdapterDispatcher AdapterDispatcher;
```

Description

Use AdapterDispatcher to get or set the interface of the adapter dispatcher. The adapter dispatcher is responsible for encoding the hidden fields and HREF values that represent calls to adapter fields and actions, and for interpreting the fields in incoming requests by calling adapters to execute their actions or to fetch image field values.

Typically, AdapterDispatcher is the interface of a TAdapterDispatcher (see page 24840) object. If the WebSnap application does not include a TAdapterDispatcher (see page 24840) component, or some other component that implements the IAdapterDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When AdapterDispatcher is nil (Delphi) or NULL (C++), the WebSnap application can't execute adapter actions or fetch image fields from adapters.

See Also

TAdapterDispatcher (see page 24840)

DispatchActions (see page 24919)

179.1.11.3.2 TCustomWebAppComponents.ApplicationAdapter Property

Provides access to the application adapter.

Pascal

```
property ApplicationAdapter: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo ApplicationAdapter;
```

Description

Use ApplicationAdapter to get or set the interface of the application adapter. The application adapter implements the fields and actions of the Application variable in server-side scripts.

Typically, ApplicationAdapter is the interface of a TApplicationAdapter object. If the WebSnap application does not include a TApplicationAdapter component, or some other component that implements the IWebApplicationInfo interface, the value of this property is nil (Delphi) or NULL (C++). When ApplicationAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the Application variable in server-side scripts.

See Also

TApplicationAdapter (see page 24032)

179.1.11.3.3 TCustomWebAppComponents.DispatchActions Property

Provides access to an action-based Web dispatcher.

Pascal

```
property DispatchActions: IWebDispatchActions;
```

C++

```
__property IWebDispatchActions DispatchActions;
```

Description

Read DispatchActions to determine whether the WebSnap application contains a Web dispatcher. A Web dispatcher maintains a list of action items that respond to incoming request messages. Web dispatchers can appear in both WebSnap and Web broker applications.

The IWebDispatchActions interface that is the value of DispatchActions does nothing special other than identify its component as a Web dispatcher. You can, however, use this interface to obtain other interfaces that belong to the Web dispatcher.

Typically, DispatchActions is the interface of a TWebDispatcher object. If the WebSnap application does not include a TWebDispatcher component, or some other component that implements the IWebDispatchActions interface, the value of this property is nil (Delphi) or NULL (C++).

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

179.1.11.3.4 TCustomWebAppComponents.EndUserAdapter Property

Provides access to an end-user adapter.

Pascal

```
property EndUserAdapter: IWebEndUser;
```

C++

```
__property IWebEndUser EndUserAdapter;
```

Description

Use EndUserAdapter to get or set the interface of the end user adapter. An end user adapter maintains information about the current end user, and supports the actions for logging users in and out. End user adapters implement the fields and actions of the EndUser variable in server-side scripts.

Typically, EndUserAdapter is the interface of a TEndUserAdapter or TEndUserSessionAdapter object. If the WebSnap application does not include a component that implements the IWebEndUser interface, the value of this property is nil (Delphi) or NULL (C++). When EndUserAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the EndUser variable in server-side scripts or take advantage of the login support that end user adapters provide.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

179.1.11.3.5 TCustomWebAppComponents.LocateFileService Property

Provides access to the file location service.

Pascal

```
property LocateFileService: ILocateFileService;
```

C++

```
__property ILocateFileService LocateFileService;
```

Description

Use LocateFileService to get or set the interface of the file location service. The file location service controls access to the templates and server-side script include files that are used while processing requests.

Typically, LocateFileService is the interface of a TLocateFileService (see page 24928) object. If the WebSnap application does not include a component that implements the ILocateFileService interface, the value of this property is nil (Delphi) or NULL (C++). When LocateFileService is nil (Delphi) or NULL (C++), the WebSnap application can still use template files and include files, but you have less control over how the application locates these files (that is, they must reside in the current directory or references to them must be qualified).

See Also

TLocateFileService (see page 24928)

179.1.11.3.6 TCustomWebAppComponents.PageDispatcher Property

Provides access to the current page dispatcher object.

Pascal

```
property PageDispatcher: IPageDispatcher;
```

C++

```
__property IPageDispatcher PageDispatcher;
```

Description

Use PageDispatcher to get or set the interface of the page dispatcher. The page dispatcher is responsible for interpreting requests for specific Web pages, checking the access rights for requested Web pages, and dispatching Web page requests to the appropriate Web page module.

Typically, PageDispatcher is the interface of a TPageDispatcher (see page 24949) object. If the WebSnap application does not include a TPageDispatcher (see page 24949) component, or some other component that implements the IPageDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When PageDispatcher is nil (Delphi) or NULL (C++), the WebSnap application does not automatically generate Web page content in response to requests that give the Web page name in their target URL.

See Also

TPageDispatcher (see page 24949)

AdapterDispatcher (see page 24919)

179.1.11.3.7 TCustomWebAppComponents.Sessions Property

Provides access to the sessions service.

Pascal

```
property Sessions: ISessionsService;
```

C++

```
__property ISessionsService Sessions;
```

Description

Use Sessions to get or set the interface of the sessions service. The sessions service maintains Web sessions so that the WebSnap application can store temporary information about an end user.

Typically, Sessions is the interface of a TSessionsService object. If the WebSnap application does not include a component that

implements the ISessionsService interface, the value of this property is nil (Delphi) or NULL (C++). When Sessions is nil (Delphi) or NULL (C++), the WebSnap application can't use Web sessions to store named information about the current end user.

See Also

TSessionsService (see page 25582)

179.1.11.3.8 TCustomWebAppComponents.UserListService Property

Provides access to the file location service.

Pascal

```
property UserListService: IWebUserList;
```

C++

```
__property IWebUserList UserListService;
```

Description

Use UserListService to get or set the interface of the user list service. The user list service maintains a list of user names, passwords, and access rights. Using this information, it can validate logins and check a user's access rights.

Typically, UserListService is the interface of a TWebUserList object. If the WebSnap application does not include a component that implements the IWebUserList interface, the value of this property is nil (Delphi) or NULL (C++). When UserListService is nil (Delphi) or NULL (C++), the WebSnap application can still allow users to log in and check access rights, but the support for this must be coded using event handlers on the page dispatcher.

See Also

TWebUserList (see page 25625)

TPageDispatcher (see page 24949)

179.1.11.4 TCustomWebAppComponents Events

The events of the TCustomWebAppComponents class are listed here.

Public Events

	Name	Description
	OnException (see page 24922)	Occurs when an exception escapes all try blocks in the WebSnap application.

179.1.11.4.1 TCustomWebAppComponents.OnException Event

Occurs when an exception escapes all try blocks in the WebSnap application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Write an OnException event handler respond to exceptions that arise while processing a request message. OnException occurs when an exception is not caught by the components that process the request message. If the OnException event handler does not handle the exception, TCustomWebAppComponents (see page 24906) updates the response message so that it describes the exception to the caller.

See Also

OnAfterDispatch (see page 24948)

179.1.12 TInvalidWebSession Class

Serves as a placeholder when an HTTP request could not be given a session.

Class Hierarchy

System::TObject → HTTPApp.TAbstractWebSession → WebDisp.TInvalidWebSession

Pascal

```
TInvalidWebSession = class(TAbstractWebSession);
```

C++

```
class TInvalidWebSession : public TAbstractWebSession;
```

File

WebDisp

Description

TInvalidWebSession implements the Session property on the Web context when the WebSnap application fails to create an active session (TWebSession (see page 24968)) for the current request. The failure to create an active session can arise from various reasons, including the situation where the WebSnap application does not have a TSessionsService component or the situation where an incoming request message tries to reactivate a session that was terminated.

TInvalidWebSession acts as a placeholder, so that the WebSnap application does not need to raise an exception when the attempt to create an active session fails. Any attempt to use TInvalidWebSession, however, leads to an ESessionException (see page 24840) exception.

See Also

TSessionsService (see page 25582)

TAbstractWebContext (see page 24644)

TWebSession (see page 24968)

ESessionException (see page 24840)

179.1.12.1 TInvalidWebSession Members

The following tables list the members exposed by TInvalidWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 24925)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 24925)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 24926)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 24926)	Sets the value of the TimoutMinutes property.
	SetValue (see page 24927)	Assigns a value to a specified name.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24924)	Creates and initializes an instance of TInvalidWebSession (see page 24923).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Terminate (see page 24927)	Raises an ESessionException (see page 24840) exception.
	UpdateResponse (see page 24927)	Does nothing.

Public Properties

	Name	Description
	SessionID (see page 15087)	Uniquely identifies the Session.
	TimeoutMinutes (see page 15087)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 15088)	Lists the named values that the session stores.

179.1.12.2 TInvalidWebSession.Create Constructor

Creates and initializes an instance of TInvalidWebSession (see page 24923).

Pascal

```
constructor Create(const AMsg: string);
```

C++

```
__fastcall TInvalidWebSession(const AnsiString AMsg);
```

Description

Do not create instances of TInvalidWebSession (see page 24923). WebSnap applications automatically create

TInvalidWebSession (see page 24923) objects when a call to the TWebSession (see page 24968) constructor fails.

AMsg is the error message from the exception that was raised within a call to the TWebSession (see page 24968) constructor. This error message is used for any ESessionException (see page 24840) exception that the TInvalidWebSession (see page 24923) object raises.

See Also

ESessionException (see page 24840)

Create (see page 24970)

179.1.12.3 TInvalidWebSession Methods

The methods of the TInvalidWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 24925)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 24925)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 24926)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 24926)	Sets the value of the TimoutMinutes property.
	SetValue (see page 24927)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 24927)	Raises an ESessionException (see page 24840) exception.
	UpdateResponse (see page 24927)	Does nothing.

179.1.12.3.1 TInvalidWebSession.GetSessionID Method

Returns the value of the SessionID property.

Pascal

```
function GetSessionID: string; override;
```

C++

```
virtual __fastcall AnsiString GetSessionID();
```

Description

GetSessionID is the protected read implementation of the SessionID property.

In TAbstractWebSession, GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID property.

See Also

SessionID (see page 15087)

179.1.12.3.2 TInvalidWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes property.

Pascal

```
function GetTimeoutMinutes: Integer; override;
```

C++

```
virtual __fastcall int GetTimeoutMinutes();
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes property.

In TAbstractWebSession, GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

TimeoutMinutes (see page 15087)

SetTimeoutMinutes (see page 15085)

179.1.12.3.3 TInvalidWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; override;
```

C++

```
virtual __fastcall Variant GetValue(const AnsiString AName);
```

Description

GetValue is the protected read implementation of the Values property.

AName is the name of the value to return.

In TAbstractWebSession, GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

Values (see page 15088)

SetValue (see page 15085)

179.1.12.3.4 TInvalidWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); override;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue);
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession, SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

GetTimeoutMinutes (see page 15084)

TimeoutMinutes (see page 15087)

179.1.12.3.5 TInvalidWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString AName, const Variant AValue);
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession, SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

GetValue (see page 15084)

Values (see page 15088)

179.1.12.3.6 TInvalidWebSession.Terminate Method

Raises an ESessionException (see page 24840) exception.

Pascal

```
procedure Terminate; override;
```

C++

```
virtual __fastcall Terminate();
```

Description

Do not call the Terminate method. TInvalidWebSession (see page 24923) does not represent an active Web session, so there is no Web session to terminate.

If the application calls the Terminate method, TInvalidWebSession (see page 24923) raises an ESessionException (see page 24840) object.

See Also

ESessionException (see page 24840)

179.1.12.3.7 TInvalidWebSession.UpdateResponse Method

Does nothing.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse);
```

Description

UpdateResponse is called automatically to allow the WebSnap application to add the session ID to the response message before it is sent to the user. In TInvalidWebSession (see page 24923), UpdateResponse does nothing, because invalid Web sessions do not have session ID's.

See Also

SessionID

179.1.13 TLocateFileService Class

TLocateFileService controls the access of templates and server-side script include files at runtime.

Class Hierarchy

Pascal

```
TLocateFileService = class(TCustomLocateFileService);
```

C++

```
class TLocateFileService : public TCustomLocateFileService;
```

File

WebDisp

Description

Add a TLocateFileService component to your WebSnap application when you want greater control over how template and server-side script include files are accessed at runtime. Define event handlers that will be called when the application requires one of these files. Event handlers can specify a different directory location for a file or return a TStream containing the file.

See Also

TStream (see page 2973)

179.1.13.1 TLocateFileService Members

The following tables list the members exposed by TLocateFileService.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindIncludeFile (see page 24884)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 24885)	Generates an OnFindStream (see page 24889) event.
	FindTemplateFile (see page 24885)	Generates an OnFindTemplateFile (see page 24889) event.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetFileStream (see page 24886)	Returns a stream object from which to read a specified file.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTemplateStream (see page 24886)	Returns a stream from which to read a template file.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	ImplFindIncludeFile (see page 24887)	Provides the underlying implementation for the FindIncludeFile (see page 24884) method.
V	ImplGetTemplateStream (see page 24887)	Provides the underlying implementation for the GetTemplateStream (see page 24886) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.

	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindIncludeFile (see page 19685)	This is FindIncludeFile, a member of class IFindIncludeFile.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetTemplateStream (see page 15321)	This is GetTemplateStream, a member of class ILocateFileService.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnFindIncludeFile (see page 24932)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 24932)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 24932)	Occurs when the WebSnap application tries to locate the template file for a content producer.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.13.2 TLocateFileService Events

The events of the TLocateFileService class are listed here.

Published Events

	Name	Description
	OnFindIncludeFile (see page 24932)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 24932)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 24932)	Occurs when the WebSnap application tries to locate the template file for a content producer.

179.1.13.2.1 TLocateFileService.OnFindIncludeFile Event

Occurs when the WebSnap application tries to locate an include file for a server-side script.

Pascal

```
property OnFindIncludeFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindIncludeFile;
```

Description

Write an OnFindIncludeFile event handler to indicate the location on disk of include files for server-side scripts. In WebSnap applications that include a locate file service component, you must supply either an OnFindIncludeFile or an OnFindStream event handler (or both) if the server-side scripts have include files. Otherwise the application can't locate these include files at all.

See Also

OnFindStream (see page 24889)

OnFindTemplateFile (see page 24889)

179.1.13.2.2 TLocateFileService.OnFindStream Event

Occurs when the WebSnap application tries to locate a file.

Pascal

```
property OnFindStream: TLocateFileServiceFindStreamEvent;
```

C++

```
__property TLocateFileServiceFindStreamEvent OnFindStream;
```

Description

Write an OnFindStream event handler to supply the WebSnap application with the contents of a file given its name. This event is particularly useful for applications that use "logical" files that do not exist physically on disk. When the WebSnap application tries to locate a file, the locate file service generates this event, along with an OnFindTemplateFile. One of these event handlers must be provided in order for the application to use the requested file.

See Also

OnFindIncludeFile (see page 24888)

OnFindTemplateFile (see page 24889)

179.1.13.2.3 TLocateFileService.OnFindTemplateFile Event

Occurs when the WebSnap application tries to locate the template file for a content producer.

Pascal

```
property OnFindTemplateFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindTemplateFile;
```

Description

Write an OnFindIncludeFile event handler to indicate the location on disk of templates that a content producer component uses to generate its content. In WebSnap applications that include a locate file service component, you must supply either an

OnFindTemplateFile or an OnFindStream event handler (or both) if the application has content producers that use template files. Otherwise content producers can't locate their templates.

See Also

OnFindStream (see page 24889)

OnFindIncludeFile (see page 24888)

179.1.14 TMultiModuleWebAppServices Class

TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.

Class Hierarchy

Pascal

```
TMultiModuleWebAppServices = class(TComponent, IWebAppServices, IWebDispatcherAccess,
IWebExceptionHandler);
```

C++

```
class TMultiModuleWebAppServices : public TComponent, public IWebAppServices, public
IWebDispatcherAccess, public IWebExceptionHandler;
```

File

WebDisp

Description

TMultiModuleWebAppServices is the base class for components that provide access to the services available in a WebSnap application. It keeps track of the current request and response objects, maintains a list of the available Web modules, and introduces methods for locating the appropriate components to handle incoming request messages.

Do not use TMultiModuleWebAppServices directly. The methods that process request messages and any exceptions that arise during that processing are simple stubs that should be overridden by a descendant class. Rather, use a TMultiModuleWebAppServices descendant such as TWebAppComponents (see page 24958), to provide access to the central components of the WebSnap application.

See Also

TWebRequest (see page 15161)

TWebResponse (see page 15191)

TWebRequestHandler (see page 25448)

TWebAppComponents (see page 24958)

IWebAppServices (see page 15227)

179.1.14.1 TMultiModuleWebAppServices Members

The following tables list the members exposed by TMultiModuleWebAppServices.

Protected Events

	Name	Description
	OnAfterDispatch (see page 24948)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 24948)	Occurs before TMultiModuleWebAppServices (see page 24933) passes an HTTP request onto the other components in the application for processing.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 24937)	Returns the value of the Access_Request property.
	Access_Response (see page 24938)	Returns the value of the Access_Response property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateContext (see page 24938)	Creates the Web context for the current request message.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterDispatch (see page 24939)	Generates an OnAfterDispatch (see page 24948) event.
	DoBeforeDispatch (see page 24939)	Generates an OnBeforeDispatch (see page 24948) event.
V	DoneModule (see page 24939)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 24940)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetExceptionHandler (see page 24940)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleException (see page 24941)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 24941)	Directs the processing of the current request message.
V	ImplFinishContext (see page 24942)	Provides the underlying implementation of the FinishContext (see page 24940) method.
V	ImplHandleException (see page 24942)	Provides the underlying implementation of the HandleException (see page 24941) method.
V	ImplHandleRequest (see page 24943)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
V	ImplInitContext (see page 24943)	Provides the underlying implementation for the InitContext (see page 24944) method.
	InitContext (see page 24944)	Creates and initializes the Web context for the current Web request.

V	InitModule (see page 24945)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 24945)	Initializes all the currently active Web modules.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	ModuleAdded (see page 24946)	Initializes a Web module when it is activated while processing the current request.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Request (see page 24946)	Provides access to the current request object.
R	Response (see page 24947)	Provides access to the current response object.
R	WebModules (see page 24947)	Lists the Web modules available in the WebSnap application.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.14.2 TMultiModuleWebAppServices Methods

The methods of the TMultiModuleWebAppServices class are listed here.

Protected Methods

	Name	Description
	Access_Request (see page 24937)	Returns the value of the Access_Request property.
	Access_Response (see page 24938)	Returns the value of the Access_Response property.
V	CreateContext (see page 24938)	Creates the Web context for the current request message.
	DoAfterDispatch (see page 24939)	Generates an OnAfterDispatch (see page 24948) event.
	DoBeforeDispatch (see page 24939)	Generates an OnBeforeDispatch (see page 24948) event.
V	DoneModule (see page 24939)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 24940)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 24940)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleException (see page 24941)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 24941)	Directs the processing of the current request message.
V	ImplFinishContext (see page 24942)	Provides the underlying implementation of the FinishContext (see page 24940) method.
V	ImplHandleException (see page 24942)	Provides the underlying implementation of the HandleException (see page 24941) method.
V	ImplHandleRequest (see page 24943)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
V	ImplInitContext (see page 24943)	Provides the underlying implementation for the InitContext (see page 24944) method.
	InitContext (see page 24944)	Creates and initializes the Web context for the current Web request.
V	InitModule (see page 24945)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 24945)	Initializes all the currently active Web modules.
	ModuleAdded (see page 24946)	Initializes a Web module when it is activated while processing the current request.

179.1.14.2.1 TMultiModuleWebAppServices.Access_Request Method

Returns the value of the Access_Request property.

Pascal

```
function Access_Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Access_Request();
```

Description

Access_Access_Request provides the TMultiModuleWebAppServices (see page 24933) object's implementation of the

Access_Request method of its IWebDispatcherAccess interface. This allows content producer components in the application to access the current request message.

See Also

Access_Request

Request (see page 15235)

Dispatcher (see page 15109)

179.1.14.2.2 TMultiModuleWebAppServices.Access_Response Method

Returns the value of the Access_Response property.

Pascal

```
function Access_Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Access_Response();
```

Description

Access_Access_Response provides the TMultiModuleWebAppServices (see page 24933) object's implementation of the Access_Response method of its IWebDispatcherAccess interface. This allows content producer components in the application to access the current Access_Response message.

See Also

Access_Response

Response (see page 15235)

Dispatcher (see page 15109)

179.1.14.2.3 TMultiModuleWebAppServices.CreateContext Method

Creates the Web context for the current request message.

Pascal

```
function CreateContext: TAbstractWebContext; virtual;
```

C++

```
virtual __fastcall TAbstractWebContext CreateContext();
```

Description

The InitContext (see page 24944) method calls CreateContext to instantiate the Web context object for the current request. This context can then be accessed by the WebSnap application using the global WebContext function.

In TMultiModuleWebAppServices (see page 24933), CreateContext creates a TWebContext object, passing the values of the Request (see page 24946), Response (see page 24947), and WebModules (see page 24947) properties to the constructor. The Web context is created without a session.

See Also

WebContext (see page 24687)

InitContext (see page 24944)

Create (see page 24662)

Request (see page 24946)

Response (see page 24947)

WebModules (see page 24947)

179.1.14.2.4 TMultiModuleWebAppServices.DoAfterDispatch Method

Generates an OnAfterDispatch (see page 24948) event.

Pascal

```
function DoAfterDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoAfterDispatch(TWebRequest Request, TWebResponse Response);
```

Description

TMultiModuleWebAppServices (see page 24933) descendants call DoAfterDispatch to generate an OnAfterDispatch (see page 24948) event after dispatching a request message to the other components in the WebSnap application.

Request (see page 24946) is the current request message that was just handled.

Response (see page 24947) is the response message that was filled in by the rest of the WebSnap application.

DoAfterDispatch returns true if the WebSnap application should send the response message back to the caller.

See Also

OnAfterDispatch (see page 24948)

179.1.14.2.5 TMultiModuleWebAppServices.DoBeforeDispatch Method

Generates an OnBeforeDispatch (see page 24948) event.

Pascal

```
function DoBeforeDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoBeforeDispatch(TWebRequest Request, TWebResponse Response);
```

Description

TMultiModuleWebAppServices (see page 24933) descendants call DoBeforeDispatch to generate an OnBeforeDispatch (see page 24948) event before dispatching a request message to the other components in the WebSnap application.

Request (see page 24946) is the current request message that needs to be handled.

Response (see page 24947) is the response message that needs to be filled out.

DoBeforeDispatch returns true if the OnBeforeDispatch (see page 24948) event handler has handled the event. When DoBeforeDispatch returns true, the WebSnap application does not need to continue processing the request.

See Also

OnBeforeDispatch (see page 24948)

179.1.14.2.6 TMultiModuleWebAppServices.DoneModule Method

Performs any final tasks before deactivating a Web module.

Pascal

```
procedure DoneModule(AWebModule: TComponent); virtual;
```

C++

```
virtual __fastcall DoneModule(TComponent * AWebModule);
```

Description

The FinishContext (see page 24940) method calls DoneModule for every active Web module as part of the final cleanup before freeing the Web modules and Web context when the WebSnap application is finished handling an HTTP request. DoneModule notifies the Web module that it is about to be deactivated, so that it can perform any final tasks before it is freed or deactivated.

AWebModule is the Web module instance that is about to be deactivated.

See Also

WebModules (see page 24947)

InitModule (see page 24945)

FinishContext (see page 24940)

179.1.14.2.7 TMultiModuleWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message.

FinishContext is not a virtual method. Descendant classes can't override this method to add additional final tasks. Instead, FinishContext calls the virtual ImplFinishContext (see page 24942) method, which descendant classes override to add their own final tasks.

See Also

InitContext (see page 24944)

ImplFinishContext (see page 24942)

179.1.14.2.8 TMultiModuleWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler returns the object that the WebSnap application should call when an exception is raised while trying to process a request message. The request handler must implement the IWebExceptionHandler interface, which includes only a single method: HandleException (see page 24941).

In TMultiModuleWebAppServices (see page 24933), GetExceptionHandler returns self this, because TMultiModuleWebAppServices (see page 24933) implements the IWebExceptionHandler interface.

See Also

HandleException (see page 24941)

179.1.14.2.9 TMultiModuleWebAppServices.HandleException Method

Responds to any exceptions not caught by the WebSnap application.

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

HandleException provides the last opportunity for a WebSnap application to handle an exception that passes through all the try blocks in the application code. If the HandleException method does not handle the exception, the WebSnap application displays a dialog box that indicates an error occurred.

HandleException calls the ImplHandleException (see page 24942) method to handle the exception. In TMultiModuleWebAppServices (see page 24933), ImplHandleException (see page 24942) does nothing. However, descendant classes override ImplHandleException (see page 24942) to provide more meaningful responses, such as generating an OnException event or creating a response message that describes the exception to the caller.

E is the exception object for the exception that occurred.

Handled returns true if HandleException handled the exception. If Handled returns false, the WebSnap application displays a dialog box that indicates an error occurred.

See Also

ImplHandleException (see page 24942)

179.1.14.2.10 TMultiModuleWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext (see page 24944) method is called to generate a Web context for the request.

2. HandleRequest is called to generate a response to the request.
3. FinishContext (see page 24940) is called to perform any final cleanup.

HandleRequest simply calls the ImplHandleRequest (see page 24943) method, which directs the processing of the request. In TMultiModuleWebAppServices (see page 24933), ImplHandleRequest (see page 24943) simply declares the request as handled while doing no processing. Descendant classes override ImplHandleRequest (see page 24943) to locate the components that should handle the request and forwarding the request to those components for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

ImplHandleRequest (see page 24943)

Request (see page 24946)

InitContext (see page 24944)

FinishContext (see page 24940)

179.1.14.2.11 TMultiModuleWebAppServices.ImplFinishContext Method

Provides the underlying implementation of the FinishContext (see page 24940) method.

Pascal

```
procedure ImplFinishContext; virtual;
```

C++

```
virtual __fastcall ImplFinishContext();
```

Description

ImplFinishContext performs any final tasks and cleanup after the WebSnap application has finished processing a request message.

In TMultiModuleWebAppServices (see page 24933), ImplFinishContext calls the DoneModule (see page 24939) method for every active Web module so that it can be freed or deactivated, and then frees the Web context for the current request.

Descendant classes override ImplFinishContext to add their own final tasks.

See Also

FinishContext (see page 24940)

DoneModule (see page 24939)

WebContext (see page 24687)

179.1.14.2.12 TMultiModuleWebAppServices.ImplHandleException Method

Provides the underlying implementation of the HandleException (see page 24941) method.

Pascal

```
procedure ImplHandleException(E: Exception; var Handled: Boolean); virtual;
```

C++

```
virtual __fastcall ImplHandleException(Exception E, Boolean Handled);
```

Description

The HandleException (see page 24941) method calls ImplHandleException to handle any exception that passes through all the try blocks in the application code. If ImplHandleException does not handle the exception, the WebSnap application displays a dialog box that indicates an error occurred.

In TMultiModuleWebAppServices (see page 24933), ImplHandleException returns true, ignoring the exception that occurred. Descendant classes override this method to provide more meaningful responses, such as generating an OnException event or creating a response message that describes the exception to the caller.

E is the exception object for the exception that occurred.

Handled returns true if ImplHandleException handled the exception. If Handled returns false, the WebSnap application displays a dialog box that indicates an error occurred.

See Also

HandleException (see page 24941)

179.1.14.2.13 TMultiModuleWebAppServices.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 24941) method.

Pascal

```
function ImplHandleRequest: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest();
```

Description

The HandleRequest (see page 24941) method calls ImplHandleRequest to handle the current HTTP request message. In TMultiModuleWebAppServices (see page 24933), ImplHandleRequest returns true, indicating that the request is handled, but does nothing to fill out the response object. Descendant classes override this method to locate components in the WebSnap application that can process the request and forward the request to them for handling.

ImplHandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

HandleRequest (see page 24941)

Request (see page 24946)

Response (see page 24947)

179.1.14.2.14 TMultiModuleWebAppServices.ImplInitContext Method

Provides the underlying implementation for the InitContext (see page 24944) method.

Pascal

```
procedure ImplInitContext(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest;
AResponse: TWebResponse); virtual;
```

C++

```
virtual __fastcall ImplInitContext(TAbstractWebModuleList AWebModuleList, TWebRequest
ARequest, TWebResponse AResponse);
```

Description

The InitContext (see page 24944) method, which is called when the WebSnap application first receives a request, calls ImplInitContext to perform any initializations and to create the Web context for the new request message.

ImplInitContext performs the following tasks:

1. Sets the WebModules (see page 24947), Request (see page 24946), and Response (see page 24947) properties to the values of the AWebModuleList, ARequest, and AResponse parameters, respectively.
2. Calls the CreateContext (see page 24938) method to create a Web context for the current request. This Web context can then be accessed using the global WebContext function.
3. Calls the InitModules (see page 24945) method to initialize all the Web modules that the AWebModuleList parameter indicates are currently instantiated. (These are the Web modules that are created for every request message.)
4. Hooks up the ModuleAdded (see page 24946) method so that it can initialize any Web modules that are instantiated in the course of processing the current request.

See Also

InitContext (see page 24944)

CreateContext (see page 24938)

WebContext (see page 24687)

Request (see page 24946)

Response (see page 24947)

WebModules (see page 24947)

InitModules (see page 24945)

179.1.14.2.15 TMultiModuleWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse
Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message. This becomes the value of the WebModules (see page 24947) property.

Request (see page 24946) describes the new request message. This becomes the value of the Request (see page 24946) property.

Response (see page 24947) is the response object that the WebSnap application should fill out when handling the current

request. This becomes the value of the Response (see page 24947) property.

InitContext is not a virtual method. Descendant classes can't override this method to add additional initializations. Instead, InitContext calls the virtual ImplInitContext (see page 24943) method, which descendant classes override to add their own initial tasks.

See Also

ImplInitContext (see page 24943)

WebContext (see page 24687)

Request (see page 24946)

Response (see page 24947)

WebModules (see page 24947)

179.1.14.2.16 TMultiModuleWebAppServices.InitModule Method

Initializes a Web module before the WebSnap application uses it to handle the current request.

Pascal

```
procedure InitModule(AWebModule: TComponent); virtual;
```

C++

```
virtual __fastcall InitModule(TComponent * AWebModule);
```

Description

Both the ModuleAdded (see page 24946) and the InitModules (see page 24945) methods call InitModule to initialize a Web module after it is first created. InitModule assigns itself as the Web dispatcher to any content producers in the Web module, and notifies the Web module that it has been activated.

AWebModule is the Web module component to initialize.

See Also

InitModules (see page 24945)

ModuleAdded (see page 24946)

WebModules (see page 24947)

Dispatcher (see page 15109)

179.1.14.2.17 TMultiModuleWebAppServices.InitModules Method

Initializes all the currently active Web modules.

Pascal

```
procedure InitModules; virtual;
```

C++

```
virtual __fastcall InitModules();
```

Description

InitModules is called to initialize the currently active Web modules when the WebSnap application first sets up the Web context for a new request. It iterates over all the active Web modules that the WebModules (see page 24947) property lists, calling the InitModule (see page 24945) method to initialize each one.

See Also

InitModule (see page 24945)

WebModules (see page 24947)

InitContext (see page 24944)

179.1.14.2.18 TMultiModuleWebAppServices.ModuleAdded Method

Initializes a Web module when it is activated while processing the current request.

Pascal

```
procedure ModuleAdded(AWebModule: TComponent);
```

C++

```
__fastcall ModuleAdded(TComponent * AWebModule);
```

Description

TMultiModuleWebAppServices (see page 24933) assigns ModuleAdded as the OnModuleAdded event handler on the TWebModuleList that is the value of the WebModules (see page 24947) property. As a result, this method is called every time the WebSnap application activates a new Web module while processing the current request.

ModuleAdded calls the InitModule (see page 24945) method to initialize the new Web module before it is used.

AWebModule is the newly activated Web module.

See Also

InitModule (see page 24945)

OnModuleAdded (see page 15059)

WebModules (see page 24947)

179.1.14.3 TMultiModuleWebAppServices Properties

The properties of the TMultiModuleWebAppServices class are listed here.

Protected Properties

	Name	Description
R	Request (see page 24946)	Provides access to the current request object.
R	Response (see page 24947)	Provides access to the current response object.
R	WebModules (see page 24947)	Lists the Web modules available in the WebSnap application.

179.1.14.3.1 TMultiModuleWebAppServices.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read Request to obtain information about the current HTTP request message. The request object provides access to the

headers of the request message, as well as the content of the message.

See Also

Response (see page 24947)

179.1.14.3.2 TMultiModuleWebAppServices.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 24946) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 24946)

179.1.14.3.3 TMultiModuleWebAppServices.WebModules Property

Lists the Web modules available in the WebSnap application.

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

Use WebModules to access one of the Web modules that make up the WebSnap application. WebModules lists all of the currently instantiated Web modules. It also provides access to the factory objects for all Web modules in the application, including those that are not yet instantiated.

When the application first receives a Web request message, the Web request handler initializes WebModules to include all Web modules that have the crAlways flag set in their factory's CreateMode property.

See Also

CreateMode

179.1.14.4 TMultiModuleWebAppServices Events

The events of the TMultiModuleWebAppServices class are listed here.

Protected Events

	Name	Description
	OnAfterDispatch (see page 24948)	Occurs after the WebSnap application generates the content of a response message.

	OnBeforeDispatch (see page 24948)	Occurs before TMultiModuleWebAppServices (see page 24933) passes an HTTP request onto the other components in the application for processing.

179.1.14.4.1 TMultiModuleWebAppServices.OnAfterDispatch Event

Occurs after the WebSnap application generates the content of a response message.

Pascal

```
property OnAfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAfterDispatch;
```

Description

Write an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the WebSnap application a request. OnAfterDispatch occurs after the other components in the WebSnap application have attempted to generate a response for the current request. It does not occur if the response message has already been sent back to the caller.

If the AfterDispatch event handler sets the Handled parameter to true, the WebSnap application sends the response back to the caller after the event handler exits. If it sets the Handled parameter to false, the WebSnap application does not send the response message.

Note: Although TMultiModuleWebAppServices (see page 24933) introduces the OnAfterDispatch event, it never calls the event handler. Descendant classes add the code to generate this event after dispatching a request message.

See Also

OnBeforeDispatch (see page 24948)

179.1.14.4.2 TMultiModuleWebAppServices.OnBeforeDispatch Event

Occurs before TMultiModuleWebAppServices (see page 24933) passes an HTTP request onto the other components in the application for processing.

Pascal

```
property OnBeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnBeforeDispatch;
```

Description

Write an OnBeforeDispatch event handler to initialize the response to an HTTP request or to handle any messages that the other components in the WebSnap application can't handle. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing this component from trying to locate a component in the WebSnap application that can handle the message.

Note: Although TMultiModuleWebAppServices (see page 24933) introduces the OnBeforeDispatch event, it never calls the event handler. Descendant classes add the code to generate this event before dispatching a request message.

See Also

OnAfterDispatch (see page 24948)

179.1.15 TPageDispatcher Class

TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.

