181.1.22.3.6 TCustomAdapterDisplayColumn.ImplCanAddClass Method

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.7 TCustomAdapterDisplayColumn.ImplFormatColumnHeading Method

Pascal

```
function ImplFormatColumnHeading(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ImplFormatColumnHeading(TWebContentOptions Options);
```

Description

This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.8 TCustomAdapterDisplayColumn.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); override;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.9 TCustomAdapterDisplayColumn.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; override;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.

181.1.22.3.10 TCustomAdapterDisplayColumn.IsColumn Method

Indicates whether the component generates the controls that appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a TCustomAdapterDisplayColumn (see page 25230) object generates the controls that appear in a single column of a data grid. As implemented in TCustomAdapterDisplayColumn (see page 25230), IsColumn always returns true.

See Also

IsColumn (see page 16895)

181.1.22.4 TCustomAdapterDisplayColumn Properties

The properties of the TCustomAdapterDisplayColumn class are listed here.

Public Properties

	Name	Description
	DisplayType (see page 25239)	Sets the display type for the column.
	ImageHeight (see page 25240)	Specifies the height of the image in the column.
	ImageWidth (see page 25240)	Specifies the width of the image in the column.

181.1.22.4.1 TCustomAdapterDisplayColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TColumnHTMLElementType;
```

C++

```
__property TColumnHTMLElementType DisplayType;
```

Description

Set DisplayType to set the display type for the column to text or image.

See Also

ImageHeight (see page 25240)

ImageWidth (see page 25240)

181.1.22.4.2 TCustomAdapterDisplayColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in pixels.

See Also

ImageWidth (see page 25240)

181.1.22.4.3 TCustomAdapterDisplayColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight (see page 25240) to indicate the width of the image in pixels.

See Also

ImageHeight (see page 25240)

181.1.23 TCustomAdapterDisplayField Class

TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.

Class Hierarchy

Pascal

```
TCustomAdapterDisplayField = class(TAdapterDataDisplay, IGetControlRequirements);
```

C++

```
class TCustomAdapterDisplayField : public TAdapterDataDisplay, public IGetControlRequirements;
```

File

WebForm

Description

TCustomAdapterDisplayField is the base class for free-form components that display and edit adapter field data. Do not directly instantiate TCustomAdapterDisplayField. Use TAdapterDisplayField (see page 25109) or create your own concrete descendants of TCustomAdapterDisplayField.

See Also

TCustomAdapterEditColumn (see page 25252)

TAdapterDisplayField (see page 25109)

IWebContent (see page 24792)

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

181.1.23.1 TCustomAdapterDisplayField Members

The following tables list the members exposed by TCustomAdapterDisplayField.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAttributes (see page 25247)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
V	ControlContent (see page 25247)	This is ControlContent, a member of class TCustomAdapterDisplayField.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
V	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
V	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
V	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 25247)	Returns the value of the LayoutAttributes property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
V	ImplContent (see page 25247)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 25248)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
V	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.

V	ImplRestoreDefaults (see page 25248)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.

	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
	Create (see page 25246)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 25240).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 25097)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 25249)	Specifies the number of columns in a display field.
	DisplayRows (see page 25249)	Specifies the number of rows in a display field.
	DisplayType (see page 25249)	Sets the display type for the column.
	DisplayWidth (see page 25250)	Specifies the width, in characters, of the generated HTML field.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 25098)	Specifies the name of the associated dataset field.
	HideOptions (see page 25098)	When field should be hidden.

R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	ImageHeight (see page 25250)	Specifies the height of the image in the column.
	ImageWidth (see page 25250)	Specifies the width of the image in the column.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	InputType (see page 25251)	Specifies the input type for the display field.
	MaxLength (see page 25251)	Specifies the maximum number of characters the user can enter into the display field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SelectRows (see page 25251)	Indicates the number of rows that can be selected.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	TextAreaWrap (see page 25251)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25098)	Specifies the vertical alignment of the generated display control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewMode (see page 25252)	Indicates the viewing state of the adapter field.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.23.2 TCustomAdapterDisplayField.Create Constructor

Creates and initializes an instance of TCustomAdapterDisplayField (see page 25240).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterDisplayField(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterDisplayField (see page 25240) at runtime. TCustomAdapterDisplayField (see page 25240) descendants added at design time using the Web Page editor are instantiated automatically.

181.1.23.3 TCustomAdapterDisplayField Methods

The methods of the TCustomAdapterDisplayField class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 25247)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	ControlContent (see page 25247)	This is ControlContent, a member of class TCustomAdapterDisplayField.
V	GetLayoutAttributes (see page 25247)	Returns the value of the LayoutAttributes property.
V	ImplContent (see page 25247)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25248)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
V	ImplRestoreDefaults (see page 25248)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.

181.1.23.3.1 TCustomAdapterDisplayField.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string);
```

C++

```
__fastcall AddAttributes(AnsiString Attrs);
```

Description

This is AddAttributes, a member of class TCustomAdapterDisplayField.

181.1.23.3.2 TCustomAdapterDisplayField.ControlContent Method

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall AnsiString ControlContent(TWebContentOptions Options);
```

Description

This is ControlContent, a member of class TCustomAdapterDisplayField.

181.1.23.3.3 TCustomAdapterDisplayField.GetLayoutAttributes Method

Returns the value of the LayoutAttributes property.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

GetLayoutAttributes returns the value of the LayoutAttributes property.

LayoutAttributes (see page 16898)

181.1.23.3.4 TCustomAdapterDisplayField.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

Content (see page 16890)

Caption (see page 16897)

ILayoutWebContent (see page 24774)

181.1.23.3.5 TCustomAdapterDisplayField.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); override;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.

181.1.23.3.6 TCustomAdapterDisplayField.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; override;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.

181.1.23.4 TCustomAdapterDisplayField Properties

The properties of the TCustomAdapterDisplayField class are listed here.

Public Properties

	Name	Description
	DisplayColumns (see page 25249)	Specifies the number of columns in a display field.
	DisplayRows (see page 25249)	Specifies the number of rows in a display field.
	DisplayType (see page 25249)	Sets the display type for the column.

	DisplayWidth (see page 25250)	Specifies the width, in characters, of the generated HTML field.
	ImageHeight (see page 25250)	Specifies the height of the image in the column.
	ImageWidth (see page 25250)	Specifies the width of the image in the column.
	InputType (see page 25251)	Specifies the input type for the display field.
	MaxLength (see page 25251)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 25251)	Indicates the number of rows that can be selected.
	TextAreaWrap (see page 25251)	Specifies how the display field treats lines that are longer than the display width.
	ViewMode (see page 25252)	Indicates the viewing state of the adapter field.

181.1.23.4.1 TCustomAdapterDisplayField.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 25249)

181.1.23.4.2 TCustomAdapterDisplayField.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns (see page 25249) to control the number of rows being displayed.

See Also

DisplayColumns (see page 25249)

181.1.23.4.3 TCustomAdapterDisplayField.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

InputType (see page 25251)

181.1.23.4.4 TCustomAdapterDisplayField.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField (see page 25240) control values are one character (M for modified or I for inserted).

181.1.23.4.5 TCustomAdapterDisplayField.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 25250)

ImageWidth (see page 25250)

181.1.23.4.6 TCustomAdapterDisplayField.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight (see page 25250) to indicate the width of the image in the column.

See Also

ImageHeight (see page 25250)

181.1.23.4.7 TCustomAdapterDisplayField.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 25250)

ImageWidth (see page 25250)

DisplayType (see page 25249)

181.1.23.4.8 TCustomAdapterDisplayField.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

181.1.23.4.9 TCustomAdapterDisplayField.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

181.1.23.4.10 TCustomAdapterDisplayField.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth (see page 25250).

See Also

DisplayWidth (see page 25250)

181.1.23.4.11 TCustomAdapterDisplayField.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

Description

Use ViewMode to specify the viewing state of the field.

181.1.24 TCustomAdapterEditColumn Class

TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.

Class Hierarchy

Pascal

```
TCustomAdapterEditColumn = class(TCustomAdapterDisplayField);
```

C++

```
class TCustomAdapterEditColumn : public TCustomAdapterDisplayField;
```

File

WebForm

Description

TCustomAdapterEditColumn has the same functionality as TCustomAdapterDisplayField (see page 25240), but is designed to work with grids. Do not directly instantiate TCustomAdapterEditColumn. Use TAdapterEditColumn (see page 25132) or create your own concrete descendants of TCustomAdapterEditColumn.

See Also

TAdapterEditColumn (see page 25132)

181.1.24.1 TCustomAdapterEditColumn Members

The following tables list the members exposed by TCustomAdapterEditColumn.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddAttributes (see page 25247)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16890)	Returns the HTML that defines the display control.
	ControlContent (see page 16891)	This is ControlContent, a member of class TWebDataDisplay.
	ControlContent (see page 25247)	This is ControlContent, a member of class TCustomAdapterDisplayField.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	EventContent (see page 16891)	This is EventContent, a member of class TWebDataDisplay.
	FieldConditions (see page 25092)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 25093)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 16891)	This is FormatCaption, a member of class TWebDataDisplay.
	FormatCaption (see page 25093)	This is FormatCaption, a member of class TAdapterDataDisplay.
	FormatColumnData (see page 25093)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 25093)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 25093)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 25094)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 16891)	Returns the value of the Caption (see page 16897) property.
	GetCaption (see page 25094)	Returns the value of the Caption property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25094)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 25094)	This is GetDesigntimeWarnings, a member of class TAdapterDataDisplay.
	GetFieldName (see page 25095)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetHTMLControlName (see page 16892)	Returns the name that other components can use to refer to the generated display control.
	GetHTMLForm (see page 16892)	Used internally to retrieve information about the form in which the display control is defined.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLayoutAttributes (see page 16892)	Returns the value of the LayoutAttributes (see page 16898) property.
	GetLayoutAttributes (see page 25247)	Returns the value of the LayoutAttributes property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVariablesContainer (see page 25095)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	GetXmlDisplayName (see page 16893)	Returns the name of the javascript object that uses TWebDataDisplay (see page 16884) to generate one of its display controls. Not used on Linux.
	GetXmlRowSetName (see page 16893)	Returns the name of the rowset in the XML data packet whose data is represented by the HTML this component generates. Not used on Linux.
	ImplContent (see page 25258)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 25096)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 25096)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 25096)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 25248)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
	ImplGetHTMLControlName (see page 16894)	Returns the name that other components can use to refer to the generated display control.
	ImplRestoreDefaults (see page 25096)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 25248)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	LabelContent (see page 16895)	This is LabelContent, a member of class TWebDataDisplay.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	RestoreDefaults (see page 25096)	This is RestoreDefaults, a member of class TAdapterDataDisplay.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
V	SetCaption (see page 16896)	Sets the value of the Caption (see page 16897) property.
V	SetCaption (see page 25097)	Sets the value of the Caption property.
	SetCaptionAttributes (see page 16896)	Sets the value of the CaptionAttributes (see page 16897) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetFieldName (see page 25097)	This is SetFieldName, a member of class TAdapterDataDisplay.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	CaptionPosition (see page 16897)	Specifies where the label appears relative to the generated display control.
R	LayoutAttributes (see page 16898)	Encodes attributes that describe how the generated control should look.
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 16889)	Creates and initializes an instance of TWebDataDisplay (see page 16884).
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 24726)	Creates and initializes an instance of TWebContainedComponent (see page 24722).
V	Create (see page 25092)	Creates and initializes an instance of TWebDataDisplay.
V	Create (see page 25246)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 25240).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 16889)	Frees an instance of TWebDataDisplay (see page 16884).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 24726)	Frees an instance of TWebContainedComponent (see page 24722).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FormatColumnData (see page 17062)	This is FormatColumnData, a member of class IFormatColumn.
	FormatColumnHeading (see page 17062)	This is FormatColumnHeading, a member of class IFormatColumn.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldName (see page 19758)	This is GetFieldName, a member of class IWebGetFieldName.
	GetHTMLControlName (see page 17063)	Returns the name of the generated HTML <INPUT> control.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
V	IsColumn (see page 16895)	Indicates whether the component generates the controls that appear in the column of a grid.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
V	IsQueryField (see page 16895)	Indicates whether the component generates the controls that appear in a query form. Not used on Linux.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RestoreDefaults (see page 17075)	This is RestoreDefaults, a member of class IRestoreDefaults.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetFieldName (see page 19784)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 25097)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 16897)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 16897)	Customizes the appearance of the generated control's label.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 16898)	Represents a tag option and its value in the tag for the display control.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DisplayColumns (see page 25249)	Specifies the number of columns in a display field.
	DisplayRows (see page 25249)	Specifies the number of rows in a display field.
	DisplayType (see page 25249)	Sets the display type for the column.
	DisplayWidth (see page 25250)	Specifies the width, in characters, of the generated HTML field.
R	FieldName (see page 19758)	This is FieldName, a member of class IWebGetFieldName.

	FieldName (see page 25098)	Specifies the name of the associated dataset field.
	HideOptions (see page 25098)	When field should be hidden.
R	HTMLControlName (see page 17064)	Indicates the name of the generated HTML control.
	ImageHeight (see page 25250)	Specifies the height of the image in the column.
	ImageWidth (see page 25250)	Specifies the width of the image in the column.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
	InputType (see page 25251)	Specifies the input type for the display field.
	MaxLength (see page 25251)	Specifies the maximum number of characters the user can enter into the display field.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	SelectRows (see page 25251)	Indicates the number of rows that can be selected.
	Style (see page 16899)	Adds style attributes to the generated display control.
	StyleRule (see page 16899)	This is StyleRule, a member of class TWebDataDisplay.
	TabIndex (see page 16899)	Determines the position of the generated control in the HTML form's tab order.
	TextAreaWrap (see page 25251)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 25098)	Specifies the vertical alignment of the generated display control.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	ViewMode (see page 25252)	Indicates the viewing state of the adapter field.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.24.2 TCustomAdapterEditColumn Methods

The methods of the TCustomAdapterEditColumn class are listed here.

Protected Methods

	Name	Description
V	ImplContent (see page 25258)	Provides the underlying implementation for the Content method.

181.1.24.2.1 TCustomAdapterEditColumn.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

See Also

Content (see page 16890)

Caption (see page 16897)

ILayoutWebContent (see page 24774)

181.1.25 TCustomAdapterErrorList Class

TCustomAdapterErrorList is the base class adapter for components that display error lists.

Class Hierarchy

Pascal

```
TCustomAdapterErrorList = class(TWebContainedComponent, IWebContent, IGetDesigntimeWarnings);
```

C++

```
class TCustomAdapterErrorList : public TWebContainedComponent, public IWebContent, public
IGetDesigntimeWarnings;
```

File

WebForm

Description

TCustomAdapterErrorList is the base class for adapter components that display error lists. Do not instantiate TCustomAdapterErrorList directly. Use TAdapterErrorList (see page 25145), or create your own concrete descendant class.

181.1.25.1 TCustomAdapterErrorList Members

The following tables list the members exposed by TCustomAdapterErrorList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.

	Content (see page 25263)	Returns the HTML that the Web item generates.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetContainerList (see page 24727)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDesigntimeWarnings (see page 25264)	This is GetDesigntimeWarnings, a member of class TCustomAdapterErrorList.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	ImplContent (see page 25264)	This is ImplContent, a member of class TCustomAdapterErrorList.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24728)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 25264)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24728)	Responds when the WebParent (see page 24731) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24729)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24729)	Sets the WebParent (see page 24731) property to be the same as this component's parent.
	SetWebParent (see page 24730)	Sets the value of the WebParent (see page 24731) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 24730)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.

R	WebParent (see page 24731)	Indicates the component that uses this TWebContainedComponent (see page 24722) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25262)	Creates an instance of TCustomAdapterErrorList (see page 25259).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25263)	Frees the memory associated with an instance of TCustomAdapterErrorList (see page 25259).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24727)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24727)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Adapter (see page 25265)	Specifies a related adapter.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.25.2 TCustomAdapterErrorList.Create Constructor

Creates an instance of TCustomAdapterErrorList (see page 25259).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterErrorList(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomAdapterErrorList (see page 25259).

See Also

Create_d

181.1.25.3 TCustomAdapterErrorList.Destroy Destructor

Frees the memory associated with an instance of TCustomAdapterErrorList (see page 25259).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterErrorList();
```

Description

Call Destroy to destroy an instance of TCustomAdapterErrorList (see page 25259) and free the memory associated with it.

181.1.25.4 TCustomAdapterErrorList Methods

The methods of the TCustomAdapterErrorList class are listed here.

Protected Methods

	Name	Description
	Content (see page 25263)	Returns the HTML that the Web item generates.
	GetDesigntimeWarnings (see page 25264)	This is GetDesigntimeWarnings, a member of class TCustomAdapterErrorList.
V	ImplContent (see page 25264)	This is ImplContent, a member of class TCustomAdapterErrorList.
V	Notification (see page 25264)	Forwards notification messages to all owned components.

181.1.25.4.1 TCustomAdapterErrorList.Content Method

Returns the HTML that the Web item generates.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall AnsiString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Call Content to access the HTML produced by the Web item.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web item should lay out its constituent parts. This object supports the ILayoutWebContent interface, which the Web item uses to fit its own content into the parent's HTML structures.

Content returns a string of HTML produced by the Web item.

See Also

ILayoutWebContent (see page 24774)

181.1.25.4.2 TCustomAdapterErrorList.GetDesigntimeWarnings Method

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

This is GetDesigntimeWarnings, a member of class TCustomAdapterErrorList.

181.1.25.4.3 TCustomAdapterErrorList.ImplContent Method

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout Layout);
```

Description

This is ImplContent, a member of class TCustomAdapterErrorList.

181.1.25.4.4 TCustomAdapterErrorList.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

181.1.25.5 TCustomAdapterErrorList Properties

The properties of the TCustomAdapterErrorList class are listed here.

Public Properties

	Name	Description
	Adapter (see page 25265)	Specifies a related adapter.

181.1.25.5.1 TCustomAdapterErrorList.Adapter Property

Specifies a related adapter.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Adapter specifies the adapter component for which this component reports errors.

181.1.26 TCustomAdapterFieldGroup Class

TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.

Class Hierarchy

Pascal

```
TCustomAdapterFieldGroup = class(TAdapterControlGroup, IAdapterDisplay,
IGetAdapterDisplayCharacteristics, IAddFieldsEditor, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterFieldGroup : public TAdapterControlGroup, public IAdapterDisplay, public
IGetAdapterDisplayCharacteristics, public IAddFieldsEditor, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterFieldGroup as a base class for components that generate organized portions of the HTML document containing one or more related HTML controls. TCustomAdapterFieldGroup introduces the properties and methods for managing a collection of Web items that generate the HTML controls that make up the group.