Class Hierarchy

Pascal

```
TPageDispatcher = class(TCustomPageDispatcher);
```

C++

```
class TPageDispatcher : public TCustomPageDispatcher;
```

File

WebDisp

Description

Add a single TPageDispatcher object to the Web application module of a WebSnap application. Typically, the WebSnap application wizard adds a page dispatcher to the Web application module that it creates.

A WebSnap application only requires a single page dispatcher. The page dispatcher examines all incoming HTTP request messages, checking the pathInfo portion of the URL to which a request is addressed for the name of a registered Web page module. It then forwards the request to the matching Web page module so that the page module can handle the request and produce the content of a response. If the request is not addressed to a URL with a pathinfo portion, the page dispatcher forwards the request to the Web page module identified by its DefaultPage (see page 24953) property.

See Also

TWebDispatcher (see page 15147)

179.1.15.1 TPageDispatcher Members

The following tables list the members exposed by TPageDispatcher.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchPageName (see page 24894)	Checks whether a specified user has a given access rights string.
	EndUser (see page 24895)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 24895)	Indicates whether the current user is permitted to view a specified Web page.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDefaultPageName (see page 24895)	Returns the value of the DefaultPageName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLoginRequired (see page 24896)	Indicates whether a user must log in before accessing a specified Web page.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetRequestedPage (see page 24896)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 24864)	Handles an HTTP request.
	ImplDispatchPageName (see page 24896)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
	ImplGetCanView (see page 24896)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
	ImplGetDefaultPageName (see page 24897)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.
	ImplGetLoginRequired (see page 24897)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
	ImplHandleRequest (see page 24864)	Handles application-specific processing of an HTTP request.
	ImplHandleRequest (see page 24897)	Handles application-specific processing of an HTTP request.
	ImplPageNameOfRequest (see page 24897)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 24898)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsLoggedIn (see page 24898)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PageNameOfRequest (see page 24898)	Returns the name of the Web page to which an HTTP request is addressed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceLoginPage (see page 24899)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	RedirectToPageName (see page 24899)	Fills out a response message so that it redirects the caller to another page in the application.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 24864)	Sets the AppDispatcher (see page 24865) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidatePage (see page 24899)	This is ValidatePage, a member of class TCustomPageDispatcher.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AppDispatcher (see page 24865)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 24901)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeRedirectToPage (see page 24902)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchPageName (see page 19728)	Checks whether a specified user has a given access rights string.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetCanView (see page 19729)	Indicates whether the current user is permitted to view a specified Web page.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.

	GetDefaultPageName (see page 19729)	Returns the value of the DefaultPageName (see page 19731) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetLoginRequired (see page 19729)	Indicates whether a user must log in before accessing a specified Web page.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleRequest (see page 15238)	Processes an HTTP request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PageNameOfRequest (see page 19730)	Returns the name of the Web page to which an HTTP request is addressed.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPageName (see page 19730)	Fills out a response message so that it redirects the caller to another page in the application.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultPageName (see page 19731)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAfterDispatchPage (see page 24954)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnBeforeDispatchPage (see page 24954)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnCanViewPage (see page 24955)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 24956)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 24956)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 24957)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Published Properties

	Name	Description
	DefaultPage (see page 24953)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

179.1.15.2 TPageDispatcher Properties

The properties of the TPageDispatcher class are listed here.

Published Properties

	Name	Description
	DefaultPage (see page 24953)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

179.1.15.2.1 TPageDispatcher.DefaultPage Property

Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Pascal

```
property DefaultPage: string;
```

C++

```
__property AnsiString DefaultPage;
```

Description

DefaultPage is the name of the registered Web page module that should handle incoming request messages that do not have a pathinfo portion on their target URL. This is the name that is supplied to the Web page module wizard when you created the default Web page module. It forms the basis of that Web page module's class name. For example, if the default Web page module has the name MyDefaultPage, the Web page module class is of type TMyDefaultPage.

If DefaultPage is an empty string, the page dispatcher uses the Web application module as a default Web page module, as long as it is a Web Page module.

179.1.15.3 TPageDispatcher Events

The events of the TPageDispatcher class are listed here.

Published Events

	Name	Description
	OnAfterDispatchPage (see page 24954)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnBeforeDispatchPage (see page 24954)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnCanViewPage (see page 24955)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 24956)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 24956)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 24957)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

179.1.15.3.1 TPageDispatcher.OnAfterDispatchPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take specific action after an HTTP request has been successfully handled by a Web page module. For example, an OnAfterDispatchPage event handler can maintain a log of all Web traffic handled by the WebSnap application.

OnAfterDispatchPage occurs only if the target Web page module succeeds in handling the request. If the target Web page module could not be validated, an OnPageAccessDenied event occurs instead. If the page could not be located, an OnPageNotFound event occurs instead.

See Also

OnBeforeDispatchPage (see page 24902)

OnPageNotFound (see page 24905)

OnCanViewPage (see page 24903)

OnIsLoginRequired (see page 24904)

OnPageAccessDenied (see page 24904)

179.1.15.3.2 TPageDispatcher.OnBeforeDispatchPage Event

Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the dispatcher forwards it to the target Web page module for processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the page dispatcher from locating the target Web page module, verifying that it can handle the request, and forwarding the request to that Web page module.

If the event handler does not handle the request (for example, if it is merely maintaining a log of incoming requests), it can leave the Handled parameter as false and the dispatcher will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

OnAfterDispatchPage (see page 24901)

OnPageNotFound (see page 24905)

OnCanViewPage (see page 24903)

OnIsLoginRequired (see page 24904)

OnPageAccessDenied (see page 24904)

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

179.1.15.3.3 TPageDispatcher.OnCanViewPage Event

Occurs just before the dispatcher passes a request message to a Web page module.

Pascal

```
property OnCanViewPage: TCanViewPageEvent;
```

C++

```
__property TCanViewPageEvent OnCanViewPage;
```

Description

Write an OnCanViewPage event handler to customize the way the WebSnap application determines whether a given request can be passed to a Web page module for processing. This event is part of the mechanism by which the dispatcher validates a Web page for viewing. The validation process, which occurs after the OnBeforeDispatchPage event, occurs as follows:

1. If the caller has not already logged in, the dispatcher generates an OnIsLoginRequired event to check whether the specified Web page requires the caller to log in.
2. If a login is required, the dispatcher does not validate the page (and so does not forward the request to the specified Web page module). Rather, it initiates the process of creating a response to allow the user to log in.

a. First, the dispatcher generates an OnPageAccessDenied event, where the application can handle the login process.

b. If the OnPageAccessDenied event handler does not handle the login process, the dispatcher forwards the request to the login page specified by the end user adapter's LoginPage property.

3. If a login is not required (either because the caller already logged in or because there is no need to log in), the dispatcher generates an OnCanViewPage event. This event can validate a caller that has logged in, or provide any other type of validation that governs access to the requested page.
4. If there is no OnCanViewPage event handler, or if the OnCanViewPage event handler does not handle the validation, the

dispatcher calls on a TEndUserAdapter component to check the user's access rights.

Tip: To access the Web request and response objects from within an OnCanViewPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties. To access information about the access rights that the target page requires, call the Web context's FindPageInfo method to obtain a Web page info object for the target page and check its ViewAccess property.

Response (see page 24659)

ViewAccess (see page 15069)

FindPageInfo (see page 24650)

179.1.15.3.4 TPageDispatcher.OnIsLoginRequired Event

Occurs when a request arrives from a caller that has not yet logged in.

Pascal

```
property OnIsLoginRequired: TLoginRequiredEvent;
```

C++

```
__property TLoginRequiredEvent OnIsLoginRequired;
```

Description

Write an OnIsLoginRequired event handler to customize the way the WebSnap application determines whether a caller must log in before obtaining access to a requested page. This event occurs after the OnBeforeDispatchPage event if the caller has not already logged in to the WebSnap application.

If there is no OnPageAccessDenied event handler, or if the OnPageAccessDenied event handler does not handle the login process, the dispatcher obtains a response message from the login page specified by the end user adapter.

OnCanViewPage (see page 24903)

OnBeforeDispatchPage (see page 24902)

OnPageAccessDenied (see page 24904)

LoginPage (see page 24118)

179.1.15.3.5 TPageDispatcher.OnPageAccessDenied Event

Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.

Pascal

```
property OnPageAccessDenied: TPageAccessDeniedEvent;
```

C++

```
__property TPageAccessDeniedEvent OnPageAccessDenied;
```

Description

Write an OnPageAccessDenied event handler to customize the response when a request for a specific Web page fails to be validated.

Tip: To access the Web request and response objects from within an OnPageAccessDenied event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

WebContext (see page 24687)

Request (see page 24658)

Response (see page 24659)

LoginPage (see page 24118)

179.1.15.3.6 TPageDispatcher.OnPageNotFound Event

Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Pascal

```
property OnPageNotFound: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnPageNotFound;
```

Description

Write an OnPageNotFound event handler to generate a response when the dispatcher can't locate the Web page module to which an HTTP request message is addressed. For example, an OnPageNotFound event handler can provide the response object with content that indicates that the requested page does not exist or that represents simple content for a page that does not have an associated Web page module.

If the OnPageNotFound event handler sets its Handled parameter to true, the page dispatcher assumes it has updated the response message and returns it. If the OnPageNotFound leaves the Handled parameter set to false, the dispatcher raises an EPageDispatcherException exception after the event handler exits.

Tip: To access the Web request and response objects from within an OnPageNotFound event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

179.1.16 TWebAppComponents Class

TWebAppComponents holds the application components that provide the WebSnap application's functionality.

Class Hierarchy

Pascal

```
TWebAppComponents = class(TCustomWebAppComponents);
```

C++

```
class TWebAppComponents : public TCustomWebAppComponents;
```

File

WebDisp

Description

Use TWebAppComponents to centralize access to the main WebSnap components. It initializes the Web context for new request messages and locates the appropriate components to handle the request message. TWebAppComponents publishes properties that provide access to the components that perform many common tasks in a WebSnap application. These properties include

PageDispatcher (see page 24965), which locates the Web page modules to process incoming request messages.

AdapterDispatcher (see page 24963), which encodes calls to adapter actions and fields, and which handles HTML form submissions and requests for dynamic images by calling adapter actions and fields.

Sessions (see page 24966), which manages the sessions for each caller.

ApplicationAdapter (see page 24963), which implements the fields and actions of the Application variable in server-side scripts.

EndUserAdapter (see page 24964), which implements the fields and actions of the EndUser variable in server-side scripts.

UserListService (see page 24966), which maintains a list of end users and their passwords and access privileges.

LocateFileService (see page 24965), which controls access to the templates and server-side script include files that are used while processing requests.

DispatchActions (see page 24964), which maintains a list of action items that can respond to request messages.

The components these properties reference are optional. The WebSnap Application wizard automatically creates components and fills in these properties for any components that you select.

Add TWebAppComponents to the application module of the WebSnap application to provide centralized access to the other components that govern the behavior of the WebSnap application.

179.1.16.1 TWebAppComponents Members

The following tables list the members exposed by TWebAppComponents.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	Access_Request (see page 24937)	Returns the value of the Access_Request property.
	Access_Response (see page 24938)	Returns the value of the Access_Response property.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	CreateContext (see page 24911)	Creates the Web context for the current request message.
V	CreateContext (see page 24938)	Creates the Web context for the current request message.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoAfterDispatch (see page 24939)	Generates an OnAfterDispatch (see page 24948) event.
	DoBeforeDispatch (see page 24939)	Generates an OnBeforeDispatch (see page 24948) event.
V	DoneModule (see page 24939)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 24940)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetAdapterDispatcher (see page 24912)	Returns the value of the AdapterDispatcher (see page 24919) property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetExceptionHandler (see page 24940)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLocateFileService (see page 24912)	Returns the value of the LocateFileService (see page 24920) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetPageDispatcher (see page 24912)	Returns the value of the PageDispatcher (see page 24921) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebApplicationInfo (see page 24913)	Returns the value of the ApplicationAdapter (see page 24919) property.
	GetWebEndUser (see page 24913)	Returns the value of the EndUserAdapter (see page 24920) property.
	GetWebUserList (see page 24913)	Returns the value of the UserListService (see page 24922) property.
	HandleException (see page 24941)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 24941)	Directs the processing of the current request message.
V	ImplFinishContext (see page 24914)	Provides the underlying implementation of the FinishContext (see page 24940) method.
V	ImplFinishContext (see page 24942)	Provides the underlying implementation of the FinishContext (see page 24940) method.
V	ImplHandleException (see page 24914)	Provides the underlying implementation of the HandleException (see page 24941) method.
V	ImplHandleException (see page 24942)	Provides the underlying implementation of the HandleException (see page 24941) method.

V	ImplHandleRequest (see page 24915)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
V	ImplHandleRequest (see page 24943)	Provides the underlying implementation for the HandleRequest (see page 24941) method.
V	ImplInitContext (see page 24915)	Provides the underlying implementation for the InitContext (see page 24944) method.
V	ImplInitContext (see page 24943)	Provides the underlying implementation for the InitContext (see page 24944) method.
	InitContext (see page 24944)	Creates and initializes the Web context for the current Web request.
V	InitModule (see page 24916)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModule (see page 24945)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 24917)	Initializes all the currently active Web modules.
V	InitModules (see page 24945)	Initializes all the currently active Web modules.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	ListRequestHandlers (see page 24917)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	ModuleAdded (see page 24946)	Initializes a Web module when it is activated while processing the current request.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 24918)	Updates the TCustomWebAppComponents (see page 24906) properties when components are added to or removed from the application.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Request (see page 24946)	Provides access to the current request object.
R	Response (see page 24947)	Provides access to the current response object.
R	WebModules (see page 24947)	Lists the Web modules available in the WebSnap application.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FinishContext (see page 15228)	Performs any final tasks after the WebSnap application has finished processing a request.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterDispatcher (see page 19706)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetExceptionHandler (see page 15229)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetLocateFileService (see page 15319)	This is GetLocateFileService, a member of class IGetLocateFileService.
	GetLocateFileService (see page 19706)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetPageDispatcher (see page 19706)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetWebApplicationInfo (see page 19706)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 19706)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 19707)	This is GetWebUserList, a member of class IGetWebAppComponents.
	HandleException (see page 15236)	This is HandleException, a member of class IWebExceptionHandler.
	HandleRequest (see page 15229)	Directs the processing of the current request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitContext (see page 15229)	Creates and initializes the Web context for the current Web request.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Request (see page 15235)	Returns the Web request object for the HTTP request message to which the application is responding.
	Response (see page 15235)	Returns the Web response object for the HTTP response message that the application is assembling.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	ExceptionHandler (see page 15230)	Indicates the object that handles exceptions that arise when processing a request message.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebApplicationInfo (see page 19707)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
R	WebEndUser (see page 19707)	This is WebEndUser, a member of class IGetWebAppComponents.

Published Events

	Name	Description
	OnAfterDispatch (see page 24967)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 24967)	Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.
	OnException (see page 24968)	Occurs when an exception escapes all try blocks in the WebSnap application.

Published Properties

	Name	Description
	AdapterDispatcher (see page 24963)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 24963)	Provides access to the application adapter.
	DispatchActions (see page 24964)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 24964)	Provides access to an end-user adapter.
	LocateFileService (see page 24965)	Provides access to the file location service.
	Name (see page 2805)	Specifies the name of the component as referenced in code.

	PageDispatcher (see page 24965)	Provides access to the current page dispatcher object.
	Sessions (see page 24966)	Provides access to the sessions service.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UserListService (see page 24966)	Provides access to the file location service.

179.1.16.2 TWebAppComponents Properties

The properties of the TWebAppComponents class are listed here.

Published Properties

	Name	Description
	AdapterDispatcher (see page 24963)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 24963)	Provides access to the application adapter.
	DispatchActions (see page 24964)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 24964)	Provides access to an end-user adapter.
	LocateFileService (see page 24965)	Provides access to the file location service.
	PageDispatcher (see page 24965)	Provides access to the current page dispatcher object.
	Sessions (see page 24966)	Provides access to the sessions service.
	UserListService (see page 24966)	Provides access to the file location service.

179.1.16.2.1 TWebAppComponents.AdapterDispatcher Property

Provides access to the current adapter dispatcher object.

Pascal

```
property AdapterDispatcher: IAdapterDispatcher;
```

C++

```
__property IAdapterDispatcher AdapterDispatcher;
```

Description

Use AdapterDispatcher to get or set the interface of the adapter dispatcher. The adapter dispatcher is responsible for encoding the hidden fields and HREF values that represent calls to adapter fields and actions, and for interpreting the fields in incoming requests by calling adapters to execute their actions or to fetch image field values.

Typically, AdapterDispatcher is the interface of a TAdapterDispatcher object. If the WebSnap application does not include a TAdapterDispatcher component, or some other component that implements the IAdapterDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When AdapterDispatcher is nil (Delphi) or NULL (C++), the WebSnap application can't execute adapter actions or fetch image fields from adapters.

See Also

TAdapterDispatcher (see page 24840)

DispatchActions (see page 24919)

179.1.16.2.2 TWebAppComponents.ApplicationAdapter Property

Provides access to the application adapter.

Pascal

```
property ApplicationAdapter: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo ApplicationAdapter;
```

Description

Use ApplicationAdapter to get or set the interface of the application adapter. The application adapter implements the fields and actions of the Application variable in server-side scripts.

Typically, ApplicationAdapter is the interface of a TApplicationAdapter object. If the WebSnap application does not include a TApplicationAdapter component, or some other component that implements the IWebApplicationInfo interface, the value of this property is nil (Delphi) or NULL (C++). When ApplicationAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the Application variable in server-side scripts.

See Also

TApplicationAdapter (see page 24032)

179.1.16.2.3 TWebAppComponents.DispatchActions Property

Provides access to an action-based Web dispatcher.

Pascal

```
property DispatchActions: IWebDispatchActions;
```

C++

```
__property IWebDispatchActions DispatchActions;
```

Description

Read DispatchActions to determine whether the WebSnap application contains a Web dispatcher. A Web dispatcher maintains a list of action items that respond to incoming request messages. Web dispatchers can appear in both WebSnap and Web broker applications.

The IWebDispatchActions interface that is the value of DispatchActions does nothing special other than identify its component as a Web dispatcher. You can, however, use this interface to obtain other interfaces that belong to the Web dispatcher.

Typically, DispatchActions is the interface of a TWebDispatcher object. If the WebSnap application does not include a TWebDispatcher component, or some other component that implements the IWebDispatchActions interface, the value of this property is nil (Delphi) or NULL (C++).

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

179.1.16.2.4 TWebAppComponents.EndUserAdapter Property

Provides access to an end-user adapter.

Pascal

```
property EndUserAdapter: IWebEndUser;
```

C++

```
__property IWebEndUser EndUserAdapter;
```

Description

Use EndUserAdapter to get or set the interface of the end user adapter. An end user adapter maintains information about the

current end user, and supports the actions for logging users in and out. End user adapters implement the fields and actions of the EndUser variable in server-side scripts.

Typically, EndUserAdapter is the interface of a TEndUserAdapter or TEndUserSessionAdapter object. If the WebSnap application does not include a component that implements the IWebEndUser interface, the value of this property is nil (Delphi) or NULL (C++). When EndUserAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the EndUser variable in server-side scripts or take advantage of the login support that end user adapters provide.

See Also

TEndUserAdapter (see page 24421)

TEndUserSessionAdapter (see page 24458)

179.1.16.2.5 TWebAppComponents.LocateFileService Property

Provides access to the file location service.

Pascal

```
property LocateFileService: ILocateFileService;
```

C++

```
__property ILocateFileService LocateFileService;
```

Description

Use LocateFileService to get or set the interface of the file location service. The file location service controls access to the templates and server-side script include files that are used while processing requests.

Typically, LocateFileService is the interface of a TLocateFileService object. If the WebSnap application does not include a component that implements the ILocateFileService interface, the value of this property is nil (Delphi) or NULL (C++). When LocateFileService is nil (Delphi) or NULL (C++), the WebSnap application can still use template files and include files, but you have less control over how the application locates these files (that is, they must reside in the current directory or references to them must be qualified).

See Also

TLocateFileService (see page 24928)

179.1.16.2.6 TWebAppComponents.PageDispatcher Property

Provides access to the current page dispatcher object.

Pascal

```
property PageDispatcher: IPageDispatcher;
```

C++

```
__property IPageDispatcher PageDispatcher;
```

Description

Use PageDispatcher to get or set the interface of the page dispatcher. The page dispatcher is responsible for interpreting requests for specific Web pages, checking the access rights for requested Web pages, and dispatching Web page requests to the appropriate Web page module.

Typically, PageDispatcher is the interface of a TPageDispatcher object. If the WebSnap application does not include a TPageDispatcher component, or some other component that implements the IPageDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When PageDispatcher is nil (Delphi) or NULL (C++), the WebSnap application does not automatically generate Web page content in response to requests that give the Web page name in their target URL.

See Also

TPageDispatcher (see page 24949)

AdapterDispatcher (see page 24919)

179.1.16.2.7 TWebAppComponents.Sessions Property

Provides access to the sessions service.

Pascal

```
property Sessions: ISessionsService;
```

C++

```
__property ISessionsService Sessions;
```

Description

Use Sessions to get or set the interface of the sessions service. The sessions service maintains Web sessions so that the WebSnap application can store temporary information about an end user.

Typically, Sessions is the interface of a TSessionsService object. If the WebSnap application does not include a component that implements the ISessionsService interface, the value of this property is nil (Delphi) or NULL (C++). When Sessions is nil (Delphi) or NULL (C++), the WebSnap application can't use Web sessions to store named information about the current end user.

See Also

TSessionsService (see page 25582)

179.1.16.2.8 TWebAppComponents.UserListService Property

Provides access to the file location service.

Pascal

```
property UserListService: IWebUserList;
```

C++

```
__property IWebUserList UserListService;
```

Description

Use UserListService to get or set the interface of the user list service. The user list service maintains a list of user names, passwords, and access rights. Using this information, it can validate logins and check a user's access rights.

Typically, UserListService is the interface of a TWebUserList object. If the WebSnap application does not include a component that implements the IWebUserList interface, the value of this property is nil (Delphi) or NULL (C++). When UserListService is nil (Delphi) or NULL (C++), the WebSnap application can still allow users to log in and check access rights, but the support for this must be coded using event handlers on the page dispatcher.

See Also

TWebUserList (see page 25625)

TPageDispatcher (see page 24949)

179.1.16.3 TWebAppComponents Events

The events of the TWebAppComponents class are listed here.

Published Events

	Name	Description
	OnAfterDispatch (see page 24967)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 24967)	Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.
	OnException (see page 24968)	Occurs when an exception escapes all try blocks in the WebSnap application.

179.1.16.3.1 TWebAppComponents.OnAfterDispatch Event

Occurs after the WebSnap application generates the content of a response message.

Pascal

```
property OnAfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAfterDispatch;
```

Description

Write an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the WebSnap application a request. OnAfterDispatch occurs after the other components in the WebSnap application have attempted to generate a response for the current request. It does not occur if the response message has already been sent back to the caller.

If the AfterDispatch event handler sets the Handled parameter to true, the WebSnap application sends the response back to the caller after the event handler exits. If it sets the Handled parameter to false, the WebSnap application does not send the response message.

Note: Although TMultiModuleWebAppServices introduces the OnAfterDispatch event, it never calls the event handler. Descendant classes add the code to generate this event after dispatching a request message.

See Also

OnBeforeDispatch (see page 24948)

179.1.16.3.2 TWebAppComponents.OnBeforeDispatch Event

Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.

Pascal

```
property OnBeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnBeforeDispatch;
```

Description

Write an OnBeforeDispatch event handler to initialize the response to an HTTP request or to handle any messages that the other components in the WebSnap application can't handle. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing this component from trying to locate a component in the WebSnap application that can handle the message.

Note: Although TMultiModuleWebAppServices introduces the OnBeforeDispatch event, it never calls the event handler. Descendant classes add the code to generate this event before dispatching a request message.

See Also

OnAfterDispatch (see page 24948)

179.1.16.3.3 TWebAppComponents.OnException Event

Occurs when an exception escapes all try blocks in the WebSnap application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Write an OnException event handler respond to exceptions that arise while processing a request message. OnException occurs when an exception is not caught by the components that process the request message. If the OnException event handler does not handle the exception, TCustomWebAppComponents updates the response message so that it describes the exception to the caller.

See Also

OnAfterDispatch (see page 24948)

179.1.17 TWebSession Class

TWebSession stores temporary information associated with the user in a WebSnap application.

Class Hierarchy

Pascal

```
TWebSession = class(TAbstractWebSession, IWebSessionAccess);
```

C++

```
class TWebSession : public TAbstractWebSession, public IWebSessionAccess;
```

File

WebDisp

Description

TWebSession represents an active Web session. Use its Values property to get or set application-specific information about the current user. If your application uses sessions to store user information, you need to include a TSessionsService component in the Web application module.

A Web session stores information that persists over multiple calls from the same user. This information is stored as a set of Variant values that are indexed by name. You can use these named Variants (see page 23567) to store application-defined information that is associated with a single user.

There is no need to instantiate session objects. A Session is created automatically when the WebSnap application receives an HTTP request message. The new session is given a unique identifier, which is added (in a cookie) to response messages, so that the same session can be used for subsequent requests from the same caller. The session persists until either the user logs

out, a specified time elapses with no request messages from the caller, or the application explicitly calls the session's Terminate (see page 24973) method.

See Also

TSessionsService (see page 25582)

TAbstractWebContext (see page 24644)

TInvalidWebSession (see page 24923)

179.1.17.1 TWebSession Members

The following tables list the members exposed by TWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 24971)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 24971)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 24972)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 24972)	Sets the value of the TimoutMinutes property.
	SetValue (see page 24972)	Assigns a value to a specified name.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 24970)	This is the overview for the Create constructor overload.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetSessionsService (see page 24976)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 24976)	This is GetWebSession, a member of class IWebSessionAccess.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Terminate (see page 24973)	Terminates the session.
	UpdateResponse (see page 24973)	Adds the session ID to a cookie in a response message.

Public Properties

	Name	Description
	SessionID (see page 15087)	Uniquely identifies the Session.
	TimeoutMinutes (see page 15087)	Indicates the time, in minutes, that a session can be idle before it terminates itself.
	Values (see page 15088)	Lists the named values that the session stores.

179.1.17.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWebSession.Create (ISessionsService, TSessionID) (see page 24970)	This is Create, a member of class TWebSession.
	TWebSession.Create (ISessionsService, TWebRequest, TWebResponse) (see page 24970)	This is Create, a member of class TWebSession.

179.1.17.2.1 TWebSession.Create Constructor (ISessionsService, TSessionID)

Pascal

```
constructor Create(ASessions: ISessionsService; AID: TSessionID); overload;
```

C++

```
__fastcall TWebSession(ISessionsService ASessions, TSessionID AID);
```

Description

This is Create, a member of class TWebSession.

179.1.17.2.2 TWebSession.Create Constructor (ISessionsService, TWebRequest, TWebResponse)

Pascal

```
constructor Create(ASessions: ISessionsService; ARequest: TWebRequest; AResponse:
TWebResponse); overload;
```

C++

```
__fastcall TWebSession(ISessionsService ASessions, TWebRequest ARequest, TWebResponse
AResponse);
```

Description

This is Create, a member of class TWebSession.

179.1.17.3 TWebSession Methods

The methods of the TWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 24971)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 24971)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 24972)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 24972)	Sets the value of the TimoutMinutes property.
	SetValue (see page 24972)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 24973)	Terminates the session.
	UpdateResponse (see page 24973)	Adds the session ID to a cookie in a response message.

179.1.17.3.1 TWebSession.GetSessionID Method

Returns the value of the SessionID property.

Pascal

```
function GetSessionID: string; override;
```

C++

```
virtual __fastcall AnsiString GetSessionID();
```

Description

GetSessionID is the protected read implementation of the SessionID property.

In TAbstractWebSession, GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID property.

See Also

SessionID (see page 15087)

179.1.17.3.2 TWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes property.

Pascal

```
function GetTimeoutMinutes: Integer; override;
```

C++

```
virtual __fastcall int GetTimeoutMinutes();
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes property.

In TAbstractWebSession, GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

TimeoutMinutes (see page 15087)

SetTimeoutMinutes (see page 15085)

179.1.17.3.3 TWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; override;
```

C++

```
virtual __fastcall Variant GetValue(const AnsiString AName);
```

Description

GetValue is the protected read implementation of the Values property.

AName is the name of the value to return.

In TAbstractWebSession, GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

Values (see page 15088)

SetValue (see page 15085)

179.1.17.3.4 TWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); override;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue);
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession, SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

GetTimeoutMinutes (see page 15084)

TimeoutMinutes (see page 15087)

179.1.17.3.5 TWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall SetValue(const AnsiString AName, const Variant AValue);
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession, SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

GetValue (see page 15084)

Values (see page 15088)

179.1.17.3.6 TWebSession.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate; override;
```

C++

```
virtual __fastcall Terminate();
```

Description

Call Terminate to explicitly terminate a session. Once a session has been terminated, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimoutMinutes minutes.

See Also

TimeoutMinutes

Values

179.1.17.3.7 TWebSession.UpdateResponse Method

Adds the session ID to a cookie in a response message.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse);
```

Description

Call UpdateResponse to add the value of the SessionID property to one of the response message's cookies. This allows the user's next request message to use the Values stored in this session.

AResponse is the Web response message to which a cookie with the session ID should be added.

See Also

SessionID

Values

179.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebSessionAccess (see page 24975)	This is class WebDisp.IWebSessionAccess.

179.2.1 IWebSessionAccess Interface

Class Hierarchy

WebDisp.IWebSessionAccess

Pascal

```
IWebSessionAccess = interface;
```

C++

```
__interface IWebSessionAccess;
```

File

WebDisp

Description

This is class WebDisp.IWebSessionAccess.

179.2.1.1 IWebSessionAccess Members

The following tables list the members exposed by IWebSessionAccess.

Public Methods

	Name	Description
	GetSessionsService (see page 24976)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 24976)	This is GetWebSession, a member of class IWebSessionAccess.

179.2.1.2 IWebSessionAccess Methods

The methods of the IWebSessionAccess class are listed here.

Public Methods

	Name	Description
	GetSessionsService (see page 24976)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 24976)	This is GetWebSession, a member of class IWebSessionAccess.

179.2.1.2.1 IWebSessionAccess.GetSessionsService Method

Pascal

```
function GetSessionsService: ISessionsService;
```

C++

```
__fastcall ISessionsService GetSessionsService();
```

Description

This is GetSessionsService, a member of class IWebSessionAccess.

179.2.1.2.2 IWebSessionAccess.GetWebSession Method

Pascal

```
function GetWebSession: IWebSession;
```

C++

```
__fastcall IWebSession GetWebSession();
```

Description

This is GetWebSession, a member of class IWebSessionAccess.

179.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AdapterRequestParamsAsStrings (see page 24977)	This is function WebDisp.AdapterRequestParamsAsStrings.
	DispatchPageName (see page 24977)	This is function WebDisp.DispatchPageName.
	EncodeParamNameValues (see page 24978)	This is function WebDisp.EncodeParamNameValues.
	EncodeParamsAsHTTPQuery (see page 24978)	This is function WebDisp.EncodeParamsAsHTTPQuery.
	ExpandScriptException (see page 24978)	This is function WebDisp.ExpandScriptException.
	ExtractParamNameValues (see page 24979)	This is function WebDisp.ExtractParamNameValues.
	FindDefaultAppPageName (see page 24979)	This is function WebDisp.FindDefaultAppPageName.
	PageNameOfRequest (see page 24979)	This is function WebDisp.PageNameOfRequest.
	RaiseDispatchBlankPageNameException (see page 24980)	This is function WebDisp.RaiseDispatchBlankPageNameException.
	RaisePageDoesNotProvideContent (see page 24980)	This is function WebDisp.RaisePageDoesNotProvideContent.
	RaisePageNotFound (see page 24980)	This is function WebDisp.RaisePageNotFound.
	RedirectToPageName (see page 24981)	This is function WebDisp.RedirectToPageName.
	RegisterAdapterRequestIdentifier (see page 24981)	This is function WebDisp.RegisterAdapterRequestIdentifier.
	SafeRedirect (see page 24981)	Redirects a browser to another specified page.

179.3.1 WebDisp.AdapterRequestParamsAsStrings Function

Pascal

```
function AdapterRequestParamsAsStrings(AAdapterRequest: IUnknown): TStrings;
```

C++

```
TStrings AdapterRequestParamsAsStrings(IUnknown AAdapterRequest);
```

File

WebDisp

Description

This is function WebDisp.AdapterRequestParamsAsStrings.

179.3.2 WebDisp.DispatchPageName Function

Pascal

```
function DispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
Boolean DispatchPageName(const AnsiString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

File

WebDisp

Description

This is function WebDisp.DispatchPageName.

179.3.3 WebDisp.EncodeParamNameValues Function

Pascal

```
function EncodeParamNameValues(ParamValues: TStrings): string;
```

C++

```
AnsiString EncodeParamNameValues(TStrings ParamValues);
```

File

WebDisp

Description

This is function WebDisp.EncodeParamNameValues.

179.3.4 WebDisp.EncodeParamsAsHTTPQuery Function

Pascal

```
function EncodeParamsAsHTTPQuery(AParams: TStrings): string;
```

C++

```
AnsiString EncodeParamsAsHTTPQuery(TStrings AParams);
```

File

WebDisp

Description

This is function WebDisp.EncodeParamsAsHTTPQuery.

179.3.5 WebDisp.ExpandScriptException Function

Pascal

```
function ExpandScriptException(E: EScriptError): string;
```

C++

```
AnsiString ExpandScriptException(EScriptError E);
```

File

WebDisp

Description

This is function WebDisp.ExpandScriptException.

179.3.6 WebDisp.ExtractParamNameValues Function

Pascal

```
procedure ExtractParamNameValues(const AParam: string; AList: TStrings);
```

C++

```
ExtractParamNameValues(const AnsiString AParam, TStrings AList);
```

File

WebDisp

Description

This is function WebDisp.ExtractParamNameValues.

179.3.7 WebDisp.FindDefaultAppPageName Function

Pascal

```
function FindDefaultAppPageName: string;
```

C++

```
AnsiString FindDefaultAppPageName();
```

File

WebDisp

Description

This is function WebDisp.FindDefaultAppPageName.

179.3.8 WebDisp.PageNameOfRequest Function

Pascal

```
function PageNameOfRequest(ARequest: TWebRequest): string;
```

C++

```
AnsiString PageNameOfRequest(TWebRequest ARequest);
```

File

WebDisp

Description

This is function WebDisp.PageNameOfRequest.

179.3.9 WebDisp.RaiseDispatchBlankPageNameException Function

Pascal

```
procedure RaiseDispatchBlankPageNameException;
```

C++

```
RaiseDispatchBlankPageNameException();
```

File

WebDisp

Description

This is function WebDisp.RaiseDispatchBlankPageNameException.

179.3.10 WebDisp.RaisePageDoesNotProvideContent Function

Pascal

```
procedure RaisePageDoesNotProvideContent(const APageName: string);
```

C++

```
RaisePageDoesNotProvideContent(const AnsiString APageName);
```

File

WebDisp

Description

This is function WebDisp.RaisePageDoesNotProvideContent.

179.3.11 WebDisp.RaisePageNotFound Function

Pascal

```
procedure RaisePageNotFound(const APageName: string);
```

C++

```
RaisePageNotFound(const AnsiString APageName);
```

File

WebDisp

Description

This is function WebDisp.RaisePageNotFound.

179.3.12 WebDisp.RedirectToPageName Function

Pascal

```
function RedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
Boolean RedirectToPageName(const AnsiString APageName, TStrings AParams, TWebResponse
AResponse, TDispatchPageFlags AFlags);
```

File

WebDisp

Description

This is function WebDisp.RedirectToPageName.

179.3.13 WebDisp.RegisterAdapterRequestIdentifier Function

Pascal

```
procedure RegisterAdapterRequestIdentifier(const AIdentifier: string);
```

C++

```
RegisterAdapterRequestIdentifier(const AnsiString AIdentifier);
```

File

WebDisp

Description

This is function WebDisp.RegisterAdapterRequestIdentifier.

179.3.14 WebDisp.SafeRedirect Function

Redirects a browser to another specified page.

Pascal

```
procedure SafeRedirect(AResponse: TWebResponse; const AURL: string);
```

C++

```
SafeRedirect(TWebResponse AResponse, const AnsiString AURL);
```

File

WebDisp

Description

Use the SafeRedirect function to send a response which redirects a Web browser to another page. AResponse is the response

object which will send the redirect. AURL is the URL for the page that the browser is being redirected to.

SafeRedirect differs from other redirect methods (such as an override of TWebResponse (see page 24989)'s SendRedirect method) in that it allows browsers to accept cookies. Other redirect methods don't allow cookies to be set during a redirect.

179.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPageAccessDenied (see page 24983)	This is record WebDisp.TPageAccessDenied.

179.4.1 WebDisp.TPageAccessDenied Enumeration

Pascal

```
TPageAccessDenied = (
  adLoginRequired,
  adCantView
);
```

C++

```
enum TPageAccessDenied {
  adLoginRequired,
  adCantView
};
```

File

WebDisp

Description

This is record WebDisp.TPageAccessDenied.

179.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActivateWebModuleEvent (see page 24984)	This is type WebDisp.TActivateWebModuleEvent.
TCanViewPageEvent (see page 24984)	This is type WebDisp.TCanViewPageEvent.
TDispatchActionEvent (see page 24985)	This is type WebDisp.TDispatchActionEvent.
TDispatchActionHandledEvent (see page 24985)	This is type WebDisp.TDispatchActionHandledEvent.
TDispatchImageEvent (see page 24985)	This is type WebDisp.TDispatchImageEvent.
TDispatchImageHandledEvent (see page 24986)	This is type WebDisp.TDispatchImageHandledEvent.
TDispatchPageEvent (see page 24986)	This is type WebDisp.TDispatchPageEvent.
TDispatchPageHandledEvent (see page 24986)	This is type WebDisp.TDispatchPageHandledEvent.
TDispatchPageParamsHandledEvent (see page 24987)	This is type WebDisp.TDispatchPageParamsHandledEvent.
TGetAdapterRequestParamsEvent (see page 24987)	This is type WebDisp.TGetAdapterRequestParamsEvent.
TLocateFileServiceFindFileEvent (see page 24987)	This is type WebDisp.TLocateFileServiceFindFileEvent.
TLocateFileServiceFindStreamEvent (see page 24988)	This is type WebDisp.TLocateFileServiceFindStreamEvent.
TLoginPagedHandledEvent (see page 24988)	This is type WebDisp.TLoginPagedHandledEvent.
TLoginRequiredEvent (see page 24988)	This is type WebDisp.TLoginRequiredEvent.
TPageAccessDeniedEvent (see page 24989)	This is type WebDisp.TPageAccessDeniedEvent.
TWebRequest (see page 24989)	This is type WebDisp.TWebRequest.
TWebResponse (see page 24989)	This is type WebDisp.TWebResponse.

179.5.1 WebDisp.TActivateWebModuleEvent Type

Pascal

```
TActivateWebModuleEvent = procedure (Sender: TObject; WebModule: TComponent) of object;
```

C++

```
(Sender: TObject; WebModule: TComponent) ( TActivateWebModuleEvent)();
```

File

WebDisp

Description

This is type WebDisp.TActivateWebModuleEvent.

179.5.2 WebDisp.TCanViewPageEvent Type

Pascal

```
TCanViewPageEvent = procedure (Sender: TObject; const PageName: string; var CanView: Boolean;
var AHandled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var CanView: Boolean; var AHandled: Boolean) (
TCanViewPageEvent)();
```

File

WebDisp

Description

This is type WebDisp.TCanViewPageEvent.

179.5.3 WebDisp.TDispatchActionEvent Type

Pascal

```
TDispatchActionEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings) of
object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TDispatchActionEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchActionEvent.

179.5.4 WebDisp.TDispatchActionHandledEvent Type

Pascal

```
TDispatchActionHandledEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings; var Handled: Boolean) (
TDispatchActionHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchActionHandledEvent.

179.5.5 WebDisp.TDispatchImageEvent Type

Pascal

```
TDispatchImageEvent = procedure (Sender: TObject; Image: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Image: TObject; Params: TStrings) ( TDispatchImageEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchImageEvent.

179.5.6 WebDisp.TDispatchImageHandledEvent Type

Pascal

```
TDispatchImageHandledEvent = procedure (Sender: TObject; Image: TObject; Params: TStrings; var
Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Image: TObject; Params: TStrings; var Handled: Boolean) (
TDispatchImageHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchImageHandledEvent.

179.5.7 WebDisp.TDispatchPageEvent Type

Pascal

```
TDispatchPageEvent = procedure (Sender: TObject; const PageName: string) of object;
```

C++

```
(Sender: TObject; const PageName: string) ( TDispatchPageEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchPageEvent.

179.5.8 WebDisp.TDispatchPageHandledEvent Type

Pascal

```
TDispatchPageHandledEvent = procedure (Sender: TObject; const PageName: string; var Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Handled: Boolean) ( TDispatchPageHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchPageHandledEvent.

179.5.9 WebDisp.TDispatchPageParamsHandledEvent Type

Pascal

```
TDispatchPageParamsHandledEvent = procedure (Sender: TObject; const PageName: string; Params:
TStrings; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; Params: TStrings; var Handled: Boolean) (
TDispatchPageParamsHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TDispatchPageParamsHandledEvent.

179.5.10 WebDisp.TGetAdapterRequestParamsEvent Type

Pascal

```
TGetAdapterRequestParamsEvent = procedure (Sender: TObject; Handler: IUnknown; var Identifer:
string; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Handler: IUnknown; var Identifer: string; Params: TStrings) (
TGetAdapterRequestParamsEvent)();
```

File

WebDisp

Description

This is type WebDisp.TGetAdapterRequestParamsEvent.

179.5.11 WebDisp.TLocateFileServiceFindFileEvent Type

Pascal

```
TLocateFileServiceFindFileEvent = procedure (ASender: TObject; AComponent: TComponent; const
AFileName: string; var AFoundFile: string; var AHandled: Boolean) of object;
```

C++

```
(ASender: TObject; AComponent: TComponent; const AFileName: string; var AFoundFile: string;
var AHandled: Boolean) ( TLocateFileServiceFindFileEvent)();
```

File

WebDisp

Description

This is type WebDisp.TLocateFileServiceFindFileEvent.

179.5.12 WebDisp.TLocateFileServiceFindStreamEvent Type

Pascal

```
TLocateFileServiceFindStreamEvent = procedure (ASender: TObject; AComponent: TComponent; const
AFileName: string; var AFoundStream: TStream; var AOwned: Boolean; var AHandled: Boolean) of
object;
```

C++

```
(ASender: TObject; AComponent: TComponent; const AFileName: string; var AFoundStream: TStream;
var AOwned: Boolean; var AHandled: Boolean) ( TLocateFileServiceFindStreamEvent)();
```

File

WebDisp

Description

This is type WebDisp.TLocateFileServiceFindStreamEvent.

179.5.13 WebDisp.TLoginPagedHandledEvent Type

Pascal

```
TLoginPagedHandledEvent = procedure (Sender: TObject; const PageName: string; var Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Handled: Boolean) ( TLoginPagedHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TLoginPagedHandledEvent.

179.5.14 WebDisp.TLoginRequiredEvent Type

Pascal

```
TLoginRequiredEvent = procedure (Sender: TObject; const PageName: string; var Required:
```

```
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Required: Boolean) ( TLoginRequiredEvent)();
```

File

WebDisp

Description

This is type WebDisp.TLoginRequiredEvent.

179.5.15 WebDisp.TPageAccessDeniedEvent Type

Pascal

```
TPageAccessDeniedEvent = procedure (Sender: TObject; const PageName: string; Reason:
TPageAccessDenied; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; Reason: TPageAccessDenied; var Handled: Boolean) (
TPageAccessDeniedEvent)();
```

File

WebDisp

Description

This is type WebDisp.TPageAccessDeniedEvent.

179.5.16 WebDisp.TWebRequest Type

Pascal

```
TWebRequest = HTTPApp.TWebRequest;
```

C++

```
HTTPApp.TWebRequest TWebRequest;
```

File

WebDisp

Description

This is type WebDisp.TWebRequest.

179.5.17 WebDisp.TWebResponse Type

Pascal

```
TWebResponse = HTTPApp.TWebResponse;
```

C++

```
HTTPApp.TWebResponse TWebResponse;
```

File

WebDisp

Description

This is type WebDisp.TWebResponse.

179.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sFailurePageParamName (see page 24991)	This is constant WebDisp.sFailurePageParamName.
sPageParamName (see page 24991)	This is constant WebDisp.sPageParamName.
sRequestIDParamName (see page 24992)	This is constant WebDisp.sRequestIDParamName.
sSessionCookieName (see page 24992)	This is constant WebDisp.sSessionCookieName.
sSuccessPageParamName (see page 24992)	This is constant WebDisp.sSuccessPageParamName.

179.6.1 WebDisp.sFailurePageParamName Constant

Pascal

```
sFailurePageParamName = '__fp';
```

C++

```
sFailurePageParamName = '__fp';
```

File

WebDisp

Description

This is constant WebDisp.sFailurePageParamName.

179.6.2 WebDisp.sPageParamName Constant

Pascal

```
sPageParamName = '__p';
```

C++

```
sPageParamName = '__p';
```

File

WebDisp

Description

This is constant WebDisp.sPageParamName.

179.6.3 WebDisp.sRequestIDParamName Constant

Pascal

```
sRequestIDParamName = '__id';
```

C++

```
sRequestIDParamName = '__id';
```

File

WebDisp

Description

This is constant WebDisp.sRequestIDParamName.

179.6.4 WebDisp.sSessionCookieName Constant

Pascal

```
sSessionCookieName = 'WebBrokerSessionID';
```

C++

```
sSessionCookieName = 'WebBrokerSessionID';
```

File

WebDisp

Description

This is constant WebDisp.sSessionCookieName.

179.6.5 WebDisp.sSuccessPageParamName Constant

Pascal

```
sSuccessPageParamName = '__sp';
```

C++

```
sSuccessPageParamName = '__sp';
```

File

WebDisp

Description

This is constant WebDisp.sSuccessPageParamName.

180 WebFact Namespace

This is namespace WebFact.

Topics

Name	Description
Classes (see page 24994)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 25022)	The following table lists structs, records, enums in this documentation.
Types (see page 25023)	The following table lists types in this documentation.

Classes

	Name	Description
	TBaseWebModuleFactory (see page 24994)	TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.
	TBaseWebPageInfo (see page 24999)	TBaseWebPageInfo stores information about a page registered with a Web page module factory.
	TBaseWebPageModuleFactory (see page 25004)	TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TWebAppDataModuleFactory (see page 25009)	TWebAppDataModule is the factory object for WebSnap application data modules.
	TWebAppPageModuleFactory (see page 25012)	TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.
	TWebDataModuleFactory (see page 25014)	TWebDataModuleFactory is the factory class for WebSnap data modules.
	TWebPageInfo (see page 25016)	TWebPageInfo describes a WebSnap page.
	TWebPageModuleFactory (see page 25019)	TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

Structs, Records, Enums

	Name	Description
	TWebPageAccessFlags (see page 25022)	This is record WebFact.TWebPageAccessFlags.

Types

Name	Description
TWebPageAccess (see page 25023)	This is type WebFact.TWebPageAccess.

180.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseWebModuleFactory (see page 24994)	TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.
	TBaseWebPageInfo (see page 24999)	TBaseWebPageInfo stores information about a page registered with a Web page module factory.
	TBaseWebPageModuleFactory (see page 25004)	TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TWebAppDataModuleFactory (see page 25009)	TWebAppDataModule is the factory object for WebSnap application data modules.
	TWebAppPageModuleFactory (see page 25012)	TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.
	TWebDataModuleFactory (see page 25014)	TWebDataModuleFactory is the factory class for WebSnap data modules.
	TWebPageInfo (see page 25016)	TWebPageInfo describes a WebSnap page.
	TWebPageModuleFactory (see page 25019)	TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

180.1.1 TBaseWebModuleFactory Class

TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.

Class Hierarchy

Pascal

```
TBaseWebModuleFactory = class(TAbstractWebModuleFactory);
```

C++

```
class TBaseWebModuleFactory : public TAbstractWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating Web module instance. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instance for reuse with subsequent request messages.

TBaseWebModuleFactory descendants generate Web modules that do generate Web pages. These Web modules can contain components, such as adapters, that perform tasks for the WebSnap application.

Do not create instances of TBaseWebModuleFactory. Although TBaseWebModuleFactory provides an implementation for the abstract or, in C++ terminology, pure virtual methods introduced by its ancestors, it is intended only as a base class. Instead, create instances of a TBaseWebModuleFactory descendant such as TWebDataModuleFactory (see page 25014) or TWebAppDataModuleFactory (see page 25009).

See Also

TWebAppDataModuleFactory (see page 25009)

TWebDataModuleFactory (see page 25014)

TWebRequestHandler (see page 25448)

180.1.1.1 TBaseWebModuleFactory Members

The following tables list the members exposed by TBaseWebModuleFactory.

Protected Methods

	Name	Description
	Create (see page 24995)	Creates and initializes an instance of TBaseWebModuleFactory (see page 24994).
V	GetCacheMode (see page 24996)	Returns the value of the CacheMode property.
V	GetComponentClass (see page 24997)	Returns the value of the ComponentClass property.
V	GetCreateMode (see page 24997)	Returns the value of the CreateMode property.
V	GetIsAppModule (see page 24997)	Returns the value of the IsAppModule property.
V	GetModuleName (see page 24998)	Returns the value of the ModuleName property.
V	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
V	GetModule (see page 24998)	Creates an instance of the associated Web module.
V	PreventDestruction (see page 24998)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
R	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.
R	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
R	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
R	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
R	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
R	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.1.2 TBaseWebModuleFactory.Create Constructor

Creates and initializes an instance of TBaseWebModuleFactory (see page 24994).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACreateMode: TWebModuleCreateMode;
ACacheMode: TWebModuleCacheMode);
```

C++

```
__fastcall TBaseWebModuleFactory(TComponentClass AComponentClass, TWebModuleCreateMode
ACreateMode, TWebModuleCacheMode ACacheMode);
```

Description

Call Create to instantiate a Web module factory. Typically, Web module factory objects are created in the initialization section of the unit for the Web module. The call to the constructor is added by the Web module wizard or WebSnap application wizard when it generates the unit for the Web module.

AComponentClass is the class of the Web module that this factory object creates. It becomes the value of the ComponentClass property.

ACreateMode describes whether the factory should create instances of the Web module for every request message, or only when the application explicitly requests the Web module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

See Also

ComponentClass

CreateMode

CacheMode

180.1.1.3 TBaseWebModuleFactory Methods

The methods of the TBaseWebModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetCacheMode (see page 24996)	Returns the value of the CacheMode property.
	GetComponentClass (see page 24997)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 24997)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 24997)	Returns the value of the IsAppModule property.
	GetModuleName (see page 24998)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 24998)	Creates an instance of the associated Web module.
	PreventDestruction (see page 24998)	Prevents the WebSnap application from freeing the Web module instance.

180.1.1.3.1 TBaseWebModuleFactory.GetCacheMode Method

Returns the value of the CacheMode property.

Pascal

```
function GetCacheMode: TWebModuleCacheMode; override;
```

C++

```
virtual __fastcall TWebModuleCacheMode GetCacheMode();
```

Description

GetCacheMode is the protected read implementation of the CacheMode property. It returns the cache mode flag that was supplied to the constructor.

See Also

CacheMode

Create (see page 24995)

180.1.1.3.2 TBaseWebModuleFactory.GetComponentClass Method

Returns the value of the ComponentClass property.

Pascal

```
function GetComponentClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetComponentClass();
```

Description

GetComponentClass is the protected read implementation of the ComponentClass property. It returns the class of the Web page module this factory creates, as supplied to the Web page module factory constructor.

See Also

ComponentClass

Create (see page 24995)

180.1.1.3.3 TBaseWebModuleFactory.GetCreateMode Method

Returns the value of the CreateMode property.

Pascal

```
function GetCreateMode: TWebModuleCreateMode; override;
```

C++

```
virtual __fastcall TWebModuleCreateMode GetCreateMode();
```

Description

GetCreateMode is the protected read implementation of the CreateMode property. It returns the create mode flag that was supplied to the constructor.

See Also

CreateMode

Create (see page 24995)

180.1.1.3.4 TBaseWebModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebModuleFactory (see page 24994), GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppDataModuleFactory (see page 25009)) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 25012)

180.1.1.3.5 TBaseWebModuleFactory.GetModule Method

Creates an instance of the associated Web module.

Pascal

```
function GetModule: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetModule();
```

Description

Call GetModule to obtain a new instance of the Web module that the factory creates. GetModule creates an instance of the class that the ComponentClass property specifies and returns it.

See Also

ComponentClass

CreateMode

CacheMode

180.1.1.3.6 TBaseWebModuleFactory.GetModuleName Method

Returns the value of the ModuleName property.

Pascal

```
function GetModuleName: string; override;
```

C++

```
virtual __fastcall AnsiString GetModuleName();
```

Description

GetModuleName is the protected read implementation of the ModuleName property. It returns the name of the class that the ComponentClass property specifies.

See Also

ModuleName

ComponentClass

180.1.1.3.7 TBaseWebModuleFactory.PreventDestruction Method

Prevents the WebSnap application from freeing the Web module instance.

Pascal

```
procedure PreventDestruction; override;
```

C++

```
virtual __fastcall PreventDestruction();
```

Description

Call PreventDestruction if the WebSnap application should not free the Web module instance when the current HTTP request message has been fully processed. For example, if another Web module contains a reference to the Web module that this factory creates, you may not want to allow the WebSnap application to free the Web module that this factory creates while the other module exists.

In TBaseWebModuleFactory (see page 24994), PreventDestruction changes the CacheMode property to caCache.

See Also

CacheMode

180.1.2 TBaseWebPageInfo Class

TBaseWebPageInfo stores information about a page registered with a Web page module factory.

Class Hierarchy

Pascal

```
TBaseWebPageInfo = class(TAbstractWebPageInfo);
```

C++

```
class TBaseWebPageInfo : public TAbstractWebPageInfo;
```

File

WebFact

Description

The TBaseWebPageInfo component stores basic information about an HTML page such as the filename, page name, page title, descriptive text, publish status, and access rights. This information is stored with the Web page module factory.

An instance of a TBaseWebPageInfo descendant, such as TWebPageInfo (see page 25016), is supplied to the constructor of the factory object that creates instances of a Web page module. Typically, the code to create this object and supply it to the Web page factory's constructor is generated by a Web page module wizard. You can change this generated code, which appears in the generated unit for the Web page module, to alter the properties of the Web page information object. For example, you may want to add a ViewAccess string to allow your application to limit access to the Web page.

In a WebSnap application, you can access the Web page information object of any Web page module by calling the FindPageInfo method of the application's global Web context.

180.1.2.1 TBaseWebPageInfo Members

The following tables list the members exposed by TBaseWebPageInfo.

Protected Methods

	Name	Description
	Create (see page 25000)	Creates and initializes a TBaseWebPageInfo (see page 24999) object.
	GetFactory (see page 15062)	Returns the value of the Factory (see page 15066) property.
V	GetIsLoginRequired (see page 25001)	Returns the value of the IsLoginRequired property.
V	GetIsPublished (see page 25002)	Returns the value of the IsPublished property.
V	GetPageDescription (see page 25002)	Returns the value of the PageDescription property.
V	GetPageFile (see page 25002)	Returns the value of the PageFile property.
V	GetPageHREF (see page 25003)	Returns the value of the PageHREF property.
V	GetPageName (see page 25003)	Returns the value of the PageName property.
V	GetPageTitle (see page 25003)	Returns the value of the PageTitle property.
V	GetViewAccess (see page 25004)	Returns the value of the ViewAccess property.
V	SetFactory (see page 25004)	Connects a specified Web page module factory with the Web page information object.

Public Properties

	Name	Description
	Factory (see page 15066)	Specifies the factory object that creates instances of the Web page module this object describes.
R	IsLoginRequired (see page 15066)	Indicates whether callers must log in before accessing the associated Web page.
R	IsPublished (see page 15067)	Indicates whether the WebSnap application automatically displays the associated page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 15068).
R	PageDescription (see page 15067)	Describes the Web page.
R	PageFile (see page 15068)	Identifies an associated file that the Web page module uses to generate its Web page.
R	PageHREF (see page 15068)	Identifies the HREF to use for references to the associated Web page that appear in hypertext links.
R	PageName (see page 15068)	Denotes the logical name for the Web page that the associated module generates
R	PageTitle (see page 15069)	Indicates the title that appears on the associated Web page.
R	ViewAccess (see page 15069)	Indicates the view access string that controls access to the associated Web page.

180.1.2.2 TBaseWebPageInfo.Create Constructor

Creates and initializes a TBaseWebPageInfo (see page 24999) object.

Pascal

```
constructor Create(AAccess: TWebPageAccess; const AFile: string; const AName: string; const
ATitle: string; const ADescription: string; const AViewAccess: string);
```

C++

```
__fastcall TBaseWebPageInfo(TWebPageAccess AAccess, const AnsiString AFile, const AnsiString
AName, const AnsiString ATitle, const AnsiString ADescription, const AnsiString AViewAccess);
```

Description

Typically, you do not need to create a call to the Web page information object constructor. The Web page module wizard generates code to make this call and pass the resulting object instance to the constructor of a Web page module factory. You may, however, want to edit the generated call to the constructor, changing some of the parameter values that the wizard supplies.

AAccess specifies access information for the associated Web page.

AFile specifies the name (or extension) of the file that the associated Web page module uses to generate its content. It becomes the value of the PageFile property.

AName is the logical name of the associated Web page. It becomes the value of the PageName property.

ATitle is the title that appears on the associated Web page. It becomes the value of the PageTitle property.

ADescription is a brief description of the associated Web page. It becomes the value of the PageDescription property.

AViewAccess is the view access string that represents a set of access rights needed to work with the associated Web page. It becomes the value of the ViewAccess property.

IsLoginRequired

180.1.2.3 TBaseWebPageInfo Methods

The methods of the TBaseWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetIsLoginRequired (see page 25001)	Returns the value of the IsLoginRequired property.
	GetIsPublished (see page 25002)	Returns the value of the IsPublished property.
	GetPageDescription (see page 25002)	Returns the value of the PageDescription property.
	GetPageFile (see page 25002)	Returns the value of the PageFile property.
	GetPageHREF (see page 25003)	Returns the value of the PageHREF property.
	GetPageName (see page 25003)	Returns the value of the PageName property.
	GetPageTitle (see page 25003)	Returns the value of the PageTitle property.
	GetViewAccess (see page 25004)	Returns the value of the ViewAccess property.
	SetFactory (see page 25004)	Connects a specified Web page module factory with the Web page information object.

180.1.2.3.1 TBaseWebPageInfo.GetIsLoginRequired Method

Returns the value of the IsLoginRequired property.

Pascal

```
function GetIsLoginRequired: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsLoginRequired();
```

Description

GetIsLoginRequired is the protected read implementation of the IsLoginRequired property. It returns true if wpLoginRequired is included in the access flags passed to the constructor.

See Also

IsLoginRequired

Create (see page 25000)

180.1.2.3.2 TBaseWebPageInfo.GetIsPublished Method

Returns the value of the IsPublished property.

Pascal

```
function GetIsPublished: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsPublished();
```

Description

GetIsPublished is the protected read implementation of the IsPublished property. It returns true if wpPublished is included in the access flags passed to the constructor.

See Also

IsPublished

Create (see page 25000)

180.1.2.3.3 TBaseWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription property.

Pascal

```
function GetPageDescription: string; override;
```

C++

```
virtual __fastcall AnsiString GetPageDescription();
```

Description

GetPageDescription is the protected read implementation of the PageDescription property. It returns the description string that is passed to the constructor.

See Also

PageDescription

Create (see page 25000)

180.1.2.3.4 TBaseWebPageInfo.GetPageFile Method

Returns the value of the PageFile property.

Pascal

```
function GetPageFile: string; override;
```

C++

```
virtual __fastcall AnsiString GetPageFile();
```

Description

GetPageFile is the protected read implementation of the PageFile property.

See Also

pagefile

180.1.2.3.5 TBaseWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF property.

Pascal

```
function GetPageHREF: string; override;
```

C++

```
virtual __fastcall AnsiString GetPageHREF();
```

Description

GetPageHREF is the protected read implementation of the PageHREF property. It returns the HTTP path string that is passed to the constructor.

See Also

PageHREF

Create (see page 25000)

180.1.2.3.6 TBaseWebPageInfo.GetPageName Method

Returns the value of the PageName property.

Pascal

```
function GetPageName: string; override;
```

C++

```
virtual __fastcall AnsiString GetPageName();
```

Description

GetPageName is the protected read implementation of the PageName property. It returns the page name that is passed to the constructor.

See Also

pagename

Create (see page 25000)

180.1.2.3.7 TBaseWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle property.

Pascal

```
function GetPageTitle: string; override;
```

C++

```
virtual __fastcall AnsiString GetPageTitle();
```

Description

GetPageTitle is the protected read implementation of the PageTitle property. It returns the title that is passed to the constructor.

See Also

pagetitle

Create (see page 25000)

180.1.2.3.8 TBaseWebPageInfo.GetViewAccess Method

Returns the value of the ViewAccess property.

Pascal

```
function GetViewAccess: string; override;
```

C++

```
virtual __fastcall AnsiString GetViewAccess();
```

Description

GetViewAccess is the protected read implementation of the ViewAccess property. It returns the view access string that is passed to the constructor.

See Also

viewaccess

Create (see page 25000)

180.1.2.3.9 TBaseWebPageInfo.SetFactory Method

Connects a specified Web page module factory with the Web page information object.

Pascal

```
procedure SetFactory(AFactory: TAbstractWebPageModuleFactory); override;
```

C++

```
virtual __fastcall SetFactory(TAbstractWebPageModuleFactory AFactory);
```

Description

SetFactory is the protected write implementation of the Factory property.

AFactory is the Web page module factory object that instantiates the Web page module that this object describes.

See Also

Factory

180.1.3 TBaseWebPageModuleFactory Class

TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.

Class Hierarchy

Pascal

```
TBaseWebPageModuleFactory = class(TAbstractWebPageModuleFactory);
```

C++

```
class TBaseWebPageModuleFactory : public TAbstractWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating Web module instances. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instances for reuse with subsequent request messages.

TBaseWebPageModuleFactory descendants generate Web page modules. In addition to holding components that perform tasks for the WebSnap application, Web page modules can generate a Web page. The Web page is described by a Web page information object, which the Web page module factory makes available as its WebPageInfo property.

Do not create instances of TBaseWebPageModuleFactory. Although TBaseWebPageModuleFactory provides an implementation for the abstract or, in C++ terminology, pure virtual methods introduced by its ancestors, it is intended only as a base class. Instead, create instances of a TBaseWebPageModuleFactory descendant such as TWebPageModuleFactory (see page 25019) or TWebAppPageModuleFactory (see page 25012).

See Also

TWebAppPageModuleFactory (see page 25012)

TWebPageModuleFactory (see page 25019)

TWebRequestHandler (see page 25448)

TWebPageInfo (see page 25016)

180.1.3.1 TBaseWebPageModuleFactory Members

The following tables list the members exposed by TBaseWebPageModuleFactory.

Protected Methods

	Name	Description
	Create (see page 25006)	Creates and initializes an instance of TBaseWebPageModuleFactory (see page 25004).
V	GetCacheMode (see page 25007)	Returns the value of the CacheMode property.
V	GetComponentClass (see page 25007)	Returns the value of the ComponentClass property.
V	GetCreateMode (see page 25007)	Returns the value of the CreateMode property.
V	GetIsAppModule (see page 25008)	Returns the value of the IsAppModule property.
V	GetModuleName (see page 25009)	Returns the value of the ModuleName property.
V	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.
V	GetWebPageInfo (see page 15072)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
V	Destroy (see page 15071)	Disposes of an object instance.
V	GetModule (see page 25008)	Creates an instance of the associated Web module.
V	PreventDestruction (see page 25009)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
R	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.
R	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
R	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
R	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
R	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
R	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.3.2 TBaseWebPageModuleFactory.Create Constructor

Creates and initializes an instance of TBaseWebPageModuleFactory (see page 25004).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACreateMode: TWebModuleCreateMode; ACacheMode: TWebModuleCacheMode);
```

C++

```
__fastcall TBaseWebPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCreateMode ACreateMode, TWebModuleCacheMode ACacheMode);
```

Description

Call Create to instantiate a Web page module factory. Typically, Web page module factory objects are created in the initialization section of the unit for the Web page module. The call to the constructor is added by the Web module wizard or WebSnap application wizard when it generates the unit for the Web page module.

AComponentClass is the class of the Web page module that this factory object creates. It becomes the value of the ComponentClass property.

AWebPageInfo is the Web page information object that describes the Web page that this factory's Web page module generates. It becomes the value of the WebPageInfo property.

ACreateMode describes whether the factory should create instances of the Web page module for every request message, or only when the application explicitly requests the Web page module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

WebPageInfo

ComponentClass

CreateMode

CacheMode

180.1.3.3 TBaseWebPageModuleFactory Methods

The methods of the TBaseWebPageModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetCacheMode (see page 25007)	Returns the value of the CacheMode property.
	GetComponentClass (see page 25007)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 25007)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 25008)	Returns the value of the IsAppModule property.
	GetModuleName (see page 25009)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 25008)	Creates an instance of the associated Web module.
	PreventDestruction (see page 25009)	Prevents the WebSnap application from freeing the Web module instance.

180.1.3.3.1 TBaseWebPageModuleFactory.GetCacheMode Method

Returns the value of the CacheMode property.

Pascal

```
function GetCacheMode: TWebModuleCacheMode; override;
```

C++

```
virtual __fastcall TWebModuleCacheMode GetCacheMode();
```

Description

GetCacheMode is the protected read implementation of the CacheMode property. It returns the cache mode flag that was supplied to the constructor.

See Also

CacheMode

Create (see page 25006)

180.1.3.3.2 TBaseWebPageModuleFactory.GetComponentClass Method

Returns the value of the ComponentClass property.

Pascal

```
function GetComponentClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetComponentClass();
```

Description

GetComponentClass is the protected read implementation of the ComponentClass property. It returns the class of the Web page module this factory creates, as supplied to the Web page module factory constructor.

See Also

ComponentClass

Create (see page 25006)

180.1.3.3.3 TBaseWebPageModuleFactory.GetCreateMode Method

Returns the value of the CreateMode property.

Pascal

```
function GetCreateMode: TWebModuleCreateMode; override;
```

C++

```
virtual __fastcall TWebModuleCreateMode GetCreateMode();
```

Description

GetCreateMode is the protected read implementation of the CreateMode property. It returns the create mode flag that was supplied to the constructor.

See Also

CreateMode

Create (see page 25006)

180.1.3.3.4 TBaseWebPageModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebPageModuleFactory (see page 25004), GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppPageModuleFactory (see page 25012)) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 25012)

180.1.3.3.5 TBaseWebPageModuleFactory.GetModule Method

Creates an instance of the associated Web module.

Pascal

```
function GetModule: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetModule();
```

Description

Call GetModule to obtain a new instance of the Web module that the factory creates. GetModule creates an instance of the class that the ComponentClass property specifies and returns it.

See Also

ComponentClass

CreateMode

CacheMode

180.1.3.3.6 TBaseWebPageModuleFactory.GetModuleName Method

Returns the value of the ModuleName property.

Pascal

```
function GetModuleName: string; override;
```

C++

```
virtual __fastcall AnsiString GetModuleName();
```

Description

GetModuleName is the protected read implementation of the ModuleName property. It returns the name of the class that the ComponentClass property specifies.

See Also

ModuleName

ComponentClass

180.1.3.3.7 TBaseWebPageModuleFactory.PreventDestruction Method

Prevents the WebSnap application from freeing the Web module instance.

Pascal

```
procedure PreventDestruction; override;
```

C++

```
virtual __fastcall PreventDestruction();
```

Description

Call PreventDestruction if the WebSnap application should not free the Web module instance when the current HTTP request message has been fully processed. For example, if another Web module contains a reference to the Web module that this factory creates, you may not want to allow the WebSnap application to free the Web module that this factory creates while the other module exists.

In TBaseWebPageModuleFactory (see page 25004), PreventDestruction changes the CacheMode property to caCache.

See Also

CacheMode

180.1.4 TWebAppDataModuleFactory Class

TWebAppDataModule is the factory object for WebSnap application data modules.

Class Hierarchy

Pascal

```
TWebAppDataModuleFactory = class(TBaseWebModuleFactory);
```

C++

```
class TWebAppDataModuleFactory : public TBaseWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory is responsible for creating the module and also contains flags that specify how the module should be managed by the WebSnap application. TWebAppDataModuleFactory contains creation flags. Creation flags determine whether the module should be cached for future requests or destroyed after each request and created for each new request.

TWebAppDataModuleFactory identifies the module as an application module. The application module contains the components responsible for dispatching the HTTP request. WebSnap applications register a single application module class.

See Also

TWebAppDataModule (see page 25388)

TWebAppPageModuleFactory (see page 25012)

TWebDataModuleFactory (see page 25014)

TWebRequestHandler (see page 25448)

TWebPageModuleFactory (see page 25019)

180.1.4.1 TWebAppDataModuleFactory Members

The following tables list the members exposed by TWebAppDataModuleFactory.