In order to let other Web items use the HTML that defines the organized collection of controls, TCustomAdapterFieldGroup implements the IWebContent interface.

Do not create instances of TCustomAdapterFieldGroup. TCustomAdapterFieldGroup manages the Web items that generate HTML defining controls, but does not combine the generated content into any content of its own. Instead, use a descendant of TCustomAdapterFieldGroup such as TAdapterFieldGroup (see page 25150).

See Also

TAdapterGrid (see page 25175)

TAdapterActionButton (see page 25034)

IWebContent (see page 24792)

181.1.26.1 TCustomAdapterFieldGroup Members

The following tables list the members exposed by TCustomAdapterFieldGroup.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterDisplayCharacteristics (see page 25272)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 25272)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 25273)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 25273)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsItem (see page 25273)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetLayoutAttributes (see page 25273)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 25274)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 25274)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 25274)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.

	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25271)	Creates and initializes an instance of TCustomAdapterFieldGroup (see page 25265).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25272)	Frees an instance of TCustomAdapterFieldGroup (see page 25265).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Adapter (see page 25084)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25085)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 25085)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 25275)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 25275)	Adds style attributes to the generated button group.
	StyleRule (see page 25276)	Applies a style in the page producer's style sheet to the button group.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.26.2 TCustomAdapterFieldGroup.Create Constructor

Creates and initializes an instance of TCustomAdapterFieldGroup (see page 25265).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterFieldGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterFieldGroup (see page 25265) at runtime. TCustomAdapterFieldGroup (see page 25265) objects added at design time using the Web Page editor are instantiated automatically.

181.1.26.3 TCustomAdapterFieldGroup.Destroy Destructor

Frees an instance of TCustomAdapterFieldGroup (see page 25265).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterFieldGroup();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

181.1.26.4 TCustomAdapterFieldGroup Methods

The methods of the TCustomAdapterFieldGroup class are listed here.

Protected Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 25272)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 25272)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAddAllFieldsItem (see page 25273)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 25273)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsItem (see page 25273)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
V	GetLayoutAttributes (see page 25273)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 25274)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
V	ImplCanAddClass (see page 25274)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 25274)	Provides the underlying implementation for the Content method.

181.1.26.4.1 TCustomAdapterFieldGroup.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.

181.1.26.4.2 TCustomAdapterFieldGroup.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.

181.1.26.4.3 TCustomAdapterFieldGroup.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.

181.1.26.4.4 TCustomAdapterFieldGroup.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.

181.1.26.4.5 TCustomAdapterFieldGroup.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.

181.1.26.4.6 TCustomAdapterFieldGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 16879)

181.1.26.4.7 TCustomAdapterFieldGroup.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.

181.1.26.4.8 TCustomAdapterFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

181.1.26.4.9 TCustomAdapterFieldGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the

HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

181.1.26.5 TCustomAdapterFieldGroup Properties

The properties of the TCustomAdapterFieldGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 25275)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 25275)	Adds style attributes to the generated button group.
	StyleRule (see page 25276)	Applies a style in the page producer's style sheet to the button group.

181.1.26.5.1 TCustomAdapterFieldGroup.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button group. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Style (see page 25275)

181.1.26.5.2 TCustomAdapterFieldGroup.Style Property

Adds style attributes to the generated button group.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button group. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 25275)

StyleRule (see page 25276)

181.1.26.5.3 TCustomAdapterFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the button group.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button group. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style (see page 25275) property.

See Also

Style (see page 25275)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.27 TCustomAdapterForm Class

TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.

Class Hierarchy

Pascal

```
TCustomAdapterForm = class(TWebControlGroup, IHTMLForm, IGetFormRequirements,
IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterForm : public TWebControlGroup, public IHTMLForm, public
IGetFormRequirements, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterForm as a base class when defining a form that can contain adapter fields and actions. TCustomAdapterForm is an abstract class, and should not be instantiated directly. Use TAdapterForm (see page 25159), which is a minimal implementation of TCustomAdapterForm, or create your own implementation.

See Also

TDataNavigator (see page 16569)

TQueryButtons (see page 16730)

TDataGrid (see page 16560)

TFieldGroup (see page 16591)

TQueryFieldGroup (see page 16736)

IWebContent (see page 24792)

181.1.27.1 TCustomAdapterForm Members

The following tables list the members exposed by TCustomAdapterForm.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetAdapterFormLayout (see page 25282)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetFormRequirements (see page 25282)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 25282)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 25283)	Returns the name of the javascript variable that refers to the generated form.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetLayoutAttributes (see page 25283)	Returns an object that specifies how the generated group of controls should look.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
	ImplCanAddClass (see page 25283)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 25284)	Provides the underlying implementation for the Content method.
	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.

V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.

	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25281)	Creates and initializes an instance of TCustomAdapterForm (see page 25276).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25281)	Frees an instance of TCustomAdapterForm (see page 25276).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
V	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
V	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	Custom (see page 25285)	Represents a tag option and its value in the generated INPUT tag.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	FormMethod (see page 25285)	Specifies the method that the adapter form adds to its generated <form> tag.
R	HTMLFormName (see page 17066)	Indicates the name of the generated HTML form.
R	HTMLFormVarName (see page 17066)	Indicates the name of the javascript variable that represents the HTML form.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	Style (see page 25285)	Adds style attributes to the generated form.
	StyleRule (see page 25286)	Applies a style in the page producer's style sheet to the form.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.27.2 TCustomAdapterForm.Create Constructor

Creates and initializes an instance of TCustomAdapterForm (see page 25276).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterForm(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterForm (see page 25276) at runtime. TCustomAdapterForm (see page 25276) objects added at design time using the Web Page editor are instantiated automatically.

181.1.27.3 TCustomAdapterForm.Destroy Destructor

Frees an instance of TCustomAdapterForm (see page 25276).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterForm();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for that the object is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.27.4 TCustomAdapterForm Methods

The methods of the TCustomAdapterForm class are listed here.

Protected Methods

	Name	Description
	GetAdapterFormLayout (see page 25282)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetFormRequirements (see page 25282)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 25282)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 25283)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 25283)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 25283)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 25284)	Provides the underlying implementation for the Content method.

181.1.27.4.1 TCustomAdapterForm.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterForm.

181.1.27.4.2 TCustomAdapterForm.GetFormRequirements Method

Pascal

```
procedure GetFormRequirements(ARequirements: TAbstractFormRequirements);
```

C++

```
__fastcall GetFormRequirements(TAbstractFormRequirements ARequirements);
```

Description

This is GetFormRequirements, a member of class TCustomAdapterForm.

181.1.27.4.3 TCustomAdapterForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormName();
```

Description

GetHTMLFormName is the read access method for the HTMLFormName property.

See Also

HTMLFormName (see page 17066)

181.1.27.4.4 TCustomAdapterForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall AnsiString GetHTMLFormVarName();
```

Description

GetHTMLFormVarName is the read access method for the HTMLFormVarName property.

See Also

HTMLFormVarName (see page 17066)

181.1.27.4.5 TCustomAdapterForm.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content (see page 16879)

181.1.27.4.6 TCustomAdapterForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

181.1.27.4.7 TCustomAdapterForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

181.1.27.5 TCustomAdapterForm Properties

The properties of the TCustomAdapterForm class are listed here.

Public Properties

	Name	Description
	Custom (see page 25285)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 25285)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 25285)	Adds style attributes to the generated form.
	StyleRule (see page 25286)	Applies a style in the page producer's style sheet to the form.

181.1.27.5.1 TCustomAdapterForm.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property AnsiString Custom;
```

Description

Use Custom to represent one or more options that qualify the <table> tag that the adapter form generates to manage the layout of its Web items. Each option and its value has the form

`OPTIONNAME=Value`

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

ALIGN=TOP TABINDEX=2

See Also

Style (see page 25285)

181.1.27.5.2 TCustomAdapterForm.FormMethod Property

Specifies the method that the adapter form adds to its generated <form> tag.

Pascal

```
property FormMethod: TFormMethod;
```

C++

```
__property TFormMethod FormMethod;
```

Description

Set FormMethod to specify the METHOD header for HTTP messages that the form submits. This value gives rise to the MethodType property of the HTTP request message.

See Also

MethodType

181.1.27.5.3 TCustomAdapterForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property AnsiString Style;
```

Description

Use Style to add a STYLE option that qualifies the <table> tag that the adapter form generates to manage the layout of its Web items. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated <table> tag as the value of a STYLE option.

See Also

Custom (see page 25285)

StyleRule (see page 25286)

181.1.27.5.4 TCustomAdapterForm.StyleRule Property

Applies a style in the page producer's style sheet to the form.

Pascal

```
property StyleRule: string;
```

C++

```
__property AnsiString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the adapter page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the form's Style (see page 25285) property.

See Also

Style (see page 25285)

Styles (see page 19830)

StylesFile (see page 19831)

181.1.28 TCustomAdapterGrid Class

TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.

Class Hierarchy

Pascal

```
TCustomAdapterGrid = class(TAdapterControlGroup, IAdapterDisplay,
IGetAdapterDisplayCharacteristics, IAddFieldsEditor, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterGrid : public TAdapterControlGroup, public IAdapterDisplay, public
IGetAdapterDisplayCharacteristics, public IAddFieldsEditor, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterGrid as a base class for Web items that generate an HTML table to display multiple records of data supplied by an adapter component. All of the adapter grid's child Web items display field components that use the same adapter, which is specified by a property of the adapter grid.

If no display fields are explicitly added to the adapter grid, it displays all of the adapter's display fields by default. The properties of default display fields cannot be modified.

TCustomAdapterGrid introduces properties to

Specify the associated Adapter (see page 25084)

Specify whether default fields should be added

Customize the appearance of the HTML table.

Do not create instances of TCustomAdapterGrid. Instead, use a descendant of TCustomAdapterGrid such as TAdapterGrid (see page 25175).

See Also

TAdapterCommandColumn (see page 25052)

TAdapterGrid (see page 25175)

TAdapterFieldGroup (see page 25150)

IWebContent (see page 24792)

181.1.28.1 TCustomAdapterGrid Members

The following tables list the members exposed by TCustomAdapterGrid.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AdapterChange (see page 25077)	Responds when the adapter associated with this control group changes.
	AddElements (see page 16878)	Used internally to generate any script declarations needed by the group of controls.
	AddNotify (see page 25077)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	CanAddClass (see page 16878)	Specifies whether a Web item of a specified type can be added to the WebFieldControls (see page 16884) property list.
	ChangeFieldControls (see page 16879)	Responds when the group of HTML controls changes.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	Content (see page 16879)	Returns the HTML that defines the group of HTML controls.
	CreateDefaultFields (see page 25078)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	FindField (see page 25078)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 25079)	Returns the value of the Adapter (see page 25084) property.
	GetAdapterDisplayCharacteristics (see page 25293)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 25294)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAdapterModeOfAdapter (see page 25079)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 25080)	Returns the value of the AdapterMode (see page 25085) property.
	GetAdapterVariableName (see page 25080)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 25294)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 25294)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 25294)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 24743)	Executes a callback for each child Web item.
	GetContainerList (see page 24744)	Returns the TWebComponentList (see page 24708) object that the Web parent uses to manage this and its other Web items.
	GetControlRequirements (see page 25080)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
V	GetDefaultWebComponents (see page 16880)	Returns the value of the DefaultWebComponents (see page 16883) property.
V	GetDefaultWebComponents (see page 24744)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetDesigntimeWarnings (see page 25081)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 25081)	Fills a string list with the names of all of the associated adapter's fields.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetLayoutAttributes (see page 16880)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 25294)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSubComponents (see page 16880)	Returns the value of the WebFieldControls (see page 16884) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVisibleFields (see page 25082)	Returns the value of the VisibleFields (see page 25086) property.
	GetWebComponents (see page 24745)	Returns the list of Web items that this item uses to generate its HTML.
V	ImplAddElements (see page 16881)	Provides the underlying implementation for the AddElements (see page 16878) method.
V	ImplCanAddClass (see page 25295)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 25295)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 25082)	Provides the underlying implementation for the GetControlRequirements (see page 25080) method.
V	ImplGetDefaultComponentList (see page 24746)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetSubComponents (see page 16882)	Provides the underlying implementation for the GetSubComponents (see page 16880) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	IsDefaultField (see page 24746)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsFieldInUse (see page 25082)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25083)	Updates the TAdapterControlGroup (see page 25070) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 25083)	Responds when the control group's adapter notifies it of a change.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	ParentChanged (see page 24747)	Responds when the WebParent (see page 24750) property changes.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 24747)	Reads the component's published properties, stored data, and owned components from a reader object.
	RemoveNotify (see page 25083)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 25084)	Sets the value of the Adapter (see page 25084) property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
V	SetChildOrder (see page 24748)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 16883)	Sets the value of the DefaultWebComponents (see page 16883) property.
V	SetDefaultWebComponents (see page 24748)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
V	SetParentComponent (see page 24748)	Sets the WebParent (see page 24750) property to be the same as this component's parent.
	SetWebParent (see page 24749)	Sets the value of the WebParent (see page 24750) property.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	DefaultWebComponents (see page 16883)	Specifies the default value of the WebFieldControls (see page 16884) property when that property is not explicitly set.
R	WebContainedComponentHelper (see page 24749)	Provides access to the helper object that implements the IWebComponent (see page 24782) interface for this contained component.
R	WebContainerComponentHelper (see page 24750)	Provides access to the helper object that allows this object to manage sub Web items.
R	WebParent (see page 24750)	Indicates the component that uses this TWebContainedContainerComponent (see page 24738) as one of its Web items.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 19726)	Registers an interest in change notifications.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CanAddClass (see page 24791)	Indicates whether a specified class can be used as a child Web item.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Content (see page 24793)	Returns the HTML that the Web item generates.
V	Create (see page 25292)	Creates and initializes an instance of TCustomAdapterGrid (see page 25286).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25293)	Frees an instance of TAdapterControlGroup.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindField (see page 19749)	This is FindField, a member of class IWebDataFields.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetComponentList (see page 24772)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 24784)	Returns the value of the Container (see page 24786) property.
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDefaultComponentList (see page 24772)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetDesigntimeWarnings (see page 19697)	This is GetDesigntimeWarnings, a member of class IGetDesigntimeWarnings.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFieldsList (see page 19750)	This is GetFieldsList, a member of class IWebDataFields.
	GetIndex (see page 24784)	Returns the value of the Index (see page 24786) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParentComponent (see page 24745)	Returns the object that uses this component to generate HTML.
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 19750)	This is GetVisibleFields, a member of class IWebDataFields.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasParent (see page 24745)	Indicates whether this component appears in another component's list of Web items.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsFieldInUse (see page 19750)	This is IsFieldInUse, a member of class IWebDataFields.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyAdapterChange (see page 19725)	Responds when the adapter changes.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.

	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 19726)	Unregisters interest in change notifications.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetComponentList (see page 24784)	Sets the value of the ComponentList (see page 24785) property.
	SetContainer (see page 24784)	Sets the value of the Container (see page 24786) property.
	SetIndex (see page 24785)	Sets the value of the Index (see page 24786) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Adapter (see page 25084)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 25085)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 25085)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
W	ComponentList (see page 24785)	Indicates the component list that contains the Web item.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Container (see page 24786)	Specifies the component that uses content generated by this Web item.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	HeadingAttributes (see page 25296)	Determines the display characteristics of the table's header.
	Index (see page 24786)	Indicates where the Web item appears in the Web component list's array of Web items.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	RowAttributes (see page 25296)	Determines the display characteristics of the table's body.
	TableAttributes (see page 25297)	Determines the basic display characteristics of the table.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
R	VisibleFields (see page 19751)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 25086)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.
R	WebFieldControls (see page 16884)	Lists the components that generate HTML controls for the Web control group.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

181.1.28.2 TCustomAdapterGrid.Create Constructor

Creates and initializes an instance of TCustomAdapterGrid (see page 25286).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterGrid(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterGrid (see page 25286) at runtime. TCustomAdapterGrid (see page 25286) objects added at design time using the Web Page editor are instantiated automatically.

181.1.28.3 TCustomAdapterGrid.Destroy Destructor

Frees an instance of TAdapterControlGroup.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterGrid();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for that the object is not nil before calling Destroy.

See Also

Free (see page 22300)

181.1.28.4 TCustomAdapterGrid Methods

The methods of the TCustomAdapterGrid class are listed here.

Protected Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 25293)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 25294)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAddAllFieldsItem (see page 25294)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 25294)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 25294)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetNewFieldPrefix (see page 25294)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
V	ImplCanAddClass (see page 25295)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 25295)	Provides the underlying implementation for the Content method.

181.1.28.4.1 TCustomAdapterGrid.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.

181.1.28.4.2 TCustomAdapterGrid.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.

181.1.28.4.3 TCustomAdapterGrid.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.

181.1.28.4.4 TCustomAdapterGrid.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall AnsiString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.

181.1.28.4.5 TCustomAdapterGrid.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall AnsiString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TCustomAdapterGrid.

181.1.28.4.6 TCustomAdapterGrid.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall AnsiString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.

181.1.28.4.7 TCustomAdapterGrid.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass (see page 16878)

WebFieldControls (see page 16884)

181.1.28.4.8 TCustomAdapterGrid.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall AnsiString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

See Also

Content (see page 16879)

AddElements (see page 16878)

ILayoutWebContent (see page 24774)

181.1.28.5 TCustomAdapterGrid Properties

The properties of the TCustomAdapterGrid class are listed here.

Public Properties

	Name	Description
	HeadingAttributes (see page 25296)	Determines the display characteristics of the table's header.
	RowAttributes (see page 25296)	Determines the display characteristics of the table's body.
	TableAttributes (see page 25297)	Determines the basic display characteristics of the table.

181.1.28.5.1 TCustomAdapterGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes (see page 25297) or RowAttributes (see page 25296) property instead.

See Also

TableAttributes (see page 25297)

RowAttributes (see page 25296)

181.1.28.5.2 TCustomAdapterGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes (see page 25297) or HeadingAttributes (see page 25296) property instead.

See Also

TableAttributes (see page 25297)

HeadingAttributes (see page 25296)

181.1.28.5.3 TCustomAdapterGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes (see page 25296) property instead.

See Also

RowAttributes (see page 25296)

HeadingAttributes (see page 25296)

181.1.29 TDesigntimeWarnings Class

Class Hierarchy

Pascal

```
TDesigntimeWarnings = class(TAbstractDesigntimeWarnings);
```

C++

```
class TDesigntimeWarnings : public TAbstractDesigntimeWarnings;
```

File

WebForm

Description

This is class WebForm.TDesigntimeWarnings.

181.1.29.1 TDesigntimeWarnings Members

The following tables list the members exposed by TDesigntimeWarnings.

Public Methods

	Name	Description
	AddObject (see page 25298)	Requests any design time warnings from a specified object.
	AddString (see page 25299)	Adds a warning string to the set of warnings that appear at design time.

	Create (see page 25298)	This is Create, a member of class TDesigntimeWarnings.
V	Destroy (see page 25298)	This is Destroy, a member of class TDesigntimeWarnings.

Public Properties

	Name	Description
R	Strings (see page 25299)	This is Strings, a member of class TDesigntimeWarnings.

181.1.29.2 TDesigntimeWarnings.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDesigntimeWarnings();
```

Description

This is Create, a member of class TDesigntimeWarnings.