Protected Methods

	Name	Description
A	GetCacheMode (see page 15045)	Returns the value of the CacheMode (see page 15048) property.
V	GetCacheMode (see page 24996)	Returns the value of the CacheMode property.
A	GetComponentClass (see page 15045)	Returns the value of the ComponentClass (see page 15049) property.
V	GetComponentClass (see page 24997)	Returns the value of the ComponentClass property.
A	GetCreateMode (see page 15046)	Returns the value of the CreateMode (see page 15049) property.
V	GetCreateMode (see page 24997)	Returns the value of the CreateMode property.
V	GetIsAppModule (see page 25011)	Returns the value of the IsAppModule property.
A	GetModuleName (see page 15047)	Returns the value of the ModuleName (see page 15050) property.
V	GetModuleName (see page 24998)	Returns the value of the ModuleName property.
V	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
	Create (see page 25011)	Creates and initializes an instance of TWebAppDataModuleFactory (see page 25009).
A	GetModule (see page 15046)	Creates an instance of the associated Web module.
V	GetModule (see page 24998)	Creates an instance of the associated Web module.
A	PreventDestruction (see page 15048)	Prevents the WebSnap application from freeing the Web module instance.
V	PreventDestruction (see page 24998)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
R	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.

R	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
R	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
R	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
R	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
R	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.4.2 TWebAppDataModuleFactory.Create Constructor

Creates and initializes an instance of TWebAppDataModuleFactory (see page 25009).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACacheMode: TWebModuleCacheMode =
caCache);
```

C++

```
__fastcall TWebAppDataModuleFactory(TComponentClass AComponentClass, TWebModuleCacheMode
ACacheMode = caCache);
```

Description

Call Create to instantiate a Web application module factory. Typically, the WebSnap application wizard generates the call to the constructor in the initialization section of the Web application module's unit.

AComponentClass is the class of the Web data module that this factory object creates. It becomes the value of the ComponentClass property.

ACacheMode indicates whether the application can cache Web application module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

ComponentClass

180.1.4.3 TWebAppDataModuleFactory Methods

The methods of the TWebAppDataModuleFactory class are listed here.

Protected Methods

	Name	Description
V	GetIsAppModule (see page 25011)	Returns the value of the IsAppModule property.

180.1.4.3.1 TWebAppDataModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebModuleFactory, GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppDataModuleFactory) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 25012)

180.1.5 TWebAppPageModuleFactory Class

TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TWebAppPageModuleFactory = class(TBaseWebPageModuleFactory);
```

C++

```
class TWebAppPageModuleFactory : public TBaseWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating the module and also contains flags that determine whether the module should be cached for future request or destroyed after each request and created for each new request.

Page module factories also contain information about the page such as the page name, description, and access rights. This information is available through the factory so that it can be retrieved without creating the module.

TWebAppPageModuleFactory identifies the module as an application module. The application module contains the components responsible for dispatching the HTTP request. WebSnap applications register a single application module class.

180.1.5.1 TWebAppPageModuleFactory Members

The following tables list the members exposed by TWebAppPageModuleFactory.

Protected Methods

	Name	Description
A	GetCacheMode (see page 15045)	Returns the value of the CacheMode (see page 15048) property.
V	GetCacheMode (see page 25007)	Returns the value of the CacheMode property.
A	GetComponentClass (see page 15045)	Returns the value of the ComponentClass (see page 15049) property.
V	GetComponentClass (see page 25007)	Returns the value of the ComponentClass property.
A	GetCreateMode (see page 15046)	Returns the value of the CreateMode (see page 15049) property.
V	GetCreateMode (see page 25007)	Returns the value of the CreateMode property.
V	GetIsAppModule (see page 25014)	Returns the value of the IsAppModule property.
A	GetModuleName (see page 15047)	Returns the value of the ModuleName (see page 15050) property.
V	GetModuleName (see page 25009)	Returns the value of the ModuleName property.
V	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.
V	GetWebPageInfo (see page 15072)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
	Create (see page 25013)	Creates and initializes an instance of TWebAppPageModuleFactory (see page 25012).
V	Destroy (see page 15071)	Disposes of an object instance.
A	GetModule (see page 15046)	Creates an instance of the associated Web module.
V	GetModule (see page 25008)	Creates an instance of the associated Web module.
A	PreventDestruction (see page 15048)	Prevents the WebSnap application from freeing the Web module instance.
V	PreventDestruction (see page 25009)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
R	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.
R	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
R	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
R	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
R	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
R	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.5.2 TWebAppPageModuleFactory.Create Constructor

Creates and initializes an instance of TWebAppPageModuleFactory (see page 25012).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebAppPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCacheMode ACacheMode = caCache);
```

Description

Call Create to instantiate a Web page module factory. Typically, the WebSnap application wizard generates the call to the constructor in the initialization section of the Web application page module's unit.

AComponentClass is the class of the Web application page module that this factory object creates.

AWebPageInfo describes the attributes of the Web application page module, such as the page name, page title, access strings, and so on. This becomes the value of the WebPageInfo property.

ACacheMode indicates whether the factory can cache Web application page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

180.1.5.3 TWebAppPageModuleFactory Methods

The methods of the TWebAppPageModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetIsAppModule (see page 25014)	Returns the value of the IsAppModule property.

180.1.5.3.1 TWebAppPageModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebPageModuleFactory, GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppPageModuleFactory) override this method to return true.

IsAppModule

TWebAppPageModuleFactory (see page 25012)

180.1.6 TWebDataModuleFactory Class

TWebDataModuleFactory is the factory class for WebSnap data modules.

Class Hierarchy

Pascal

```
TWebDataModuleFactory = class(TBaseWebModuleFactory);
```

C++

```
class TWebDataModuleFactory : public TBaseWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. (In Delphi, the factory object is typically created in the initialization section of the module source file; in C++, it is added in a #pragma startup.)The factory is responsible for creating the module and also contains flags that specify how the module should be managed by the WebSnap application. TWebDataModuleFactory includes caching flags and creation flags. Caching flags determine whether the module should be cached for future request, or destroyed after each request and created for each new request. Creation flags determine whether the module should be automatically created for every request or created on demand.

The WebSnap application may register multiple Web data module classes. Each class is registered with an instance of TWebDataModuleFactory.

180.1.6.1 TWebDataModuleFactory Members

The following tables list the members exposed by TWebDataModuleFactory.

Protected Methods

	Name	Description
A	GetCacheMode (see page 15045)	Returns the value of the CacheMode (see page 15048) property.
V	GetCacheMode (see page 24996)	Returns the value of the CacheMode property.
A	GetComponentClass (see page 15045)	Returns the value of the ComponentClass (see page 15049) property.
V	GetComponentClass (see page 24997)	Returns the value of the ComponentClass property.
A	GetCreateMode (see page 15046)	Returns the value of the CreateMode (see page 15049) property.
V	GetCreateMode (see page 24997)	Returns the value of the CreateMode property.
A	GetIsAppModule (see page 15046)	Returns the value of the IsAppModule (see page 15050) property.
V	GetIsAppModule (see page 24997)	Returns the value of the IsAppModule property.
A	GetModuleName (see page 15047)	Returns the value of the ModuleName (see page 15050) property.
V	GetModuleName (see page 24998)	Returns the value of the ModuleName property.
V	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
	Create (see page 25016)	Creates and initializes an instance of TWebDataModuleFactory (see page 25014).
A	GetModule (see page 15046)	Creates an instance of the associated Web module.
V	GetModule (see page 24998)	Creates an instance of the associated Web module.

A	PreventDestruction (see page 15048)	Prevents the WebSnap application from freeing the Web module instance.
V	PreventDestruction (see page 24998)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
R	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.
R	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
R	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
R	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
R	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
R	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.6.2 TWebDataModuleFactory.Create Constructor

Creates and initializes an instance of TWebDataModuleFactory (see page 25014).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACreateMode: TWebModuleCreateMode =
crOnDemand; ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebDataModuleFactory(TComponentClass AComponentClass, TWebModuleCreateMode
ACreateMode = crOnDemand, TWebModuleCacheMode ACacheMode = caCache);
```

Description

Call Create to instantiate a Web data module factory. Typically, the Web module wizard generates the call to the constructor in the initialization section of the Web data module's unit.

AComponentClass is the class of the Web data module that this factory object creates.

ACreateMode describes whether the factory should create instances of the Web data module for every request message, or only when the application explicitly requests the Web data module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web data module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

CacheMode

ComponentClass

180.1.7 TWebPageInfo Class

TWebPageInfo describes a WebSnap page.

Class Hierarchy

Pascal

```
TWebPageInfo = class(TBaseWebPageInfo);
```

C++

```
class TWebPageInfo : public TBaseWebPageInfo;
```

File

WebFact

Description

The TWebPageInfo module stores information relating to a web page, such as the template filename, page name, title, description, and access rights. This information is part of the web page module factory. This information is stored as part of the factory rather than as part of the module so that it can be accessed without creating the web page module.

An instance of a TWebPageInfo is supplied to the constructor of the factory object that creates instances of the Web page module. Typically, the code to create this object and supply it to the Web page factory's constructor is generated by a Web page module wizard (in Delphi, the generated code appears in the initialization section of the generated unit for the Web page module; in C++, it appears in a #pragma startup). You can change the generated code to alter the properties of the Web page information object. For example, you may want to add a ViewAccess string to allow your application to limit access to the Web page.

In a WebSnap application, you can access the Web page information object of any Web page module by calling the FindPageInfo method of the application's global Web context.

180.1.7.1 TWebPageInfo Members

The following tables list the members exposed by TWebPageInfo.

Protected Methods

	Name	Description
	GetFactory (see page 15062)	Returns the value of the Factory (see page 15066) property.
V	GetIsLoginRequired (see page 15062)	Returns the value of the IsLoginRequired (see page 15066) property.
V	GetIsLoginRequired (see page 25001)	Returns the value of the IsLoginRequired property.
V	GetIsPublished (see page 15062)	Returns the value of the IsPublished (see page 15067) property.
V	GetIsPublished (see page 25002)	Returns the value of the IsPublished property.
V	GetPageDescription (see page 15063)	Returns the value of the PageDescription (see page 15067) property.
V	GetPageDescription (see page 25002)	Returns the value of the PageDescription property.
A	GetPageFile (see page 15063)	Returns the value of the PageFile (see page 15068) property.
V	GetPageFile (see page 25002)	Returns the value of the PageFile property.
V	GetPageHREF (see page 15064)	Returns the value of the PageHREF (see page 15068) property.
V	GetPageHREF (see page 25003)	Returns the value of the PageHREF property.
A	GetPageName (see page 15064)	Returns the value of the PageName (see page 15068) property.
V	GetPageName (see page 25003)	Returns the value of the PageName property.
V	GetPageTitle (see page 15064)	Returns the value of the PageTitle (see page 15069) property.
V	GetPageTitle (see page 25003)	Returns the value of the PageTitle property.
V	GetViewAccess (see page 15065)	Returns the value of the ViewAccess (see page 15069) property.
V	GetViewAccess (see page 25004)	Returns the value of the ViewAccess property.

	SetFactory (see page 15065)	Sets the value of the Factory (see page 15066) property.
	SetFactory (see page 25004)	Connects a specified Web page module factory with the Web page information object.

Public Methods

	Name	Description
	Create (see page 25018)	Creates and initializes a TWebPageInfo (see page 25016) object.

Public Properties

	Name	Description
	Factory (see page 15066)	Specifies the factory object that creates instances of the Web page module this object describes.
R	IsLoginRequired (see page 15066)	Indicates whether callers must log in before accessing the associated Web page.
R	IsPublished (see page 15067)	Indicates whether the WebSnap application automatically displays the associated page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 15068).
R	PageDescription (see page 15067)	Describes the Web page.
R	PageFile (see page 15068)	Identifies an associated file that the Web page module uses to generate its Web page.
R	PageHREF (see page 15068)	Identifies the HREF to use for references to the associated Web page that appear in hypertext links.
R	PageName (see page 15068)	Denotes the logical name for the Web page that the associated module generates
R	PageTitle (see page 15069)	Indicates the title that appears on the associated Web page.
R	ViewAccess (see page 15069)	Indicates the view access string that controls access to the associated Web page.

180.1.7.2 TWebPageInfo.Create Constructor

Creates and initializes a TWebPageInfo (see page 25016) object.

Pascal

```
constructor Create(AAccess: TWebPageAccess = [wpPublished]; const APageFile: string = '.html';
const APageName: string = ''; const ACaption: string = ''; const ADescription: string = '';
const AViewAccess: string = '');
```

C++

```
__fastcall TWebPageInfo(TWebPageAccess AAccess = [wpPublished], const AnsiString APageFile =
'.html', const AnsiString APageName = '', const AnsiString ACaption = '', const AnsiString
ADescription = '', const AnsiString AViewAccess = '');
```

Description

Typically, you do not need create a call to the Web page information object constructor. The Web page module wizard generates code to make this call and pass the resulting object instance to the constructor of a Web page module factory. You may, however, want to edit the generated call to the constructor, changing some of the parameter values that the wizard supplies.

AAccess specifies access information for the associated Web page.

APageFile specifies the name (or extension) of the file that the associated Web page module uses to generate its content. It becomes the value of the PageFile property.

APageName is the logical name of the associated Web page. It becomes the value of the PageName property.

ACaption is the title that appears on the associated Web page. It becomes the value of the PageTitle property.

ADescription is a brief description of the associated Web page. It becomes the value of the PageDescription property.

AViewAccess is the view access string that represents a set of access rights needed to work with the associated Web page. It becomes the value of the ViewAccess property.

180.1.8 TWebPageModuleFactory Class

TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TWebPageModuleFactory = class(TBaseWebPageModuleFactory);
```

C++

```
class TWebPageModuleFactory : public TBaseWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating the module and also contains flags that specify how the WebSnap application should manage the creation, destruction, and use of the Web module. TWebPageModuleFactory also contains flags that determine whether the module should be cached for future request or destroyed after each request and created for each new request.

Note: In the Delphi language, the factory object is created in the initialization section of the module source file.

Page module factories also contain information about the page such as the page name, description, and access rights. This information is available through the factory so that it can be retrieved without creating the module.

WebSnap applications can contain multiple Web page module factories (hence multiple Web page modules), each of which creates the Web page module for a different Web page that the application can create.

180.1.8.1 TWebPageModuleFactory Members

The following tables list the members exposed by TWebPageModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 15045)	Returns the value of the CacheMode (see page 15048) property.
	GetCacheMode (see page 25007)	Returns the value of the CacheMode property.
	GetComponentClass (see page 15045)	Returns the value of the ComponentClass (see page 15049) property.
	GetComponentClass (see page 25007)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 15046)	Returns the value of the CreateMode (see page 15049) property.
	GetCreateMode (see page 25007)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 15046)	Returns the value of the IsAppModule (see page 15050) property.
	GetIsAppModule (see page 25008)	Returns the value of the IsAppModule property.
	GetModuleName (see page 15047)	Returns the value of the ModuleName (see page 15050) property.
	GetModuleName (see page 25009)	Returns the value of the ModuleName property.
	GetWebPageInfo (see page 15047)	Returns the value of the WebPageInfo (see page 15050) property.
	GetWebPageInfo (see page 15072)	Returns the value of the WebPageInfo (see page 15050) property.

Public Methods

	Name	Description
	Create (see page 25020)	Creates and initializes an instance of TWebPageModuleFactory (see page 25019).
	Destroy (see page 15071)	Disposes of an object instance.
	GetModule (see page 15046)	Creates an instance of the associated Web module.
	GetModule (see page 25008)	Creates an instance of the associated Web module.
	PreventDestruction (see page 15048)	Prevents the WebSnap application from freeing the Web module instance.
	PreventDestruction (see page 25009)	Prevents the WebSnap application from freeing the Web module instance.

Public Properties

	Name	Description
	CacheMode (see page 15048)	Indicates whether the factory can cache Web modules for reuse.
	ComponentClass (see page 15049)	Specifies the class type of the Web module that this factory creates.
	CreateMode (see page 15049)	Indicates when the factory creates instances of its Web module.
	IsAppModule (see page 15050)	Indicates whether the corresponding Web module is the main Web application module.
	ModuleName (see page 15050)	Specifies the name of the Web module class that this factory instantiates.
	WebPageInfo (see page 15050)	Describes the attributes of the Web page that the corresponding Web module generates, if any.

180.1.8.2 TWebPageModuleFactory.Create Constructor

Creates and initializes an instance of TWebPageModuleFactory (see page 25019).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACreateMode: TWebModuleCreateMode = crOnDemand; ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCreateMode ACreateMode = crOnDemand, TWebModuleCacheMode ACacheMode =
caCache);
```

Description

Call Create to instantiate a Web page module factory. Typically, the Web page module wizard generates the call to the constructor in the Web page module's unit. In Delphi, the constructor call is placed in the initialization section of the unit. In C++, the call is placed in a #pragma startup.

AComponentClass is the class of the Web page module that this factory object creates.

AWebPageInfo describes the attributes of the Web page module, such as the page name, page title, access strings, and so on. This becomes the value of the WebPageInfo property.

ACreateMode describes whether the factory should create instances of the Web page module for every request message, or only when the application explicitly requests the Web page module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

180.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TWebPageAccessFlags (see page 25022)	This is record WebFact.TWebPageAccessFlags.

180.2.1 WebFact.TWebPageAccessFlags Enumeration

Pascal

```
TWebPageAccessFlags = (
  wpPublished,
  wpLoginRequired
);
```

C++

```
enum TWebPageAccessFlags {
  wpPublished,
  wpLoginRequired
};
```

File

WebFact

Description

This is record WebFact.TWebPageAccessFlags.

180.3 Types

The following table lists types in this documentation.

Types

Name	Description
TWebPageAccess (see page 25023)	This is type WebFact.TWebPageAccess.

180.3.1 WebFact.TWebPageAccess Type

Pascal

```
TWebPageAccess = set of TWebPageAccessFlags;
```

C++

```
TWebPageAccessFlags TWebPageAccess;
```

File

WebFact

Description

This is type WebFact.TWebPageAccess.

181 WebForm Namespace

This is namespace WebForm.

Topics

Name	Description
Classes (see page 25028)	The following table lists classes in this documentation.
Interfaces (see page 25303)	The following table lists interfaces in this documentation.
Functions (see page 25312)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 25315)	The following table lists structs, records, enums in this documentation.
Types (see page 25321)	The following table lists types in this documentation.
Constants (see page 25323)	The following table lists constants in this documentation.

Classes

	Name	Description
	TAbstractControlRequirements (see page 25029)	TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TAbstractFormRequirements (see page 25032)	This is class WebForm.TAbstractFormRequirements.
	TAdapterActionButton (see page 25034)	TAdapterActionButton generates HTML controls for executing adapter actions.
	TAdapterActionsListHelper (see page 25046)	TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.
	TAdapterCommandColumn (see page 25052)	TAdapterCommandColumn generates a column of action controls in an adapter grid.
	TAdapterCommandGroup (see page 25062)	TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.
	TAdapterControlGroup (see page 25070)	TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 25109) or TAdapterDisplayColumn (see page 25099).
	TAdapterDataDisplay (see page 25086)	TAdapterDataDisplay is the base class for components that display adapter fields as form fields.
	TAdapterDisplayColumn (see page 25099)	TAdapterDisplayColumn displays an Adapter field in a grid.
	TAdapterDisplayField (see page 25109)	TAdapterDisplayField displays an Adapter field as a form field.
	TAdapterDisplayReferenceGroup (see page 25122)	TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.
	TAdapterEditColumn (see page 25132)	TAdapterEditColumn displays an adapter field as a form field in a grid.
	TAdapterErrorList (see page 25145)	TAdapterErrorList is the error list display component.
	TAdapterFieldGroup (see page 25150)	TAdapterFieldGroup is a container for Adapter (see page 25156) display field components such as TAdapterDisplayField (see page 25109). TAdapterFieldGroup labels and fields in an HTML form.
	TAdapterForm (see page 25159)	TAdapterForm generates an HTML form displaying Adapter fields.

	TAdapterFormLayout (see page 25166)	This is class WebForm.TAdapterFormLayout.
	TAdapterGrid (see page 25175)	TAdapterGrid is a container for Adapter (see page 25182) display field components such as TAdapterDisplayColumn (see page 25099). TAdapterGrid generates an HTML table.
	TControlRequirements (see page 25185)	TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TCustomAdapterActionButton (see page 25189)	TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.
	TCustomAdapterCommandColumn (see page 25205)	TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.
	TCustomAdapterCommandGroup (see page 25220)	TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 25062).
	TCustomAdapterDisplayColumn (see page 25230)	TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.
	TCustomAdapterDisplayField (see page 25240)	TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.
	TCustomAdapterEditColumn (see page 25252)	TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.
	TCustomAdapterErrorList (see page 25259)	TCustomAdapterErrorList is the base class adapter for components that display error lists.
	TCustomAdapterFieldGroup (see page 25265)	TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.
	TCustomAdapterForm (see page 25276)	TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.
	TCustomAdapterGrid (see page 25286)	TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.
	TDesigntimeWarnings (see page 25297)	This is class WebForm.TDesigntimeWarnings.
	TGeneratedFunctions (see page 25300)	This is class WebForm.TGeneratedFunctions.

Constants

Name	Description
sDisplayText (see page 25323)	This is constant WebForm.sDisplayText.
sFieldText (see page 25323)	This is constant WebForm.sFieldText.
sFormGet (see page 25324)	This is constant WebForm.sFormGet.
sFormPost (see page 25324)	This is constant WebForm.sFormPost.
sMultipartForm (see page 25324)	This is constant WebForm.sMultipartForm.

Functions

	Name	Description
	CalcDisplayFieldHTMLElementType (see page 25312)	This is function WebForm.CalcDisplayFieldHTMLElementType.
	CalcDisplayFieldViewMode (see page 25312)	This is function WebForm.CalcDisplayFieldViewMode.
	FindVariablesContainer (see page 25313)	This is function WebForm.FindVariablesContainer.
	FindVariablesContainerInParent (see page 25313)	This is function WebForm.FindVariablesContainerInParent.
	GetAdapterModeOfAdapterInParent (see page 25313)	This is function WebForm.GetAdapterModeOfAdapterInParent.
	MakeAdapterHTMLName (see page 25314)	This is function WebForm.MakeAdapterHTMLName.
	MakeAdapterVariableName (see page 25314)	This is function WebForm.MakeAdapterVariableName.

Interfaces

	Name	Description
	IAdapterDisplay (see page 25303)	This is class WebForm.IAdapterDisplay.
	IGetAdapterFormLayout (see page 25303)	This is class WebForm.IGetAdapterFormLayout.
	IGetAdapterModeOfDisplay (see page 25304)	This is class WebForm.IGetAdapterModeOfDisplay.
	IGetAdapterOfDisplay (see page 25305)	This is class WebForm.IGetAdapterOfDisplay.
	IGetAdapterVariableName (see page 25306)	This is class WebForm.IGetAdapterVariableName.
	IGetControlRequirements (see page 25308)	This is class WebForm.IGetControlRequirements.
	IGetFormRequirements (see page 25309)	This is class WebForm.IGetFormRequirements.
	IGetVariablesContainerOfDisplay (see page 25310)	This is class WebForm.IGetVariablesContainerOfDisplay.

Structs, Records, Enums

	Name	Description
	TActionButtonHideOption (see page 25315)	TActionButtonHideOptions (see page 25321) indicates when a control to represent an adapter action should not be generated.
	TColumnHTMLElementType (see page 25316)	This is record WebForm.TColumnHTMLElementType.
	TCommandHTMLElementType (see page 25316)	TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.
	TDisplayFieldHideOption (see page 25317)	TDisplayFieldHideOptions (see page 25321) indicates when a control to represent a dataset field should not be generated.
	TDisplayFieldHTMLElementType (see page 25318)	TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TDisplayFieldViewMode (see page 25318)	TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.
	TInputFieldHTMLElementType (see page 25319)	TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TLayoutState (see page 25320)	This is record WebForm.TLayoutState.

Types

Name	Description
TActionButtonHideOptions (see page 25321)	This is type WebForm.TActionButtonHideOptions.
TAdapterDataDisplayClass (see page 25321)	This is type WebForm.TAdapterDataDisplayClass.
TDisplayFieldHideOptions (see page 25321)	This is type WebForm.TDisplayFieldHideOptions.

181.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractControlRequirements (see page 25029)	TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TAbstractFormRequirements (see page 25032)	This is class WebForm.TAbstractFormRequirements.
	TAdapterActionButton (see page 25034)	TAdapterActionButton generates HTML controls for executing adapter actions.
	TAdapterActionsListHelper (see page 25046)	TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.
	TAdapterCommandColumn (see page 25052)	TAdapterCommandColumn generates a column of action controls in an adapter grid.
	TAdapterCommandGroup (see page 25062)	TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.
	TAdapterControlGroup (see page 25070)	TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 25109) or TAdapterDisplayColumn (see page 25099).
	TAdapterDataDisplay (see page 25086)	TAdapterDataDisplay is the base class for components that display adapter fields as form fields.
	TAdapterDisplayColumn (see page 25099)	TAdapterDisplayColumn displays an Adapter field in a grid.
	TAdapterDisplayField (see page 25109)	TAdapterDisplayField displays an Adapter field as a form field.
	TAdapterDisplayReferenceGroup (see page 25122)	TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.
	TAdapterEditColumn (see page 25132)	TAdapterEditColumn displays an adapter field as a form field in a grid.
	TAdapterErrorList (see page 25145)	TAdapterErrorList is the error list display component.
	TAdapterFieldGroup (see page 25150)	TAdapterFieldGroup is a container for Adapter (see page 25156) display field components such as TAdapterDisplayField (see page 25109). TAdapterFieldGroup labels and fields in an HTML form.
	TAdapterForm (see page 25159)	TAdapterForm generates an HTML form displaying Adapter fields.
	TAdapterFormLayout (see page 25166)	This is class WebForm.TAdapterFormLayout.
	TAdapterGrid (see page 25175)	TAdapterGrid is a container for Adapter (see page 25182) display field components such as TAdapterDisplayColumn (see page 25099). TAdapterGrid generates an HTML table.
	TControlRequirements (see page 25185)	TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TCustomAdapterActionButton (see page 25189)	TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.
	TCustomAdapterCommandColumn (see page 25205)	TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.
	TCustomAdapterCommandGroup (see page 25220)	TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 25062).
	TCustomAdapterDisplayColumn (see page 25230)	TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.
	TCustomAdapterDisplayField (see page 25240)	TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.
	TCustomAdapterEditColumn (see page 25252)	TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.
	TCustomAdapterErrorList (see page 25259)	TCustomAdapterErrorList is the base class adapter for components that display error lists.
	TCustomAdapterFieldGroup (see page 25265)	TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.
	TCustomAdapterForm (see page 25276)	TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.
	TCustomAdapterGrid (see page 25286)	TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.

	TDesigntimeWarnings (see page 25297)	This is class WebForm.TDesigntimeWarnings.
	TGeneratedFunctions (see page 25300)	This is class WebForm.TGeneratedFunctions.

181.1.1 TAbstractControlRequirements Class

TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.

Class Hierarchy

WebForm.TAbstractControlRequirements

Pascal

```
TAbstractControlRequirements = class;
```

C++

```
class TAbstractControlRequirements;
```

File

WebForm

Description

Components that generate HTML controls to represent the fields of an adapter (TAdapterControlGroup (see page 25070) and TAdapterDataDisplay (see page 25086) descendants) use descendants of TAbstractControlRequirements. The descendants of TAbstractControlRequirements store the variable and function declarations the adapter form must include before the control group can assemble HTML controls for the fields of the adapter it represents.

TAbstractControlRequirements introduces methods to

Store a specified function or variable (along with its value).

Query whether the function or variable declaration has already been added to the list of requirements.

Store an indication of whether the control requires that it be contained in a multipart form.

TAbstractControlRequirements is abstract or, in C++ terminology, pure virtual. It does not implement any of the methods it declares. WebSnap applications use TAbstractControlRequirements descendants such as TControlRequirements (see page 25185), which provide implementations for these methods.

See Also

TAdapterControlGroup (see page 25070)

TAdapterDataDisplay (see page 25086)

TAdapterForm (see page 25159)

TControlRequirements (see page 25185)

181.1.1.1 TAbstractControlRequirements Members

The following tables list the members exposed by TAbstractControlRequirements.

Public Methods

	Name	Description
	DefineFunction (see page 25030)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 25030)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 25031)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 25031)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 25032)	Stores the fact that the generated HTML form should be multipart.

181.1.1.2 TAbstractControlRequirements Methods

The methods of the TAbstractControlRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 25030)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 25030)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 25031)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 25031)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 25032)	Stores the fact that the generated HTML form should be multipart.

181.1.1.2.1 TAbstractControlRequirements.DefineFunction Method

Adds the declaration of a function to those that this control requirements object stores.

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineFunction(const AnsiString AName, const AnsiString ABody) = 0;
```

Description

DefineFunction stores the declaration of a function that has the name AName, where ABody is the text of the function body.

AName is the name of the function. This name is one of a standard set that the adapter form knows to call under specific circumstances. For example, the name can be the standard name of the function to generate an HTML button.

ABody is the body of the specified function. This value is typically customized to reflect the properties of a specific control in the form.

See Also

IsFunctionDefined (see page 25031)

DefineVariable (see page 25030)

181.1.1.2.2 TAbstractControlRequirements.DefineVariable Method

Adds the declaration of a variable to those that this control requirements object stores.

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string; AAdapter: Boolean);
virtual; abstract;
```

C++

```
virtual __fastcall DefineVariable(const AnsiString AName, const AnsiString AValue, Boolean
AAdapter) = 0;
```

Description

DefineVariable stores the name and value of a variable declaration.

AName is the name of the variable.

AValue is the value to assign to the variable.

AAdapter indicates whether this variable is the one that declares the adapter object whose field a control represents or whose set of fields a control group represents.

See Also

DefineFunction (see page 25030)

IsVariableDefined (see page 25031)

Adapter (see page 25084)

181.1.1.2.3 TAbstractControlRequirements.IsFunctionDefined Method

Indicates whether a function with the specified name has already been added to the list of control requirements.

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const AnsiString AName) = 0;
```

Description

IsFunctionDefined returns true if the control requirements object already lists a function with the specified name. That is, IsFunctionDefined returns true if the DefineFunction (see page 25030) method has been called to define the specified function, and false otherwise.

AName is the name of the function.

See Also

DefineFunction (see page 25030)

IsVariableDefined (see page 25031)

181.1.1.2.4 TAbstractControlRequirements.IsVariableDefined Method

Indicates whether a variable with the specified name has already been added to the list of control requirements.

Pascal

```
function IsVariableDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const AnsiString AName) = 0;
```

Description

IsVariableDefined returns true if the control requirements object already lists a variable with the specified name. That is, IsVariableDefined returns true if the DefineVariable (see page 25030) method has been called to define a value for the specified variable, and false otherwise.

AName is the name of the variable.

See Also

DefineVariable (see page 25030)

IsFunctionDefined (see page 25031)

181.1.1.2.5 TAbstractControlRequirements.RequiresMultipartForm Method

Stores the fact that the generated HTML form should be multipart.

Pascal

```
procedure RequiresMultipartForm; virtual; abstract;
```

C++

```
virtual __fastcall RequiresMultipartForm() = 0;
```

Description

Web items call this method if they need to be contained in a multipart form (for example, when a field in the form is represented by a reference to another file). A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

181.1.2 TAbstractFormRequirements Class

Class Hierarchy

Pascal

```
TAbstractFormRequirements = class;
```

C++

```
class TAbstractFormRequirements;
```

File

WebForm

Description

This is class WebForm.TAbstractFormRequirements.

181.1.2.1 TAbstractFormRequirements Members

The following tables list the members exposed by TAbstractFormRequirements.

Public Methods

	Name	Description
	DefineFunction (see page 25033)	This is DefineFunction, a member of class TAbstractFormRequirements.
	DefineVariable (see page 25033)	This is DefineVariable, a member of class TAbstractFormRequirements.
	IsFunctionDefined (see page 25033)	This is IsFunctionDefined, a member of class TAbstractFormRequirements.
	IsVariableDefined (see page 25034)	This is IsVariableDefined, a member of class TAbstractFormRequirements.

181.1.2.2 TAbstractFormRequirements Methods

The methods of the TAbstractFormRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 25033)	This is DefineFunction, a member of class TAbstractFormRequirements.
	DefineVariable (see page 25033)	This is DefineVariable, a member of class TAbstractFormRequirements.
	IsFunctionDefined (see page 25033)	This is IsFunctionDefined, a member of class TAbstractFormRequirements.
	IsVariableDefined (see page 25034)	This is IsVariableDefined, a member of class TAbstractFormRequirements.

181.1.2.2.1 TAbstractFormRequirements.DefineFunction Method

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineFunction(const AnsiString AName, const AnsiString ABody) = 0;
```

Description

This is DefineFunction, a member of class TAbstractFormRequirements.

181.1.2.2.2 TAbstractFormRequirements.DefineVariable Method

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineVariable(const AnsiString AName, const AnsiString AValue) = 0;
```

Description

This is DefineVariable, a member of class TAbstractFormRequirements.

181.1.2.2.3 TAbstractFormRequirements.IsFunctionDefined Method

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const AnsiString AName) = 0;
```

Description

This is IsFunctionDefined, a member of class TAbstractFormRequirements.

181.1.2.2.4 TAbstractFormRequirements.IsVariableDefined Method

Pascal

```
function IsVariableDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const AnsiString AName) = 0;
```

Description

This is IsVariableDefined, a member of class TAbstractFormRequirements.

181.1.3 TAdapterActionButton Class

TAdapterActionButton generates HTML controls for executing adapter actions.

Class Hierarchy

Pascal

```
TAdapterActionButton = class(TCustomAdapterActionButton);
```

C++

```
class TAdapterActionButton : public TCustomAdapterActionButton;
```

File

WebForm

Description

Add TAdapterActionButton to the hierarchy of Web items that an adapter page producer (TAdapterPageProducer) maintains to include a control in the HTML form that executes an adapter action. When the end user clicks the control, it sends a request message that executes the adapter action. Use the ActionName (see page 25039) property to specify the adapter action that the generated control executes.

TAdapterActionButton can generate a variety of controls, including labeled buttons, images that the user can click, and hypertext links. Use the DisplayType (see page 25041) property to specify the type of control you want. Other properties customize the appearance of the control, or indicate when it is included in HTML forms.

See Also

TAdapterPageProducer (see page 19802)

TCustomAdapterAction (see page 24188)

TAdapterForm (see page 25159)

181.1.3.1 TAdapterActionButton Members

The following tables list the members exposed by TAdapterActionButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindAssociatedAction (see page 25195)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 25196)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 25196)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 25196)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
V	GetCaption (see page 16869)	Returns the value of the Caption (see page 16870) property.
V	GetCaption (see page 25196)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25197)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 25197)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 25197)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16869)	Returns the layout object that specifies how the generated control should look.
V	GetLayoutAttributes (see page 25197)	Returns the layout object that specifies how the generated control should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

A	ImplContent (see page 16869)	Provides the underlying implementation for the Content (see page 16868) method.
V	ImplContent (see page 25198)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25198)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
V	ImplRestoreDefaults (see page 25198)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25199)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25199)	This is RestoreDefaults, a member of class TCustomAdapterActionButton.
	SetActionName (see page 25199)	This is SetActionName, a member of class TCustomAdapterActionButton.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16870)	Sets the value of the Caption (see page 16870) property.
V	SetCaption (see page 25200)	Sets the value of the Caption property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16868)	Creates and initializes an instance of TWebButton (see page 16863).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	Create (see page 25194)	Creates and initializes an instance of TCustomAdapterActionButton (see page 25189).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	Destroy (see page 25195)	Frees an instance of TCustomAdapterActionButton (see page 25189).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionName (see page 19755)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetActionName (see page 19783)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	ActionName (see page 25039)	Specifies the name of the action taken by the Web button.
	Align (see page 25040)	Specifies the horizontal alignment of the generated HTML control.
	Caption (see page 25040)	Specifies the caption that appears on the button.
	Custom (see page 25040)	Represents a tag option and its value in the generated INPUT tag.
	DisplayColumns (see page 25041)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 25041)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 25042)	Specifies the name of the page to display when an error occurs executing the action.

	HideOptions (see page 25042)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 25043)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 25043)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 25043)	Specifies the width of the generated element if it is a clickable image.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PageName (see page 25044)	Specifies the name of the page to display after successfully executing the action.
	Style (see page 25044)	Adds style attributes to the generated button control.
	StyleRule (see page 25045)	Applies a style in the page producer's style sheet to the button.
	Tag (see page 2808)	Stores an integer value as part of a component.
	VAlign (see page 25045)	Specifies the vertical alignment of the generated HTML control.

181.1.3.2 TAdapterActionButton Properties

The properties of the TAdapterActionButton class are listed here.

Published Properties

	Name	Description
	ActionName (see page 25039)	Specifies the name of the action taken by the Web button.
	Align (see page 25040)	Specifies the horizontal alignment of the generated HTML control.
	Caption (see page 25040)	Specifies the caption that appears on the button.
	Custom (see page 25040)	Represents a tag option and its value in the generated INPUT tag.
	DisplayColumns (see page 25041)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 25041)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 25042)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 25042)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 25043)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 25043)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 25043)	Specifies the width of the generated element if it is a clickable image.
	PageName (see page 25044)	Specifies the name of the page to display after successfully executing the action.
	Style (see page 25044)	Adds style attributes to the generated button control.
	StyleRule (see page 25045)	Applies a style in the page producer's style sheet to the button.
	VAlign (see page 25045)	Specifies the vertical alignment of the generated HTML control.

181.1.3.2.1 TAdapterActionButton.ActionName Property

Specifies the name of the action taken by the Web button.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;__property AnsiString ActionName;
```

Description

Use ActionName to get or set the name of the adapter action that executes in response to requests sent when the user clicks this object's generated control. ActionName is the same as the ActionName property of the adapter action object that this control executes.

See Also

Caption

ActionName (see page 24198)

181.1.3.2.2 TAdapterActionButton.Align Property

Specifies the horizontal alignment of the generated HTML control.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the generated HTML control is positioned horizontally within its parent HTML element. If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each individual of the items within the grid generated to position them into rows.

Align indicates the desired value of the Align option of the HTML tag for the generated control.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 25204)

DisplayColumns (see page 25201)

ItemCount (see page 24074)

181.1.3.2.3 TAdapterActionButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom (see page 16871)

GetCaption (see page 16869)

SetCaption (see page 16870)

181.1.3.2.4 TAdapterActionButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption (see page 16870)

Style (see page 16871)

181.1.3.2.5 TAdapterActionButton.DisplayColumns Property

Indicates the number of columns to use when laying out the generated HTML control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

An adapter action may represent multiple commands. When the TCustomAdapterActionButton object generates controls for such an action, it must handle the layout of individual items for each of the action's commands. DisplayColumns controls how many items (controls) appear in a row before TCustomAdapterActionButton starts a new row of controls.

If the corresponding adapter action does not represent multiple commands (that is, if its ItemCount property is not greater than 1), the value of DisplayColumns has no effect.

If DisplayColumns is –1, the Web browser controls the layout of the adapter action's items.

See Also

ItemCount (see page 24074)

DisplayType (see page 25202)

181.1.3.2.6 TAdapterActionButton.DisplayType Property

Specifies the DisplayType of the generated HTML control.

Pascal

```
property DisplayType: TCommandHTMLElementType;
```

C++

```
__property TCommandHTMLElementType DisplayType;
```

Description

DisplayType controls the type of HTML element that this Web item generates.

When DisplayType is ctDefault (the default), TCustomAdapterActionButton uses the element type that the associated adapter action suggests. Change DisplayType to generate a different type of control or set of controls.

When DisplayType is ctImage or ctEventImages, you must set the ImageProducer property to a component that can provide the image or images.

See Also

ImageProducer (see page 25203)

Caption

GetDisplayStyle (see page 24056)

181.1.3.2.7 TAdapterActionButton.ErrorPageName Property

Specifies the name of the page to display when an error occurs executing the action.

Pascal

```
property ErrorPageName: string;
```

C++

```
__property AnsiString ErrorPageName;
```

Description

Use ErrorPageName to indicate the Web page that should appear if the WebSnap application encounters an error when executing the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

PageName (see page 25204)

pagename

181.1.3.2.8 TAdapterActionButton.HideOptions Property

Controls when the generated HTML element appears in HTML forms.

Pascal

```
property HideOptions: TActionButtonHideOptions;
```

C++

```
__property TActionButtonHideOptions HideOptions;
```

Description

HideOptions controls when this Web item generates an HTML control for its associated action. This property is a set of flags that control when the adapter page producer suppresses the controls that this object generates. If HideOptions is an empty set, TCustomAdapterActionButton always generates a control for its associated adapter action.

See Also

GetVisible (see page 24061)

WebEnabled (see page 24071)

HasExecuteAccess (see page 24062)

181.1.3.2.9 TAdapterActionButton.ImageHeight Property

Specifies the height of the generated element if it is a clickable image.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

ImageHeight controls the height of the image that the user can click to execute the associated action. If ImageHeight is –1 (the default), the browser controls the height it uses to display the generated image.

ImageHeight is only used when the value of the DisplayType property is ctImage or ctEventImages.

See Also

ImageProducer (see page 25203)

ImageWidth (see page 25204)

DisplayType (see page 25202)

181.1.3.2.10 TAdapterActionButton.ImageProducer Property

Specifies the interface that this adapter action button uses to generate images.

Pascal

```
property ImageProducer: IActionImageProducer;
```

C++

```
__property IActionImageProducer ImageProducer;
```

Description

Set ImageProducer when the value of the DisplayType is ctImage or ctEventImages. ImageProducer is the interface of the component that supplies the image or images that appear in HTML forms as the control that this Web item generates. When the user clicks on the generated image in the HTML form, the associated action executes.

See Also

DisplayType (see page 25202)

ImageHeight (see page 25203)

ImageWidth (see page 25204)

181.1.3.2.11 TAdapterActionButton.ImageWidth Property

Specifies the width of the generated element if it is a clickable image.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

ImageWidth controls the width of the image that the user can click to execute the associated action. If ImageWidth is –1 (the default), the browser controls the width it uses to display the generated image.

ImageWidth is only used when the value of the DisplayType property is ctImage or ctEventImages.

See Also

ImageProducer (see page 25203)

ImageHeight (see page 25203)

DisplayType (see page 25202)

181.1.3.2.12 TAdapterActionButton.PageName Property

Specifies the name of the page to display after successfully executing the action.

Pascal

```
property PageName: string;
```

C++

```
__property AnsiString PageName;
```

Description

Use PageName to indicate the Web page that should appear if the WebSnap application successfully executes the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

ErrorPageName (see page 25202)

pagename

181.1.3.2.13 TAdapterActionButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 16871)

StyleRule (see page 16872)

181.1.3.2.14 TAdapterActionButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style (see page 16871)

Styles (see page 17127)

StylesFile (see page 17128)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.3.2.15 TAdapterActionButton.VAlign Property

Specifies the vertical alignment of the generated HTML control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the generated HTML control is positioned vertically within its parent HTML element. VAlign indicates the desired value of the VAlign option of the HTML tag for the generated control. . If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each of the individual items within the grid generated to position them into rows.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 25201)

DisplayColumns (see page 25201)

ItemCount (see page 24074)

181.1.4 TAdapterActionsListHelper Class

TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.

Class Hierarchy

Pascal

```
TAdapterActionsListHelper = class(TObject);
```

C++

```
class TAdapterActionsListHelper : public TObject;
```

File

WebForm

Description

AdapterActionsListHelper is a helper object that works with components that generate a collection of controls for executing adapter actions. Such components include TAdapterCommandColumn (see page 25052) and TAdapterCommandGroup (see page 25062). TAdapterActionsListHelper handles common tasks that allow the display component to work with the IDE. These tasks include locating child Web items for specified actions, listing the child Web items (adapter action buttons) of the display component, and specifying the text of menu commands that operate on the set of child Web items.

See Also

TAdapterCommandColumn (see page 25052)

TAdapterCommandGroup (see page 25062)

TAdapterActionButton (see page 25034)

181.1.4.1 TAdapterActionsListHelper Members

The following tables list the members exposed by TAdapterActionsListHelper.

Protected Methods

	Name	Description
	FindAction (see page 25048)	Returns the child Web item that corresponds to the specified adapter action.
	GetActionsList (see page 25049)	Fills a list with the names of all the actions for which there are child Web items.
	GetAddAllFieldsItem (see page 25049)	Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.
	GetAddFieldsDlgCaption (see page 25049)	Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.
	GetAddFieldsItem (see page 25050)	Returns the string that the IDE uses for the command to display the Add Commands dialog.
	GetNewFieldPrefix (see page 25050)	Returns the string that is used to start the names of all automatically-generated Web items.
	GetVisibleActions (see page 25051)	Fills a list with the names of all the actions for which there are child Web items.
	IsActionInUse (see page 25051)	Indicates whether there is a child Web item that corresponds to a specified action.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25047)	Creates and initializes an instance of TAdapterActionsListHelper (see page 25046).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	AddDefaultActions (see page 25052)	Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

181.1.4.2 TAdapterActionsListHelper.Create Constructor

Creates and initializes an instance of TAdapterActionsListHelper (see page 25046).

Pascal

```
constructor Create(AComponent: TComponent; AHelper: TWebContainerComponentHelper);
```

C++

```
__fastcall TAdapterActionsListHelper(TComponent * AComponent, TWebContainerComponentHelper
AHelper);
```

Description

Do not instantiate TAdapterActionsListHelper (see page 25046). It is created by display components that use it to handle their interactions with the IDE.

AComponent is the adapter display component that uses TAdapterActionsListHelper (see page 25046) to interact with the IDE. This component is a Web item, such as TAdapterCommandColumn (see page 25052) or TAdapterCommandGroup (see page 25062), that assembles a set of HTML controls for executing adapter actions.

AHelper is the helper object that ACompnent uses to manage its list of child Web items.

See Also

TAdapterCommandColumn (see page 25052)

TAdapterCommandGroup (see page 25062)

181.1.4.3 TAdapterActionsListHelper Methods

The methods of the TAdapterActionsListHelper class are listed here.

Protected Methods

	Name	Description
	FindAction (see page 25048)	Returns the child Web item that corresponds to the specified adapter action.
	GetActionsList (see page 25049)	Fills a list with the names of all the actions for which there are child Web items.
	GetAddAllFieldsItem (see page 25049)	Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.
	GetAddFieldsDlgCaption (see page 25049)	Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.
	GetAddFieldsItem (see page 25050)	Returns the string that the IDE uses for the command to display the Add Commands dialog.
	GetNewFieldPrefix (see page 25050)	Returns the string that is used to start the names of all automatically-generated Web items.
	GetVisibleActions (see page 25051)	Fills a list with the names of all the actions for which there are child Web items.
	IsActionInUse (see page 25051)	Indicates whether there is a child Web item that corresponds to a specified action.

181.1.4.3.1 TAdapterActionsListHelper.FindAction Method

Returns the child Web item that corresponds to the specified adapter action.

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const AnsiString AName);
```

Description

FindAction searches through the list of child Web items for a component that corresponds to the specified adapter action.

AName is the name of the adapter action to locate.

FindAction returns the child Web item (typically a TAdapterActionButton (see page 25034) instance) that generates a control for the specified action. If there is no child Web item for the specified action, FindAction returns nil (Delphi) or NULL (C++).

See Also

GetActionsList (see page 25049)

GetVisibleActions (see page 25051)

IsActionInUse (see page 25051)

ActionName (see page 25200)

181.1.4.3.2 TAdapterActionsListHelper.GetActionsList Method

Fills a list with the names of all the actions for which there are child Web items.

Pascal

```
procedure GetActionsList(List: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings List);
```

Description

GetActionsList searches through the variables that have been defined for child Web items that represent adapter actions. It adds the names of any actions it finds to the list, along with the class of the Web item that represents each action.

List is the list to fill with the names of adapter actions for which there are child Web items.

See Also

FindAction (see page 25048)

GetVisibleActions (see page 25051)

IsActionInUse (see page 25051)

ActionName (see page 25200)

181.1.4.3.3 TAdapterActionsListHelper.GetAddAllFieldsItem Method

Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

The IDE calls GetAddAllFieldsItem to customize the label of the command that adds all the default items to the list of child Web items. Because TAdapterActionsListHelper (see page 25046) is specialized for controls that contain adapter action buttons, it returns the string 'Add All Commands'.

See Also

GetAddFieldsDlgCaption (see page 25049)

GetAddFieldsItem (see page 25050)

GetNewFieldPrefix (see page 25050)

181.1.4.3.4 TAdapterActionsListHelper.GetAddFieldsDlgCaption Method

Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

The IDE calls GetAddFieldsDlgCaption to label the dialog that lists available child Web items. Because TAdapterActionsListHelper (see page 25046) is specialized for controls that contain adapter action buttons, it returns the string 'Add Commands'.

See Also

GetAddAllFieldsItem (see page 25049)

GetAddFieldsItem (see page 25050)

GetNewFieldPrefix (see page 25050)

181.1.4.3.5 TAdapterActionsListHelper.GetAddFieldsItem Method

Returns the string that the IDE uses for the command to display the Add Commands dialog.

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

The IDE calls GetAddFieldsItem to customize the label of the command that brings up a dialog where you can select child Web items to add. Because TAdapterActionsListHelper (see page 25046) is specialized for controls that contain adapter action buttons, it returns the string 'Add Commands ...'.

See Also

GetAddFieldsDlgCaption (see page 25049)

GetAddAllFieldsItem (see page 25049)

GetNewFieldPrefix (see page 25050)

181.1.4.3.6 TAdapterActionsListHelper.GetNewFieldPrefix Method

Returns the string that is used to start the names of all automatically-generated Web items.

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

When the IDE adds new child Web items, it generates names of the components it adds. Because TAdapterActionsListHelper (see page 25046) is specialized for controls that contain adapter action buttons, the names of those TAdapterActionButton (see page 25034) components are generated by prepending the string that this method returns to the name of the action the button executes.

GetNewFieldPrefix returns the string 'Cmd'.

GetAddFieldsDlgCaption (see page 25049)

GetAddAllFieldsItem (see page 25049)

GetAddFieldsItem (see page 25050)

181.1.4.3.7 TAdapterActionsListHelper.GetVisibleActions Method

Fills a list with the names of all the actions for which there are child Web items.

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

GetVisibleActions returns the list of child Web items that generate HTML controls for the associated component. Each element in this list is an adapter action button (TAdapterActionButton (see page 25034) object).

If you have explicitly added child Web items, the returned list contains the child Web items you added. Otherwise, if the AddDefaultActions (see page 25052) property is true, the list contains adapter action buttons for the default actions of the adapter. If AddDefaultActions (see page 25052) is false, the list is empty.

FindAction (see page 25048)

GetActionsList (see page 25049)

IsActionInUse (see page 25051)

TAdapterActionButton (see page 25034)

AddDefaultActions (see page 25052)

181.1.4.3.8 TAdapterActionsListHelper.IsActionInUse Method

Indicates whether there is a child Web item that corresponds to a specified action.

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const AnsiString AName);
```

Description

IsActionInUse indicates whether the associated component already has a child Web item that executes a specified adapter action.

AName is the name of the adapter action.

IsActionInUse returns true if there is a child Web item that executes the specified action, false if there is no child Web item for the action.

181.1.4.4 TAdapterActionsListHelper Properties

The properties of the TAdapterActionsListHelper class are listed here.

Public Properties

	Name	Description
	AddDefaultActions (see page 25052)	Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

181.1.4.4.1 TAdapterActionsListHelper.AddDefaultActions Property

Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

Pascal

```
property AddDefaultActions: Boolean;
```

C++

```
__property Boolean AddDefaultActions;
```

Description

AddDefaultCommands determines what controls appear in the generated set of HTML controls if you do not explicitly add any adapter action buttons to the WebFieldControls property of the component that uses this TAdapterActionsListHelper (see page 25046). When AddDefaultCommands is true (the default), the associated component automatically adds controls for every default action of its adapter when you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the associated component only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.

181.1.5 TAdapterCommandColumn Class

TAdapterCommandColumn generates a column of action controls in an adapter grid.

Class Hierarchy

Pascal

```
TAdapterCommandColumn = class(TCustomAdapterCommandColumn);
```

C++

```
class TAdapterCommandColumn : public TCustomAdapterCommandColumn;
```

File

WebForm

Description

Add TAdapterCommandColumn as a child Web item to an adapter grid (TAdapterGrid (see page 25175)). TAdapterCommandColumn adds a column to the grid that contains controls that execute adapter actions. Specify the controls in the cells of this column by adding adapter action buttons (TAdapterActionButton (see page 25034) objects) as child Web items of the TAdapterCommandColumn object. Each cell in the column contains all the adapter action buttons you add as child Web items. For each row in the grid, the column contains duplicates of the same set of adapter action buttons.

Use the TAdapterCommandColumn properties to specify which adapter action buttons appear in the column and to customize their layout and appearance. These properties include:

The AddDefaultCommands (see page 25058), WebFieldControls, and VisibleCommands (see page 25219) properties, which specify which adapter action buttons appear in the column.

The Caption (see page 25059) and CaptionAttributes (see page 25060) properties, which determine the appearance of the label at the top of the column.

The Align (see page 25059), VAlign (see page 25062), and DisplayColumns (see page 25060) properties, which determine the layout of controls inside each cell.

The Style (see page 25061) and StyleRule (see page 25061) properties, which let you apply a style from a stylesheet to the column.

TAdapterDisplayColumn (see page 25099)

TAdapterActionButton (see page 25034)

181.1.5.1 TAdapterCommandColumn Members

The following tables list the members exposed by TAdapterCommandColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FormatColumnData (see page 25211)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 25212)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 25212)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 25212)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.

V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplCanAddClass (see page 25213)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplContent (see page 25213)	Provides the underlying implementation for the Content method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 25214)	Responds to changes that affect the associated adapter.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AdapterActionsListHelper (see page 25215)	Identifies the helper object that enables this component to work with the editor at design time.
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	Create (see page 25210)	Creates and initializes an instance of TCustomAdapterCommandColumn (see page 25205).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
V	Destroy (see page 25211)	Frees an instance of TCustomAdapterCommandColumn (see page 25205).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.

	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleCommands (see page 25219)	Lists the child Web items that generate controls that appear in cells of the column.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	AddDefaultCommands (see page 25058)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 25059)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 25059)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 25060)	Specifies the attributes of the Caption property.
	Custom (see page 25060)	Represents a tag option and its value.
	DisplayColumns (see page 25060)	Specifies the number of adapter action buttons that can appear in a single row.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 25061)	Adds style attributes to the generated caption.
	StyleRule (see page 25061)	Applies a style in the page producer's style sheet to the generated column.
	Tag (see page 2808)	Stores an integer value as part of a component.
	VAlign (see page 25062)	Specifies the vertical alignment of the action control buttons within the column.

181.1.5.2 TAdapterCommandColumn Properties

The properties of the TAdapterCommandColumn class are listed here.

Published Properties

	Name	Description
	AddDefaultCommands (see page 25058)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 25059)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 25059)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 25060)	Specifies the attributes of the Caption property.
	Custom (see page 25060)	Represents a tag option and its value.
	DisplayColumns (see page 25060)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 25061)	Adds style attributes to the generated caption.
	StyleRule (see page 25061)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 25062)	Specifies the vertical alignment of the action control buttons within the column.

181.1.5.2.1 TAdapterCommandColumn.AddDefaultCommands Property

Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

Set AddDefaultCommands property to specify what should appear in the generated column when you do not explicitly add any adapter action buttons to the WebFieldControls property. When AddDefaultCommands is true (the default), the adapter command column automatically adds controls for every default action of the associated adapter if you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the adapter command column only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.

See Also

WebFieldControls (see page 16884)

DefaultWebComponents (see page 23778)

VisibleCommands (see page 25219)

181.1.5.2.2 TAdapterCommandColumn.Align Property

Specifies the horizontal alignment of the action control buttons within the column.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the child HTML control are positioned horizontally within this column. Align indicates the desired value of the Align option of the HTML tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 25219)

DisplayColumns (see page 25217)

181.1.5.2.3 TAdapterCommandColumn.Caption Property

Specifies the text label that appears at the top of the column.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to get or set the caption for the column in the adapter grid. The caption is the text label that appears at the top of the column.

To change the appearance or layout of the caption, use the CaptionAttribute property.

See Also

CaptionAttributes (see page 25217)

181.1.5.2.4 TAdapterCommandColumn.CaptionAttributes Property

Specifies the attributes of the Caption property.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the column caption.

See Also

Caption (see page 25216)

181.1.5.2.5 TAdapterCommandColumn.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the column. Each option and its value has the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces.

TCustomAdapterCommandColumn inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 25218)

StyleRule (see page 25218)

181.1.5.2.6 TAdapterCommandColumn.DisplayColumns Property

Specifies the number of adapter action buttons that can appear in a single row.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Set DisplayColumns to organize the layout of adapter action buttons when the WebFieldControls property lists more than one

adapter action button. TCustomAdapterCommandColumn places the adapter action buttons by rows in the cells of the adapter grid column. DisplayColumns limits the number of controls that can appear in a single row within each column cell. If the WebFieldControls property lists more adapter action buttons than DisplayColumns, then the cell contains multiple rows of controls.

See Also

WebFieldControls (see page 16884)

181.1.5.2.7 TAdapterCommandColumn.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated column. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the column as the value of a STYLE option.

Note: Style affects the contents of the column cells. To specify display characteristics of the column's caption, use the CaptionAttributes property instead.

See Also

Custom (see page 25217)

StyleRule (see page 25218)

CaptionAttributes (see page 25217)

181.1.5.2.8 TAdapterCommandColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated column.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated column. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

See Also

Custom (see page 25217)

Style (see page 25218)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.5.2.9 TAdapterCommandColumn.VAlign Property

Specifies the vertical alignment of the action control buttons within the column.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the child HTML control are positioned vertically within the cells of this column. VAlign indicates the desired value of the VAlign option of the HTML tag.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 25216)

DisplayColumns (see page 25217)

181.1.6 TAdapterCommandGroup Class

TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.

Class Hierarchy

Pascal

```
TAdapterCommandGroup = class(TCustomAdapterCommandGroup);
```

C++

```
class TAdapterCommandGroup : public TCustomAdapterCommandGroup;
```

File

WebForm

Description

TAdapterCommandGroup is added to a TAdapterPageProducer to cause the page producer to generate a group of HTML elements that executes adapter actions. First add a TAdapterForm (see page 25159) to the TAdapterPageProducer and then add TAdapterCommandGroup as a child of TAdapterForm (see page 25159). TAdapterCommandGroup does not reference an adapter directly. Instead, it references a component that references an adapter. Typically, TAdapterCommandGroup references either TAdapterGrid (see page 25175) or TAdapterFieldGroup (see page 25150). TAdapterCommandGroup contains child components, such as TAdapterActionButton (see page 25034), that are responsible for rendering individual HTML elements, such as buttons. By default, TAdapterCommandGroup will automatically add one child component for each action in the adapter.

See Also

TAdapterDisplayReferenceGroup (see page 25122)

TCustomAdapterCommandGroup (see page 25220)

TAdapterForm (see page 25159)

TAdapterFieldGroup (see page 25150)

TAdapterGrid (see page 25175)

TAdapterActionButton (see page 25034)

181.1.6.1 TAdapterCommandGroup Members

The following tables list the members exposed by TAdapterCommandGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25128)	Responds to changes in the adapter on which the controls in this group operate.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DisplayComponentChange (see page 25129)	Responds when the DisplayComponent (see page 25132) property changes.
	GetAdapter (see page 25226)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterDisplayCharacteristics (see page 25129)	Indicates the display characteristics of the HTML this component generates.
	GetAdapterFormLayout (see page 25226)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 25227)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 25227)	Returns the adapter mode defined by the TAdapterPageProducer components.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25130)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.

	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplCanAddClass (see page 25227)	Checks the inheritance of the given component.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplContent (see page 25228)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 25166) component.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 25130)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 25131)	Responds when the associated display component changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	SetWebDisplayComponent (see page 25131)	Sets the value of the DisplayComponent (see page 25132) property.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 25228)	Provides read-only access to the Adapter that this command group uses.
R	AdapterActionsListHelper (see page 25229)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
V	Create (see page 16919)	Creates an instance of TWebDisplayReferenceGroup (see page 16915).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	Create (see page 25127)	Creates an instance of TWebDisplayReferenceGroup.
V	Create (see page 25225)	Creator for TCustomAdapterCommandGroup (see page 25220).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 16919)	Frees an instance of TWebDisplayReferenceGroup (see page 16915).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
V	Destroy (see page 25128)	Frees an instance of TAdapterDisplayReferenceGroup (see page 25122).
V	Destroy (see page 25225)	Frees an instance of TAdapterDisplayReferenceGroup.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleCommands (see page 25230)	Provides read-only access to the TWebComponentList that stores the list of visible components.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	AddDefaultCommands (see page 25069)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 25069)	Provides read and write access to the custom HTML element attributes, such as Valign="top."
	DisplayComponent (see page 25069)	Associates the group with a component that generates the display controls.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 25070)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 25070)	Provides read and write access to the internal string that stores the CSS style rule for the control group.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.6.2 TAdapterCommandGroup Properties

The properties of the TAdapterCommandGroup class are listed here.

Published Properties

	Name	Description
	AddDefaultCommands (see page 25069)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 25069)	Provides read and write access to the custom HTML element attributes, such as Valign="top."
	DisplayComponent (see page 25069)	Associates the group with a component that generates the display controls.
	Style (see page 25070)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 25070)	Provides read and write access to the internal string that stores the CSS style rule for the control group.

181.1.6.2.1 TAdapterCommandGroup.AddDefaultCommands Property

Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

The AddDefaultCommands property provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

181.1.6.2.2 TAdapterCommandGroup.Custom Property

Provides read and write access to the custom HTML element attributes, such as Valign="top."

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

The Custom property provides read and write access to the custom HTML element attributes, such as Valign="top." The content of this string will be written as it is when generating HTML.

181.1.6.2.3 TAdapterCommandGroup.DisplayComponent Property

Associates the group with a component that generates the display controls.

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

Use DisplayComponent to associate the group of controls with a Web item that generates the display elements those controls influence. Typical values of DisplayComponent are TAdapterGrid or TAdapterFieldGroup.

TAdapterDisplayReferenceGroup descendants use the value of DisplayComponent to access the display controls to influence, and to access the adapter, whose information is displayed or manipulated.

See Also

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

181.1.6.2.4 TAdapterCommandGroup.Style Property

Provides read and write access to the internal string that stores the CSS style, such as making the background color red.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

The Style property provides read and write access to the internal string that stores the CSS style, such as making the background color red.

181.1.6.2.5 TAdapterCommandGroup.StyleRule Property

Provides read and write access to the internal string that stores the CSS style rule for the control group.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

The StyleRule property provides read and write access to the internal string that stores the CSS style rule for the control group. This property is used to reference a CSS style defined in TAdapterPageProducer. ::Styles.

181.1.7 TAdapterControlGroup Class

TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 25109) or TAdapterDisplayColumn (see page 25099).

Class Hierarchy

Pascal

```
TAdapterControlGroup = class(TWebControlGroup, IWebDataFields, INotifyAdapterChange,
IGetAdapterVariableName, IGetAdapterOfDisplay, INotifyList, IGetVariablesContainerOfDisplay,
IGetDesigntimeWarnings, IGetAdapterModeOfDisplay, IGetControlRequirements);
```

C++

```
class TAdapterControlGroup : public TWebControlGroup, public IWebDataFields, public
INotifyAdapterChange, public IGetAdapterVariableName, public IGetAdapterOfDisplay, public
INotifyList, public IGetVariablesContainerOfDisplay, public IGetDesigntimeWarnings, public
IGetAdapterModeOfDisplay, public IGetControlRequirements;
```

File

WebForm

Description

Do not create instances of TAdapterControlGroup. Instead, use a descendant of TAdapterControlGroup that manages particular types of display field components. These descendants include TAdapterFieldGroup (see page 25150) and TAdapterGrid (see page 25175).

Descendants of TAdapterControlGroup are children of TAdapterPageProducer form components. Use the Web page editor to add TAdapterControlGroup descendants to an adapter form when building an HTML form.

See Also

TAdapterFieldGroup (see page 25150)

TAdapterGrid (see page 25175)

TAdapterPageProducer (see page 19802)

TAdapterForm (see page 25159)

TAdapter (see page 23713)

181.1.7.1 TAdapterControlGroup Members

The following tables list the members exposed by TAdapterControlGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.

V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25076)	Creates and initializes an instance of TAdapterControlGroup (see page 25070).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25076)	Frees an instance of TAdapterControlGroup (see page 25070).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Adapter (see page 25084)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25085)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 25085)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.7.2 TAdapterControlGroup.Create Constructor

Creates and initializes an instance of TAdapterControlGroup (see page 25070).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterControlGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TAdapterControlGroup (see page 25070) at runtime. TAdapterControlGroup (see page 25070) objects added at design time are instantiated automatically.

See Also

Owner (see page 2807)

181.1.7.3 TAdapterControlGroup.Destroy Destructor

Frees an instance of TAdapterControlGroup (see page 25070).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterControlGroup();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for that the object is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.7.4 TAdapterControlGroup Methods

The methods of the TAdapterControlGroup class are listed here.

Protected Methods

	Name	Description
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.

	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
V	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.

181.1.7.4.1 TAdapterControlGroup.AdapterChange Method

Responds when the adapter associated with this control group changes.

Pascal

```
procedure AdapterChange; virtual;
```

C++

```
virtual __fastcall AdapterChange();
```

Description

AdapterChange is called automatically when the value of the Adapter (see page 25084) property changes, or when the application makes changes to the adapter that is the value of the Adapter (see page 25084) property.

AdapterChange performs the following tasks to respond to the change:

Updates the list of default adapter display field components that is the value of VisibleFields (see page 25086) when you have not explicitly assigned child Web items.

Notifies all of the child Web items listed in the WebFieldControls property that the adapter has changed.

Notifies any objects that registered interest by calling the AddNotify (see page 25077) method that the adapter has changed.

See Also

Adapter (see page 25084)

AddNotify (see page 25077)

WebFieldControls (see page 16884)

VisibleFields (see page 25086)

181.1.7.4.2 TAdapterControlGroup.AddNotify Method

Registers interest so that the adapter control group notifies an object of changes to its adapter.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Other Web items in the adapter form call AddNotify to register an interest in when the control group's adapter changes. AddNotify adds the specified object to an internal list of interested objects. When the Adapter (see page 25084) property changes, it calls every object in this internal list to notify it of the change.

There is no need for the child Web items listed in the WebFieldControls property to call AddNotify. These objects are notified automatically.

ANotify is the object that registers an interest in change notifications.

See Also

AdapterChange (see page 25077)

RemoveNotify (see page 25083)

Adapter (see page 25084)

181.1.7.4.3 TAdapterControlGroup.CreateDefaultFields Method

Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.

Pascal

```
procedure CreateDefaultFields;
```

C++

```
__fastcall CreateDefaultFields();
```

Description

TAdapterControlGroup (see page 25070) calls CreateDefaultFields internally when it needs to generate child Web items for the fields of the adapter that the Adapter (see page 25084) property specifies. The resulting list becomes the value of the VisibleFields (see page 25086) property if you have not explicitly added any child Web items to the WebFieldControls property and AddDefaultFields (see page 25085) is true.

See Also

VisibleFields (see page 25086)

Adapter (see page 25084)

AddDefaultFields (see page 25085)

WebFieldControls (see page 16884)

181.1.7.4.4 TAdapterControlGroup.FindField Method

Returns the child Web item that represents the value of a specified adapter field.

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const AnsiString AName);
```

Description

FindField searches the list of child Web items for one that represents the specified adapter field. If it finds a Web item that represents the specified field, it returns that adapter display field component. Otherwise, FindField returns nil (Delphi) or NULL (C++).

AName is the name of a field that the adapter control group's adapter contains.

See Also

VisibleFields (see page 25086)

GetFieldsList (see page 25081)

Adapter (see page 25084)

181.1.7.4.5 TAdapterControlGroup.GetAdapter Method

Returns the value of the Adapter (see page 25084) property.

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

GetAdapter is the protected read implementation of the Adapter (see page 25084) property.

See Also

Adapter (see page 25084)

181.1.7.4.6 TAdapterControlGroup.GetAdapterModeOfAdapter Method

Returns the current mode of the control group's adapter.

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfAdapter();
```

Description

GetAdapterModeOfAdapter returns the current mode of the adapter that the Adapter (see page 25084) property specifies. If the adapter's mode is not currently set, GetAdapterModeOfAdapter returns the value of the AdapterMode (see page 25085) property.

See Also

AdapterMode (see page 25085)

Adapter (see page 25084)

GetAdapterModeOfDisplay (see page 25080)

181.1.7.4.7 TAdapterControlGroup.GetAdapterModeOfDisplay Method

Returns the value of the AdapterMode (see page 25085) property.

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfDisplay();
```

Description

GetAdapterModeOfDisplay returns the value of the AdapterMode (see page 25085) property. This is the value that influences the type and behavior of the HTML controls that child Web items generate. It may differ from the current mode of the control group's adapter, which the GetAdapterModeOfAdapter (see page 25079) method returns.

See Also

AdapterMode (see page 25085)

GetAdapterModeOfAdapter (see page 25079)

181.1.7.4.8 TAdapterControlGroup.GetAdapterVariableName Method

Returns the variable name that refers to the control group's adapter in server-side script.

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall AnsiString GetAdapterVariableName();
```

Description

TAdapterControlGroup (see page 25070) uses GetAdapterVariableName internally when generating server-side script that refers to its adapter.

See Also

Adapter (see page 25084)

181.1.7.4.9 TAdapterControlGroup.GetControlRequirements Method

Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

The adapter form object that includes this control group as a child Web item calls GetControlRequirements to obtain declarations for the variables and functions that the control group uses to assemble HTML controls for its adapter's fields.

ARequirements is the control requirements object that collects a list of required variables and functions.

GetControlRequirements simply calls the ImplGetControlRequirements (see page 25082) method, which adds a variable that represents the control group's adapter to ARequirements if it is not already there.