181.1.29.3 TDesigntimeWarnings.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDesigntimeWarnings();
```

Description

This is Destroy, a member of class TDesigntimeWarnings.

181.1.29.4 TDesigntimeWarnings Methods

The methods of the TDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
V	AddObject (see page 25298)	Requests any design time warnings from a specified object.
V	AddString (see page 25299)	Adds a warning string to the set of warnings that appear at design time.

181.1.29.4.1 TDesigntimeWarnings.AddObject Method

Requests any design time warnings from a specified object.

Pascal

```
procedure AddObject(AObject: TObject); override;
```

C++

```
virtual __fastcall AddObject(TObject * AObject);
```

Description

AddObject collects the design time warnings from the specified object by calling its GetDesigntimeWarnings method (if it has one). If the object has already been added by a previous call to AddObject, AddObject detects this and does nothing.

AObject is the Web item from which to request design-time warnings.

See Also

GetDesigntimeWarnings (see page 25130)

AddString (see page 19632)

181.1.29.4.2 TDesigntimeWarnings.AddString Method

Adds a warning string to the set of warnings that appear at design time.

Pascal

```
procedure AddString(AWarning: string); override;
```

C++

```
virtual __fastcall AddString(AnsiString AWarning);
```

Description

AddString adds a string to the design-time warnings object. The adapter page producer displays all such warning strings in the HTML form that appears in the HTML view of the editor.

AWarning is a warning string that describes a problem that the developer can rectify (such as an invalid property value or missing component).

See Also

TAdapterPageProducer (see page 19802)

AddObject (see page 19632)

181.1.29.5 TDesigntimeWarnings Properties

The properties of the TDesigntimeWarnings class are listed here.

Public Properties

	Name	Description
R	Strings (see page 25299)	This is Strings, a member of class TDesigntimeWarnings.

181.1.29.5.1 TDesigntimeWarnings.Strings Property

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

This is Strings, a member of class TDesigntimeWarnings.

181.1.30 TGeneratedFunctions Class

Class Hierarchy

WebForm.TGeneratedFunctions

Pascal

```
TGeneratedFunctions = class;
```

C++

```
class TGeneratedFunctions;
```

File

WebForm

Description

This is class WebForm.TGeneratedFunctions.

181.1.30.1 TGeneratedFunctions Members

The following tables list the members exposed by TGeneratedFunctions.

Public Methods

	Name	Description
	Add (see page 25301)	This is Add, a member of class TGeneratedFunctions.
	Create (see page 25300)	This is Create, a member of class TGeneratedFunctions.
V	Destroy (see page 25301)	This is Destroy, a member of class TGeneratedFunctions.
	Exists (see page 25301)	This is Exists, a member of class TGeneratedFunctions.

Public Properties

	Name	Description
R	ItemCount (see page 25302)	This is ItemCount, a member of class TGeneratedFunctions.
R	Names (see page 25302)	This is Names, a member of class TGeneratedFunctions.
R	Script (see page 25302)	This is Script, a member of class TGeneratedFunctions.

181.1.30.2 TGeneratedFunctions.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TGeneratedFunctions();
```

Description

This is Create, a member of class TGeneratedFunctions.

181.1.30.3 TGeneratedFunctions.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TGeneratedFunctions();
```

Description

This is Destroy, a member of class TGeneratedFunctions.

181.1.30.4 TGeneratedFunctions Methods

The methods of the TGeneratedFunctions class are listed here.

Public Methods

	Name	Description
	Add (see page 25301)	This is Add, a member of class TGeneratedFunctions.
	Exists (see page 25301)	This is Exists, a member of class TGeneratedFunctions.

181.1.30.4.1 TGeneratedFunctions.Add Method

Pascal

```
procedure Add(const AName: string; const AScript: string);
```

C++

```
__fastcall Add(const AnsiString AName, const AnsiString AScript);
```

Description

This is Add, a member of class TGeneratedFunctions.

181.1.30.4.2 TGeneratedFunctions.Exists Method

Pascal

```
function Exists(const AName: string): Boolean;
```

C++

```
__fastcall Boolean Exists(const AnsiString AName);
```

Description

This is Exists, a member of class TGeneratedFunctions.

181.1.30.5 TGeneratedFunctions Properties

The properties of the TGeneratedFunctions class are listed here.

Public Properties

	Name	Description
R	ItemCount (see page 25302)	This is ItemCount, a member of class TGeneratedFunctions.

R	Names (see page 25302)	This is Names, a member of class TGeneratedFunctions.
R	Script (see page 25302)	This is Script, a member of class TGeneratedFunctions.

181.1.30.5.1 TGeneratedFunctions.ItemCount Property

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

This is ItemCount, a member of class TGeneratedFunctions.

181.1.30.5.2 TGeneratedFunctions.Names Property

Pascal

```
property Names [I: Integer]: string;
```

C++

```
__property AnsiString Names[int I];
```

Description

This is Names, a member of class TGeneratedFunctions.

181.1.30.5.3 TGeneratedFunctions.Script Property

Pascal

```
property Script [I: Integer]: string;
```

C++

```
__property AnsiString Script[int I];
```

Description

This is Script, a member of class TGeneratedFunctions.

181.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterDisplay (see page 25303)	This is class WebForm.IAdapterDisplay.
	IGetAdapterFormLayout (see page 25303)	This is class WebForm.IGetAdapterFormLayout.
	IGetAdapterModeOfDisplay (see page 25304)	This is class WebForm.IGetAdapterModeOfDisplay.
	IGetAdapterOfDisplay (see page 25305)	This is class WebForm.IGetAdapterOfDisplay.
	IGetAdapterVariableName (see page 25306)	This is class WebForm.IGetAdapterVariableName.
	IGetControlRequirements (see page 25308)	This is class WebForm.IGetControlRequirements.
	IGetFormRequirements (see page 25309)	This is class WebForm.IGetFormRequirements.
	IGetVariablesContainerOfDisplay (see page 25310)	This is class WebForm.IGetVariablesContainerOfDisplay.

181.2.1 IAdapterDisplay Interface

Class Hierarchy

WebForm.IAdapterDisplay

Pascal

```
IAdapterDisplay = interface;
```

C++

```
__interface IAdapterDisplay;
```

File

WebForm

Description

This is class WebForm.IAdapterDisplay.

181.2.2 IGetAdapterFormLayout Interface

Class Hierarchy

WebForm.IGetAdapterFormLayout

Pascal

```
IGetAdapterFormLayout = interface;
```

C++

```
__interface IGetAdapterFormLayout;
```

File

WebForm

Description

This is class WebForm.IGetAdapterFormLayout.

181.2.2.1 IGetAdapterFormLayout Members

The following tables list the members exposed by IGetAdapterFormLayout.

Public Methods

	Name	Description
	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

181.2.2.2 IGetAdapterFormLayout Methods

The methods of the IGetAdapterFormLayout class are listed here.

Public Methods

	Name	Description
	GetAdapterFormLayout (see page 25304)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

181.2.2.2.1 IGetAdapterFormLayout.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

181.2.3 IGetAdapterModeOfDisplay Interface

Class Hierarchy

WebForm.IGetAdapterModeOfDisplay

Pascal

```
IGetAdapterModeOfDisplay = interface;
```

C++

```
__interface IGetAdapterModeOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetAdapterModeOfDisplay.

181.2.3.1 IGetAdapterModeOfDisplay Members

The following tables list the members exposed by IGetAdapterModeOfDisplay.

Public Methods

	Name	Description
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

181.2.3.2 IGetAdapterModeOfDisplay Methods

The methods of the IGetAdapterModeOfDisplay class are listed here.

Public Methods

	Name	Description
	GetAdapterModeOfAdapter (see page 25305)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 25305)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

181.2.3.2.1 IGetAdapterModeOfDisplay.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.

181.2.3.2.2 IGetAdapterModeOfDisplay.GetAdapterModeOfDisplay Method

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall AnsiString GetAdapterModeOfDisplay();
```

Description

This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

181.2.4 IGetAdapterOfDisplay Interface

Class Hierarchy

Pascal

```
IGetAdapterOfDisplay = interface;
```

C++

```
__interface IGetAdapterOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetAdapterOfDisplay.

181.2.4.1 IGetAdapterOfDisplay Members

The following tables list the members exposed by IGetAdapterOfDisplay.

Public Methods

	Name	Description
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.

181.2.4.2 IGetAdapterOfDisplay Methods

The methods of the IGetAdapterOfDisplay class are listed here.

Public Methods

	Name	Description
	GetAdapter (see page 25306)	This is GetAdapter, a member of class IGetAdapterOfDisplay.

181.2.4.2.1 IGetAdapterOfDisplay.GetAdapter Method

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

This is GetAdapter, a member of class IGetAdapterOfDisplay.

181.2.5 IGetAdapterVariableName Interface

Class Hierarchy

WebForm.IGetAdapterVariableName

Pascal

```
IGetAdapterVariableName = interface;
```

C++

```
__interface IGetAdapterVariableName;
```

File

WebForm

Description

This is class WebForm.IGetAdapterVariableName.

181.2.5.1 IGetAdapterVariableName Members

The following tables list the members exposed by IGetAdapterVariableName.

Public Methods

	Name	Description
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

181.2.5.2 IGetAdapterVariableName Methods

The methods of the IGetAdapterVariableName class are listed here.

Public Methods

	Name	Description
	GetAdapterVariableName (see page 25307)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

181.2.5.2.1 IGetAdapterVariableName.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall AnsiString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

181.2.5.3 IGetAdapterVariableName Properties

The properties of the IGetAdapterVariableName class are listed here.

Public Properties

	Name	Description
R	AdapterVariableName (see page 25308)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

181.2.5.3.1 IGetAdapterVariableName.AdapterVariableName Property

Pascal

```
property AdapterVariableName: string;
```

C++

```
__property AnsiString AdapterVariableName;
```

Description

This is AdapterVariableName, a member of class IGetAdapterVariableName.

181.2.6 IGetControlRequirements Interface

Class Hierarchy

WebForm.IGetControlRequirements

Pascal

```
IGetControlRequirements = interface;
```

C++

```
__interface IGetControlRequirements;
```

File

WebForm

Description

This is class WebForm.IGetControlRequirements.

181.2.6.1 IGetControlRequirements Members

The following tables list the members exposed by IGetControlRequirements.

Public Methods

	Name	Description
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.

181.2.6.2 IGetControlRequirements Methods

The methods of the IGetControlRequirements class are listed here.

Public Methods

	Name	Description
	GetControlRequirements (see page 25309)	This is GetControlRequirements, a member of class IGetControlRequirements.

181.2.6.2.1 IGetControlRequirements.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class IGetControlRequirements.

181.2.7 IGetFormRequirements Interface

Class Hierarchy

WebForm.IGetFormRequirements

Pascal

```
IGetFormRequirements = interface;
```

C++

```
__interface IGetFormRequirements;
```

File

WebForm

Description

This is class WebForm.IGetFormRequirements.

181.2.7.1 IGetFormRequirements Members

The following tables list the members exposed by IGetFormRequirements.

Public Methods

	Name	Description
	GetFormRequirements (see page 25310)	This is GetFormRequirements, a member of class IGetFormRequirements.

181.2.7.2 IGetFormRequirements Methods

The methods of the IGetFormRequirements class are listed here.

Public Methods

	Name	Description
	GetFormRequirements (see page 25310)	This is GetFormRequirements, a member of class IGetFormRequirements.

181.2.7.2.1 IGetFormRequirements.GetFormRequirements Method

Pascal

```
procedure GetFormRequirements(ARequirements: TAbstractFormRequirements);
```

C++

```
__fastcall GetFormRequirements(TAbstractFormRequirements ARequirements);
```

Description

This is GetFormRequirements, a member of class IGetFormRequirements.

181.2.8 IGetVariablesContainerOfDisplay Interface

Class Hierarchy

WebForm.IGetVariablesContainerOfDisplay

Pascal

```
IGetVariablesContainerOfDisplay = interface;
```

C++

```
__interface IGetVariablesContainerOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetVariablesContainerOfDisplay.

181.2.8.1 IGetVariablesContainerOfDisplay Members

The following tables list the members exposed by IGetVariablesContainerOfDisplay.

Public Methods

	Name	Description
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

181.2.8.2 IGetVariablesContainerOfDisplay Methods

The methods of the IGetVariablesContainerOfDisplay class are listed here.

Public Methods

	Name	Description
	GetVariablesContainer (see page 25311)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

181.2.8.2.1 IGetVariablesContainerOfDisplay.GetVariablesContainer Method

Pascal

```
function GetVariablesContainer: TComponent;
```

C++

```
__fastcall TComponent * GetVariablesContainer();
```

Description

This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

181.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CalcDisplayFieldHTMLElementType (see page 25312)	This is function WebForm.CalcDisplayFieldHTMLElementType.
	CalcDisplayFieldViewMode (see page 25312)	This is function WebForm.CalcDisplayFieldViewMode.
	FindVariablesContainer (see page 25313)	This is function WebForm.FindVariablesContainer.
	FindVariablesContainerInParent (see page 25313)	This is function WebForm.FindVariablesContainerInParent.
	GetAdapterModeOfAdapterInParent (see page 25313)	This is function WebForm.GetAdapterModeOfAdapterInParent.
	MakeAdapterHTMLName (see page 25314)	This is function WebForm.MakeAdapterHTMLName.
	MakeAdapterVariableName (see page 25314)	This is function WebForm.MakeAdapterVariableName.

181.3.1 WebForm.CalcDisplayFieldHTMLElementType Function

Pascal

```
function CalcDisplayFieldHTMLElementType(AField: TComponent; const AAdapterMode: string;
ADisplayType: TDisplayFieldHTMLElementType; var AType: TDisplayFieldHTMLElementType): Boolean;
```

C++

```
Boolean CalcDisplayFieldHTMLElementType(TComponent * AField, const AnsiString AAdapterMode,
TDisplayFieldHTMLElementType ADisplayType, TDisplayFieldHTMLElementType AType);
```

File

WebForm

Description

This is function WebForm.CalcDisplayFieldHTMLElementType.

181.3.2 WebForm.CalcDisplayFieldViewMode Function

Pascal

```
function CalcDisplayFieldViewMode(AField: TComponent; const AAdapterMode: string; AViewMode:
TDisplayFieldViewMode; var AMode: TDisplayFieldViewMode): Boolean;
```

C++

```
Boolean CalcDisplayFieldViewMode(TComponent * AField, const AnsiString AAdapterMode,
TDisplayFieldViewMode AViewMode, TDisplayFieldViewMode AMode);
```

File

WebForm

Description

This is function WebForm.CalcDisplayFieldViewMode.

181.3.3 WebForm.FindVariablesContainer Function

Pascal

```
function FindVariablesContainer(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindVariablesContainer(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.FindVariablesContainer.

181.3.4 WebForm.FindVariablesContainerInParent Function

Pascal

```
function FindVariablesContainerInParent(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindVariablesContainerInParent(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.FindVariablesContainerInParent.

181.3.5 WebForm.GetAdapterModeOfAdapterInParent Function

Pascal

```
function GetAdapterModeOfAdapterInParent(AComponent: TComponent): string;
```

C++

```
AnsiString GetAdapterModeOfAdapterInParent(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.GetAdapterModeOfAdapterInParent.

181.3.6 WebForm.MakeAdapterHTMLName Function

Pascal

```
function MakeAdapterHTMLName(AVarName: string): string;
```

C++

```
AnsiString MakeAdapterHTMLName(AnsiString AVarName);
```

File

WebForm

Description

This is function WebForm.MakeAdapterHTMLName.

181.3.7 WebForm.MakeAdapterVariableName Function

Pascal

```
function MakeAdapterVariableName(AComponent: TComponent): string;
```

C++

```
AnsiString MakeAdapterVariableName(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.MakeAdapterVariableName.

181.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TActionButtonHideOption (see page 25315)	TActionButtonHideOptions (see page 25321) indicates when a control to represent an adapter action should not be generated.
	TColumnHTMLElementType (see page 25316)	This is record WebForm.TColumnHTMLElementType.
	TCommandHTMLElementType (see page 25316)	TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.
	TDisplayFieldHideOption (see page 25317)	TDisplayFieldHideOptions (see page 25321) indicates when a control to represent a dataset field should not be generated.
	TDisplayFieldHTMLElementType (see page 25318)	TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TDisplayFieldViewMode (see page 25318)	TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.
	TInputFieldHTMLElementType (see page 25319)	TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TLayoutState (see page 25320)	This is record WebForm.TLayoutState.

181.4.1 WebForm.TActionButtonHideOption Enumeration

TActionButtonHideOptions (see page 25321) indicates when a control to represent an adapter action should not be generated.

Pascal

```
TActionButtonHideOption = (
  bhoHideOnNoExecuteAccess,
  bhoHideOnActionNotVisible,
  bhoHideOnDisabledAction,
  bhoHideAlways
);
```

C++

```
enum TActionButtonHideOption {
  bhoHideOnNoExecuteAccess,
  bhoHideOnActionNotVisible,
  bhoHideOnDisabledAction,
  bhoHideAlways
};
```

File

WebForm

Description

TActionButtonHideOptions (see page 25321) is a set of TActionButtonHideOption values. It can include zero or more of the following values:

Value	Meaning
bhoHideOnNoExecuteAccess	Suppress the HTML control when the user does not have rights to execute the associated action, as indicated by the action's HasExecuteAccess method. When this flag is set, server-side script can suppress the control by setting the action's CanExecute property to false.

bhoHideOnActionNotVisible	Suppress the HTML control when the action returns false from its GetVisible method. When this flag is set, server-side script can suppress the control by setting the action's Visible property to false. This flag is set by default.
bhoHideOnDisabledAction	Suppress the HTML control when the action returns false from its WebEnabled method. When this flag is set, server-side script can suppress the control by setting the action's Enabled property to false.
bhoHideAlways	Always suppress the HTML control.

181.4.2 WebForm.TColumnHTMLElementType Enumeration

Pascal

```
TColumnHTMLElementType = (
  coltDefault,
  coltText,
  coltImage,
  coltList
);
```

C++

```
enum TColumnHTMLElementType {
  coltDefault,
  coltText,
  coltImage,
  coltList
};
```

File

WebForm

Description

This is record WebForm.TColumnHTMLElementType.

181.4.3 WebForm.TCommandHTMLElementType Enumeration

TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.

Pascal

```
TCommandHTMLElementType = (
  ctDefault,
  ctButton,
  ctImage,
  ctAnchor,
  ctEventImages
);
```

C++

```
enum TCommandHTMLElementType {
  ctDefault,
  ctButton,
```

```
  ctImage,
  ctAnchor,
  ctEventImages
};
```

File

WebForm

Description

Each element type indicates a different HTML element. TCommandHTMLElementType defines HTML elements that the user can click to execute a command.

The following table lists the possible values:

Value	Meaning
ctDefault	Generate the element type that the adapter action object suggests.
ctButton	Generate a push button with a text label.
ctImage	Generate an image that the user can click.
ctAnchor	Generate a hypertext link.
ctEventImages	Generate an element that displays a different image, depending on the users action. That is, the image changes dynamically depending on user events such as whether the mouse is over the control, whether the user is clicking the control, and so on.

See Also

DisplayType

181.4.4 WebForm.TDisplayFieldHideOption Enumeration

TDisplayFieldHideOptions (see page 25321) indicates when a control to represent a dataset field should not be generated.

Pascal

```
TDisplayFieldHideOption = (
  hoHideOnNoInputAccess,
  hoHideOnNoDisplayAccess,
  hoHideOnFieldNotVisible,
  hoHideAlways
);
```

C++

```
enum TDisplayFieldHideOption {
  hoHideOnNoInputAccess,
  hoHideOnNoDisplayAccess,
  hoHideOnFieldNotVisible,
  hoHideAlways
};
```

File

WebForm

Description

TDisplayFieldHideOptions (see page 25321) is a set of TDisplayFieldHideOption values. It can include zero or more of the following values:

Value	Meaning
hoHideOnNoInputAccess	Do not generate a control if the user does not have permission to modify this field.
hoHideOnNoDisplayAccess	Do not generate a control if the user does not have permission to view this field.
hoHideOnFieldNotVisable	Do not generate a control if the field is marked as hidden.
hoHideAlways	Never generate a control for the field.

181.4.5 WebForm.TDisplayFieldHTMLElementType Enumeration

TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.

Pascal

```
TDisplayFieldHTMLElementType = (
  dftDefault,
  dftText,
  dftImage,
  dftList
);
```

C++

```
enum TDisplayFieldHTMLElementType {
  dftDefault,
  dftText,
  dftImage,
  dftList
};
```

File

WebForm

Description

Each element type indicates a different HTML element. TDisplayFieldHTMLElementType defines read-only HTML elements.

The following table lists the possible values:

Value	Meaning
dftDefault	Use the default display type of the component that generates the HTML control
dftText	Display as a text string.
dftImage	Display as an image.
dftList	Display as a list of values.

181.4.6 WebForm.TDisplayFieldViewMode Enumeration

TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.

Pascal

```
TDisplayFieldViewMode = (
  vmDefault,
  vmInput,
  vmDisplay,
  vmToggleOnAccess
);
```

C++

```
enum TDisplayFieldViewMode {
  vmDefault,
  vmInput,
  vmDisplay,
  vmToggleOnAccess
};
```

File

WebForm

Description

The following table lists the possible values for the TDisplayFieldViewMode type and the meaning corresponding to each:

Value	Meaning
vmDefault	Use the default mode associated with the adapter.
vmInput	Generate an input control for the field.
vmDisplay	Generate a read-only control for the field.
vmToggleOnAccess	Generate a control that toggles between read-only and input mode when the user tries to access it.

181.4.7 WebForm.TInputFieldHTMLElementType Enumeration

TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.

Pascal

```
TInputFieldHTMLElementType = (
  iftDefault,
  iftTextInput,
  iftPasswordInput,
  iftSelect,
  iftSelectMultiple,
  iftRadio,
  iftCheckBox,
  iftTextArea,
  iftFile
);
```

C++

```
enum TInputFieldHTMLElementType {
  iftDefault,
  iftTextInput,
  iftPasswordInput,
  iftSelect,
  iftSelectMultiple,
```

```
    iftRadio,
    iftCheckBox,
    iftTextArea,
    iftFile
  };
```

File

WebForm

Description

TInputFieldHTMLElementType defines the set of possible HTML controls that can be used to input an adapter field value. The following table lists the possible values for the TInputFieldHTMLElementType type and the meaning corresponding to each flag:

Flag	Input field type
iftCheckBox	The input field is a check box.
iftDefault	The input field is the default type.
iftFile	The input field is a file.
iftPasswordInput	The input field is a password prompt.
iftRadio	The input field is a radio button.
iftSelect	The input field is selectable. iftSelect is only used with iftCheckBox and iftRadio.
iftSelectMultiple	More than one input field may be selected at a time. iftSelectMultiple is only used with iftCheckBox and iftRadio.
iftTextArea	The field is a text area.
iftTextInput	The input field is a text input box.

181.4.8 WebForm.TLayoutState Enumeration

Pascal

```
  TLayoutState = (
    lsUnknown,
    lsFields,
    lsButtons
  );
```

C++

```
  enum TLayoutState {
    lsUnknown,
    lsFields,
    lsButtons
  };
```

File

WebForm

Description

This is record WebForm.TLayoutState.

181.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActionButtonHideOptions (see page 25321)	This is type WebForm.TActionButtonHideOptions.
TAdapterDataDisplayClass (see page 25321)	This is type WebForm.TAdapterDataDisplayClass.
TDisplayFieldHideOptions (see page 25321)	This is type WebForm.TDisplayFieldHideOptions.

181.5.1 WebForm.TActionButtonHideOptions Type

Pascal

```
TActionButtonHideOptions = set of TActionButtonHideOption;
```

C++

```
TActionButtonHideOption TActionButtonHideOptions;
```

File

WebForm

Description

This is type WebForm.TActionButtonHideOptions.

181.5.2 WebForm.TAdapterDataDisplayClass Type

Pascal

```
TAdapterDataDisplayClass = class of TAdapterDataDisplay;
```

C++

```
TAdapterDataDisplay TAdapterDataDisplayClass;
```

File

WebForm

Description

This is type WebForm.TAdapterDataDisplayClass.

181.5.3 WebForm.TDisplayFieldHideOptions Type

Pascal

```
TDisplayFieldHideOptions = set of TDisplayFieldHideOption;
```

C++

```
TDisplayFieldHideOption TDisplayFieldHideOptions;
```

File

WebForm

Description

This is type WebForm.TDisplayFieldHideOptions.

181.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sDisplayText (see page 25323)	This is constant WebForm.sDisplayText.
sFieldText (see page 25323)	This is constant WebForm.sFieldText.
sFormGet (see page 25324)	This is constant WebForm.sFormGet.
sFormPost (see page 25324)	This is constant WebForm.sFormPost.
sMultipartForm (see page 25324)	This is constant WebForm.sMultipartForm.

181.6.1 WebForm.sDisplayText Constant

Pascal

```
sDisplayText = '<%%= %0:s.DisplayText %%>';
```

C++

```
sDisplayText = '<%%= %0:s.DisplayText %%>';
```

File

WebForm

Description

This is constant WebForm.sDisplayText.

181.6.2 WebForm.sFieldText Constant

Pascal

```
sFieldText = '<%%= %0:s.EditText %%>';
```

C++

```
sFieldText = '<%%= %0:s.EditText %%>';
```

File

WebForm

Description

This is constant WebForm.sFieldText.

181.6.3 WebForm.sFormGet Constant

Pascal

```
sFormGet = 'get';
```

C++

```
sFormGet = 'get';
```

File

WebForm

Description

This is constant WebForm.sFormGet.

181.6.4 WebForm.sFormPost Constant

Pascal

```
sFormPost = 'post';
```

C++

```
sFormPost = 'post';
```

File

WebForm

Description

This is constant WebForm.sFormPost.

181.6.5 WebForm.sMultipartForm Constant

Pascal

```
sMultipartForm = 'multipart/form-data';
```

C++

```
sMultipartForm = 'multipart/form-data';
```

File

WebForm

Description

This is constant WebForm.sMultipartForm.

182 WebModu Namespace

This is namespace WebModu.

Topics

Name	Description
Classes (see page 25327)	The following table lists classes in this documentation.
Functions (see page 25426)	The following table lists functions in this documentation.
Types (see page 25428)	The following table lists types in this documentation.

Classes

	Name	Description
	EWebModuleException (see page 25327)	EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.
	TAdapterActionName (see page 25328)	TAdapterActionName describes an adapter action by name.
	TCustomWebAppDataModule (see page 25332)	TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.
	TCustomWebAppPageModule (see page 25339)	TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.
	TCustomWebDataModule (see page 25348)	TCustomWebDataModule is the base class for all Web modules in a WebSnap application.
	TCustomWebPageModule (see page 25357)	TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.
	TSiteModuleHelper (see page 25368)	TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.
	TSitePageModuleHelper (see page 25377)	TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.
	TWebAppDataModule (see page 25388)	TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.
	TWebAppPageModule (see page 25394)	TWebAppPageModule is used as the WebSnap application module when the application module generates a page.
	TWebAppPageModuleHelper (see page 25403)	This is class WebModu.TWebAppPageModuleHelper.
	TWebDataModule (see page 25405)	TWebDataModule is a container for components in a WebSnap application.
	TWebNotifyContainer (see page 25410)	This is class WebModu.TWebNotifyContainer.
	TWebPageModule (see page 25414)	TWebPageModule is a WebSnap module that generates a page.
	TWebPageModuleHelper (see page 25422)	This is class WebModu.TWebPageModuleHelper.

Functions

	Name	Description
	FindNamedModuleVariable (see page 25426)	This is function WebModu.FindNamedModuleVariable.
	GetModuleVariable (see page 25426)	This is function WebModu.GetModuleVariable.
	GetModuleVariableCount (see page 25426)	This is function WebModu.GetModuleVariableCount.

Types

Name	Description
TGetParamsEvent (see page 25428)	This is type WebModu.TGetParamsEvent.

182.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWebModuleException (see page 25327)	EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.
	TAdapterActionName (see page 25328)	TAdapterActionName describes an adapter action by name.
	TCustomWebAppDataModule (see page 25332)	TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.
	TCustomWebAppPageModule (see page 25339)	TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.
	TCustomWebDataModule (see page 25348)	TCustomWebDataModule is the base class for all Web modules in a WebSnap application.
	TCustomWebPageModule (see page 25357)	TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.
	TSiteModuleHelper (see page 25368)	TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.
	TSitePageModuleHelper (see page 25377)	TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.
	TWebAppDataModule (see page 25388)	TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.
	TWebAppPageModule (see page 25394)	TWebAppPageModule is used as the WebSnap application module when the application module generates a page.
	TWebAppPageModuleHelper (see page 25403)	This is class WebModu.TWebAppPageModuleHelper.
	TWebDataModule (see page 25405)	TWebDataModule is a container for components in a WebSnap application.
	TWebNotifyContainer (see page 25410)	This is class WebModu.TWebNotifyContainer.
	TWebPageModule (see page 25414)	TWebPageModule is a WebSnap module that generates a page.
	TWebPageModuleHelper (see page 25422)	This is class WebModu.TWebPageModuleHelper.

182.1.1 EWebModuleException Class

EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.

Class Hierarchy

Pascal

```
EWebModuleException = class(EWebBrokerException);
```

C++

```
class EWebModuleException : public EWebBrokerException;
```

File

WebModu

Description

EWebModuleException is the exception that is raised when a server-side script in a WebSnap application tries to do direct a Web module to perform a task it does not know how to handle. For example, Web modules raise this exception when a script

tries to access a variable in a Web module that does not support the use of variables.

See Also

TWebDataModule (see page 25405)

TWebAppDataModule (see page 25388)

TWebPageModule (see page 25414)

TWebAppPageModule (see page 25394)

182.1.2 TAdapterActionName Class

TAdapterActionName describes an adapter action by name.

Class Hierarchy

Pascal

```
TAdapterActionName = class(TPersistent);
```

C++

```
class TAdapterActionName : public TPersistent;
```

File

WebModu

Description

TAdapterAction represents a TAdapterAction object. It is used when the action is referenced by name rather than directly as a component. TAdapterAction publishes properties that specify the name of the action and the parent adapter component to which it belongs. The read-only Action (see page 25331) property provides access to the action component with the specified name that belongs to the specified adapter.

See Also

TAdapter (see page 23713)

TAdapterAction (see page 23726)

182.1.2.1 TAdapterActionName Members

The following tables list the members exposed by TAdapterActionName.

Protected Methods

	Name	Description
	AssignTo (see page 25330)	Copies the properties of an object to a destination object.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetOwner (see page 2932)	Returns the owner of an object.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Action (see page 25331)	Indicates the action that this object specifies.

Published Methods

	Name	Description
	Create (see page 25329)	Creates and initializes an instance of TAdapterActionName (see page 25328).

Published Properties

	Name	Description
	ActionName (see page 25331)	Specifies the name of the action this object represents.
	Adapter (see page 25332)	Specifies the adapter to which the action belongs.

182.1.2.2 TAdapterActionName.Create Constructor

Creates and initializes an instance of TAdapterActionName (see page 25328).

Pascal

```
constructor Create(AModule: TComponent);
```

C++

```
__fastcall TAdapterActionName(TComponent * AModule);
```

Description

Call Create to instantiate TAdapterActionName (see page 25328).

AModule is the Web module instance that should be notified if the adapter specified by the Adapter (see page 25332) property is deleted. The TAdapterActionName (see page 25328) constructor calls this Adapter (see page 25332)'s FreeNotification method so that the adapter will notify the Web module if it (and its actions) are freed.

See Also

FreeNotification (see page 2775)

Adapter (see page 25332)

182.1.2.3 TAdapterActionName Methods

The methods of the TAdapterActionName class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 25330)	Copies the properties of an object to a destination object.

182.1.2.3.1 TAdapterActionName.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

182.1.2.4 TAdapterActionName Properties

The properties of the TAdapterActionName class are listed here.

Public Properties

	Name	Description
R	Action (see page 25331)	Indicates the action that this object specifies.

Published Properties

	Name	Description
	ActionName (see page 25331)	Specifies the name of the action this object represents.
	Adapter (see page 25332)	Specifies the adapter to which the action belongs.

182.1.2.4.1 TAdapterActionName.Action Property

Indicates the action that this object specifies.

Pascal

```
property Action: TComponent;
```

C++

```
__property TComponent * Action;
```

Description

Read Action to access the adapter action component specified by the Adapter (see page 25332) and ActionName (see page 25331) properties. That is, Action is the action with the name specified by ActionName (see page 25331) that belongs to the adapter specified by Adapter (see page 25332).

See Also

ActionName (see page 25331)

Adapter (see page 25332)

TAdapterAction (see page 23726)

182.1.2.4.2 TAdapterActionName.ActionName Property

Specifies the name of the action this object represents.

Pascal

```
property ActionName: string;
```

C++

```
__property AnsiString ActionName;
```

Description

Set ActionName to the name of the desired action. This is the name of one of the actions that belongs to the adapter that the Adapter (see page 25332) property specifies.

See Also

Action (see page 25331)

Adapter (see page 25332)

Actions (see page 24181)

182.1.2.4.3 TAdapterActionName.Adapter Property

Specifies the adapter to which the action belongs.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to the adapter component to which the named action belongs. The TAdapterActionName (see page 25328) object represents the action that this adapter returns when you call its FindAction method, passing in the value of the ActionName (see page 25331) property.

See Also

Action (see page 25331)

ActionName (see page 25331)

Actions (see page 24181)

FindAction (see page 24153)

182.1.3 TCustomWebAppDataModule Class

TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.

Class Hierarchy

Pascal

```
TCustomWebAppDataModule = class(TCustomWebDataModule, IGetWebAppServices, IInterface);
```

C++

```
class TCustomWebAppDataModule : public TCustomWebDataModule, public IGetWebAppServices, public
IInterface;
```

File

WebModu

Description

Use TCustomWebAppDataModule as a base class for defining data modules that function as the main Web module in a WebSnap application. As the application module, TCustomWebAppDataModule provides access to the IWebAppServices interface that allows the WebSnap application to create a Web context for incoming requests and to forward requests to a dispatcher for handling.

If you want an application module that also has an associated HTML page, then derive from TCustomWebAppPageModule (see page 25339) instead.

See Also

TWebAppDataModule (see page 25388)

182.1.3.1 TCustomWebAppDataModule Members

The following tables list the members exposed by TCustomWebAppDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebAppServices (see page 25337)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Notification (see page 25338)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 25338)	Returns a reference to a specified interface if the module supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Public Events

	Name	Description
	OnActivate (see page 25356)	Occurs when the Web module is activated.
	OnDeactivate (see page 25357)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25336)	Creates a new TCustomWebAppDataModule (see page 25332) instance.
	CreateNew (see page 25337)	Creates a data module without using the associated form file to initialize it.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.

	Destroy (see page 25337)	Frees a Web application data module instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AppServices (see page 25339)	Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 25332) object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.3.2 TCustomWebAppDataModule.Create Constructor

Creates a new TCustomWebAppDataModule (see page 25332) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebAppDataModule(TComponent * AOwner);
```

Description

Use this constructor to create a new TCustomWebAppDataModule (see page 25332). WebSnap modules are registered with a factory that is responsible for creating modules as needed. The module's source unit defines a function that returns an instance of the module.

AOwner is the component that becomes the value of the Owner property.