See Also

ImplGetControlRequirements (see page 25082)

TAdapterForm (see page 25159)

GetAdapterVariableName (see page 25080)

181.1.7.4.10 TAdapterControlGroup.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the adapter control group needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the adapter control group an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

If the Adapter (see page 25084) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. Otherwise, GetDesigntimeWarnings adds a reference to Adapter (see page 25084) to the design-time warnings object so that it can obtain any warning messages that the adapter wants to add.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

See Also

Adapter (see page 25084)

TAdapterPageProducer (see page 19802)

181.1.7.4.11 TAdapterControlGroup.GetFieldsList Method

Fills a string list with the names of all of the associated adapter's fields.

Pascal

```
procedure GetFieldsList(List: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings List);
```

Description

The CreateDefaultFields (see page 25078) method calls GetFieldsList to obtain a list of adapter fields for which it needs to create default child Web items. GetFieldsList obtains a list of the names of its fields from the adapter, and adds them to the specified string list. For any field that is a "default" field (as defined by the adapter), the string in the list is associated with the class of the child Web item that generates a control to represent that field.

List is a string list to fill with the names of (and Web item classes for) the adapter's default fields.

See Also

CreateDefaultFields (see page 25078)

Adapter (see page 25084)

181.1.7.4.12 TAdapterControlGroup.GetVisibleFields Method

Returns the value of the VisibleFields (see page 25086) property.

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

GetVisibleFields is the protected implementation of the VisibleFields (see page 25086) property.

See Also

VisibleFields (see page 25086)

181.1.7.4.13 TAdapterControlGroup.ImplGetControlRequirements Method

Provides the underlying implementation for the GetControlRequirements (see page 25080) method.

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

The GetControlRequirements (see page 25080) method calls ImplGetControlRequirements to add the variables and functions the control group needs to have declared to the control requirements object. This method adds the requirement of a variable with the name that the GetAdapterVariableName (see page 25080) method returns to represent the adapter whose fields the control group displays.

ARequirements is the control requirements object that collects a list of required variables and functions.

See Also

GetControlRequirements (see page 25080)

GetAdapterVariableName (see page 25080)

181.1.7.4.14 TAdapterControlGroup.IsFieldInUse Method

Indicates whether one of the adapter control group's child Web items represents a specified adapter field.

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const AnsiString AName);
```

Description

IsFieldInUse returns true if one of its child Web items represents the adapter field with the specified name, false otherwise.

AName is the name of a field that the adapter control group's adapter contains.

See Also

FindField (see page 25078)

VisibleFields (see page 25086)

Adapter (see page 25084)

181.1.7.4.15 TAdapterControlGroup.Notification Method

Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

In TAdapterControlGroup (see page 25070), Notification checks whether AComponent is the value of the Adapter (see page 25084) property. If so, and Operation is opRemove, Notification sets the Adapter (see page 25084) property to nil (Delphi) or NULL (C++).

See Also

Adapter (see page 25084)

181.1.7.4.16 TAdapterControlGroup.NotifyAdapterChange Method

Responds when the control group's adapter notifies it of a change.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is called automatically when the application makes changes to the adapter that is the value of the Adapter (see page 25084) property. This method calls the AdapterChange (see page 25077) method, which updates the list of default fields to be represented, and forwards the notification on to other Web items that may need to adjust themselves.

Sender is the component that sent the notification.

See Also

Adapter (see page 25084)

AdapterChange (see page 25077)

181.1.7.4.17 TAdapterControlGroup.RemoveNotify Method

Unregisters interest in changes to the control group's adapter.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Other Web items in the adapter form call RemoveNotify to unregister an interest in when the control group's adapter changes. The object must have previously registered interest by a call to the AddNotify (see page 25077) method. RemoveNotify removes the specified object from the internal list of interested objects.

ANotify is the object that had previously registered an interest in change notifications.

See Also

AdapterChange (see page 25077)

AddNotify (see page 25077)

181.1.7.4.18 TAdapterControlGroup.SetAdapter Method

Sets the value of the Adapter (see page 25084) property.

Pascal

```
procedure SetAdapter(const Value: TComponent);
```

C++

```
__fastcall SetAdapter(const TComponent * Value);
```

Description

SetAdapter is the protected write implementaiton of the Adapter (see page 25084) property.

See Also

Adapter (see page 25084)

181.1.7.5 TAdapterControlGroup Properties

The properties of the TAdapterControlGroup class are listed here.

Public Properties

	Name	Description
	Adapter (see page 25084)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25085)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 25085)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

181.1.7.5.1 TAdapterControlGroup.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 24159)

GetFieldsList (see page 25081)

AdapterMode (see page 25085)

WebFieldControls (see page 16884)

181.1.7.5.2 TAdapterControlGroup.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property AnsiString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert, Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter (see page 25084) property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

See Also

Mode (see page 7810)

Adapter (see page 25084)

WebFieldControls (see page 16884)

181.1.7.5.3 TAdapterControlGroup.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter (see page 25084) page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter (see page 25084) property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

See Also

VisibleFields (see page 25086)

WebFieldControls (see page 16884)

Adapter (see page 25084)

181.1.7.5.4 TAdapterControlGroup.VisibleFields Property

Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

Read VisibleFields to determine the adapter display field components that generate HTML controls for this adapter control group. If you have explicitly added child Web items to the control group, or if the AddDefaultFields (see page 25085) property is false, VisibleFields is the same as the value of the WebFieldControls property. If you have not added any child Web items and AddDefaultFields (see page 25085) is true, VisibleFields is a list of adapter display field components that generate controls for the default fields of the control group's adapter.

See Also

WebFieldControls (see page 16884)

AddDefaultFields (see page 25085)

Adapter (see page 25084)

181.1.8 TAdapterDataDisplay Class

TAdapterDataDisplay is the base class for components that display adapter fields as form fields.

Class Hierarchy

Pascal

```
TAdapterDataDisplay = class(TWebDataDisplay, IWebGetFieldName, IWebSetFieldName,
IGetAdapterVariableName, IRestoreDefaults, IGetControlRequirements,
IGetVariablesContainerOfDisplay, IGetDesigntimeWarnings, IFormatColumn);
```

C++

```
class TAdapterDataDisplay : public TWebDataDisplay, public IWebGetFieldName, public
IWebSetFieldName, public IGetAdapterVariableName, public IRestoreDefaults, public
IGetControlRequirements, public IGetVariablesContainerOfDisplay, public
IGetDesigntimeWarnings, public IFormatColumn;
```

File

WebForm

Description

TAdapterDataDisplay is the base class for components that display adapter fields as HTML form fields. Its descendants include the following classes:

TAdapterDisplayField (see page 25109), which supports free-form display and editing of adapter field data.

TAdapterDisplayColumn (see page 25099), which supports grid display of adapter field data.

TAdapterEditColumn (see page 25132), which supports grid editing of adapter field data.

See Also

TAdapterDisplayField (see page 25109)

TAdapterDisplayColumn (see page 25099)

TAdapterEditColumn (see page 25132)

181.1.8.1 TAdapterDataDisplay Members

The following tables list the members exposed by TAdapterDataDisplay.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.

V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 25092)	Creates and initializes an instance of TWebDataDisplay.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 25097)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FieldName (see page 25098)	Specifies the name of the associated dataset field.
	HideOptions (see page 25098)	When field should be hidden.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VAlign (see page 25098)	Specifies the vertical alignment of the generated display control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.8.2 TAdapterDataDisplay.Create Constructor

Creates and initializes an instance of TWebDataDisplay.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterDataDisplay(TComponent * AOwner);
```

Description

Call Create to instantiate TWebDataDisplay at runtime. TWebDataDisplay descendants added at design time are instantiated automatically.

181.1.8.3 TAdapterDataDisplay Methods

The methods of the TAdapterDataDisplay class are listed here.

Protected Methods

	Name	Description
	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.

181.1.8.3.1 TAdapterDataDisplay.FieldConditions Method

Pascal

```
function FieldConditions(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString FieldConditions(TWebContentOptions Options);
```

Description

This is FieldConditions, a member of class TAdapterDataDisplay.

181.1.8.3.2 TAdapterDataDisplay.FindAssociatedField Method

Pascal

```
function FindAssociatedField: TComponent;
```

C++

```
__fastcall TComponent * FindAssociatedField();
```

Description

This is FindAssociatedField, a member of class TAdapterDataDisplay.

181.1.8.3.3 TAdapterDataDisplay.FormatCaption Method

Pascal

```
function FormatCaption: string; override;
```

C++

```
virtual __fastcall AnsiString FormatCaption();
```

Description

This is FormatCaption, a member of class TAdapterDataDisplay.

181.1.8.3.4 TAdapterDataDisplay.FormatColumnData Method

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnData(const AnsiString Content, TWebContentOptions Options);
```

Description

This is FormatColumnData, a member of class TAdapterDataDisplay.

181.1.8.3.5 TAdapterDataDisplay.FormatColumnHeading Method

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnHeading(TWebContentOptions Options);
```

Description

This is FormatColumnHeading, a member of class TAdapterDataDisplay.

181.1.8.3.6 TAdapterDataDisplay.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.

181.1.8.3.7 TAdapterDataDisplay.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall AnsiString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class TAdapterDataDisplay.

181.1.8.3.8 TAdapterDataDisplay.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16897)

181.1.8.3.9 TAdapterDataDisplay.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class TAdapterDataDisplay.

181.1.8.3.10 TAdapterDataDisplay.GetDesigntimeWarnings Method

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.

181.1.8.3.11 TAdapterDataDisplay.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall AnsiString GetFieldName();
```

Description

This is GetFieldName, a member of class TAdapterDataDisplay.

181.1.8.3.12 TAdapterDataDisplay.GetVariablesContainer Method

Pascal

```
function GetVariablesContainer: TComponent;
```

C++

```
__fastcall TComponent * GetVariablesContainer();
```

Description

This is GetVariablesContainer, a member of class TAdapterDataDisplay.

181.1.8.3.13 TAdapterDataDisplay.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

See Also

Content (see page 16890)

Caption (see page 16897)

ILayoutWebContent (see page 24774)

181.1.8.3.14 TAdapterDataDisplay.ImplFormatColumnData Method

Pascal

```
function ImplFormatColumnData(const Content: string; Options: TWebContentOptions): string;
virtual;
```

C++

```
virtual __fastcall AnsiString ImplFormatColumnData(const AnsiString Content,
TWebContentOptions Options);
```

Description

This is ImplFormatColumnData, a member of class TAdapterDataDisplay.

181.1.8.3.15 TAdapterDataDisplay.ImplFormatColumnHeading Method

Pascal

```
function ImplFormatColumnHeading(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplFormatColumnHeading(TWebContentOptions Options);
```

Description

This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.

181.1.8.3.16 TAdapterDataDisplay.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.

181.1.8.3.17 TAdapterDataDisplay.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.

181.1.8.3.18 TAdapterDataDisplay.RestoreDefaults Method

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

This is RestoreDefaults, a member of class TAdapterDataDisplay.

181.1.8.3.19 TAdapterDataDisplay.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(Value: string); override;
```

C++

```
virtual __fastcall SetCaption(AnsiString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

See Also

Caption (see page 16897)

181.1.8.3.20 TAdapterDataDisplay.SetFieldName Method

Pascal

```
procedure SetFieldName(const Value: string);
```

C++

```
__fastcall SetFieldName(const AnsiString Value);
```

Description

This is SetFieldName, a member of class TAdapterDataDisplay.

181.1.8.4 TAdapterDataDisplay Properties

The properties of the TAdapterDataDisplay class are listed here.

Public Properties

	Name	Description
	Align (see page 25097)	Specifies the horizontal alignment of the component relative to its containing cell.
	FieldName (see page 25098)	Specifies the name of the associated dataset field.
	HideOptions (see page 25098)	When field should be hidden.
	VAlign (see page 25098)	Specifies the vertical alignment of the generated display control.

181.1.8.4.1 TAdapterDataDisplay.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 25098)

181.1.8.4.2 TAdapterDataDisplay.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet (see page 7807)

181.1.8.4.3 TAdapterDataDisplay.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

181.1.8.4.4 TAdapterDataDisplay.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

See Also

Align (see page 25097)

181.1.9 TAdapterDisplayColumn Class

TAdapterDisplayColumn displays an Adapter field in a grid.

Class Hierarchy

Pascal

```
TAdapterDisplayColumn = class(TCustomAdapterDisplayColumn);
```

C++

```
class TAdapterDisplayColumn : public TCustomAdapterDisplayColumn;
```

File

WebForm

Description

Add TAdapterDisplayColumn as a child of a TAdapterGrid (see page 25175) to display an Adapter field. The TAdapterGrid (see page 25175) specifies the Adapter used by TAdapterDisplayColumn.

Use the properties and methods of TAdapterDisplayColumn to:

Specify the Adapter field whose value the component displays.

Specify a caption for the column.

Specify when the column should be hidden.

Customize the appearance of the column.

TAdapterDisplayColumn supports multiple display presentation: text, list, and image. The display type can be set explicitly or TAdapterDisplayColumn will automatically choose a display type that is appropriate for the Adapter field.

TAdapterDisplayColumn is a minimal implementation of TCustomAdapterDisplayColumn (see page 25230). To extend this component, create your own concrete descendant of TCustomAdapterDisplayColumn (see page 25230).

See Also

TCustomAdapterDisplayColumn (see page 25230)

181.1.9.1 TAdapterDisplayColumn Members

The following tables list the members exposed by TAdapterDisplayColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 25237)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 25237)	This is ControlContent, a member of class TCustomAdapterDisplayColumn.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	FormatImage (see page 25237)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 25237)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 25238)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).

	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplCanAddClass (see page 25238)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 25238)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 25238)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 25239)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
	Create (see page 25092)	Creates and initializes an instance of TWebDataDisplay.
	Create (see page 25236)	Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 25230).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
V	IsColumn (see page 25239)	Indicates whether the component generates the controls that appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Align (see page 25105)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25105)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 25105)	Customizes the appearance of the generated control's label.
	Custom (see page 25106)	Represents a tag option and its value in the tag for the display control.
	DisplayType (see page 25106)	Sets the display type for the column.
	FieldName (see page 25107)	Specifies the name of the associated dataset field.
	HideOptions (see page 25107)	When field should be hidden.
	ImageHeight (see page 25107)	Specifies the height of the image in the column.
	ImageWidth (see page 25107)	Specifies the width of the image in the column.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 25108)	Adds style attributes to the generated display control.
	StyleRule (see page 25108)	This is StyleRule, a member of class TAdapterDisplayColumn.
	Tag (see page 2808)	Stores an integer value as part of a component.
	VAlign (see page 25108)	Specifies the vertical alignment of the generated display control.

181.1.9.2 TAdapterDisplayColumn Properties

The properties of the TAdapterDisplayColumn class are listed here.

Published Properties

	Name	Description
	Align (see page 25105)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25105)	Specifies the text of a label that indicates what information the generated control displays.

	CaptionAttributes (see page 25105)	Customizes the appearance of the generated control's label.
	Custom (see page 25106)	Represents a tag option and its value in the tag for the display control.
	DisplayType (see page 25106)	Sets the display type for the column.
	FieldName (see page 25107)	Specifies the name of the associated dataset field.
	HideOptions (see page 25107)	When field should be hidden.
	ImageHeight (see page 25107)	Specifies the height of the image in the column.
	ImageWidth (see page 25107)	Specifies the width of the image in the column.
	Style (see page 25108)	Adds style attributes to the generated display control.
	StyleRule (see page 25108)	This is StyleRule, a member of class TAdapterDisplayColumn.
	VAlign (see page 25108)	Specifies the vertical alignment of the generated display control.

181.1.9.2.1 TAdapterDisplayColumn.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 25098)

181.1.9.2.2 TAdapterDisplayColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

181.1.9.2.3 TAdapterDisplayColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

181.1.9.2.4 TAdapterDisplayColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

181.1.9.2.5 TAdapterDisplayColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TColumnHTMLElementType;
```

C++

```
__property TColumnHTMLElementType DisplayType;
```

Description

Set DisplayType to set the display type for the column to text or image.

See Also

ImageHeight (see page 25240)

ImageWidth (see page 25240)

181.1.9.2.6 TAdapterDisplayColumn.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet (see page 7807)

181.1.9.2.7 TAdapterDisplayColumn.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

181.1.9.2.8 TAdapterDisplayColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in pixels.

See Also

ImageWidth (see page 25240)

181.1.9.2.9 TAdapterDisplayColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in pixels.

See Also

ImageHeight (see page 25240)

181.1.9.2.10 TAdapterDisplayColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

181.1.9.2.11 TAdapterDisplayColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TAdapterDisplayColumn.

181.1.9.2.12 TAdapterDisplayColumn.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

See Also

Align (see page 25097)

181.1.10 TAdapterDisplayField Class

TAdapterDisplayField displays an Adapter field as a form field.

Class Hierarchy

Pascal

```
TAdapterDisplayField = class(TCustomAdapterDisplayField);
```

C++

```
class TAdapterDisplayField : public TCustomAdapterDisplayField;
```

File

WebForm

Description

Add TAdapterDisplayField as a child of a TAdapterFieldGroup (see page 25150) to display an Adapter field. The TAdapterFieldGroup (see page 25150) specifies the Adapter used by TAdapterDisplayField.

Use the properties and methods of TAdapterDisplayField to:

Specify the Adapter field whose value the component displays.

Specify a caption for the field.

Specify when the field should be hidden.

Customize the appearance of the column.

Specify whether the field is used for input or display only.

TAdapterDisplayField supports multiple display type: text, list, and image. The display type can be set explicitly or TAdapterDisplayField will automatically choose a display type that is appropriate for the Adapter field.

TAdapterDisplayField supports multiple input types: Text, Password, Select, MultipleSelect, Radio, CheckBox, TextArea, and File. The input type can be set explicitly or TAdapterDisplayField will automatically choose an input type that is appropriate for the Adapter field.

TAdapterDisplayField instances are not used in grids. TAdapterEditColumn (see page 25132) provides equivalent functionality in a grid context.

TAdapterDisplayField is a minimal implementation of TCustomAdapterDisplayField (see page 25240). To extend the features of this component, define your own descendant of TCustomAdapterDisplayField (see page 25240).

See Also

TAdapterEditColumn (see page 25132)

181.1.10.1 TAdapterDisplayField Members

The following tables list the members exposed by TAdapterDisplayField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAttributes (see page 25247)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 25247)	This is ControlContent, a member of class TCustomAdapterDisplayField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 25094)	Returns the value of the Caption property.

	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetLayoutAttributes (see page 25247)	Returns the value of the LayoutAttributes property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 25247)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25248)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
V	ImplRestoreDefaults (see page 25248)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	Create (see page 25092)	Creates and initializes an instance of TWebDataDisplay.
V	Create (see page 25246)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 25240).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.

	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Align (see page 25115)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25116)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 25116)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 25116)	Specifies where the label appears relative to the generated display control.
	Custom (see page 25117)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 25117)	Specifies the number of columns in a display field.
	DisplayRows (see page 25117)	Specifies the number of rows in a display field.
	DisplayType (see page 25118)	Sets the display type for the column.
	DisplayWidth (see page 25118)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 25118)	Specifies the name of the associated dataset field.
	HideOptions (see page 25119)	When field should be hidden.
	ImageHeight (see page 25119)	Specifies the height of the image in the column.
	ImageWidth (see page 25119)	Specifies the width of the image in the column.
	InputType (see page 25120)	Specifies the input type for the display field.
	MaxLength (see page 25120)	Specifies the maximum number of characters the user can enter into the display field.

	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SelectRows (see page 25120)	Indicates the number of rows that can be selected.
	Style (see page 25121)	Adds style attributes to the generated display control.
	StyleRule (see page 25121)	This is StyleRule, a member of class TAdapterDisplayField.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TextAreaWrap (see page 25121)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25122)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 25122)	Indicates the viewing state of the adapter field.

181.1.10.2 TAdapterDisplayField Properties

The properties of the TAdapterDisplayField class are listed here.

Published Properties

	Name	Description
	Align (see page 25115)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25116)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 25116)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 25116)	Specifies where the label appears relative to the generated display control.
	Custom (see page 25117)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 25117)	Specifies the number of columns in a display field.
	DisplayRows (see page 25117)	Specifies the number of rows in a display field.
	DisplayType (see page 25118)	Sets the display type for the column.
	DisplayWidth (see page 25118)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 25118)	Specifies the name of the associated dataset field.
	HideOptions (see page 25119)	When field should be hidden.
	ImageHeight (see page 25119)	Specifies the height of the image in the column.
	ImageWidth (see page 25119)	Specifies the width of the image in the column.
	InputType (see page 25120)	Specifies the input type for the display field.
	MaxLength (see page 25120)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 25120)	Indicates the number of rows that can be selected.
	Style (see page 25121)	Adds style attributes to the generated display control.
	StyleRule (see page 25121)	This is StyleRule, a member of class TAdapterDisplayField.
	TextAreaWrap (see page 25121)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25122)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 25122)	Indicates the viewing state of the adapter field.

181.1.10.2.1 TAdapterDisplayField.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 25098)

181.1.10.2.2 TAdapterDisplayField.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

181.1.10.2.3 TAdapterDisplayField.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

181.1.10.2.4 TAdapterDisplayField.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

181.1.10.2.5 TAdapterDisplayField.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

181.1.10.2.6 TAdapterDisplayField.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 25249)

181.1.10.2.7 TAdapterDisplayField.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns to control the number of rows being displayed.

See Also

DisplayColumns (see page 25249)

181.1.10.2.8 TAdapterDisplayField.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

InputType (see page 25251)

181.1.10.2.9 TAdapterDisplayField.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField control values are one character (M for modified or I for inserted).

181.1.10.2.10 TAdapterDisplayField.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet (see page 7807)

181.1.10.2.11 TAdapterDisplayField.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

181.1.10.2.12 TAdapterDisplayField.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 25250)

ImageWidth (see page 25250)

181.1.10.2.13 TAdapterDisplayField.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in the column.

See Also

ImageHeight (see page 25250)

181.1.10.2.14 TAdapterDisplayField.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

DisplayType (see page 25249)

181.1.10.2.15 TAdapterDisplayField.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

181.1.10.2.16 TAdapterDisplayField.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

181.1.10.2.17 TAdapterDisplayField.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

181.1.10.2.18 TAdapterDisplayField.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TAdapterDisplayField.

181.1.10.2.19 TAdapterDisplayField.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth.

See Also

DisplayWidth (see page 25250)

181.1.10.2.20 TAdapterDisplayField.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

Align (see page 25097)

181.1.10.2.21 TAdapterDisplayField.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

Description

Use ViewMode to specify the viewing state of the field.

181.1.11 TAdapterDisplayReferenceGroup Class

TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.

Class Hierarchy

Pascal

```
TAdapterDisplayReferenceGroup = class(TWebDisplayReferenceGroup, IGetDesigntimeWarnings,
INotifyAdapterChange, IGetAdapterDisplayCharacteristics);
```

C++

```
class TAdapterDisplayReferenceGroup : public TWebDisplayReferenceGroup, public
IGetDesigntimeWarnings, public INotifyAdapterChange, public IGetAdapterDisplayCharacteristics;
```

File

WebForm

Description

Use TAdapterDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of controls. The TAdapterDisplayReferenceGroup is associated with another component that generates HTML elements to display the data from an adapter. This component is the value of the DisplayComponent (see page 25132) property. The child Web items of TAdapterDisplayReferenceGroup generate the individual controls in the collection this class arranges. Each of those controls operates on the display element produced by the component that is the value of the DisplayComponent (see page 25132) property.

Do not create instances of TAdapterDisplayReferenceGroup. TAdapterDisplayReferenceGroup only manages the Web items that generate controls, the association to a display generator, and the logic for working with the WebSnap editors in the IDE. It does not include any special logic for working with the display generator's adapter. To add a component that organizes controls in an adapter form, use a descendant of TAdapterDisplayReferenceGroup such as TAdapterCommandGroup (see page 25062).

See Also

TAdapterCommandGroup (see page 25062)

181.1.11.1 TAdapterDisplayReferenceGroup Members

The following tables list the members exposed by TAdapterDisplayReferenceGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25128)	Responds to changes in the adapter on which the controls in this group operate.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DisplayComponentChange (see page 25129)	Responds when the DisplayComponent (see page 25132) property changes.
	GetAdapterDisplayCharacteristics (see page 25129)	Indicates the display characteristics of the HTML this component generates.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25130)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 25130)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 25131)	Responds when the associated display component changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 25131)	Sets the value of the DisplayComponent (see page 25132) property.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25127)	Creates an instance of TWebDisplayReferenceGroup.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25128)	Frees an instance of TAdapterDisplayReferenceGroup (see page 25122).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayComponent (see page 25132)	Associates the group with a component that generates the display controls.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.11.2 TAdapterDisplayReferenceGroup.Create Constructor

Creates an instance of TWebDisplayReferenceGroup.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterDisplayReferenceGroup(TComponent * AOwner);
```

Description

Call TWebDisplayReferenceGroup to instantiate TWebDisplayReferenceGroup at runtime. TWebDisplayReferenceGroup components added at design time are instantiated automatically.

181.1.11.3 TAdapterDisplayReferenceGroup.Destroy Destructor

Frees an instance of TAdapterDisplayReferenceGroup (see page 25122).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDisplayReferenceGroup();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.11.4 TAdapterDisplayReferenceGroup Methods

The methods of the TAdapterDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
	AdapterChange (see page 25128)	Responds to changes in the adapter on which the controls in this group operate.
	DisplayComponentChange (see page 25129)	Responds when the DisplayComponent (see page 25132) property changes.
	GetAdapterDisplayCharacteristics (see page 25129)	Indicates the display characteristics of the HTML this component generates.
	GetDesigntimeWarnings (see page 25130)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	NotifyAdapterChange (see page 25130)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 25131)	Responds when the associated display component changes.
	SetWebDisplayComponent (see page 25131)	Sets the value of the DisplayComponent (see page 25132) property.

181.1.11.4.1 TAdapterDisplayReferenceGroup.AdapterChange Method

Responds to changes in the adapter on which the controls in this group operate.

Pascal

```
procedure AdapterChange; virtual;
```

C++

```
virtual __fastcall AdapterChange();
```

Description

TAdapterDisplayReferenceGroup (see page 25122) calls AdapterChange internally whenever the adapter associated with its display component changes. This happens in response to the following occurrences:

The component specified by DisplayComponent (see page 25132) notifies this one that it has changed.

Another component notifies this one of a change to the adapter by calling the NotifyAdapterChange (see page 25130) method.

AdapterChange responds to the change by regenerating its list of default child Web items and passing the notification on to every child Web item in its WebFieldControls property list.

See Also

NotifyAdapterChange (see page 25130)

DisplayComponent (see page 25132)

DisplayComponentChange (see page 25129)

WebFieldControls (see page 16884)

181.1.11.4.2 TAdapterDisplayReferenceGroup.DisplayComponentChange Method

Responds when the DisplayComponent (see page 25132) property changes.

Pascal

```
procedure DisplayComponentChange; virtual;
```

C++

```
virtual __fastcall DisplayComponentChange();
```

Description

The component specified by the DisplayComponent (see page 25132) property calls DisplayComponentChange when its properties change. This allows the TAdapterDisplayReferenceGroup (see page 25122) object to update itself to reflect any changes.

In TAdapterDisplayReferenceGroup (see page 25122), DisplayComponentChange calls the AdapterChange (see page 25128) method, to ensure that its Web items are up-to-date in case the change was to the associated adapter.

See Also

AdapterChange (see page 25128)

DisplayComponent (see page 25132)

181.1.11.4.3 TAdapterDisplayReferenceGroup.GetAdapterDisplayCharacteristics Method

Indicates the display characteristics of the HTML this component generates.

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

Adapter actions call GetAdapterDisplayCharacteristics from their IsDefaultAction methods to determine whether their function should be included in the adapter's default set of actions. If the adapter action is appropriate to operate on an HTML form with the indicated characteristics, the adapter action returns true from its IsDefaultAction method.

In TAdapterDisplayReferenceGroup (see page 25122), GetAdapterDisplayCharacteristics delegates this task by fetching the display characteristics from the associated display component.

See Also

IsDefaultAction (see page 24070)

DisplayComponent (see page 25132)

181.1.11.4.4 TAdapterDisplayReferenceGroup.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the reference group needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the display reference group an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DisplayComponent (see page 25132) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. Otherwise, GetDesigntimeWarnings adds the display component to the list of objects that can supply design-time warnings.

See Also

DisplayComponent (see page 25132)

TAdapterPageProducer (see page 19802)

181.1.11.4.5 TAdapterDisplayReferenceGroup.NotifyAdapterChange Method

Responds when other components notify this one of changes to the adapter.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

Other components in the WebSnap application call NotifyAdapterChange when they detect possible changes to the adapter on which this group's controls operate.

Sender is the component that detected the possible change and sent the notification.

NotifyAdapterChange calls the AdapterChange (see page 25128) method, which responds to the notification.

See Also

AdapterChange (see page 25128)

DisplayComponent (see page 25132)

181.1.11.4.6 TAdapterDisplayReferenceGroup.OnDisplayComponentChange Method

Responds when the associated display component changes.

Pascal

```
procedure OnDisplayComponentChange(ASender: TObject);
```

C++

```
__fastcall OnDisplayComponentChange(TObject * ASender);
```

Description

The component specified by the DisplayComponent (see page 25132) property calls OnDisplayComponentChange to notify this component of changes to its properties or child Web items.

ASender is the display component that calls this method.

OnDisplayComponentChange calls the DisplayComponentChange (see page 25129) method, which responds to the change.

See Also

DisplayComponentChange (see page 25129)

DisplayComponent (see page 25132)

181.1.11.4.7 TAdapterDisplayReferenceGroup.SetWebDisplayComponent Method

Sets the value of the DisplayComponent (see page 25132) property.

Pascal

```
procedure SetWebDisplayComponent(const AComponent: TComponent); override;
```

C++

```
virtual __fastcall SetWebDisplayComponent(const TComponent * AComponent);
```

Description

SetWebDisplayComponent is the protected write implementation of the DisplayComponent (see page 25132) property.

AComponent is the new value of the DisplayComponent (see page 25132) property.

See Also

DisplayComponent (see page 25132)

181.1.11.5 TAdapterDisplayReferenceGroup Properties

The properties of the TAdapterDisplayReferenceGroup class are listed here.

Public Properties

	Name	Description
	DisplayComponent (see page 25132)	Associates the group with a component that generates the display controls.

181.1.11.5.1 TAdapterDisplayReferenceGroup.DisplayComponent Property

Associates the group with a component that generates the display controls.

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

Use DisplayComponent to associate the group of controls with a Web item that generates the display elements those controls influence. Typical values of DisplayComponent are TAdapterGrid (see page 25175) or TAdapterFieldGroup (see page 25150).

TAdapterDisplayReferenceGroup (see page 25122) descendants use the value of DisplayComponent to access the display controls to influence, and to access the adapter, whose information is displayed or manipulated.

See Also

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

181.1.12 TAdapterEditColumn Class

TAdapterEditColumn displays an adapter field as a form field in a grid.

Class Hierarchy

Pascal

```
TAdapterEditColumn = class(TCustomAdapterEditColumn);
```

C++

```
class TAdapterEditColumn : public TCustomAdapterEditColumn;
```

File

WebForm

Description

TAdapterEditColumn has the same functionality as TAdapterDisplayField (see page 25109), but is designed to work with grids. TAdapterEditColumn is a minimal implementation of TCustomAdapterEditColumn (see page 25252).

See Also

TCustomAdapterEditColumn (see page 25252)

TAdapterDisplayField (see page 25109)

181.1.12.1 TAdapterEditColumn Members

The following tables list the members exposed by TAdapterEditColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAttributes (see page 25247)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
A	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
V	ControlContent (see page 25247)	This is ControlContent, a member of class TCustomAdapterDisplayField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.

	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetLayoutAttributes (see page 25247)	Returns the value of the LayoutAttributes property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
V	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 25247)	Provides the underlying implementation for the Content method.
V	ImplContent (see page 25258)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25248)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
V	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
V	ImplRestoreDefaults (see page 25248)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	Create (see page 25092)	Creates and initializes an instance of TWebDataDisplay.
V	Create (see page 25246)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 25240).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).

	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.

	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Align (see page 25138)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25139)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 25139)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 25139)	Specifies where the label appears relative to the generated display control.
	Custom (see page 25140)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 25140)	Specifies the number of columns in a display field.
	DisplayRows (see page 25140)	Specifies the number of rows in a display field.
	DisplayType (see page 25141)	Sets the display type for the column.
	DisplayWidth (see page 25141)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 25141)	Specifies the name of the associated dataset field.
	HideOptions (see page 25142)	When field should be hidden.
	ImageHeight (see page 25142)	Specifies the height of the image in the column.
	ImageWidth (see page 25142)	Specifies the width of the image in the column.
	InputType (see page 25143)	Specifies the input type for the display field.
	MaxLength (see page 25143)	Specifies the maximum number of characters the user can enter into the display field.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	SelectRows (see page 25143)	Indicates the number of rows that can be selected.

	Style (see page 25144)	Adds style attributes to the generated display control.
	StyleRule (see page 25144)	This is StyleRule, a member of class TAdapterEditColumn.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TextAreaWrap (see page 25144)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25145)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 25145)	Indicates the viewing state of the adapter field.

181.1.12.2 TAdapterEditColumn Properties

The properties of the TAdapterEditColumn class are listed here.

Published Properties

	Name	Description
	Align (see page 25138)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 25139)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 25139)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 25139)	Specifies where the label appears relative to the generated display control.
	Custom (see page 25140)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 25140)	Specifies the number of columns in a display field.
	DisplayRows (see page 25140)	Specifies the number of rows in a display field.
	DisplayType (see page 25141)	Sets the display type for the column.
	DisplayWidth (see page 25141)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 25141)	Specifies the name of the associated dataset field.
	HideOptions (see page 25142)	When field should be hidden.
	ImageHeight (see page 25142)	Specifies the height of the image in the column.
	ImageWidth (see page 25142)	Specifies the width of the image in the column.
	InputType (see page 25143)	Specifies the input type for the display field.
	MaxLength (see page 25143)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 25143)	Indicates the number of rows that can be selected.
	Style (see page 25144)	Adds style attributes to the generated display control.
	StyleRule (see page 25144)	This is StyleRule, a member of class TAdapterEditColumn.
	TextAreaWrap (see page 25144)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25145)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 25145)	Indicates the viewing state of the adapter field.

181.1.12.2.1 TAdapterEditColumn.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 25098)

181.1.12.2.2 TAdapterEditColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes (see page 16897)

CaptionPosition (see page 16897)

181.1.12.2.3 TAdapterEditColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption (see page 16897)

CaptionPosition (see page 16897)

HeadingAttributes (see page 16509)

181.1.12.2.4 TAdapterEditColumn.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition: TCaptionPosition;
```