182.1.3.3 TCustomWebAppDataModule.CreateNew Constructor

Creates a data module without using the associated form file to initialize it.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebAppDataModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 25336) to create a data module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

182.1.3.4 TCustomWebAppDataModule.Destroy Destructor

Frees a Web application data module instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebAppDataModule();
```

Description

```
destructor Destroy; override;
```

Destroy is the destructor for the object instance. It clears the AppServices (see page 25339) property and calls the inherited destructor. The AppServices (see page 25339) interface is cleared to prevent design time problems that could otherwise occur because the object that implements AppServices (see page 25339) may also be owned by a Web page module.

182.1.3.5 TCustomWebAppDataModule Methods

The methods of the TCustomWebAppDataModule class are listed here.

Protected Methods

	Name	Description
	GetWebAppServices (see page 25337)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	Notification (see page 25338)	Responds to notifications that components are about to be inserted or removed.
V	QueryInterface (see page 25338)	Returns a reference to a specified interface if the module supports that interface.

182.1.3.5.1 TCustomWebAppDataModule.GetWebAppServices Method

Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

GetWebAppServices returns the IWebAppServices interface that is stored in this TCustomWebDataModule (see page 25348). This is the same as the value of the AppServices (see page 25339) property.

See Also

AppServices (see page 25339)

182.1.3.5.2 TCustomWebAppDataModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebAppDataModule (see page 25332) uses this method to check whether the component that implements AppServices (see page 25339) is about to be removed, and if so, sets the value of the AppServices (see page 25339) property to nil (Delphi) or NULL (C++).

See Also

AppServices (see page 25339)

182.1.3.5.3 TCustomWebAppDataModule.QueryInterface Method

Returns a reference to a specified interface if the module supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the Web application module supports the interface specified by IID. If so, QueryInterface

increments the reference count.

sets the Obj parameter so that it points to an instance of the specified interface.

returns 0 to indicate success.

If the Web application module does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

See Also

_AddRef (see page 22397)

182.1.3.6 TCustomWebAppDataModule Properties

The properties of the TCustomWebAppDataModule class are listed here.

Public Properties

	Name	Description
	AppServices (see page 25339)	Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 25332) object.

182.1.3.6.1 TCustomWebAppDataModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 25332) object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

TWebAppComponents (see page 24958)

WebContext (see page 24687)

182.1.4 TCustomWebAppPageModule Class

TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.

Class Hierarchy

Pascal

```
TCustomWebAppPageModule = class(TCustomWebPageModule, IGetWebAppServices, IInterface);
```

C++

```
class TCustomWebAppPageModule : public TCustomWebPageModule, public IGetWebAppServices, public
IInterface;
```

File

WebModu

Description

Use TCustomWebAppPageModule as a base class for defining data modules that function as the main Web module in a WebSnap application and that have an associated Web page. As the application module, TCustomWebAppPageModule provides access to the IWebAppServices interface that allows the WebSnap application to create a Web context for incoming requests and to forward requests to a dispatcher for handling. As a Web page module, TCustomWebAppPageModule generates an associated Web page. This Web page is returned by default when incoming request messages do not specify what Web page they want.

TWebAppPageModule (see page 25394)

WebContext

182.1.4.1 TCustomWebAppPageModule Members

The following tables list the members exposed by TCustomWebAppPageModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSiteModuleHelper (see page 25363)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSitePageModuleHelper (see page 25364)	Returns the value of the SitePageModuleHelper (see page 25366) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebAppServices (see page 25346)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 25346)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 25346)	Returns a reference to a specified interface if the module supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServices (see page 25347)	Sets the value of the AppServices (see page 25347) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.
R	SitePageModuleHelper (see page 25366)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnActivate (see page 25356)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25366)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 25367)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25367)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 25368)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 25357)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25344)	Creates and initializes an instance of TCustomWebAppPageModule (see page 25339).
V	CreateNew (see page 25345)	Creates and initializes an instance of TCustomWebAppPageModule (see page 25339) without using an associated form file.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25345)	Frees an instance of TCustomWebAppPageModule (see page 25339).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AppServices (see page 25347)	Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 25339) object.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	DefaultAction (see page 19696)	This is DefaultAction, a member of class IGetDefaultAction.
	DefaultAction (see page 25365)	Represents the adapter action associated with the Web page module.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PageProducer (see page 25365)	Indicates the interface of the page producer that generates the content of the Web page.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.4.2 TCustomWebAppPageModule.Create Constructor

Creates and initializes an instance of TCustomWebAppPageModule (see page 25339).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebAppPageModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebAppPageModule (see page 25339) constructor. Instead, use a TWebAppPageModuleFactory object to create Web module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 25012)

Owner (see page 2807)

182.1.4.3 TCustomWebAppPageModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebAppPageModule (see page 25339) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebAppPageModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 25344) to create a data module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 25012)

Owner (see page 2807)

182.1.4.4 TCustomWebAppPageModule.Destroy Destructor

Frees an instance of TCustomWebAppPageModule (see page 25339).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebAppPageModule();
```

Description

Destroy is the destructor for the object instance. It clears the AppServices (see page 25347) property and calls the inherited destructor. The AppServices (see page 25347) interface is cleared to prevent design time problems that could otherwise occur because the object that implements AppServices (see page 25347) may also be owned by a Web page module.

See Also

AppServices (see page 25347)

Free (see page 22300)

182.1.4.5 TCustomWebAppPageModule Methods

The methods of the TCustomWebAppPageModule class are listed here.

Protected Methods

	Name	Description
	GetWebAppServices (see page 25346)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	Notification (see page 25346)	Responds to notifications that components are about to be inserted or removed.
V	QueryInterface (see page 25346)	Returns a reference to a specified interface if the module supports that interface.
	SetAppServices (see page 25347)	Sets the value of the AppServices (see page 25347) property.

182.1.4.5.1 TCustomWebAppPageModule.GetWebAppServices Method

Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

GetWebAppServices returns the IWebAppServices interface that is stored in this Web application module. This is the same as the value of the AppServices (see page 25347) property.

See Also

AppServices (see page 25347)

182.1.4.5.2 TCustomWebAppPageModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebAppPageModule (see page 25339) uses this method to check whether the component that implements AppServices (see page 25347) is about to be removed, and if so, sets the value of the AppServices (see page 25347) property to nil (Delphi) or NULL (C++).

See Also

AppServices (see page 25347)

182.1.4.5.3 TCustomWebAppPageModule.QueryInterface Method

Returns a reference to a specified interface if the module supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the Web application module supports the interface specified by IID. If so, QueryInterface

increments the reference count.

sets the Obj parameter so that it points to an instance of the specified interface.

returns 0 to indicate success.

If the Web application module does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

See Also

_AddRef (see page 22397)

182.1.4.5.4 TCustomWebAppPageModule.SetAppServices Method

Sets the value of the AppServices (see page 25347) property.

Pascal

```
procedure SetAppServices(const Value: IWebAppServices);
```

C++

```
__fastcall SetAppServices(const IWebAppServices Value);
```

Description

SetAppServices is the protected write implemenation of the AppServices (see page 25347) property.

See Also

AppServices (see page 25347)

182.1.4.6 TCustomWebAppPageModule Properties

The properties of the TCustomWebAppPageModule class are listed here.

Public Properties

	Name	Description
	AppServices (see page 25347)	Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 25339) object.

182.1.4.6.1 TCustomWebAppPageModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 25339) object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects

on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 24958)

WebContext (see page 24687)

182.1.5 TCustomWebDataModule Class

TCustomWebDataModule is the base class for all Web modules in a WebSnap application.

Class Hierarchy

Pascal

```
TCustomWebDataModule = class(TDataModule, IWebVariablesContainer, INotifyWebActivate,
IIterateObjectSupport, IWebSnapObjClass);
```

C++

```
class TCustomWebDataModule : public TDataModule, public IWebVariablesContainer, public
INotifyWebActivate, public IIterateObjectSupport, public IWebSnapObjClass;
```

File

WebModu

Description

TCustomWebDataModule is the common base class for Web modules that can be used in a WebSnap application. This class introduces properties for the current HTTP request and response objects, a property to hold the current session object, and events that let you respond when the Web module is activated and deactivated. It also introduces support for interacting with server-side script and managing the WebSnap components that are placed into the Web module.

Do not create instances of TCustomWebDataModule. It is intended only as a base class. Instead, use the Web module wizard or the WebSnap application wizard to add a TCustomWebDataModule descendant to your WebSnap application. Descendant classes include TWebAppDataModule (see page 25388), TWebAppPageModule (see page 25394), TWebPageModule (see page 25414), and TWebDataModule (see page 25405).

See Also

TWebAppDataModule (see page 25388)

TWebAppPageModule (see page 25394)

TWebPageModule (see page 25414)

TWebDataModule (see page 25405)

182.1.5.1 TCustomWebDataModule Members

The following tables list the members exposed by TCustomWebDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Public Events

	Name	Description
	OnActivate (see page 25356)	Occurs when the Web module is activated.
	OnDeactivate (see page 25357)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348).
	CreateNew (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25353)	Frees an instance of TCustomWebDataModule (see page 25348).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.

R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.5.2 TCustomWebDataModule.Create Constructor

Creates and initializes an instance of TCustomWebDataModule (see page 25348).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebDataModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebDataModule (see page 25348) constructor. Instead, use a Web module factory object to create Web module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 25012)

TWebAppDataModuleFactory (see page 25009)

TWebDataModuleFactory (see page 25014)

TWebPageModuleFactory (see page 25019)

Owner (see page 2807)

182.1.5.3 TCustomWebDataModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebDataModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 25352) to create a Web module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 25012)

Owner (see page 2807)

182.1.5.4 TCustomWebDataModule.Destroy Destructor

Frees an instance of TCustomWebDataModule (see page 25348).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebDataModule();
```

Description

Typically, WebSnap applications do not explicitly free Web module instances. Instead, the FinishContext method of the Web application services object frees or deactivates Web modules automatically when the application has finished processing an HTTP request.

See Also

FinishContext (see page 15228)

Free (see page 22300)

182.1.5.5 TCustomWebDataModule Methods

The methods of the TCustomWebDataModule class are listed here.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.

182.1.5.5.1 TCustomWebDataModule.GetSiteModuleHelper Method

Returns the value of the SiteModuleHelper (see page 25356) property.

Pascal

```
function GetSiteModuleHelper: TSiteModuleHelper; virtual;
```

C++

```
virtual __fastcall TSiteModuleHelper GetSiteModuleHelper();
```

Description

GetSiteModuleHelper is the protected read implementation of the SiteModuleHelper (see page 25356) property.

See Also

SiteModuleHelper (see page 25356)

182.1.5.5.2 TCustomWebDataModule.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

182.1.5.5.3 TCustomWebDataModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebDataModule (see page 25348) overrides this method to pass the notification on to the object that is the value of the SiteModuleHelper (see page 25356) property.

See Also

SiteModuleHelper (see page 25356)

182.1.5.6 TCustomWebDataModule Properties

The properties of the TCustomWebDataModule class are listed here.

Protected Properties

	Name	Description
R	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Public Properties

	Name	Description
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.

182.1.5.6.1 TCustomWebDataModule.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 25355)

182.1.5.6.2 TCustomWebDataModule.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 25355) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 25355)

182.1.5.6.3 TCustomWebDataModule.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Read Session to obtain information from or add information to the current Web session. All requests are assigned a Web

session, although you can only use the session to store information about the current user if the WebSnap application includes a TSessionsService component. Web sessions persist over multiple calls from the same end user until they are terminated (for example, when the user logs out or when a timeout period elapses).

See Also

TSessionsService (see page 25582)

182.1.5.6.4 TCustomWebDataModule.SiteModuleHelper Property

References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Pascal

```
property SiteModuleHelper: TSiteModuleHelper;
```

C++

```
__property TSiteModuleHelper SiteModuleHelper;
```

Description

Applications can't use the protected SiteModuleHelper property. TCustomWebDataModule (see page 25348) uses this property internally to delegate tasks involved in managing the WebSnap components it contains and to generate the OnActivate (see page 25356) and OnDeactivate (see page 25357) events when the Web module is activated and deactivated.

See Also

OnActivate (see page 25356)

OnDeactivate (see page 25357)

182.1.5.7 TCustomWebDataModule Events

The events of the TCustomWebDataModule class are listed here.

Public Events

	Name	Description
	OnActivate (see page 25356)	Occurs when the Web module is activated.
	OnDeactivate (see page 25357)	Occurs when the Web module is deactivated.

182.1.5.7.1 TCustomWebDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 25357)

CreateMode

182.1.5.7.2 TCustomWebDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 25356)

182.1.6 TCustomWebPageModule Class

TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.

Class Hierarchy

Pascal

```
TCustomWebPageModule = class(TCustomWebDataModule, IDefaultPageFileName, IPageResult,
ISetWebContentOptions, IGetDefaultAction, IGetProducerComponent, IProducerEditorViewSupport);
```

C++

```
class TCustomWebPageModule : public TCustomWebDataModule, public IDefaultPageFileName, public
```

```
IPageResult, public ISetWebContentOptions, public IGetDefaultAction, public
IGetProducerComponent, public IProducerEditorViewSupport;
```

File

WebModu

Description

TCustomWebPageModule is the common base class for Web modules that generate a Web page for a WebSnap application. This class introduces two new properties:

PageProducer (see page 25365), which is a page producer component that generates the Web page associated with this module.

DefaultAction (see page 25365), which is an adapter action associated with the module's Web page. Typically, the action sets up parameters that appear in HTTP requests for the Web page.

TCustomWebPageModule also introduces events that occur when the WebSnap application calls on the Web page module to generate its page or when it generates a redirect message to redirect a request to the associated page.

Do not create instances of TCustomWebPageModule. It is intended only as a base class. Instead, use the Web module wizard or the WebSnap application wizard to add a TCustomWebPageModule descendant to your WebSnap application. Descendant classes include TWebAppPageModule (see page 25394) and TWebPageModule (see page 25414).

See Also

TWebPageModule (see page 25414)

TWebAppPageModule (see page 25394)

182.1.6.1 TCustomWebPageModule Members

The following tables list the members exposed by TCustomWebPageModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25363)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSitePageModuleHelper (see page 25364)	Returns the value of the SitePageModuleHelper (see page 25366) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 25364)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.
R	SitePageModuleHelper (see page 25366)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnActivate (see page 25356)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25366)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 25367)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25367)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 25368)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 25357)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357).
V	CreateNew (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357) without using an associated form file.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25363)	Frees an instance of TCustomWebPageModule (see page 25357).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.

	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultAction (see page 25365)	Represents the adapter action associated with the Web page module.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	PageProducer (see page 25365)	Indicates the interface of the page producer that generates the content of the Web page.
R	Request (see page 25355)	Provides access to the current request object.

R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.6.2 TCustomWebPageModule.Create Constructor

Creates and initializes an instance of TCustomWebPageModule (see page 25357).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebPageModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebPageModule (see page 25357) constructor. Instead, use a Web page module factory object to create Web page module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 25012)

TWebPageModuleFactory (see page 25019)

Owner (see page 2807)

182.1.6.3 TCustomWebPageModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebPageModule (see page 25357) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebPageModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 25362) to create a Web page module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 25012)

Owner (see page 2807)

182.1.6.4 TCustomWebPageModule.Destroy Destructor

Frees an instance of TCustomWebPageModule (see page 25357).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebPageModule();
```

Description

Typically, WebSnap applications do not explicitly free Web page module instances. Instead, the FinishContext method of the Web application services object frees or deactivates Web modules automatically when the application has finished processing an HTTP request.

See Also

FinishContext (see page 15228)

Free (see page 22300)

182.1.6.5 TCustomWebPageModule Methods

The methods of the TCustomWebPageModule class are listed here.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 25363)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetSitePageModuleHelper (see page 25364)	Returns the value of the SitePageModuleHelper (see page 25366) property.
	Notification (see page 25364)	Responds to notifications that components are about to be inserted or removed.

182.1.6.5.1 TCustomWebPageModule.GetSiteModuleHelper Method

Returns the value of the SiteModuleHelper (see page 25356) property.

Pascal

```
function GetSiteModuleHelper: TSiteModuleHelper; override;
```

C++

```
virtual __fastcall TSiteModuleHelper GetSiteModuleHelper();
```

Description

GetSiteModuleHelper is the protected read implementation of the SiteModuleHelper (see page 25356) property. TCustomWebPageModule (see page 25357) overrides the inherited method to return the value of the SitePageModuleHelper (see page 25366) property.

See Also

SiteModuleHelper (see page 25356)

SitePageModuleHelper (see page 25366)

182.1.6.5.2 TCustomWebPageModule.GetSitePageModuleHelper Method

Returns the value of the SitePageModuleHelper (see page 25366) property.

Pascal

```
function GetSitePageModuleHelper: TSitePageModuleHelper; virtual;
```

C++

```
virtual __fastcall TSitePageModuleHelper GetSitePageModuleHelper();
```

Description

GetSitePageModuleHelper is the protected read implementation of the SitePageModuleHelper (see page 25366) property.

See Also

SitePageModuleHelper (see page 25366)

182.1.6.5.3 TCustomWebPageModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebPageModule (see page 25357) overrides this method to update the PageProducer (see page 25365) and DefaultAction (see page 25365) properties as appropriate.

See Also

PageProducer (see page 25365)

DefaultAction (see page 25365)

182.1.6.6 TCustomWebPageModule Properties

The properties of the TCustomWebPageModule class are listed here.

Protected Properties

	Name	Description
	SitePageModuleHelper (see page 25366)	References the helper object that assists in assembling the module's Web page.

Public Properties

	Name	Description
	DefaultAction (see page 25365)	Represents the adapter action associated with the Web page module.

	PageProducer (see page 25365)	Indicates the interface of the page producer that generates the content of the Web page.

182.1.6.6.1 TCustomWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

PageProducer (see page 25365)

182.1.6.6.2 TCustomWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

See Also

TAdapterPageProducer (see page 19802)

TDataSetPagePRoducer

TXSLPagePRoducer

TPageProducer (see page 15309)

TDataSetTableProducer (see page 10277)

TQueryTableProducer (see page 8152)

TInetXPageProducer (see page 17145)

182.1.6.6.3 TCustomWebPageModule.SitePageModuleHelper Property

References the helper object that assists in assembling the module's Web page.

Pascal

```
property SitePageModuleHelper: TSitePageModuleHelper;
```

C++

```
__property TSitePageModuleHelper SitePageModuleHelper;
```

Description

Applications can't use the protected SitePageModuleHelper property. TCustomWebPageModule (see page 25357) uses this property internally to delegate tasks involved in assembling the content of its Web page and in interacting with editor views at design time.

182.1.6.7 TCustomWebPageModule Events

The events of the TCustomWebPageModule class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 25366)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 25367)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25367)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 25368)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

182.1.6.7.1 TCustomWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 25367)

PageProducer (see page 25365)

Response (see page 25355)

182.1.6.7.2 TCustomWebPageModule.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

Write an OnAfterRedirectToPage event handler to take any final action before returns a response message that redirects the user to this Web page. For example, the OnAfterRedirectToPage event handler can make adjustments to the headers of the response message.

This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost) to this page.

See Also

OnBeforeRedirectToPage (see page 25368)

OnAfterDispatchPage (see page 25366)

RedirectOptions (see page 24074)

Response (see page 25355)

182.1.6.7.3 TCustomWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request (see page 25355) and Response (see page 25355) properties.

See Also

OnAfterDispatchPage (see page 25366)

Request (see page 25355)

Response (see page 25355)

PageProducer (see page 25365)

182.1.6.7.4 TCustomWebPageModule.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

Write an OnBeforeRedirectToPage event handler to perform any tasks necessary for redirecting a request to the associated Web page. For example, the OnBeforeRedirectToPage event handler can add parameters to the Params parameter so that they appear in the request that results from the redirection. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

If the event handler sets Handled to true, the Web page module assumes it has handled the redirection and performs no further processing. Otherwise, after the event handler exits, the Web page module sets up the response message to encode the redirection parameters and calls SendRedirect.

See Also

OnAfterRedirectToPage (see page 25367)

OnBeforeDispatchPage (see page 25367)

SendRedirect (see page 15201)

Request (see page 25355)

Response (see page 25355)

182.1.7 TSiteModuleHelper Class

TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSiteModuleHelper = class(TObject);
```

C++

```
class TSiteModuleHelper : public TObject;
```

File

WebModu

Description

Web modules create and use an instance of TSiteModuleHelper to keep track of WebSnap objects contained in the module and to generate OnActivate (see page 25376) and OnDeactivate (see page 25376) events when the Web module is activated and deactivated.

You should not need to work directly with TSiteModuleHelper instances. The Web module creates and uses this object.

See Also

TCustomWebDataModule (see page 25348)

TCustomWebDataModule (see page 25348)

TCustomWebDataModule (see page 25348)

182.1.7.1 TSiteModuleHelper Members

The following tables list the members exposed by TSiteModuleHelper.

Protected Methods

	Name	Description
	EndIterator (see page 25371)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 25371)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 25372)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 25372)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 25372)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 25372)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 25373)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 25373)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 25373)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 25374)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 25374)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 25374)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 25376)	This is OnActivate, a member of class TSiteModuleHelper.
	OnDeactivate (see page 25376)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25370)	Creates and initializes an instance of TSiteModuleHelper (see page 25368).

V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25370)	Frees an instance of TSiteModuleHelper (see page 25368).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 25373)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Request (see page 25375)	Provides access to the current request object.
R	Response (see page 25375)	Provides access to the current response object.
R	Session (see page 25375)	Provides access to the current Web session.
R	WebModuleContext (see page 25376)	Keeps track of name/value pairs that store information for the Web module.

182.1.7.2 TSiteModuleHelper.Create Constructor

Creates and initializes an instance of TSiteModuleHelper (see page 25368).

Pascal

```
constructor Create(AModule: TComponent); virtual;
```

C++

```
virtual __fastcall TSiteModuleHelper(TComponent * AModule);
```

Description

Web modules call the TSiteModuleHelper (see page 25368) constructor from their own constructors.

AModule is the Web module that is using the TSiteModuleHelper (see page 25368) object to keep track of its components and activation events. The TSiteModuleHelper (see page 25368) object becomes the value of the module's SiteModuleHelper property.

See Also

SiteModuleHelper (see page 25356)

182.1.7.3 TSiteModuleHelper.Destroy Destructor

Frees an instance of TSiteModuleHelper (see page 25368).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSiteModuleHelper();
```

Description

Do not free TSiteModuleHelper (see page 25368) instances. This object is freed by the Web module that uses it.

See Also

Free (see page 22300)

182.1.7.4 TSiteModuleHelper Methods

The methods of the TSiteModuleHelper class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 25371)	This is EndIterator, a member of class TSiteModuleHelper.
	FindNamedVariable (see page 25371)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 25372)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 25372)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 25372)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 25372)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 25373)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 25373)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 25373)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 25374)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 25374)	This is StartIterator, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
	Notification (see page 25373)	Responds to notifications that components are about to be inserted or removed.

182.1.7.4.1 TSiteModuleHelper.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TSiteModuleHelper.

182.1.7.4.2 TSiteModuleHelper.FindNamedVariable Method

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const AnsiString AName);
```

Description

This is FindNamedVariable, a member of class TSiteModuleHelper.

182.1.7.4.3 TSiteModuleHelper.FindVariable Method

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const AnsiString AName);
```

Description

This is FindVariable, a member of class TSiteModuleHelper.

182.1.7.4.4 TSiteModuleHelper.FindVariableContainer Method

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const AnsiString AName);
```

Description

This is FindVariableContainer, a member of class TSiteModuleHelper.

182.1.7.4.5 TSiteModuleHelper.GetCurrentObject Method

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

This is GetCurrentObject, a member of class TSiteModuleHelper.

182.1.7.4.6 TSiteModuleHelper.GetVariable Method

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

This is GetVariable, a member of class TSiteModuleHelper.

182.1.7.4.7 TSiteModuleHelper.GetVariableCount Method

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

This is GetVariableCount, a member of class TSiteModuleHelper.

182.1.7.4.8 TSiteModuleHelper.NextIteration Method

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

This is NextIteration, a member of class TSiteModuleHelper.

182.1.7.4.9 TSiteModuleHelper.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation);
```

C++

```
__fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TSiteModuleHelper (see page 25368) overrides this method to ensure that any WebSnap objects added to the associated module receive notifications when the module is activated or deactivated.

182.1.7.4.10 TSiteModuleHelper.NotifyActivate Method

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

This is NotifyActivate, a member of class TSiteModuleHelper.

182.1.7.4.11 TSiteModuleHelper.NotifyDeactivate Method

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

This is NotifyDeactivate, a member of class TSiteModuleHelper.

182.1.7.4.12 TSiteModuleHelper.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TSiteModuleHelper.

182.1.7.5 TSiteModuleHelper Properties

The properties of the TSiteModuleHelper class are listed here.

Protected Properties

	Name	Description
R	Module (see page 25374)	This is Module, a member of class TSiteModuleHelper.

Public Properties

	Name	Description
R	Request (see page 25375)	Provides access to the current request object.
R	Response (see page 25375)	Provides access to the current response object.
R	Session (see page 25375)	Provides access to the current Web session.
R	WebModuleContext (see page 25376)	Keeps track of name/value pairs that store information for the Web module.

182.1.7.5.1 TSiteModuleHelper.Module Property

Pascal

```
property Module: TComponent;
```

C++

```
__property TComponent * Module;
```

Description

This is Module, a member of class TSiteModuleHelper.

182.1.7.5.2 TSiteModuleHelper.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 25375)

182.1.7.5.3 TSiteModuleHelper.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 25375) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 25375)

182.1.7.5.4 TSiteModuleHelper.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Read Session to obtain information from or add information to the current Web session. All requests are assigned a Web session, although you can only use the session to store information about the current user if the WebSnap application includes a TSessionsService component. Web sessions persist over multiple calls from the same end user until they are terminated (for example, when the user logs out or when a time-out period elapses).

See Also

TSessionsService (see page 25582)

182.1.7.5.5 TSiteModuleHelper.WebModuleContext Property

Keeps track of name/value pairs that store information for the Web module.

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

Use WebModuleContext to access the TWebModuleContext object. The TWebModuleContext object maintains a list of named variables that the components in the Web module can use.

See Also

WebModuleContext (see page 15279)

182.1.7.6 TSiteModuleHelper Events

The events of the TSiteModuleHelper class are listed here.

Public Events

	Name	Description
	OnActivate (see page 25376)	This is OnActivate, a member of class TSiteModuleHelper.
	OnDeactivate (see page 25376)	This is OnDeactivate, a member of class TSiteModuleHelper.

182.1.7.6.1 TSiteModuleHelper.OnActivate Event

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

This is OnActivate, a member of class TSiteModuleHelper.

182.1.7.6.2 TSiteModuleHelper.OnDeactivate Event

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

This is OnDeactivate, a member of class TSiteModuleHelper.

182.1.8 TSitePageModuleHelper Class

TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSitePageModuleHelper = class(TSiteModuleHelper);
```

C++

```
class TSitePageModuleHelper : public TSiteModuleHelper;
```

File

WebModu

Description

Web page modules create and use an instance of TSitePageModuleHelper to assist in the following tasks:

Assembling the content of the associated Web page.

Interacting with editor views at design time.

Keeping track of WebSnap objects contained in the module.

Generating the events that occur when the Web module is activated or deactivated, and when it dispatches or redirects a request for a Web page.

You should not need to work directly with TSitePageModuleHelper instances. The Web page module creates and uses this object.

See Also

TCustomWebPageModule (see page 25357)

TCustomWebDataModule (see page 25348)

TCustomWebDataModule (see page 25348)

TCustomWebPageModule (see page 25357)

TCustomWebPageModule (see page 25357)

TCustomWebPageModule (see page 25357)

TCustomWebPageModule (see page 25357)

182.1.8.1 TSitePageModuleHelper Members

The following tables list the members exposed by TSitePageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 25380)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 25371)	This is EndIterator, a member of class TSiteModuleHelper.
	FindNamedVariable (see page 25371)	This is FindNamedVariable, a member of class TSiteModuleHelper.

	FindVariable (see page 25372)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 25372)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 25372)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 25381)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 25381)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 25381)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 25381)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 25382)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 25382)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 25372)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 25373)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 25382)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 25382)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 25382)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 25383)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 25383)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 25383)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 25383)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 25384)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 25384)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 25384)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 25384)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 25385)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 25373)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 25373)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 25374)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 25385)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 25385)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 25385)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 25374)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 25374)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 25376)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 25386)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 25387)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25387)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 25387)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 25376)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25379)	Creates and initializes an instance of TSitePageModuleHelper (see page 25377).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25380)	Frees an instance of TSitePageModuleHelper (see page 25377).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 25373)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DefaultAction (see page 25386)	Represents the adapter action associated with the Web page module.
R	Request (see page 25375)	Provides access to the current request object.
R	Response (see page 25375)	Provides access to the current response object.
R	Session (see page 25375)	Provides access to the current Web session.
R	WebModuleContext (see page 25376)	Keeps track of name/value pairs that store information for the Web module.

182.1.8.2 TSitePageModuleHelper.Create Constructor

Creates and initializes an instance of TSitePageModuleHelper (see page 25377).

Pascal

```
constructor Create(AModule: TComponent); override;
```

C++

```
virtual __fastcall TSitePageModuleHelper(TComponent * AModule);
```

Description

Web page modules call the TSitePageModuleHelper (see page 25377) constructor from their own constructors.

AModule is the Web page module that is using the TSitePageModuleHelper (see page 25377) object to generate events and help assemble its Web content. The TSitePageModuleHelper (see page 25377) object becomes the value of the module's SitePageModuleHelper property.

See Also

SitePageModuleHelper (see page 25366)

182.1.8.3 TSitePageModuleHelper.Destroy Destructor

Frees an instance of TSitePageModuleHelper (see page 25377).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSitePageModuleHelper();
```

Description

Do not free TSitePageModuleHelper (see page 25377) instances. This object is freed by the Web page module that uses it.

See Also

Free (see page 22300)

182.1.8.4 TSitePageModuleHelper Methods

The methods of the TSitePageModuleHelper class are listed here.

Protected Methods

	Name	Description
	DispatchPage (see page 25380)	This is DispatchPage, a member of class TSitePageModuleHelper.
	GetDefaultAction (see page 25381)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 25381)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 25381)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 25381)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 25382)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 25382)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetXMLData (see page 25382)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 25382)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 25382)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 25383)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 25383)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 25383)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 25383)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 25384)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 25384)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 25384)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 25384)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 25385)	This is IncludePage, a member of class TSitePageModuleHelper.
	RedirectToPage (see page 25385)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 25385)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 25385)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.

182.1.8.4.1 TSitePageModuleHelper.DispatchPage Method

Pascal

```
function DispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchPage(const AnsiString APageName, TWebResponse AWebResponse);
```

Description

This is DispatchPage, a member of class TSitePageModuleHelper.

182.1.8.4.2 TSitePageModuleHelper.GetDefaultAction Method

Pascal

```
function GetDefaultAction: TComponent;
```

C++

```
__fastcall TComponent * GetDefaultAction();
```

Description

This is GetDefaultAction, a member of class TSitePageModuleHelper.

182.1.8.4.3 TSitePageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; virtual;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TSitePageModuleHelper.

182.1.8.4.4 TSitePageModuleHelper.GetProducerComponent Method

Pascal

```
function GetProducerComponent: TComponent;
```

C++

```
__fastcall TComponent * GetProducerComponent();
```

Description

This is GetProducerComponent, a member of class TSitePageModuleHelper.

182.1.8.4.5 TSitePageModuleHelper.GetRedirectParams Method

Pascal

```
procedure GetRedirectParams(const APageName: string; AParams: TStrings);
```

C++

```
__fastcall GetRedirectParams(const AnsiString APageName, TStrings AParams);
```

Description

This is GetRedirectParams, a member of class TSitePageModuleHelper.

182.1.8.4.6 TSitePageModuleHelper.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall AnsiString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class TSitePageModuleHelper.

182.1.8.4.7 TSitePageModuleHelper.GetTemplateStream Method

Pascal

```
function GetTemplateStream(const APage: string; out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetTemplateStream(const AnsiString APage, Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TSitePageModuleHelper.

182.1.8.4.8 TSitePageModuleHelper.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class TSitePageModuleHelper.

182.1.8.4.9 TSitePageModuleHelper.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class TSitePageModuleHelper.

182.1.8.4.10 TSitePageModuleHelper.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.

182.1.8.4.11 TSitePageModuleHelper.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class TSitePageModuleHelper.

182.1.8.4.12 TSitePageModuleHelper.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class TSitePageModuleHelper.

182.1.8.4.13 TSitePageModuleHelper.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class TSitePageModuleHelper.

182.1.8.4.14 TSitePageModuleHelper.HTMLFromTemplate Method

Pascal

```
function HTMLFromTemplate(AStream: TStream): string;
```

C++

```
__fastcall AnsiString HTMLFromTemplate(TStream AStream);
```

Description

This is HTMLFromTemplate, a member of class TSitePageModuleHelper.

182.1.8.4.15 TSitePageModuleHelper.ImplDispatchPage Method

Pascal

```
function ImplDispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplDispatchPage(const AnsiString APageName, TWebResponse
AWebResponse);
```

Description

This is ImplDispatchPage, a member of class TSitePageModuleHelper.

182.1.8.4.16 TSitePageModuleHelper.ImplIncludePage Method

Pascal

```
function ImplIncludePage(const APageName: string; var AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream ImplIncludePage(const AnsiString APageName, Boolean AOwned);
```

Description

This is ImplIncludePage, a member of class TSitePageModuleHelper.

182.1.8.4.17 TSitePageModuleHelper.ImplRedirectToPage Method

Pascal

```
function ImplRedirectToPage(const APageName: string; AParams: TStrings; AResponse:
TWebResponse): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplRedirectToPage(const AnsiString APageName, TStrings AParams,
TWebResponse AResponse);
```

Description

This is ImplRedirectToPage, a member of class TSitePageModuleHelper.

182.1.8.4.18 TSitePageModuleHelper.ImplSetWebContentOptions Method

Pascal

```
procedure ImplSetWebContentOptions(AOptions: TWebContentOptions); virtual;
```

C++

```
virtual __fastcall ImplSetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.

182.1.8.4.19 TSitePageModuleHelper.IncludePage Method

Pascal

```
function IncludePage(const APageName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream IncludePage(const AnsiString APageName, Boolean AOwned);
```

Description

This is IncludePage, a member of class TSitePageModuleHelper.

182.1.8.4.20 TSitePageModuleHelper.RedirectToPage Method

Pascal

```
function RedirectToPage(const APageName: string; AParams: TStrings; AResponse: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean RedirectToPage(const AnsiString APageName, TStrings AParams, TWebResponse
AResponse);
```

Description

This is RedirectToPage, a member of class TSitePageModuleHelper.

182.1.8.4.21 TSitePageModuleHelper.SetDefaultPageFileName Method

Pascal

```
procedure SetDefaultPageFileName(const AValue: string);
```

C++

```
__fastcall SetDefaultPageFileName(const AnsiString AValue);
```

Description

This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.

182.1.8.4.22 TSitePageModuleHelper.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class TSitePageModuleHelper.

182.1.8.5 TSitePageModuleHelper Properties

The properties of the TSitePageModuleHelper class are listed here.

Public Properties

	Name	Description
	DefaultAction (see page 25386)	Represents the adapter action associated with the Web page module.

182.1.8.5.1 TSitePageModuleHelper.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 25365)

182.1.8.6 TSitePageModuleHelper Events

The events of the TSitePageModuleHelper class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 25386)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 25387)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25387)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 25387)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

182.1.8.6.1 TSitePageModuleHelper.OnAfterDispatchPage Event

Occurs after the Web page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

OnAfterDispatchPage uses the same event handler as that of the Web page module's OnAfterDispatchPage event. The TSitePageModuleHelper (see page 25377) object generates this event after the Web page module writes the content for its Web page to the response object.

See Also

ondeactivate (see page 25376)

OnAfterDispatchPage (see page 25366)

182.1.8.6.2 TSitePageModuleHelper.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

OnAfterRedirectToPage uses the same event handler as that of the Web page module's OnAfterRedirectToPage event. The TSitePageModuleHelper (see page 25377) object generates this event after the Web page module sends a response redirecting the caller to its Web page.

See Also

OnBeforeRedirectToPage (see page 25387)

OnAfterRedirectToPage (see page 25367)

182.1.8.6.3 TSitePageModuleHelper.OnBeforeDispatchPage Event

Occurs before the Web module generates the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

OnBeforeDispatchPage uses the same event handler as that of the Web page module's OnBeforeDispatchPage event. The TSitePageModuleHelper (see page 25377) object generates this event before the Web page module generates the content for its Web page.

See Also

OnAfterDispatchPage (see page 25386)

OnBeforeDispatchPage (see page 25367)

182.1.8.6.4 TSitePageModuleHelper.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

OnBeforeRedirectToPage uses the same event handler as that of the Web page module's OnBeforeRedirectToPage event. The TSitePageModuleHelper (see page 25377) object generates this event before the Web page module assembles and sends a response redirecting the caller to its Web page.

See Also

OnAfterRedirectToPage (see page 25387)

OnBeforeRedirectToPage (see page 25368)

182.1.9 TWebAppDataModule Class

TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.

Class Hierarchy

Pascal