C++

```
__property TCaptionPosition CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes (see page 16897)

Caption (see page 16897)

181.1.12.2.5 TAdapterEditColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style (see page 16899)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

181.1.12.2.6 TAdapterEditColumn.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 25249)

181.1.12.2.7 TAdapterEditColumn.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns to control the number of rows being displayed.

See Also

DisplayColumns (see page 25249)

181.1.12.2.8 TAdapterEditColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

InputType (see page 25251)

181.1.12.2.9 TAdapterEditColumn.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField control values are one character (M for modified or I for inserted).

181.1.12.2.10 TAdapterEditColumn.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property AnsiString FieldName;__property AnsiString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet (see page 7807)

181.1.12.2.11 TAdapterEditColumn.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

181.1.12.2.12 TAdapterEditColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 25250)

ImageWidth (see page 25250)

181.1.12.2.13 TAdapterEditColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in the column.

See Also

ImageHeight (see page 25250)

181.1.12.2.14 TAdapterEditColumn.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

DisplayType (see page 25249)

181.1.12.2.15 TAdapterEditColumn.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

181.1.12.2.16 TAdapterEditColumn.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

181.1.12.2.17 TAdapterEditColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom (see page 16898)

stylerule (see page 16899)

CaptionAttributes (see page 16897)

Setting Web Item Properties

181.1.12.2.18 TAdapterEditColumn.StyleRule Property

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

This is StyleRule, a member of class TAdapterEditColumn.

181.1.12.2.19 TAdapterEditColumn.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth.

See Also

DisplayWidth (see page 25250)

181.1.12.2.20 TAdapterEditColumn.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

See Also

Align (see page 25097)

181.1.12.2.21 TAdapterEditColumn.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

Description

Use ViewMode to specify the viewing state of the field.

181.1.13 TAdapterErrorList Class

TAdapterErrorList is the error list display component.

Class Hierarchy

Pascal

```
TAdapterErrorList = class(TCustomAdapterErrorList);
```

C++

```
class TAdapterErrorList : public TCustomAdapterErrorList;
```

File

WebForm

Description

Use TAdapterErrorList to display errors relating to a specific adapter component.

TAdapterErrorList is a minimal implementation of TCustomAdapterErrorList (see page 25259). To extend its features, create your own concrete descendant of TCustomAdapterErrorList (see page 25259).

Note: Do not confuse TAdapterErrorList with TAdapterErrorsList.

See Also

TAdapterErrorsList (see page 23810)

181.1.13.1 TAdapterErrorList Members

The following tables list the members exposed by TAdapterErrorList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 25263)	Returns the HTML that the Web item generates.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDesigntimeWarnings (see page 25264)	This is GetDesigntimeWarnings, a member of class TCustomAdapterErrorList.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	ImplContent (see page 25264)	This is ImplContent, a member of class TCustomAdapterErrorList.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25264)	Forwards notification messages to all owned components.

	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).

	Create (see page 25262)	Creates an instance of TCustomAdapterErrorList (see page 25259).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	Destroy (see page 25263)	Frees the memory associated with an instance of TCustomAdapterErrorList (see page 25259).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.

	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Adapter (see page 25149)	Specifies a related adapter.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.13.2 TAdapterErrorList Properties

The properties of the TAdapterErrorList class are listed here.

Published Properties

	Name	Description
	Adapter (see page 25149)	Specifies a related adapter.

181.1.13.2.1 TAdapterErrorList.Adapter Property

Specifies a related adapter.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Adapter specifies the adapter component for which this component reports errors.

181.1.14 TAdapterFieldGroup Class

TAdapterFieldGroup is a container for Adapter (see page 25156) display field components such as TAdapterDisplayField (see page 25109). TAdapterFieldGroup labels and fields in an HTML form.

Class Hierarchy

Pascal

```
TAdapterFieldGroup = class(TCustomAdapterFieldGroup);
```

C++

```
class TAdapterFieldGroup : public TCustomAdapterFieldGroup;
```

File

WebForm

Description

Add TAdapterFieldGroup as a child of TAdapterForm (see page 25159).

TAdapterFieldGroup is associated with an Adapter (see page 25156). All of its child display field components will use the same Adapter (see page 25156).

If no display fields have been explicitly added to the TAdapterFieldGroup, display fields associated with all of the Adapter (see page 25156) fields will be added by default. The properties of default display fields cannot be modified.

Modifying the AdapterMode (see page 25157) property of TAdapterFieldGroup may change the default display type or input type of Adapter (see page 25156) fields. This may cause the display field children of TAdapterFieldGroup to change appearance.

Use the properties and methods of TAdapterFieldGroup to:

Specify the associated Adapter (see page 25156).

Specify when the Adapter (see page 25156) Mode.

Specify whether default fields should be added.

See Also

TAdapterDisplayField (see page 25109)

TAdapterForm (see page 25159)

181.1.14.1 TAdapterFieldGroup Members

The following tables list the members exposed by TAdapterFieldGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterDisplayCharacteristics (see page 25272)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 25272)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 25273)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 25273)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.

	GetAddFieldsItem (see page 25273)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetLayoutAttributes (see page 25273)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 25274)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplCanAddClass (see page 25274)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplContent (see page 25274)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.

	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	Create (see page 25076)	Creates and initializes an instance of TAdapterControlGroup (see page 25070).
V	Create (see page 25271)	Creates and initializes an instance of TCustomAdapterFieldGroup (see page 25265).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
V	Destroy (see page 25076)	Frees an instance of TAdapterControlGroup (see page 25070).
V	Destroy (see page 25272)	Frees an instance of TCustomAdapterFieldGroup (see page 25265).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Adapter (see page 25156)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25157)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 25157)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	Custom (see page 25158)	Represents a tag option and its value in the generated INPUT tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 25158)	Adds style attributes to the generated button group.
	StyleRule (see page 25158)	Applies a style in the page producer's style sheet to the button group.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.14.2 TAdapterFieldGroup Properties

The properties of the TAdapterFieldGroup class are listed here.

Published Properties

	Name	Description
	Adapter (see page 25156)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25157)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 25157)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	Custom (see page 25158)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 25158)	Adds style attributes to the generated button group.
	StyleRule (see page 25158)	Applies a style in the page producer's style sheet to the button group.

181.1.14.2.1 TAdapterFieldGroup.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 24159)

GetFieldsList (see page 25081)

AdapterMode (see page 25085)

WebFieldControls (see page 16884)

181.1.14.2.2 TAdapterFieldGroup.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property AnsiString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert, Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

See Also

Mode (see page 7810)

Adapter (see page 25084)

WebFieldControls (see page 16884)

181.1.14.2.3 TAdapterFieldGroup.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

See Also

VisibleFields (see page 25086)

WebFieldControls (see page 16884)

Adapter (see page 25084)

181.1.14.2.4 TAdapterFieldGroup.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button group. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Style (see page 25275)

181.1.14.2.5 TAdapterFieldGroup.Style Property

Adds style attributes to the generated button group.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button group. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 25275)

StyleRule (see page 25276)

181.1.14.2.6 TAdapterFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the button group.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button group. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

Style (see page 25275)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.15 TAdapterForm Class

TAdapterForm generates an HTML form displaying Adapter fields.

Class Hierarchy

Pascal

```
TAdapterForm = class(TCustomAdapterForm);
```

C++

```
class TAdapterForm : public TCustomAdapterForm;
```

File

WebForm

Description

TAdapter form is a basic implementation of TCustomAdapterForm (see page 25276). Add TAdapterForm to a TAdapterPageProducer to display Adapter fields users can view and/or edit, and Adapter actions that users can execute.

Add child components to TAdapterForm to display Adapter fields and Adapter actions. Child components include TAdapterGrid (see page 25175), TAdapterFieldGroup (see page 25150), and TAdapterCommandGroup (see page 25062). Add TAdapterErrors to TAdapterForm to display errors that are generated by an Adapter.

Use the properties and methods of TAdapterForm to:

Customize the appearance of the HTML form.

Indicate the HTTP method used to submit the HTML form.

See Also

TAdapterPageProducer (see page 19802)

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

TAdapterCommandGroup (see page 25062)

TAdapterErrorList (see page 25145)

181.1.15.1 TAdapterForm Members

The following tables list the members exposed by TAdapterForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAdapterFormLayout (see page 25282)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetFormRequirements (see page 25282)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 25282)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 25283)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).

	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetLayoutAttributes (see page 25283)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
	ImplCanAddClass (see page 25283)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
	ImplContent (see page 25284)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.

V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	Create (see page 25281)	Creates and initializes an instance of TCustomAdapterForm (see page 25276).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
V	Destroy (see page 25281)	Frees an instance of TCustomAdapterForm (see page 25276).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFormRequirements (see page 25310)	This is GetFormRequirements, a member of class IGetFormRequirements.
	GetHTMLFormName (see page 17065)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 17065)	Returns the name of the javascript variable that refers to the generated form.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.

	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Custom (see page 25164)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 25165)	Specifies the method that the adapter form adds to its generated <form> tag.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Style (see page 25165)	Adds style attributes to the generated form.
	StyleRule (see page 25165)	Applies a style in the page producer's style sheet to the form.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.15.2 TAdapterForm Properties

The properties of the TAdapterForm class are listed here.

Published Properties

	Name	Description
	Custom (see page 25164)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 25165)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 25165)	Adds style attributes to the generated form.
	StyleRule (see page 25165)	Applies a style in the page producer's style sheet to the form.

181.1.15.2.1 TAdapterForm.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the <table> tag that the adapter form generates to manage the layout of its Web items. Each option and its value has the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

ALIGN=TOP TABINDEX=2

See Also

Style (see page 25285)

181.1.15.2.2 TAdapterForm.FormMethod Property

Specifies the method that the adapter form adds to its generated <form> tag.

Pascal

```
property FormMethod: TFormMethod;
```

C++

```
__property TFormMethod FormMethod;
```

Description

Set FormMethod to specify the METHOD header for HTTP messages that the form submits. This value gives rise to the MethodType property of the HTTP request message.

See Also

MethodType

181.1.15.2.3 TAdapterForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the <table> tag that the adapter form generates to manage the layout of its Web items. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated <table> tag as the value of a STYLE option.

See Also

Custom (see page 25285)

StyleRule (see page 25286)

181.1.15.2.4 TAdapterForm.StyleRule Property

Applies a style in the page producer's style sheet to the form.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the adapter page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the form's Style property.

See Also

Style (see page 25285)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.16 TAdapterFormLayout Class

Class Hierarchy

Pascal

```
TAdapterFormLayout = class(TLayoutWebContent, IGetAdapterFormLayout);
```

C++

```
class TAdapterFormLayout : public TLayoutWebContent, public IGetAdapterFormLayout;
```

File

WebForm

Description

This is class WebForm.TAdapterFormLayout.

181.1.16.1 TAdapterFormLayout Members

The following tables list the members exposed by TAdapterFormLayout.

Protected Methods

	Name	Description
	_AddRef (see page 24700)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 24701)	Responds when the caller releases a reference to this object's interface.
	EndButtons (see page 25169)	This is EndButtons, a member of class TAdapterFormLayout.
	EndField (see page 25169)	This is EndField, a member of class TAdapterFormLayout.
	EndFields (see page 25169)	This is EndFields, a member of class TAdapterFormLayout.
	EndRow (see page 25169)	This is EndRow, a member of class TAdapterFormLayout.
	EndTable (see page 25170)	This is EndTable, a member of class TAdapterFormLayout.
	GetAdapterFormLayout (see page 25170)	This is GetAdapterFormLayout, a member of class TAdapterFormLayout.
	GetChildTableIndent (see page 25170)	This is GetChildTableIndent, a member of class TAdapterFormLayout.
	GetFieldIndent (see page 25170)	This is GetFieldIndent, a member of class TAdapterFormLayout.
	GetTableIndent (see page 25171)	This is GetTableIndent, a member of class TAdapterFormLayout.
V	ImplLayoutButton (see page 25171)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 25171)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 25172)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 25172)	Provides the underlying implementation for the LayoutTable method.
	LayoutButton (see page 24703)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 24704)	Converts the HTML declaring a field into a form the associated Web item can use.

	LayoutLabelAndField (see page 24704)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 24705)	This is LayoutTable, a member of class TLayoutWebContent.
	NextColumn (see page 25173)	This is NextColumn, a member of class TAdapterFormLayout.
V	QueryInterface (see page 24705)	Returns a reference to a specified interface if the object supports that interface.
	StartButtons (see page 25173)	This is StartButtons, a member of class TAdapterFormLayout.
	StartFields (see page 25173)	This is StartFields, a member of class TAdapterFormLayout.
	StartRow (see page 25173)	This is StartRow, a member of class TAdapterFormLayout.
	StartTable (see page 25174)	This is StartTable, a member of class TAdapterFormLayout.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25168)	Creates a new TLayoutWebContent object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndLayout (see page 25169)	This is EndLayout, a member of class TAdapterFormLayout.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LayoutButton (see page 24775)	This is LayoutButton, a member of class ILayoutWebContent.
	LayoutField (see page 24775)	This is LayoutField, a member of class ILayoutWebContent.
	LayoutLabelAndField (see page 24775)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 24776)	This is LayoutTable, a member of class ILayoutWebContent.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	BreakButtons (see page 25174)	This is BreakButtons, a member of class TAdapterFormLayout.
R	ChildTableIndent (see page 25174)	This is ChildTableIndent, a member of class TAdapterFormLayout.
	ColumnCount (see page 25174)	This is ColumnCount, a member of class TAdapterFormLayout.
R	FieldIndent (see page 25175)	This is FieldIndent, a member of class TAdapterFormLayout.

R	ParentLayout (see page 24706)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.
	TableHeader (see page 25175)	This is TableHeader, a member of class TAdapterFormLayout.
R	TableIndent (see page 25175)	This is TableIndent, a member of class TAdapterFormLayout.

181.1.16.2 TAdapterFormLayout.Create Constructor

Creates a new TLayoutWebContent object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TAdapterFormLayout(TLayout AParentLayout);
```

Description

Call Create to instantiate a TLayoutWebContent descendant to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout property.

See Also

ParentLayout (see page 24706)

181.1.16.3 TAdapterFormLayout Methods

The methods of the TAdapterFormLayout class are listed here.

Protected Methods

	Name	Description
	EndButtons (see page 25169)	This is EndButtons, a member of class TAdapterFormLayout.
	EndField (see page 25169)	This is EndField, a member of class TAdapterFormLayout.
	EndFields (see page 25169)	This is EndFields, a member of class TAdapterFormLayout.
	EndRow (see page 25169)	This is EndRow, a member of class TAdapterFormLayout.
	EndTable (see page 25170)	This is EndTable, a member of class TAdapterFormLayout.
	GetAdapterFormLayout (see page 25170)	This is GetAdapterFormLayout, a member of class TAdapterFormLayout.
	GetChildTableIndent (see page 25170)	This is GetChildTableIndent, a member of class TAdapterFormLayout.
	GetFieldIndent (see page 25170)	This is GetFieldIndent, a member of class TAdapterFormLayout.
	GetTableIndent (see page 25171)	This is GetTableIndent, a member of class TAdapterFormLayout.
V	ImplLayoutButton (see page 25171)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 25171)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 25172)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 25172)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 25173)	This is NextColumn, a member of class TAdapterFormLayout.
	StartButtons (see page 25173)	This is StartButtons, a member of class TAdapterFormLayout.
	StartFields (see page 25173)	This is StartFields, a member of class TAdapterFormLayout.
	StartRow (see page 25173)	This is StartRow, a member of class TAdapterFormLayout.
	StartTable (see page 25174)	This is StartTable, a member of class TAdapterFormLayout.

Public Methods

	Name	Description
	EndLayout (see page 25169)	This is EndLayout, a member of class TAdapterFormLayout.

181.1.16.3.1 TAdapterFormLayout.EndButtons Method

Pascal

```
function EndButtons: string;
```

C++

```
__fastcall AnsiString EndButtons();
```

Description

This is EndButtons, a member of class TAdapterFormLayout.

181.1.16.3.2 TAdapterFormLayout.EndField Method

Pascal

```
function EndField: string;
```

C++

```
__fastcall AnsiString EndField();
```

Description

This is EndField, a member of class TAdapterFormLayout.

181.1.16.3.3 TAdapterFormLayout.EndFields Method

Pascal

```
function EndFields: string;
```

C++

```
__fastcall AnsiString EndFields();
```

Description

This is EndFields, a member of class TAdapterFormLayout.

181.1.16.3.4 TAdapterFormLayout.EndLayout Method

Pascal

```
function EndLayout: string;
```

C++

```
__fastcall AnsiString EndLayout();
```

Description

This is EndLayout, a member of class TAdapterFormLayout.

181.1.16.3.5 TAdapterFormLayout.EndRow Method

Pascal

```
function EndRow: string;
```

C++

```
__fastcall AnsiString EndRow();
```

Description

This is EndRow, a member of class TAdapterFormLayout.

181.1.16.3.6 TAdapterFormLayout.EndTable Method

Pascal

```
function EndTable: string;
```

C++

```
__fastcall AnsiString EndTable();
```

Description

This is EndTable, a member of class TAdapterFormLayout.

181.1.16.3.7 TAdapterFormLayout.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TAdapterFormLayout.

181.1.16.3.8 TAdapterFormLayout.GetChildTableIndent Method

Pascal

```
function GetChildTableIndent: string;
```

C++

```
__fastcall AnsiString GetChildTableIndent();
```

Description

This is GetChildTableIndent, a member of class TAdapterFormLayout.

181.1.16.3.9 TAdapterFormLayout.GetFieldIndent Method

Pascal

```
function GetFieldIndent: string;
```

C++

```
__fastcall AnsiString GetFieldIndent();
```

Description

This is GetFieldIndent, a member of class TAdapterFormLayout.

181.1.16.3.10 TAdapterFormLayout.GetTableIndent Method

Pascal

```
function GetTableIndent: string;
```

C++

```
__fastcall AnsiString GetTableIndent();
```

Description

This is GetTableIndent, a member of class TAdapterFormLayout.

181.1.16.3.11 TAdapterFormLayout.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutButton(const AnsiString HTMLButton, TLayoutAttributes
Attributes);
```

Description

The LayoutButton method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton method.

See Also

LayoutButton (see page 24703)

181.1.16.3.12 TAdapterFormLayout.ImplLayoutField Method

Provides the underlying implementation for the LayoutField method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutField(const AnsiString HTMLField, TLayoutAttributes
Attributes);
```

Description

The LayoutField method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField method.

See Also

LayoutField (see page 24704)

181.1.16.3.13 TAdapterFormLayout.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutLabelAndField(const AnsiString HTMLLabel, const
AnsiString HTMLField, TLayoutAttributes Attributes);
```

Description

The LayoutLabelAndField method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField method.

See Also

LayoutLabelAndField (see page 24704)

181.1.16.3.14 TAdapterFormLayout.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall AnsiString ImplLayoutTable(const AnsiString HTMLTable, TLayoutAttributes
Attributes);
```

Description

The LayoutTable method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable method.

See Also

layouttable (see page 24705)

181.1.16.3.15 TAdapterFormLayout.NextColumn Method

Pascal

```
function NextColumn(SubItemCount: Integer): string;
```

C++

```
__fastcall AnsiString NextColumn(int SubItemCount);
```

Description

This is NextColumn, a member of class TAdapterFormLayout.

181.1.16.3.16 TAdapterFormLayout.StartButtons Method

Pascal

```
function StartButtons: string;
```

C++

```
__fastcall AnsiString StartButtons();
```

Description

This is StartButtons, a member of class TAdapterFormLayout.

181.1.16.3.17 TAdapterFormLayout.StartFields Method

Pascal

```
function StartFields(ColCount: Integer): string;
```

C++

```
__fastcall AnsiString StartFields(int ColCount);
```

Description

This is StartFields, a member of class TAdapterFormLayout.

181.1.16.3.18 TAdapterFormLayout.StartRow Method

Pascal

```
function StartRow: string;
```

C++

```
__fastcall AnsiString StartRow();
```

Description

This is StartRow, a member of class TAdapterFormLayout.

181.1.16.3.19 TAdapterFormLayout.StartTable Method

Pascal

```
function StartTable: string;
```

C++

```
__fastcall AnsiString StartTable();
```

Description

This is StartTable, a member of class TAdapterFormLayout.

181.1.16.4 TAdapterFormLayout Properties

The properties of the TAdapterFormLayout class are listed here.

Public Properties

	Name	Description
	BreakButtons (see page 25174)	This is BreakButtons, a member of class TAdapterFormLayout.
R	ChildTableIndent (see page 25174)	This is ChildTableIndent, a member of class TAdapterFormLayout.
	ColumnCount (see page 25174)	This is ColumnCount, a member of class TAdapterFormLayout.
R	FieldIndent (see page 25175)	This is FieldIndent, a member of class TAdapterFormLayout.
	TableHeader (see page 25175)	This is TableHeader, a member of class TAdapterFormLayout.
R	TableIndent (see page 25175)	This is TableIndent, a member of class TAdapterFormLayout.

181.1.16.4.1 TAdapterFormLayout.BreakButtons Property

Pascal

```
property BreakButtons: Boolean;
```

C++

```
__property Boolean BreakButtons;
```

Description

This is BreakButtons, a member of class TAdapterFormLayout.

181.1.16.4.2 TAdapterFormLayout.ChildTableIndent Property

Pascal

```
property ChildTableIndent: string;
```

C++

```
__property AnsiString ChildTableIndent;
```

Description

This is ChildTableIndent, a member of class TAdapterFormLayout.

181.1.16.4.3 TAdapterFormLayout.ColumnCount Property

Pascal

```
property ColumnCount: Integer;
```

C++

```
__property int ColumnCount;
```

Description

This is ColumnCount, a member of class TAdapterFormLayout.

181.1.16.4.4 TAdapterFormLayout.FieldIndent Property

Pascal

```
property FieldIndent: string;
```

C++

```
__property AnsiString FieldIndent;
```

Description

This is FieldIndent, a member of class TAdapterFormLayout.

181.1.16.4.5 TAdapterFormLayout.TableHeader Property

Pascal

```
property TableHeader: string;
```

C++

```
__property AnsiString TableHeader;
```

Description

This is TableHeader, a member of class TAdapterFormLayout.

181.1.16.4.6 TAdapterFormLayout.TableIndent Property

Pascal

```
property TableIndent: string;
```

C++

```
__property AnsiString TableIndent;
```

Description

This is TableIndent, a member of class TAdapterFormLayout.

181.1.17 TAdapterGrid Class

TAdapterGrid is a container for Adapter (see page 25182) display field components such as TAdapterDisplayColumn (see page 25099). TAdapterGrid generates an HTML table.

Class Hierarchy

Pascal

```
TAdapterGrid = class(TCustomAdapterGrid);
```

C++

```
class TAdapterGrid : public TCustomAdapterGrid;
```

File

WebForm

Description

Add TAdapterGrid as a child of TAdapterForm (see page 25159). TAdapterGrid is associated with an Adapter (see page 25182). All of it's child display field components will use the same Adapter (see page 25182).

If no display fields have been explicitly added to the TAdapterGrid, display fields associated with all of the Adapter (see page 25182) fields will be added by default. The properties of default display fields cannot be modified.

Modifying the AdapterMode (see page 25182) property of TAdapterGrid may change the default display type or input type of Adapter (see page 25182) fields. This may cause the display field children of TAdapterGrid to change appearance.

Use the properties and methods of TAdapterGrid to:

Specify the associated Adapter (see page 25182).

Specify when the Adapter (see page 25182) Mode.

Specify whether default fields should be added.

Customize the appearance of the HTML table.

See Also

TAdapterDisplayColumn (see page 25099)

TAdapterForm (see page 25159)

181.1.17.1 TAdapterGrid Members

The following tables list the members exposed by TAdapterGrid.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterDisplayCharacteristics (see page 25293)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 25294)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 25294)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 25294)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 25294)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.

	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 25294)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 16881)	Provides the underlying implementation for the CanAddClass (see page 16878) method.
V	ImplCanAddClass (see page 25295)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 16882)	Provides the underlying implementation for the Content (see page 16879) method.
V	ImplContent (see page 25295)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16877)	Creates and initializes an instance of TWebControlGroup (see page 16872).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24742)	Creates and initializes an instance of TWebContainedContainerComponent (see page 24738).
V	Create (see page 25076)	Creates and initializes an instance of TAdapterControlGroup (see page 25070).
V	Create (see page 25292)	Creates and initializes an instance of TCustomAdapterGrid (see page 25286).

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16877)	Frees an instance of TWebControlGroup (see page 16872).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24743)	Frees an instance of TWebContainedContainerComponent (see page 24738).
	Destroy (see page 25076)	Frees an instance of TAdapterControlGroup (see page 25070).
	Destroy (see page 25293)	Frees an instance of TAdapterControlGroup.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Adapter (see page 25182)	Specifies the adapter that supplies values to or receives values from the controls in the group.

	AdapterMode (see page 25182)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 25183)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	HeadingAttributes (see page 25184)	Determines the display characteristics of the table's header.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	RowAttributes (see page 25184)	Determines the display characteristics of the table's body.
	TableAttributes (see page 25184)	Determines the basic display characteristics of the table.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.17.2 TAdapterGrid Properties

The properties of the TAdapterGrid class are listed here.

Published Properties

	Name	Description
	Adapter (see page 25182)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25182)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 25183)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	HeadingAttributes (see page 25184)	Determines the display characteristics of the table's header.
	RowAttributes (see page 25184)	Determines the display characteristics of the table's body.
	TableAttributes (see page 25184)	Determines the basic display characteristics of the table.

181.1.17.2.1 TAdapterGrid.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 24159)

GetFieldsList (see page 25081)

AdapterMode (see page 25085)

WebFieldControls (see page 16884)

181.1.17.2.2 TAdapterGrid.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property AnsiString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert, Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

See Also

Mode (see page 7810)

Adapter (see page 25084)

WebFieldControls (see page 16884)

181.1.17.2.3 TAdapterGrid.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

See Also

VisibleFields (see page 25086)

WebFieldControls (see page 16884)

Adapter (see page 25084)

181.1.17.2.4 TAdapterGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes or RowAttributes property instead.

See Also

TableAttributes (see page 25297)

RowAttributes (see page 25296)

181.1.17.2.5 TAdapterGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes or HeadingAttributes property instead.

See Also

TableAttributes (see page 25297)

HeadingAttributes (see page 25296)

181.1.17.2.6 TAdapterGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes property instead.

See Also

RowAttributes (see page 25296)

HeadingAttributes (see page 25296)

181.1.18 TControlRequirements Class

TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.

Class Hierarchy

Pascal

```
TControlRequirements = class(TAbstractControlRequirements);
```

C++

```
class TControlRequirements : public TAbstractControlRequirements;
```

File

WebForm

Description

Adapter forms create instances of TControlRequirements to store information about variables and functions that are needed for generating an HTML form to display the controls they contain. Components that generate HTML controls to represent the fields of an adapter (TAdapterControlGroup (see page 25070) and TAdapterDataDisplay (see page 25086) descendants) use the TControlRequirements instance that the form provides to store these variable and function declarations.

Typically, applications do not need to create or use TControlRequirements instances. Component writers that create Web items for an adapter form (that is, components that generate HTML controls to reflect the fields of an adapter) use the methods of TControlRequirements when implementing the GetControlRequirements method.

See Also

TAdapterControlGroup (see page 25070)

TAdapterDataDisplay (see page 25086)

TAdapterForm (see page 25159)

181.1.18.1 TControlRequirements Members

The following tables list the members exposed by TControlRequirements.

Public Methods

	Name	Description
	Create (see page 25186)	Creates and initializes an instance of TControlRequirements (see page 25185).
V	DefineFunction (see page 25187)	Adds the declaration of a function to those that this control requirements object stores.
V	DefineVariable (see page 25187)	Adds the declaration of a variable to those that this control requirements object stores.
V	Destroy (see page 25186)	Frees an instance of TControlRequirements (see page 25185).
V	IsFunctionDefined (see page 25188)	Indicates whether a function with the specified name has already been added to the list of control requirements.
V	IsVariableDefined (see page 25188)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
V	RequiresMultipartForm (see page 25189)	Stores the fact that the generated HTML form should be multipart.

Public Properties

	Name	Description
R	NeedMultipartForm (see page 25189)	Indicates whether the form that the adapter form generates must be multipart.

181.1.18.2 TControlRequirements.Create Constructor

Creates and initializes an instance of TControlRequirements (see page 25185).

Pascal

```
constructor Create;
```

C++

```
__fastcall TControlRequirements();
```

Description

Applications should have no need to instantiate TControlRequirements (see page 25185). The adapter form creates instances of this object to assemble and store information from their Web items.

See Also

TAdapterForm (see page 25159)

181.1.18.3 TControlRequirements.Destroy Destructor

Frees an instance of TControlRequirements (see page 25185).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TControlRequirements();
```

Description

Applications should have no need to create or destroy TControlRequirements (see page 25185) instances. These objects are created and freed by the adapter form.

See Also

TAdapterForm (see page 25159)

181.1.18.4 TControlRequirements Methods

The methods of the TControlRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 25187)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 25187)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 25188)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 25188)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 25189)	Stores the fact that the generated HTML form should be multipart.

181.1.18.4.1 TControlRequirements.DefineFunction Method

Adds the declaration of a function to those that this control requirements object stores.

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); override;
```

C++

```
virtual __fastcall DefineFunction(const AnsiString AName, const AnsiString ABody);
```

Description

DefineFunction stores the declaration of a function that has the name AName, where ABody is the text of the function body.

AName is the name of the function. This name is one of a standard set that the adapter form knows to call under specific circumstances. For example, the name can be the standard name of the function to generate an HTML button.

ABody is the body of the specified function. This value is typically customized to reflect the properties of a specific control in the form.

See Also

IsFunctionDefined (see page 25188)

DefineVariable (see page 25187)

181.1.18.4.2 TControlRequirements.DefineVariable Method

Adds the declaration of a variable to those that this control requirements object stores.

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string; AAdapter: Boolean);
override;
```

C++

```
virtual __fastcall DefineVariable(const AnsiString AName, const AnsiString AValue, Boolean
AAdapter);
```

Description

DefineVariable stores the name and value of a variable declaration.

AName is the name of the variable.

AValue is the value to assign to the variable.

AAdapter indicates whether this variable is the one that declares the adapter object whose field a control represents or whose set of fields a control group represents.

See Also

IsVariableDefined (see page 25188)

DefineFunction (see page 25187)

181.1.18.4.3 TControlRequirements.IsFunctionDefined Method

Indicates whether a function with the specified name has already been added to the list of control requirements.

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const AnsiString AName);
```

Description

IsFunctionDefined returns true if the control requirements object already lists a function with the specified name. That is, IsFunctionDefined returns true if the DefineFunction (see page 25187) method has been called to define the specified function, and false otherwise.

AName is the name of the function.

See Also

DefineFunction (see page 25187)

IsVariableDefined (see page 25188)

181.1.18.4.4 TControlRequirements.IsVariableDefined Method

Indicates whether a variable with the specified name has already been added to the list of control requirements.

Pascal

```
function IsVariableDefined(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const AnsiString AName);
```

Description

IsVariableDefined returns true if the control requirements object already lists a variable with the specified name. That is, IsVariableDefined returns true if the DefineVariable (see page 25187) method has been called to define a value for the specified variable, and false otherwise.

AName is the name of the variable.

See Also

DefineVariable (see page 25187)

IsFunctionDefined (see page 25188)

181.1.18.4.5 TControlRequirements.RequiresMultipartForm Method

Stores the fact that the generated HTML form should be multipart.

Pascal

```
procedure RequiresMultipartForm; override;
```

C++

```
virtual __fastcall RequiresMultipartForm();
```

Description

Web items call this method if they need to be contained in a multipart form (for example, when a field in the form is represented by a reference to another file). A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

See Also

NeedMultipartForm (see page 25189)

181.1.18.5 TControlRequirements Properties

The properties of the TControlRequirements class are listed here.

Public Properties

	Name	Description
	NeedMultipartForm (see page 25189)	Indicates whether the form that the adapter form generates must be multipart.

181.1.18.5.1 TControlRequirements.NeedMultipartForm Property

Indicates whether the form that the adapter form generates must be multipart.

Pascal

```
property NeedMultipartForm: Boolean;
```

C++

```
__property Boolean NeedMultipartForm;
```

Description

NeedMultipartForm indicates whether any control has called the RequiresMultipartForm (see page 25189) method to indicate that the form that contains it must be multipart. A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

See Also

RequiresMultipartForm (see page 25189)

181.1.19 TCustomAdapterActionButton Class

TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.

Class Hierarchy

Pascal

```
TCustomAdapterActionButton = class(TWebButton, IWebGetActionName, IWebSetActionName,
IRestoreDefaults, IGetControlRequirements, IGetAdapterVariableName, IGetDesignTimeWarnings);
```

C++

```
class TCustomAdapterActionButton : public TWebButton, public IWebGetActionName, public
IWebSetActionName, public IRestoreDefaults, public IGetControlRequirements, public
IGetAdapterVariableName, public IGetDesignTimeWarnings;
```

File

WebForm

Description

Use TCustomAdapterActionButton as a base class when defining Web items that generate HTML controls for adapter actions. TCustomAdapterActionButton descendants are added to Web items that appear in the hierarchy of a TAdapterForm (see page 25159) object. The adapter action button generates an HTML control that appears in the HTML form. When the end user clicks that control, it sends a request message that executes the adapter action.

TCustomAdapterActionButton introduces properties to link this component to the adapter action it executes, and for defining the type and appearance of the generated control in the HTML form.

See Also

TAdapterActionButton (see page 25034)

TCustomAdapterAction (see page 24188)

TAdapterForm (see page 25159)

181.1.19.1 TCustomAdapterActionButton Members

The following tables list the members exposed by TCustomAdapterActionButton.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16868)	Returns the HTML that defines the button control.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindAssociatedAction (see page 25195)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 25196)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 25196)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 25196)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
	GetCaption (see page 25196)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25197)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 25197)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 25197)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 25197)	Returns the layout object that specifies how the generated control should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	ImplContent (see page 25198)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 25198)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
	ImplRestoreDefaults (see page 25198)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 25199)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25199)	This is RestoreDefaults, a member of class TCustomAdapterActionButton.
	SetActionName (see page 25199)	This is SetActionName, a member of class TCustomAdapterActionButton.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

V	SetCaption (see page 25200)	Sets the value of the Caption property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25194)	Creates and initializes an instance of TCustomAdapterActionButton (see page 25189).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25195)	Frees an instance of TCustomAdapterActionButton (see page 25189).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	ActionName (see page 25200)	Specifies the name of the action taken by the Web button.
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 25201)	Specifies the horizontal alignment of the generated HTML control.
	Caption (see page 16870)	Specifies the caption that appears on the button.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16871)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 25201)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 25202)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 25202)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 25202)	Controls (see page 5711) when the generated HTML element appears in HTML forms.
	ImageHeight (see page 25203)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 25203)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 25204)	Specifies the width of the generated element if it is a clickable image.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PageName (see page 25204)	Specifies the name of the page to display after successfully executing the action.
	Style (see page 16871)	Adds style attributes to the generated button control.
	StyleRule (see page 16872)	Applies a style in the page producer's style sheet to the button.
	VAlign (see page 25204)	Specifies the vertical alignment of the generated HTML control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.19.2 TCustomAdapterActionButton.Create Constructor

Creates and initializes an instance of TCustomAdapterActionButton (see page 25189).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterActionButton(TComponent * AOwner);
```

Description

Call Create to instantiate an adapter action button at runtime. Adapter action buttons added to an adapter form at design time are created automatically.

AOwner is the component, typically a Web module, that is responsible for freeing the TCustomAdapterActionButton (see page 25189) instance. This becomes the value of the Owner property.

See Also

Owner (see page 2807)

181.1.19.3 TCustomAdapterActionButton.Destroy Destructor

Frees an instance of TCustomAdapterActionButton (see page 25189).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterActionButton();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the TCustomAdapterActionButton (see page 25189) is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.19.4 TCustomAdapterActionButton Methods

The methods of the TCustomAdapterActionButton class are listed here.

Protected Methods

	Name	Description
	FindAssociatedAction (see page 25195)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 25196)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 25196)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 25196)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
V	GetCaption (see page 25196)	Returns the value of the Caption property.
	GetControlRequirements (see page 25197)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 25197)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 25197)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
V	GetLayoutAttributes (see page 25197)	Returns the layout object that specifies how the generated control should look.
V	ImplContent (see page 25198)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25198)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
V	ImplRestoreDefaults (see page 25198)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
V	Notification (see page 25199)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 25199)	This is RestoreDefaults, a member of class TCustomAdapterActionButton.
	SetActionName (see page 25199)	This is SetActionName, a member of class TCustomAdapterActionButton.
V	SetCaption (see page 25200)	Sets the value of the Caption property.

181.1.19.4.1 TCustomAdapterActionButton.FindAssociatedAction Method

Pascal

```
function FindAssociatedAction: TComponent;
```

C++

```
__fastcall TComponent * FindAssociatedAction();
```

Description

This is FindAssociatedAction, a member of class TCustomAdapterActionButton.

181.1.19.4.2 TCustomAdapterActionButton.GetActionName Method

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall AnsiString GetActionName();
```

Description

This is GetActionName, a member of class TCustomAdapterActionButton.