```
TWebAppDataModule = class(TCustomWebAppDataModule);
```

C++

```
class TWebAppDataModule : public TCustomWebAppDataModule;
```

File

WebModu

Description

TWebAppDataModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppDataModule when it creates a TWebAppDataModule. System (see page 22079) components may be added or removed later. TWebAppComponents is the component in a TWebAppDataModule that references all of the system components in use by the WebSnap application.

See Also

Web Modules

182.1.9.1 TWebAppDataModule Members

The following tables list the members exposed by TWebAppDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebAppServices (see page 25337)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25338)	Responds to notifications that components are about to be inserted or removed.
V	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 25338)	Returns a reference to a specified interface if the module supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.

	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 2827)	Creates an instance of a data module.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 25336)	Creates a new TCustomWebAppDataModule (see page 25332) instance.
	Create (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348).
	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
	CreateNew (see page 25337)	Creates a data module without using the associated form file to initialize it.
	CreateNew (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2829)	Destroys the instance of the data module.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 25337)	Frees a Web application data module instance.
	Destroy (see page 25353)	Frees an instance of TCustomWebDataModule (see page 25348).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebAppServices (see page 15221)	This is GetWebAppServices, a member of class IGetWebAppServices.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.

R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActivate (see page 25393)	Occurs when the Web module is activated.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDeactivate (see page 25393)	Occurs when the Web module is deactivated.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	AppServices (see page 25392)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.9.2 TWebAppDataModule Properties

The properties of the TWebAppDataModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 25392)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

182.1.9.2.1 TWebAppDataModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 24958)

WebContext (see page 24687)

182.1.9.3 TWebAppDataModule Events

The events of the TWebAppDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 25393)	Occurs when the Web module is activated.
	OnDeactivate (see page 25393)	Occurs when the Web module is deactivated.

182.1.9.3.1 TWebAppDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 25357)

CreateMode

182.1.9.3.2 TWebAppDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 25356)

182.1.10 TWebAppPageModule Class

TWebAppPageModule is used as the WebSnap application module when the application module generates a page.

Class Hierarchy

Pascal

```
TWebAppPageModule = class(TCustomWebAppPageModule);
```

C++

```
class TWebAppPageModule : public TCustomWebAppPageModule;
```

File

WebModu

Description

Like TWebAppDataModule (see page 25388), TWebAppPageModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppPageModule when it creates a TWebAppPageModule. System (see page 22079) components may be added or removed later. TWebAppComponents is the component in a TWebAppPageModule that references all of the system components in use by the WebSnap application.

The WebAppPageModule is different from TWebAppDataModule (see page 25388) because it generates a page. The PageProducer (see page 25400) property references the producer component responsible for generating content. This property must not be nil (Delphi) or NULL (C++) or no content will be generated. The WebSnap Application Wizard automatically adds a page producer component when it creates a new TWebAppPageModule.

Web Modules

182.1.10.1 TWebAppPageModule Members

The following tables list the members exposed by TWebAppPageModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSiteModuleHelper (see page 25363)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSitePageModuleHelper (see page 25364)	Returns the value of the SitePageModuleHelper (see page 25366) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetWebAppServices (see page 25346)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25346)	Responds to notifications that components are about to be inserted or removed.
V	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.
V	Notification (see page 25364)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	QueryInterface (see page 25346)	Returns a reference to a specified interface if the module supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.

	SetAppServices (see page 25347)	Sets the value of the AppServices (see page 25347) property.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.
R	SitePageModuleHelper (see page 25366)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 25367)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeRedirectToPage (see page 25368)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 2827)	Creates an instance of a data module.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 25344)	Creates and initializes an instance of TCustomWebAppPageModule (see page 25339).

	Create (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348).
	Create (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357).
	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
	CreateNew (see page 25345)	Creates and initializes an instance of TCustomWebAppPageModule (see page 25339) without using an associated form file.
	CreateNew (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.
	CreateNew (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357) without using an associated form file.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2829)	Destroys the instance of the data module.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 25345)	Frees an instance of TCustomWebAppPageModule (see page 25339).
	Destroy (see page 25353)	Frees an instance of TCustomWebDataModule (see page 25348).
	Destroy (see page 25363)	Frees an instance of TCustomWebPageModule (see page 25357).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetWebAppServices (see page 15221)	This is GetWebAppServices, a member of class IGetWebAppServices.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.

	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActivate (see page 25401)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25401)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 25402)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDeactivate (see page 25402)	Occurs when the Web module is deactivated.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	AppServices (see page 25399)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 25400)	Represents the adapter action associated with the Web page module.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	PageProducer (see page 25400)	Indicates the interface of the page producer that generates the content of the Web page.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.10.2 TWebAppPageModule Properties

The properties of the TWebAppPageModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 25399)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 25400)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 25400)	Indicates the interface of the page producer that generates the content of the Web page.

182.1.10.2.1 TWebAppPageModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppPageModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 24958)

WebContext (see page 24687)

182.1.10.2.2 TWebAppPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 25365)

182.1.10.2.3 TWebAppPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

TAdapterPageProducer (see page 19802)

TDataSetPagePRoducer

TXSLPagePRoducer

TPageProducer (see page 15309)

TDataSetTableProducer (see page 10277)

TQueryTableProducer (see page 8152)

TInetXPageProducer (see page 17145)

182.1.10.3 TWebAppPageModule Events

The events of the TWebAppPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 25401)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25401)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 25402)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 25402)	Occurs when the Web module is deactivated.

182.1.10.3.1 TWebAppPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 25357)

CreateMode

182.1.10.3.2 TWebAppPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 25367)

PageProducer (see page 25365)

Response (see page 25355)

182.1.10.3.3 TWebAppPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 25366)

Request (see page 25355)

Response (see page 25355)

PageProducer (see page 25365)

182.1.10.3.4 TWebAppPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 25356)

182.1.11 TWebAppPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebAppPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebAppPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebAppPageModuleHelper.

182.1.11.1 TWebAppPageModuleHelper Members

The following tables list the members exposed by TWebAppPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 25380)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 25371)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 25371)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 25372)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 25372)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 25372)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 25381)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 25405)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.
	GetProducerComponent (see page 25381)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 25381)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 25382)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 25382)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 25372)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 25373)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 25382)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 25382)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 25382)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 25383)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 25383)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 25383)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 25383)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 25384)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 25384)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 25384)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 25384)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 25385)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 25373)	This is NextIteration, a member of class TSiteModuleHelper.

	NotifyActivate (see page 25373)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 25374)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 25385)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 25385)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 25385)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 25374)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 25374)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 25376)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 25386)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 25387)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25387)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 25387)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 25376)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 25370)	Creates and initializes an instance of TSiteModuleHelper (see page 25368).
V	Create (see page 25379)	Creates and initializes an instance of TSitePageModuleHelper (see page 25377).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 25370)	Frees an instance of TSiteModuleHelper (see page 25368).
V	Destroy (see page 25380)	Frees an instance of TSitePageModuleHelper (see page 25377).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 25373)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DefaultAction (see page 25386)	Represents the adapter action associated with the Web page module.
R	Request (see page 25375)	Provides access to the current request object.
R	Response (see page 25375)	Provides access to the current response object.
R	Session (see page 25375)	Provides access to the current Web session.
R	WebModuleContext (see page 25376)	Keeps track of name/value pairs that store information for the Web module.

182.1.11.2 TWebAppPageModuleHelper Methods

The methods of the TWebAppPageModuleHelper class are listed here.

Protected Methods

	Name	Description
V	GetPageProducer (see page 25405)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.

182.1.11.2.1 TWebAppPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TWebAppPageModuleHelper.

182.1.12 TWebDataModule Class

TWebDataModule is a container for components in a WebSnap application.

Class Hierarchy

Pascal

```
TWebDataModule = class(TCustomWebDataModule);
```

C++

```
class TWebDataModule : public TCustomWebDataModule;
```

File

WebModu

Description

Use TWebDataModule as a container for components that may be used by other modules in your WebSnap application. TWebDataModule is compatible with WebSnap applications. The initialization section of TWebDataModule registers a factory that is used by the WebSnap application to create the data module.

See Also

Web Modules

182.1.12.1 TWebDataModule Members

The following tables list the members exposed by TWebDataModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.

	Notification (see page 2783)	Forwards notification messages to all owned components.
	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 2827)	Creates an instance of a data module.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348).
	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.

	CreateNew (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2829)	Destroys the instance of the data module.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 25353)	Frees an instance of TCustomWebDataModule (see page 25348).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)

V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActivate (see page 25409)	Occurs when the Web module is activated.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDeactivate (see page 25410)	Occurs when the Web module is deactivated.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.12.2 TWebDataModule Events

The events of the TWebDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 25409)	Occurs when the Web module is activated.
	OnDeactivate (see page 25410)	Occurs when the Web module is deactivated.

182.1.12.2.1 TWebDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 25357)

CreateMode

182.1.12.2.2 TWebDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 25356)

182.1.13 TWebNotifyContainer Class

Class Hierarchy

Pascal

```
TWebNotifyContainer = class(TObject);
```

C++

```
class TWebNotifyContainer : public TObject;
```

File

WebModu

Description

This is class WebModu.TWebNotifyContainer.

182.1.13.1 TWebNotifyContainer Members

The following tables list the members exposed by TWebNotifyContainer.

Protected Fields

	Name	Description
	FList (see page 25413)	This is FList, a member of class TWebNotifyContainer.

Protected Methods

	Name	Description
	GetCount (see page 25413)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 25413)	This is Add, a member of class TWebNotifyContainer.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25411)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25412)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyWebActivate (see page 25414)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 25414)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

182.1.13.2 TWebNotifyContainer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebNotifyContainer();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

182.1.13.3 TWebNotifyContainer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebNotifyContainer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

182.1.13.4 TWebNotifyContainer Fields

The fields of the TWebNotifyContainer class are listed here.

Protected Fields

	Name	Description
	FList (see page 25413)	This is FList, a member of class TWebNotifyContainer.

182.1.13.4.1 TWebNotifyContainer.FList Field

Pascal

```
FList: TComponentList;
```

C++

```
TComponentList FList;
```

Description

This is FList, a member of class TWebNotifyContainer.

182.1.13.5 TWebNotifyContainer Methods

The methods of the TWebNotifyContainer class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 25413)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 25413)	This is Add, a member of class TWebNotifyContainer.
	NotifyWebActivate (see page 25414)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 25414)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

182.1.13.5.1 TWebNotifyContainer.Add Method

Pascal

```
procedure Add(AComponent: TComponent);
```

C++

```
__fastcall Add(TComponent * AComponent);
```

Description

This is Add, a member of class TWebNotifyContainer.

182.1.13.5.2 TWebNotifyContainer.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TWebNotifyContainer.

182.1.13.5.3 TWebNotifyContainer.NotifyWebActivate Method

Pascal

```
procedure NotifyWebActivate;
```

C++

```
__fastcall NotifyWebActivate();
```

Description

This is NotifyWebActivate, a member of class TWebNotifyContainer.

182.1.13.5.4 TWebNotifyContainer.NotifyWebDeactivate Method

Pascal

```
procedure NotifyWebDeactivate;
```

C++

```
__fastcall NotifyWebDeactivate();
```

Description

This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

182.1.14 TWebPageModule Class

TWebPageModule is a WebSnap module that generates a page.

Class Hierarchy

Pascal

```
TWebPageModule = class(TCustomWebPageModule);
```

C++

```
class TWebPageModule : public TCustomWebPageModule;
```

File

WebModu

Description

Use TWebPageModule in a WebSnap application to hold all the components needed for generating a specific Web page. When you use the WebSnap page module wizard to create a TWebPageModule descendant, the wizard adds a page producer to the module. The page producer generates the content of the Web page and adds code to the unit it creates (in Delphi, the code is added to the initialization section; in C++, it is added to a #pragma startup). The added code registers the TWebPageModule descendant with a factory object that the WebSnap application can use to create the Web page module.

The page producer that the wizard adds to the Web page module becomes the value of the PageProducer (see page 25420) property. If the PageProducer (see page 25420) property is nil (Delphi) or NULL (C++), the Web page module can't generate the content of a Web page. Add additional components to the Web page module that assist the page producer in creating its content. Other modules in the WebSnap application can access any components you add to the Web page module, but typically Web page module components are intended only for internal use.

TWebDataModule (see page 25405)

TWebPageModuleFactory (see page 25019)

Web Modules

182.1.14.1 TWebPageModule Members

The following tables list the members exposed by TWebPageModule.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2830)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoCreate (see page 2831)	This is DoCreate, a member of class TDataModule.
V	DoDestroy (see page 2831)	This is DoDestroy, a member of class TDataModule.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
V	GetChildren (see page 2831)	This is GetChildren, a member of class TDataModule.

	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetSiteModuleHelper (see page 25353)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSiteModuleHelper (see page 25363)	Returns the value of the SiteModuleHelper (see page 25356) property.
V	GetSitePageModuleHelper (see page 25364)	Returns the value of the SitePageModuleHelper (see page 25366) property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
V	GetWebSnapObjClass (see page 25354)	Returns the class type for this adapter field.
	HandleCreateException (see page 2831)	This is HandleCreateException, a member of class TDataModule.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 25354)	Responds to notifications that components are about to be inserted or removed.
V	Notification (see page 25364)	Responds to notifications that components are about to be inserted or removed.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
V	ReadState (see page 2832)	This is ReadState, a member of class TDataModule.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	SiteModuleHelper (see page 25356)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 25356) and OnDeactivate (see page 25357) events.
R	SitePageModuleHelper (see page 25366)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 25367)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeRedirectToPage (see page 25368)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 2829)	Generates an OnCreate (see page 2833) event.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 2830)	Generates an OnDestroy (see page 2834) event.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
V	Create (see page 2827)	Creates an instance of a data module.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348).
V	Create (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357).
V	CreateNew (see page 2828)	Creates an instance of a data module and registers with the global screen object.
V	CreateNew (see page 25352)	Creates and initializes an instance of TCustomWebDataModule (see page 25348) without using an associated form file.
V	CreateNew (see page 25362)	Creates and initializes an instance of TCustomWebPageModule (see page 25357) without using an associated form file.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2829)	Destroys the instance of the data module.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 25353)	Frees an instance of TCustomWebDataModule (see page 25348).
V	Destroy (see page 25363)	Frees an instance of TCustomWebPageModule (see page 25357).
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchPage (see page 19732)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 19723)	This is EndIterator, a member of class IIteratorSupport.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	FindVariable (see page 15330)	This is FindVariable, a member of class IWebVariablesContainer.
	FindVariableContainer (see page 15331)	This is FindVariableContainer, a member of class IWebVariablesContainer.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetCurrentObject (see page 19719)	This is GetCurrentObject, a member of class IIterateObjectSupport.

	GetDefaultAction (see page 19696)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetProducerComponent (see page 19702)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVariable (see page 15331)	This is GetVariable, a member of class IWebVariablesContainer.
	GetVariableCount (see page 15331)	This is GetVariableCount, a member of class IWebVariablesContainer.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 19733)	This is IncludePage, a member of class IPageResult.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 19723)	Advances to the objects next item.
	NotifyActivate (see page 24778)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 24778)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPage (see page 19733)	This is RedirectToPage, a member of class IPageResult.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDefaultPageFileName (see page 19683)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetWebContentOptions (see page 24782)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 19724)	This is StartIterator, a member of class IIteratorSupport.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.

R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DesignOffset (see page 2832)	Specifies the design offset for the data module at design time.
	DesignSize (see page 2832)	Specifies the design size for the data module at design time.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Request (see page 25355)	Provides access to the current request object.
R	Response (see page 25355)	Provides access to the current response object.
R	Session (see page 25355)	Provides access to the current Web session.
R	VariableCount (see page 15331)	This is VariableCount, a member of class IWebVariablesContainer.
R	Variables (see page 15332)	This is Variables, a member of class IWebVariablesContainer.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnActivate (see page 25421)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25421)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 25421)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnCreate (see page 2833)	Occurs when an application instantiates a data module.
	OnDeactivate (see page 25422)	Occurs when the Web module is deactivated.
	OnDestroy (see page 2834)	Occurs when the data module is about to be destroyed.

Published Properties

	Name	Description
	DefaultAction (see page 25419)	Represents the adapter action associated with the Web page module.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	OldCreateOrder (see page 2833)	Specifies when OnCreate (see page 2833) and OnDestroy (see page 2834) events occur.
	PageProducer (see page 25420)	Indicates the interface of the page producer that generates the content of the Web page.
	Tag (see page 2808)	Stores an integer value as part of a component.

182.1.14.2 TWebPageModule Properties

The properties of the TWebPageModule class are listed here.

Published Properties

	Name	Description
	DefaultAction (see page 25419)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 25420)	Indicates the interface of the page producer that generates the content of the Web page.

182.1.14.2.1 TWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 25365)

182.1.14.2.2 TWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

TAdapterPageProducer (see page 19802)

TDataSetPagePRoducer

TXSLPagePRoducer

TPageProducer (see page 15309)

TDataSetTableProducer (see page 10277)

TQueryTableProducer (see page 8152)

TInetXPageProducer (see page 17145)

182.1.14.3 TWebPageModule Events

The events of the TWebPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 25421)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 25421)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 25421)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 25422)	Occurs when the Web module is deactivated.

182.1.14.3.1 TWebPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 25357)

CreateMode

182.1.14.3.2 TWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 25367)

PageProducer (see page 25365)

Response (see page 25355)

182.1.14.3.3 TWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 25366)

Request (see page 25355)

Response (see page 25355)

PageProducer (see page 25365)

182.1.14.3.4 TWebPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 25356)

182.1.15 TWebPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebPageModuleHelper.

182.1.15.1 TWebPageModuleHelper Members

The following tables list the members exposed by TWebPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 25380)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 25371)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 25371)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 25372)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 25372)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 25372)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 25381)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 25425)	This is GetPageProducer, a member of class TWebPageModuleHelper.
	GetProducerComponent (see page 25381)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 25381)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 25382)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 25382)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 25372)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 25373)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 25382)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 25382)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 25382)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 25383)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 25383)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 25383)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 25383)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 25384)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 25384)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 25384)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 25384)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 25385)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 25373)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 25373)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 25374)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 25385)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 25385)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 25385)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 25374)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 25374)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 25376)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 25386)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 25387)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 25387)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 25387)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 25376)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 25370)	Creates and initializes an instance of TSiteModuleHelper (see page 25368).
V	Create (see page 25379)	Creates and initializes an instance of TSitePageModuleHelper (see page 25377).
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 25370)	Frees an instance of TSiteModuleHelper (see page 25368).
V	Destroy (see page 25380)	Frees an instance of TSitePageModuleHelper (see page 25377).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 25373)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	DefaultAction (see page 25386)	Represents the adapter action associated with the Web page module.
R	Request (see page 25375)	Provides access to the current request object.
R	Response (see page 25375)	Provides access to the current response object.

R	Session (see page 25375)	Provides access to the current Web session.
R	WebModuleContext (see page 25376)	Keeps track of name/value pairs that store information for the Web module.

182.1.15.2 TWebPageModuleHelper Methods

The methods of the TWebPageModuleHelper class are listed here.

Protected Methods

	Name	Description
V	GetPageProducer (see page 25425)	This is GetPageProducer, a member of class TWebPageModuleHelper.

182.1.15.2.1 TWebPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TWebPageModuleHelper.

182.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FindNamedModuleVariable (see page 25426)	This is function WebModu.FindNamedModuleVariable.
	GetModuleVariable (see page 25426)	This is function WebModu.GetModuleVariable.
	GetModuleVariableCount (see page 25426)	This is function WebModu.GetModuleVariableCount.

182.2.1 WebModu.FindNamedModuleVariable Function

Pascal