181.1.19.4.3 TCustomAdapterActionButton.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.

181.1.19.4.4 TCustomAdapterActionButton.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall AnsiString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.

181.1.19.4.5 TCustomAdapterActionButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall AnsiString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption (see page 16870)

SetCaption (see page 16870)

181.1.19.4.6 TCustomAdapterActionButton.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class TCustomAdapterActionButton.

181.1.19.4.7 TCustomAdapterActionButton.GetDesigntimeWarnings Method

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.

181.1.19.4.8 TCustomAdapterActionButton.GetHTMLFormVarName Method

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormVarName();
```

Description

This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.

181.1.19.4.9 TCustomAdapterActionButton.GetLayoutAttributes Method

Returns the layout object that specifies how the generated control should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebButton, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout of buttons does not make use of layout attributes.

See Also

Content (see page 16868)

181.1.19.4.10 TCustomAdapterActionButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content (see page 16868)

ILayoutWebContent (see page 24774)

181.1.19.4.11 TCustomAdapterActionButton.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.

181.1.19.4.12 TCustomAdapterActionButton.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.

181.1.19.4.13 TCustomAdapterActionButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

181.1.19.4.14 TCustomAdapterActionButton.RestoreDefaults Method

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

This is RestoreDefaults, a member of class TCustomAdapterActionButton.

181.1.19.4.15 TCustomAdapterActionButton.SetActionName Method

Pascal

```
procedure SetActionName(const AValue: string);
```

C++

```
__fastcall SetActionName(const AnsiString AValue);
```

Description

This is SetActionName, a member of class TCustomAdapterActionButton.

181.1.19.4.16 TCustomAdapterActionButton.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const AnsiString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

See Also

Caption (see page 16870)

GetCaption (see page 16869)

181.1.19.5 TCustomAdapterActionButton Properties

The properties of the TCustomAdapterActionButton class are listed here.

Public Properties

	Name	Description
	ActionName (see page 25200)	Specifies the name of the action taken by the Web button.
	Align (see page 25201)	Specifies the horizontal alignment of the generated HTML control.
	DisplayColumns (see page 25201)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 25202)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 25202)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 25202)	Controls (see page 5711) when the generated HTML element appears in HTML forms.
	ImageHeight (see page 25203)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 25203)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 25204)	Specifies the width of the generated element if it is a clickable image.
	PageName (see page 25204)	Specifies the name of the page to display after successfully executing the action.
	VAlign (see page 25204)	Specifies the vertical alignment of the generated HTML control.

181.1.19.5.1 TCustomAdapterActionButton.ActionName Property

Specifies the name of the action taken by the Web button.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

Use ActionName to get or set the name of the adapter action that executes in response to requests sent when the user clicks this object's generated control. ActionName is the same as the ActionName property of the adapter action object that this control executes.

See Also

Caption

ActionName (see page 24198)

181.1.19.5.2 TCustomAdapterActionButton.Align Property

Specifies the horizontal alignment of the generated HTML control.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the generated HTML control is positioned horizontally within its parent HTML element. If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each individual of the items within the grid generated to position them into rows.

Align indicates the desired value of the Align option of the HTML tag for the generated control.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 25204)

DisplayColumns (see page 25201)

ItemCount (see page 24074)

181.1.19.5.3 TCustomAdapterActionButton.DisplayColumns Property

Indicates the number of columns to use when laying out the generated HTML control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

An adapter action may represent multiple commands. When the TCustomAdapterActionButton (see page 25189) object generates controls for such an action, it must handle the layout of individual items for each of the action's commands. DisplayColumns controls how many items (controls) appear in a row before TCustomAdapterActionButton (see page 25189) starts a new row of controls.

If the corresponding adapter action does not represent multiple commands (that is, if its ItemCount property is not greater than 1), the value of DisplayColumns has no effect.

If DisplayColumns is –1, the Web browser controls the layout of the adapter action's items.

See Also

ItemCount (see page 24074)

DisplayType (see page 25202)

181.1.19.5.4 TCustomAdapterActionButton.DisplayType Property

Specifies the DisplayType of the generated HTML control.

Pascal

```
property DisplayType: TCommandHTMLElementType;
```

C++

```
__property TCommandHTMLElementType DisplayType;
```

Description

DisplayType controls the type of HTML element that this Web item generates.

When DisplayType is ctDefault (the default), TCustomAdapterActionButton (see page 25189) uses the element type that the associated adapter action suggests. Change DisplayType to generate a different type of control or set of controls.

When DisplayType is ctImage or ctEventImages, you must set the ImageProducer (see page 25203) property to a component that can provide the image or images.

See Also

ImageProducer (see page 25203)

Caption

GetDisplayStyle (see page 24056)

181.1.19.5.5 TCustomAdapterActionButton.ErrorPageName Property

Specifies the name of the page to display when an error occurs executing the action.

Pascal

```
property ErrorPageName: string;
```

C++

```
__property AnsiString ErrorPageName;
```

Description

Use ErrorPageName to indicate the Web page that should appear if the WebSnap application encounters an error when executing the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

PageName (see page 25204)

pagename

181.1.19.5.6 TCustomAdapterActionButton.HideOptions Property

Controls (see page 5711) when the generated HTML element appears in HTML forms.

Pascal

```
property HideOptions: TActionButtonHideOptions;
```

C++

```
__property TActionButtonHideOptions HideOptions;
```

Description

HideOptions controls when this Web item generates an HTML control for its associated action. This property is a set of flags that control when the adapter page producer suppresses the controls that this object generates. If HideOptions is an empty set, TCustomAdapterActionButton (see page 25189) always generates a control for its associated adapter action.

See Also

GetVisible (see page 24061)

WebEnabled (see page 24071)

HasExecuteAccess (see page 24062)

181.1.19.5.7 TCustomAdapterActionButton.ImageHeight Property

Specifies the height of the generated element if it is a clickable image.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

ImageHeight controls the height of the image that the user can click to execute the associated action. If ImageHeight is –1 (the default), the browser controls the height it uses to display the generated image.

ImageHeight is only used when the value of the DisplayType (see page 25202) property is ctImage or ctEventImages.

See Also

ImageProducer (see page 25203)

ImageWidth (see page 25204)

DisplayType (see page 25202)

181.1.19.5.8 TCustomAdapterActionButton.ImageProducer Property

Specifies the interface that this adapter action button uses to generate images.

Pascal

```
property ImageProducer: IActionImageProducer;
```

C++

```
__property IActionImageProducer ImageProducer;
```

Description

Set ImageProducer when the value of the DisplayType (see page 25202) is ctImage or ctEventImages. ImageProducer is the interface of the component that supplies the image or images that appear in HTML forms as the control that this Web item generates. When the user clicks on the generated image in the HTML form, the associated action executes.

See Also

DisplayType (see page 25202)

ImageHeight (see page 25203)

ImageWidth (see page 25204)

181.1.19.5.9 TCustomAdapterActionButton.ImageWidth Property

Specifies the width of the generated element if it is a clickable image.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

ImageWidth controls the width of the image that the user can click to execute the associated action. If ImageWidth is –1 (the default), the browser controls the width it uses to display the generated image.

ImageWidth is only used when the value of the DisplayType (see page 25202) property is ctImage or ctEventImages.

See Also

ImageProducer (see page 25203)

ImageHeight (see page 25203)

DisplayType (see page 25202)

181.1.19.5.10 TCustomAdapterActionButton.PageName Property

Specifies the name of the page to display after successfully executing the action.

Pascal

```
property PageName: string;
```

C++

```
__property AnsiString PageName;
```

Description

Use PageName to indicate the Web page that should appear if the WebSnap application successfully executes the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

ErrorPageName (see page 25202)

pagename

181.1.19.5.11 TCustomAdapterActionButton.VAlign Property

Specifies the vertical alignment of the generated HTML control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the generated HTML control is positioned vertically within its parent HTML element. VAlign indicates the desired value of the VAlign option of the HTML tag for the generated control. . If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each of the individual items within the grid generated to position them into rows.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 25201)

DisplayColumns (see page 25201)

ItemCount (see page 24074)

181.1.20 TCustomAdapterCommandColumn Class

TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.

Class Hierarchy

Pascal

```
TCustomAdapterCommandColumn = class(TWebControlGroup, IWebActionsList, IAddFieldsEditor,
IFormatColumn, IGetAdapterDisplayCharacteristics, INotifyAdapterChange);
```

C++

```
class TCustomAdapterCommandColumn : public TWebControlGroup, public IWebActionsList, public
IAddFieldsEditor, public IFormatColumn, public IGetAdapterDisplayCharacteristics, public
INotifyAdapterChange;
```

File

WebForm

Description

Use TCustomAdapterCommandColumn as a base class when creating a specialized display control that organizes the output of several adapter action buttons (TAdapterActionButton (see page 25034) objects) into a column of an adapter grid (TAdapterGrid (see page 25175)). TCustomAdapterCommandColumn generates the HTML to lay out a single column of an adapter grid. Each cell in the column can contain one or more adapter action buttons, each of which executes an adapter action. For each row in the grid, the column contains duplicates of the same set of adapter action buttons.

Use the TCustomAdapterCommandColumn properties to specify which adapter action buttons appear in the column and to customize their layout and appearance. These properties include:

The AddDefaultCommands (see page 25215), WebFieldControls, and VisibleCommands (see page 25219) properties, which specify which adapter action buttons appear in the column.

The Caption (see page 25216) and CaptionAttributes (see page 25217) properties, which determine the appearance of the label at the top of the column.

The Align (see page 25216), VAlign (see page 25219), and DisplayColumns (see page 25217) properties, which determine the layout of controls inside each cell.

The Style (see page 25218) and StyleRule (see page 25218) properties, which let you apply a style from a stylesheet to the column.

See Also

TAdapterCommandColumn (see page 25052)

TAdapterGrid (see page 25175)

TAdapterEditColumn (see page 25132)

TAdapterDisplayColumn (see page 25099)

TAdapterActionButton (see page 25034)

181.1.20.1 TCustomAdapterCommandColumn Members

The following tables list the members exposed by TCustomAdapterCommandColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.

	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FormatColumnData (see page 25211)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 25212)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 25212)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 25212)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 25213)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 25213)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 25214)	Responds to changes that affect the associated adapter.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	AdapterActionsListHelper (see page 25215)	Identifies the helper object that enables this component to work with the editor at design time.
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25210)	Creates and initializes an instance of TCustomAdapterCommandColumn (see page 25205).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25211)	Frees an instance of TCustomAdapterCommandColumn (see page 25205).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AddDefaultCommands (see page 25215)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 25216)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 25216)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 25217)	Specifies the attributes of the Caption (see page 25216) property.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 25217)	Represents a tag option and its value.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 25217)	Specifies the number of adapter action buttons that can appear in a single row.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 25218)	Adds style attributes to the generated caption.
	StyleRule (see page 25218)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 25219)	Specifies the vertical alignment of the action control buttons within the column.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleCommands (see page 25219)	Lists the child Web items that generate controls that appear in cells of the column.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.20.2 TCustomAdapterCommandColumn.Create Constructor

Creates and initializes an instance of TCustomAdapterCommandColumn (see page 25205).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterCommandColumn(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterCommandColumn (see page 25205) at runtime. TCustomAdapterCommandColumn (see page 25205) descendants added at design time are instantiated automatically.

AOwner is the component that becomes the value of the Owner property. Typically, this is the Web module.

See Also

Owner (see page 2807)

181.1.20.3 TCustomAdapterCommandColumn.Destroy Destructor

Frees an instance of TCustomAdapterCommandColumn (see page 25205).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterCommandColumn();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the TCustomAdapterCommandColumn (see page 25205) reference is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.20.4 TCustomAdapterCommandColumn Methods

The methods of the TCustomAdapterCommandColumn class are listed here.

Protected Methods

	Name	Description
	FormatColumnData (see page 25211)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 25212)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 25212)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
V	GetLayoutAttributes (see page 25212)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 25213)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 25213)	Provides the underlying implementation for the Content method.
	NotifyAdapterChange (see page 25214)	Responds to changes that affect the associated adapter.

181.1.20.4.1 TCustomAdapterCommandColumn.FormatColumnData Method

Generates the HTML for the cells in the column that contain controls to execute actions.

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnData(const AnsiString Content, TWebContentOptions Options);
```

Description

The adapter grid calls FormatColumnData to update the HTML for the contents of a cell to include any column attributes that affect the layout of that content. This method adds attributes to the HTML that reflect the Align (see page 25216) and VAlign (see page 25219) properties.

Content is the HTML that represents the content of the cell. It is the value that the Content method returns.

Options contains a set of flags that limit what can be included in the generated HTML.

FormatColumnData returns the resulting HTML.

See Also

Content (see page 16879)

TAdapterGrid (see page 25175)

Align (see page 25216)

VAlign (see page 25219)

181.1.20.4.2 TCustomAdapterCommandColumn.FormatColumnHeading Method

Generates the HTML for the table header cell for this column.

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatColumnHeading(TWebContentOptions Options);
```

Description

The adapter grid calls FormatColumnHeading to generate the HTML for the top cell of the column (the one that contains the caption). This method generates the HTML to reflect the Caption (see page 25216) and CaptionAttributes (see page 25217) properties.

Options contains a set of flags that limit what can be included in the generated HTML.

FormatColumnHeading returns the resulting HTML.

See Also

Caption (see page 25216)

TAdapterGrid (see page 25175)

CaptionAttributes (see page 25217)

181.1.20.4.3 TCustomAdapterCommandColumn.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.

181.1.20.4.4 TCustomAdapterCommandColumn.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

GetLayoutAttributes adds returns a TLayoutAttributes object that encodes the values of the Style (see page 25218), StyleRule (see page 25218), and Custom (see page 25217) properties.

See Also

Content (see page 16879)

Style (see page 25218)

StyleRule (see page 25218)

Custom (see page 25217)

181.1.20.4.5 TCustomAdapterCommandColumn.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TCustomAdapterCommandColumn (see page 25205) descendant can add a component of type AClass to its WebFieldControls property list.

AParent is the TCustomAdapterCommandColumn (see page 25205) instance to which the component will be added.

AClass is the class of the component to be added.

In TCustomAdapterCommandColumn (see page 25205), ImplCanAddClass returns true if AClass is a descendant of TCustomAdapterActionButton (see page 25189) or TCustomLayoutGroup.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

TCustomAdapterActionButton (see page 25189)

TCustomLayoutGroup (see page 16528)

181.1.20.4.6 TCustomAdapterCommandColumn.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML for the controls in one cell of the column. ImplContent generates the HTML to display the controls that the VisibleCommands (see page 25219) property lists, reflecting the values of the DisplayColumns (see page 25217), .Style (see page 25218), StyleRule (see page 25218), and Custom (see page 25217) properties.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TCustomAdapterCommandColumn (see page 25205) should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

Note: ImplContent does not include attributes for the alignment of controls inside the cell. The FormatColumnData (see page 25211) method adds this information to the HTML that ImplContent generates.

See Also

Content (see page 16879)

FormatColumnData (see page 25211)

ILayoutWebContent (see page 24774)

VisibleCommands (see page 25219)

DisplayColumns (see page 25217)

Style (see page 25218)

StyleRule (see page 25218)

Custom (see page 25217)

181.1.20.4.7 TCustomAdapterCommandColumn.NotifyAdapterChange Method

Responds to changes that affect the associated adapter.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is called automatically when the associated adapter changes. This method updates the set of default actions for that adapter to reflect the current change, and passes on the change notification to the actions that the WebFieldControls property lists.

See Also

GetDefaultWebComponents (see page 16880)

WebFieldControls (see page 16884)

181.1.20.5 TCustomAdapterCommandColumn Properties

The properties of the TCustomAdapterCommandColumn class are listed here.

Protected Properties

	Name	Description
R	AdapterActionsListHelper (see page 25215)	Identifies the helper object that enables this component to work with the editor at design time.

Public Properties

	Name	Description
	AddDefaultCommands (see page 25215)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 25216)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 25216)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 25217)	Specifies the attributes of the Caption (see page 25216) property.
	Custom (see page 25217)	Represents a tag option and its value.
	DisplayColumns (see page 25217)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 25218)	Adds style attributes to the generated caption.
	StyleRule (see page 25218)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 25219)	Specifies the vertical alignment of the action control buttons within the column.
R	VisibleCommands (see page 25219)	Lists the child Web items that generate controls that appear in cells of the column.

181.1.20.5.1 TCustomAdapterCommandColumn.AdapterActionsListHelper Property

Identifies the helper object that enables this component to work with the editor at design time.

Pascal

```
property AdapterActionsListHelper: TAdapterActionsListHelper;
```

C++

```
__property TAdapterActionsListHelper AdapterActionsListHelper;
```

Description

AdapterActionsListHelper provides read-only access to a helper object that implements design-time editing functions on behalf of this component. This helper object implements methods for locating child Web items for specified actions, for listing the child Web items of this component, and for specifying the text of menu commands that operate on this component's list of adapter action buttons.

See Also

WebFieldControls (see page 16884)

181.1.20.5.2 TCustomAdapterCommandColumn.AddDefaultCommands Property

Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

Set AddDefaultCommands property to specify what should appear in the generated column when you do not explicitly add any adapter action buttons to the WebFieldControls property. When AddDefaultCommands is true (the default), the adapter command column automatically adds controls for every default action of the associated adapter if you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the adapter command column only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.

See Also

WebFieldControls (see page 16884)

DefaultWebComponents (see page 23778)

VisibleCommands (see page 25219)

181.1.20.5.3 TCustomAdapterCommandColumn.Align Property

Specifies the horizontal alignment of the action control buttons within the column.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the child HTML control are positioned horizontally within this column. Align indicates the desired value of the Align option of the HTML tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 25219)

DisplayColumns (see page 25217)

181.1.20.5.4 TCustomAdapterCommandColumn.Caption Property

Specifies the text label that appears at the top of the column.

Pascal

```
property Caption: string;
```

C++

```
__property AnsiString Caption;
```

Description

Use Caption to get or set the caption for the column in the adapter grid. The caption is the text label that appears at the top of the column.

To change the appearance or layout of the caption, use the CaptionAttribute property.

See Also

CaptionAttributes (see page 25217)

181.1.20.5.5 TCustomAdapterCommandColumn.CaptionAttributes Property

Specifies the attributes of the Caption (see page 25216) property.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the column caption.

See Also

Caption (see page 25216)

181.1.20.5.6 TCustomAdapterCommandColumn.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the column. Each option and its value has the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces.

TCustomAdapterCommandColumn (see page 25205) inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 25218)

StyleRule (see page 25218)

181.1.20.5.7 TCustomAdapterCommandColumn.DisplayColumns Property

Specifies the number of adapter action buttons that can appear in a single row.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Set DisplayColumns to organize the layout of adapter action buttons when the WebFieldControls property lists more than one adapter action button. TCustomAdapterCommandColumn (see page 25205) places the adapter action buttons by rows in the cells of the adapter grid column. DisplayColumns limits the number of controls that can appear in a single row within each column cell. If the WebFieldControls property lists more adapter action buttons than DisplayColumns, then the cell contains multiple rows of controls.

See Also

WebFieldControls (see page 16884)

181.1.20.5.8 TCustomAdapterCommandColumn.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to specify display characteristics that affect the generated column. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the column as the value of a STYLE option.

Note: Style affects the contents of the column cells. To specify display characteristics of the column's caption, use the CaptionAttributes (see page 25217) property instead.

See Also

Custom (see page 25217)

StyleRule (see page 25218)

CaptionAttributes (see page 25217)

181.1.20.5.9 TCustomAdapterCommandColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated column.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated column. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 25218) property instead.

See Also

Custom (see page 25217)

Style (see page 25218)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.20.5.10 TCustomAdapterCommandColumn.VAlign Property

Specifies the vertical alignment of the action control buttons within the column.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the child HTML control are positioned vertically within the cells of this column. VAlign indicates the desired value of the VAlign option of the HTML tag.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 25216)

DisplayColumns (see page 25217)

181.1.20.5.11 TCustomAdapterCommandColumn.VisibleCommands Property

Lists the child Web items that generate controls that appear in cells of the column.

Pascal

```
property VisibleCommands: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleCommands;
```

Description

VisibleCommands is the list of child Web items that generate HTML controls for the cells of the adapter command column. Each element in this list is an adapter action button (TAdapterActionButton (see page 25034) object).

If you have explicitly added child Web items to this component, VisibleCommands is the same as the value of the WebFieldControls property. Otherwise, if the AddDefaultCommands (see page 25215) property is true, VisibleCommands lists adapter action buttons for the default actions of the associated adapter. If AddDefaultCommands (see page 25215) is false, VisibleCommands is an empty list.

See Also

WebFieldControls (see page 16884)

AddDefaultCommands (see page 25215)

TAdapterActionButton (see page 25034)

181.1.21 TCustomAdapterCommandGroup Class

TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 25062).

Class Hierarchy

Pascal

```
TCustomAdapterCommandGroup = class(TAdapterDisplayReferenceGroup, IWebActionsList,
IGetAdapterOfDisplay, IGetVariablesContainerOfDisplay, IAddFieldsEditor,
IGetAdapterModeOfDisplay, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterCommandGroup : public TAdapterDisplayReferenceGroup, public
IWebActionsList, public IGetAdapterOfDisplay, public IGetVariablesContainerOfDisplay, public
IAddFieldsEditor, public IGetAdapterModeOfDisplay, public IGetAdapterFormLayout;
```

File

WebForm

Description

Derive from TCustomAdapterCommandGroup to define a component that generates a group of HTML buttons or other HTML elements that execute adapter actions.

See Also

TAdapterDisplayReferenceGroup (see page 25122)

TAdapterCommandGroup (see page 25062)

TAdapterForm (see page 25159)

TAdapterFieldGroup (see page 25150)

TAdapterGrid (see page 25175)

TAdapterActionButton (see page 25034)

181.1.21.1 TCustomAdapterCommandGroup Members

The following tables list the members exposed by TCustomAdapterCommandGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25128)	Responds to changes in the adapter on which the controls in this group operate.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DisplayComponentChange (see page 25129)	Responds when the DisplayComponent (see page 25132) property changes.
	GetAdapter (see page 25226)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterDisplayCharacteristics (see page 25129)	Indicates the display characteristics of the HTML this component generates.
	GetAdapterFormLayout (see page 25226)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 25227)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 25227)	Returns the adapter mode defined by the TAdapterPageProducer components.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25130)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.

	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	GetWebDisplayComponent (see page 16920)	This is GetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 25227)	Checks the inheritance of the given component.
V	ImplContent (see page 25228)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 25166) component.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 16920)	Forwards notification messages to all owned components.
	NotifyAdapterChange (see page 25130)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 25131)	Responds when the associated display component changes.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
V	SetWebDisplayComponent (see page 16921)	This is SetWebDisplayComponent, a member of class TWebDisplayReferenceGroup.
V	SetWebDisplayComponent (see page 25131)	Sets the value of the DisplayComponent (see page 25132) property.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	Adapter (see page 25228)	Provides read-only access to the Adapter that this command group uses.
R	AdapterActionsListHelper (see page 25229)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebDisplay (see page 16921)	This is WebDisplay, a member of class TWebDisplayReferenceGroup.
	WebDisplayComponent (see page 16921)	
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25225)	Creator for TCustomAdapterCommandGroup (see page 25220).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25225)	Frees an instance of TAdapterDisplayReferenceGroup.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindAction (see page 19744)	This is FindAction, a member of class IWebActionsList.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetActionsList (see page 19744)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterDisplayCharacteristics (see page 19687)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAddAllFieldsItem (see page 24770)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 24770)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.

	GetAddFieldsItem (see page 24770)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNewFieldPrefix (see page 24771)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleActions (see page 19745)	This is GetVisibleActions, a member of class IWebActionsList.
	GetWebDisplayComponent (see page 17081)	This is GetWebDisplayComponent, a member of class IWebDisplayReference.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsActionInUse (see page 19745)	This is IsActionInUse, a member of class IWebActionsList.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AddDefaultCommands (see page 25229)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.

	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 25229)	Provides read and write access to the custom HTML element attributes, such as Valign="top."
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayComponent (see page 25132)	Associates the group with a component that generates the display controls.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 25229)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 25230)	Provides read and write access to the internal string that stores the CSS style rule for the control group.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleActions (see page 19745)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleCommands (see page 25230)	Provides read-only access to the TWebComponentList that stores the list of visible components.
R	WebDisplayComponent (see page 17081)	
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.21.2 TCustomAdapterCommandGroup.Create Constructor

Creator for TCustomAdapterCommandGroup (see page 25220).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterCommandGroup(TComponent * AOwner);
```

Description

This constructor calls the base class version, and then creates a TAdapterActionsListHelper (see page 25046) component and sets the AddDefaultActions property to true by default.

See Also

Create_d

AddDefaultActions (see page 25052)

181.1.21.3 TCustomAdapterCommandGroup.Destroy Destructor

Frees an instance of TAdapterDisplayReferenceGroup.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterCommandGroup();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.21.4 TCustomAdapterCommandGroup Methods

The methods of the TCustomAdapterCommandGroup class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 25226)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterFormLayout (see page 25226)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 25227)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 25227)	Returns the adapter mode defined by the TAdapterPageProducer components.
V	ImplCanAddClass (see page 25227)	Checks the inheritance of the given component.
V	ImplContent (see page 25228)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 25166) component.

181.1.21.4.1 TCustomAdapterCommandGroup.GetAdapter Method

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

This is GetAdapter, a member of class TCustomAdapterCommandGroup.

181.1.21.4.2 TCustomAdapterCommandGroup.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.

181.1.21.4.3 TCustomAdapterCommandGroup.GetAdapterModeOfAdapter Method

Returns the adapter mode defined by the adapter component.

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfAdapter();
```

Description

The GetAdapterModeOfAdapter function returns the adapter mode defined by the adapter component. Some adapters support a mode. For example, the TDataSetAdapter supports Edit, Insert, and Delete modes. The mode can be set by TAdapterPageProducer components or during adapter action execution. The mode defined by adapter action takes precedence over the mode defined by TAdapterPageProducer components.

181.1.21.4.4 TCustomAdapterCommandGroup.GetAdapterModeOfDisplay Method

Returns the adapter mode defined by the TAdapterPageProducer components.

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfDisplay();
```

Description

This function returns the adapter mode defined by the TAdapterPageProducer components. Some adapters support a mode. For example, the TDataSetAdapter supports Edit, Insert, and Delete modes. The mode can be set by TAdapterPageProducer components or during adapter action execution. The mode defined by adapter action takes precedence over the mode defined by TAdapterPageProducer components.

181.1.21.4.5 TCustomAdapterCommandGroup.ImplCanAddClass Method

Checks the inheritance of the given component.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddClass checks the inheritance of the given component. If it is derived from either TCustomAdapterActionButton (see page 25189) or TCustomLayoutGroup, it will return True to indicate that the class can be added to this TCustomAdapterCommandGroup (see page 25220).

181.1.21.4.6 TCustomAdapterCommandGroup.ImplContent Method

Lays out the buttons for the command group using the TAdapterFormLayout (see page 25166) component.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The ImplContent function lays out the buttons for the command group using the TAdapterFormLayout (see page 25166) component. It loops through all of the visible child components, calling them to render their HTML content.

181.1.21.5 TCustomAdapterCommandGroup Properties

The properties of the TCustomAdapterCommandGroup class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 25228)	Provides read-only access to the Adapter that this command group uses.
R	AdapterActionsListHelper (see page 25229)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Public Properties

	Name	Description
	AddDefaultCommands (see page 25229)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 25229)	Provides read and write access to the custom HTML element attributes, such as Valign="top."
	Style (see page 25229)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 25230)	Provides read and write access to the internal string that stores the CSS style rule for the control group.
R	VisibleCommands (see page 25230)	Provides read-only access to the TWebComponentList that stores the list of visible components.

181.1.21.5.1 TCustomAdapterCommandGroup.Adapter Property

Provides read-only access to the Adapter that this command group uses.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

The Adapter property provides read-only access to the Adapter that this command group uses.

181.1.21.5.2 TCustomAdapterCommandGroup.AdapterActionsListHelper Property

Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Pascal

```
property AdapterActionsListHelper: TAdapterActionsListHelper;
```

C++

```
__property TAdapterActionsListHelper AdapterActionsListHelper;
```

Description

The AdapterActionsListHelper provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

181.1.21.5.3 TCustomAdapterCommandGroup.AddDefaultCommands Property

Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

The AddDefaultCommands property provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

181.1.21.5.4 TCustomAdapterCommandGroup.Custom Property

Provides read and write access to the custom HTML element attributes, such as Valign="top."

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

The Custom property provides read and write access to the custom HTML element attributes, such as Valign="top." The content of this string will be written as it is when generating HTML.

181.1.21.5.5 TCustomAdapterCommandGroup.Style Property

Provides read and write access to the internal string that stores the CSS style, such as making the background color red.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

The Style property provides read and write access to the internal string that stores the CSS style, such as making the background color red.

181.1.21.5.6 TCustomAdapterCommandGroup.StyleRule Property

Provides read and write access to the internal string that stores the CSS style rule for the control group.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

The StyleRule property provides read and write access to the internal string that stores the CSS style rule for the control group. This property is used to reference a CSS style defined in TAdapterPageProducer. ::Styles.

181.1.21.5.7 TCustomAdapterCommandGroup.VisibleCommands Property

Provides read-only access to the TWebComponentList that stores the list of visible components.

Pascal

```
property VisibleCommands: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleCommands;
```

Description

The VisibleCommands property provides read-only access to the TWebComponentList that stores the list of visible components.

181.1.22 TCustomAdapterDisplayColumn Class

TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.

Class Hierarchy

Pascal

```
TCustomAdapterDisplayColumn = class(TAdapterDataDisplay);
```

C++

```
class TCustomAdapterDisplayColumn : public TAdapterDataDisplay;
```

File

WebForm

Description

TCustomAdapterDisplayColumn is the base class for grid components that display adapter field data. Do not directly instantiate TCustomAdapterDisplayColumn. Use TAdapterDisplayColumn (see page 25099) or create your own concrete descendants of TCustomAdapterDisplayColumn.

See Also

IWebContent (see page 24792)

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

TAdapterCommandColumn (see page 25052)

TAdapterCommandGroup (see page 25062)

TAdapterDisplayColumn (see page 25099)

181.1.22.1 TCustomAdapterDisplayColumn Members

The following tables list the members exposed by TCustomAdapterDisplayColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 25237)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 25237)	This is ControlContent, a member of class TCustomAdapterDisplayColumn.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	FormatImage (see page 25237)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 25237)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 25238)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.

	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplCanAddClass (see page 25238)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.
	ImplContent (see page 16894)	Provides the underlying implementation for the Content (see page 16890) method.
	ImplContent (see page 25095)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 25238)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
	ImplGetControlRequirements (see page 25238)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplRestoreDefaults (see page 25239)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.

R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25236)	Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 25230).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 25239)	Indicates whether the component generates the controls that appear in the column of a data grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 25097)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.

R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayType (see page 25239)	Sets the display type for the column.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 25098)	Specifies the name of the associated dataset field.
	HideOptions (see page 25098)	When field should be hidden.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	ImageHeight (see page 25240)	Specifies the height of the image in the column.
	ImageWidth (see page 25240)	Specifies the width of the image in the column.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	VAlign (see page 25098)	Specifies the vertical alignment of the generated display control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.22.2 TCustomAdapterDisplayColumn.Create Constructor

Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 25230).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterDisplayColumn(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterDisplayColumn (see page 25230) at runtime. TCustomAdapterDisplayColumn (see page 25230) objects added at design time using the Web Page editor are instantiated automatically.

181.1.22.3 TCustomAdapterDisplayColumn Methods

The methods of the TCustomAdapterDisplayColumn class are listed here.

Protected Methods

	Name	Description
	CanAddClass (see page 25237)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
V	ControlContent (see page 25237)	This is ControlContent, a member of class TCustomAdapterDisplayColumn.
	FormatImage (see page 25237)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 25237)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 25238)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
V	ImplCanAddClass (see page 25238)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.

	ImplFormatColumnHeading (see page 25238)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
	ImplGetControlRequirements (see page 25238)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
	ImplRestoreDefaults (see page 25239)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.

Public Methods

	Name	Description
	IsColumn (see page 25239)	Indicates whether the component generates the controls that appear in the column of a data grid.

181.1.22.3.1 TCustomAdapterDisplayColumn.CanAddClass Method

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddClass, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.2 TCustomAdapterDisplayColumn.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.3 TCustomAdapterDisplayColumn.FormatImage Method

Pascal

```
function FormatImage(const VarName: string; const HTMLName: string; Options:
TWebContentOptions): string;
```

C++

```
__fastcall AnsiString FormatImage(const AnsiString VarName, const AnsiString HTMLName,
TWebContentOptions Options);
```

Description

This is FormatImage, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.4 TCustomAdapterDisplayColumn.FormatListDisplay Method

Pascal

```
function FormatListDisplay(const VarName: string; const HTMLName: string): string;
```

C++

```
__fastcall AnsiString FormatListDisplay(const AnsiString VarName, const AnsiString HTMLName);
```

Description

This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.5 TCustomAdapterDisplayColumn.FormatTextDisplay Method

Pascal

```
function FormatTextDisplay(const VarName: string; const HTMLName: string): string;
```

C++

```
__fastcall AnsiString FormatTextDisplay(const AnsiString VarName, const AnsiString HTMLName);
```

Description

This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