```
function FindNamedModuleVariable(AModule: TComponent; const AName: string): TComponent;
```

C++

```
TComponent * FindNamedModuleVariable(TComponent * AModule, const AnsiString AName);
```

File

WebModu

Description

This is function WebModu.FindNamedModuleVariable.

182.2.2 WebModu.GetModuleVariable Function

Pascal

```
function GetModuleVariable(AModule: TComponent; Index: Integer): TComponent;
```

C++

```
TComponent * GetModuleVariable(TComponent * AModule, int Index);
```

File

WebModu

Description

This is function WebModu.GetModuleVariable.

182.2.3 WebModu.GetModuleVariableCount Function

Pascal

```
function GetModuleVariableCount(AModule: TComponent): Integer;
```

C++

```
int GetModuleVariableCount(TComponent * AModule);
```

File

WebModu

Description

This is function WebModu.GetModuleVariableCount.

182.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetParamsEvent (see page 25428)	This is type WebModu.TGetParamsEvent.

182.3.1 WebModu.TGetParamsEvent Type

Pascal

```
TGetParamsEvent = procedure (Sender: TObject; Params: TStrings);
```

C++

```
(Sender: TObject; Params: TStrings) ( TGetParamsEvent)();
```

File

WebModu

Description

This is type WebModu.TGetParamsEvent.

183 WebNode Namespace

This is namespace WebNode.

Topics

Name	Description
Interfaces (see page 25430)	The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 25430)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

183.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 25430)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

183.1.1 IWebNode Interface

IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

Class Hierarchy

WebNode.IWebNode

Pascal

```
IWebNode = interface;
```

C++

```
__interface IWebNode;
```

File

WebNode

Description

TRIO objects use IWebNode to execute method calls on an invokable interface. IWebNode takes an encoded method call, executes it, and returns the encoded results. Typically, objects that implement IWebNode use a specific transport protocol to forward the encoded method call to a remote server. For example, the THTTPReqResp class implements this interface for making interface calls to a remote Web Service application using HTTP.

When implementing the IWebNode interface, you can use another IWebNode implementation to delegate part of the method execution. For example, you can write a class that compresses or encrypts the encoded method call, passes it to another IWebNode implementation that expects the compressed or encrypted string, and then decompresses or decrypts the results returned by the other IWebNode implementation.

Note: C++ method declarations that use IWebNode use the _di_IWebNode type instead. This type is a DelphiInterface wrapper around the IWebNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< >  _di_IWebNode;
```

See Also

THTTPReqResp (see page 19961)

TRio

183.1.1.1 IWebNode Members

The following tables list the members exposed by IWebNode.

Public Methods

	Name	Description
	BeforeExecute (see page 25431)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 25433)	Returns the value of the MimeBoundary (see page 25433) property.
	SetMimeBoundary (see page 25433)	Sets the value of the MimeBoundary (see page 25433) property.

Public Properties

	Name	Description
	MimeBoundary (see page 25433)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

183.1.1.2 IWebNode Methods

The methods of the IWebNode class are listed here.

Public Methods

	Name	Description
	BeforeExecute (see page 25431)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 25433)	Returns the value of the MimeBoundary (see page 25433) property.
	SetMimeBoundary (see page 25433)	Sets the value of the MimeBoundary (see page 25433) property.

183.1.1.2.1 IWebNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMD: TIntfMetaData; const MethMD: TIntfMethEntry;
MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMD, const TIntfMethEntry MethMD, int
MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute (see page 25432) method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute (see page 25432) method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 25432)

OnBeforeExecute (see page 18730)

183.1.1.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	IWebNode.Execute (String, TStream) (see page 25432)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream) (see page 25432)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream, TStream) (see page 25432)	Executes an encoded method call and returns the encoded results in a stream.

183.1.1.2.2.1 IWebNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Response: TStream); overload; deprecated;
procedure Execute(const Request: TStream; Response: TStream); overload;
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall Execute(const AnsiString DataMsg, TStream Response);
__fastcall Execute(const TStream Request, TStream Response);
__fastcall TStream Execute(const TStream Request);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert (see page 18122)

BeforeExecute (see page 25431)

183.1.1.2.3 IWebNode.GetMimeBoundary Method

Returns the value of the MimeBoundary (see page 25433) property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall AnsiString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary (see page 25433) property.

See Also

MimeBoundary (see page 25433)

183.1.1.2.4 IWebNode.SetMimeBoundary Method

Sets the value of the MimeBoundary (see page 25433) property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(AnsiString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary (see page 25433) property.

Value is the new value for MimeBoundary (see page 25433).

See Also

MimeBoundary (see page 25433)

183.1.1.3 IWebNode Properties

The properties of the IWebNode class are listed here.

Public Properties

	Name	Description
	MimeBoundary (see page 25433)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

183.1.1.3.1 IWebNode.MimeBoundary Property

Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Pascal

```
property MimeBoundary: string;
```

C++

```
__property AnsiString MimeBoundary;
```

Description

When the method call is included in a multipart form, MimeBoundary is the value of the MIME boundary header that uniquely identifies the part of the form that contains the method call. If the method call is not included in a multipart form, MimeBoundary is an empty string.

TWebModuleFactory

184.1.1.1 TWebModuleFactoryList Members

The following tables list the members exposed by TWebModuleFactoryList.

Protected Methods

	Name	Description
	GetItem (see page 25439)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 25438)	Adds a factory to the web module factory list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25437)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25438)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AppModuleFactory (see page 25439)	
R	ItemCount (see page 25439)	Lists the number of items in the web module factory list.
R	Items (see page 25440)	

184.1.1.2 TWebModuleFactoryList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebModuleFactoryList();
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

Destroy (see page 22287)

new

184.1.1.3 TWebModuleFactoryList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleFactoryList();
```

Description

Do not call ~Destroy directly. Instead, use the delete keyword when destroying VCL objects.

~Destroy deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

delete

184.1.1.4 TWebModuleFactoryList Methods

The methods of the TWebModuleFactoryList class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 25439)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 25438)	Adds a factory to the web module factory list.

184.1.1.4.1 TWebModuleFactoryList.AddFactory Method

Adds a factory to the web module factory list.

Pascal

```
procedure AddFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddFactory(TAbstractWebModuleFactory AFactory);
```

Description

Use the AddFactory method to add a factory to the web module factory list (more here, obviously).

See Also

AppModuleFactory (see page 25439)

184.1.1.4.2 TWebModuleFactoryList.GetItem Method

Pascal

```
function GetItem(I: Integer): TAbstractWebModuleFactory;
```

C++

```
__fastcall TAbstractWebModuleFactory GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleFactoryList.

184.1.1.5 TWebModuleFactoryList Properties

The properties of the TWebModuleFactoryList class are listed here.

Public Properties

	Name	Description
R	AppModuleFactory (see page 25439)	
R	ItemCount (see page 25439)	Lists the number of items in the web module factory list.
R	Items (see page 25440)	

184.1.1.5.1 TWebModuleFactoryList.AppModuleFactory Property

Pascal

```
property AppModuleFactory: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory AppModuleFactory;
```

See Also

AddFactory (see page 25438)

184.1.1.5.2 TWebModuleFactoryList.ItemCount Property

Lists the number of items in the web module factory list.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

Use the ItemCount property to list the number of items in the web module factory list.

See Also

Items (see page 25440)

184.1.1.5.3 TWebModuleFactoryList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory Items[int I];
```

See Also

AddFactory (see page 25438)

ItemCount (see page 25439)

184.1.2 TWebModuleList Class

TWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.

Class Hierarchy

Pascal

```
TWebModuleList = class(TAbstractWebModuleList);
```

C++

```
class TWebModuleList : public TAbstractWebModuleList;
```

File

WebReq

Description

TWebModuleList contains every Web module that has been instantiated in order to serve the current request. In addition, it lists the factory objects for all Web modules in the application, including any that are not instantiated.

When a WebSnap application handles multiple requests concurrently, it includes multiple Web modules lists, each on a separate thread and each associated with a different request.

The Web context, which can be accessed using the global WebContext function, provides access to the TWebModuleList object that is associated with the current request. Use the Web context's WebModules property to obtain a reference to the Web module list.

See Also

TWebModuleFactoryList (see page 25436)

TAbstractWebModuleFactory (see page 15043)

WebContext

TAbstractWebContext (see page 24644)

184.1.2.1 TWebModuleList Members

The following tables list the members exposed by TWebModuleList.

Protected Methods

	Name	Description
	GetFactory (see page 25446)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 25447)	
	GetItem (see page 25447)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 25447)	
	GetOnModuleAdded (see page 25447)	
	SetOnModuleAdded (see page 25448)	

Protected Properties

	Name	Description
	Factories (see page 25448)	This is Factories, a member of class TWebModuleList.

Public Events

	Name	Description
	OnModuleAdded (see page 15059)	Occurs when a new Web module is added to the Items (see page 15058) property array.

Public Methods

	Name	Description
	AddModule (see page 25443)	Adds a module to the Items property array.
	AddModuleClass (see page 25443)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 25444)	Creates a new Web module, given its name, and adds it to the Items property array.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AutoCreateModules (see page 25445)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 25445)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25442)	Creates and initializes a TWebModuleList (see page 25440) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25442)	Frees a TWebModuleList (see page 25440) instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindModuleClass (see page 25446)	Locates a Web module given its class reference.
	FindModuleName (see page 25446)	Locates a Web module given its name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Factory (see page 15057)	Lists the Web module factories for all the Web modules available in the application.
R	FactoryCount (see page 15058)	Indicates the number of Web module factories listed in the Factory (see page 15057) property array.
R	ItemCount (see page 15058)	Indicates the number of Web modules that have been instantiated in the current thread.
R	Items (see page 15058)	Lists the instantiated Web modules in the current thread.

184.1.2.2 TWebModuleList.Create Constructor

Creates and initializes a TWebModuleList (see page 25440) object.

Pascal

```
constructor Create(const AFactories: TWebModuleFactoryList);
```

C++

```
__fastcall TWebModuleList(const TWebModuleFactoryList AFactories);
```

Description

There is no need to call the TWebModuleList (see page 25440) constructor. Web module lists are created automatically for each incoming HTTP request.

AFactories is the list of Web module factories in the WebSnap application. TWebModuleList (see page 25440) uses this list to implement the Factory property.

See Also

Factory

184.1.2.3 TWebModuleList.Destroy Destructor

Frees a TWebModuleList (see page 25440) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleList();
```

Description

Do not free TWebModuleList (see page 25440) objects. Web module lists are freed automatically when the WebSnap application finishes processing the HTTP request.

184.1.2.4 TWebModuleList Methods

The methods of the TWebModuleList class are listed here.

Protected Methods

	Name	Description
	GetFactory (see page 25446)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 25447)	
	GetItem (see page 25447)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 25447)	
	GetOnModuleAdded (see page 25447)	
	SetOnModuleAdded (see page 25448)	

Public Methods

	Name	Description
	AddModule (see page 25443)	Adds a module to the Items property array.
	AddModuleClass (see page 25443)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 25444)	Creates a new Web module, given its name, and adds it to the Items property array.
	AutoCreateModules (see page 25445)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 25445)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	FindModuleClass (see page 25446)	Locates a Web module given its class reference.
	FindModuleName (see page 25446)	Locates a Web module given its name.

184.1.2.4.1 TWebModuleList.AddModule Method

Adds a module to the Items property array.

Pascal

```
procedure AddModule(AComponent: TComponent);
```

C++

```
__fastcall AddModule(TComponent * AComponent);
```

Description

Call AddModule to add a newly instantiated Web module to the Items property array.

AComponent is a Web module instance that is not already listed in the Items property array. It must be one of the objects created by a Web module factory from the Factory property array.

See Also

AddModuleName (see page 25444)

AddModuleClass (see page 25443)

Items

Factory

184.1.2.4.2 TWebModuleList.AddModuleClass Method

Creates a new Web module, given its class, and adds it to the Items property array.

Pascal

```
function AddModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleClass(TComponentClass AClass);
```

Description

AddModuleClass searches for a Web module factory that can create a Web module of the specified class. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AClass is a class reference to the Web module you want to instantiate. It should not match the class type of any Web module already listed in the Items property array.

AddModuleClass returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified class, AddModuleClass returns nil (Delphi) or NULL (C++).

See Also

AddModuleName (see page 25444)

AddModule (see page 25443)

Items

Factory

FindModuleClass (see page 25446)

184.1.2.4.3 TWebModuleList.AddModuleName Method

Creates a new Web module, given its name, and adds it to the Items property array.

Pascal

```
function AddModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleName(const AnsiString AName);
```

Description

AddModuleName searches for a Web module factory that can create a Web module of the specified name. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AName is the name of the Web module you want to instantiate. It should not match the name of any Web module already listed in the Items property array.

AddModuleClass (see page 25443) returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified name, AddModuleClass (see page 25443) returns nil (Delphi) or NULL (C++).

See Also

AddModuleClass (see page 25443)

AddModule (see page 25443)

Items

Factory

FindModuleName (see page 25446)

184.1.2.4.4 TWebModuleList.AutoCreateModules Method

Instantiates the Web modules that are flagged to handle all incoming requests.

Pascal

```
procedure AutoCreateModules;
```

C++

```
__fastcall AutoCreateModules();
```

Description

TWebRequestHandler (see page 25448) calls AutoCreateModules to instantiate all of the Web modules that should be used to handle every incoming request object.

AutoCreateModules searches the module factory list for factory objects that have a CreateMode property with the crAlways flag. For each such factory object, AutoCreateModules creates the corresponding Web module if it does not already exist and adds it to the Items property array.

See Also

CreateMode (see page 15049)

AutoDestroyModules (see page 25445)

Items

Factory

TWebRequestHandler (see page 25448)

184.1.2.4.5 TWebModuleList.AutoDestroyModules Method

Frees all Web modules that are flagged as inappropriate for caching between requests.

Pascal

```
procedure AutoDestroyModules;
```

C++

```
__fastcall AutoDestroyModules();
```

Description

TWebRequestHandler (see page 25448) calls AutoDestroyModules when it finishes processing an HTTP request message. This allows the Web module list to free those Web modules that should not be cached for reuse with another request message.

AutoDestroyModules searches the module factory list for factory objects that have a CacheMode property with the caDestroy flag. For each such factory object, AutoDestroyModules frees the Web module if it exists and removes it from Items property array.

See Also

CacheMode (see page 15048)

AutoCreateModules (see page 25445)

Items

TWebRequestHandler (see page 25448)

Factory

184.1.2.4.6 TWebModuleList.FindModuleClass Method

Locates a Web module given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass);
```

Description

Call FindModuleClass to locate the Web module instance of a given class type. FindModuleClass searches the Items property array for a Web module instance of the specified class.

AClass is a class reference to the class type of the desired Web module.

FindModuleClass returns the requested Web module instance if it exists. If there is no Web module of the specified class, FindModuleClass returns nil (Delphi) or NULL (C++).

See Also

FindModuleName (see page 25446)

Items

184.1.2.4.7 TWebModuleList.FindModuleName Method

Locates a Web module given its name.

Pascal

```
function FindModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const AnsiString AName);
```

Description

Call FindModuleName to locate the Web module instance of a given name. FindModuleClass (see page 25446) searches the Items property array for a Web module instance of the specified name.

AName is the name of the desired Web module.

FindModuleName returns the requested Web module instance if it exists. If there is no Web module with the specified name, FindModuleClass (see page 25446) returns nil (Delphi) or NULL (C++).

See Also

FindModuleClass (see page 25446)

Items

184.1.2.4.8 TWebModuleList.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractWebModuleFactory; override;
```

C++

```
virtual __fastcall TAbstractWebModuleFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TWebModuleList.

184.1.2.4.9 TWebModuleList.GetFactoryCount Method

Pascal

```
function GetFactoryCount: Integer; override;
```

C++

```
virtual __fastcall int GetFactoryCount();
```

See Also

GetFactory (see page 15055)

FactoryCount (see page 15058)

184.1.2.4.10 TWebModuleList.GetItem Method

Pascal

```
function GetItem(I: Integer): TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleList.

184.1.2.4.11 TWebModuleList.GetItemCount Method

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

See Also

GetItem (see page 15056)

ItemCount (see page 15058)

184.1.2.4.12 TWebModuleList.GetOnModuleAdded Method

Pascal

```
function GetOnModuleAdded: TModuleAddedProc; override;
```

C++

```
virtual __fastcall TModuleAddedProc GetOnModuleAdded();
```

See Also

OnModuleAdded (see page 15059)

SetOnModuleAdded (see page 15057)

184.1.2.4.13 TWebModuleList.SetOnModuleAdded Method

Pascal

```
procedure SetOnModuleAdded(AProc: TModuleAddedProc); override;
```

C++

```
virtual __fastcall SetOnModuleAdded(TModuleAddedProc AProc);
```

See Also

GetOnModuleAdded (see page 15056)

OnModuleAdded (see page 15059)

184.1.2.5 TWebModuleList Properties

The properties of the TWebModuleList class are listed here.

Protected Properties

	Name	Description
	Factories (see page 25448)	This is Factories, a member of class TWebModuleList.

184.1.2.5.1 TWebModuleList.Factories Property

Pascal

```
property Factories: TWebModuleFactoryList;
```

C++

```
__property TWebModuleFactoryList Factories;
```

Description

This is Factories, a member of class TWebModuleList.

184.1.3 TWebRequestHandler Class

TWebRequestHandler maintains the Web modules in an application and creates request and response objects when the application receives HTTP request messages.

Class Hierarchy

Pascal

```
TWebRequestHandler = class(TComponent);
```

C++

```
class TWebRequestHandler : public TComponent;
```

File

WebReq

Description

TWebRequestHandler keeps a pool of active Web modules. In response to a request from the application, TWebRequestHandler creates a request object and assigns it to one of the active Web modules.

Do not create instances of TWebRequestHandler. Use TWebRequestHandler as a base class when declaring nonvisual components that can appear on the component palette and be used in the form designer. Properties and methods of TWebRequestHandler provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TWebApplication (see page 24618)

TWebModule (see page 15154)

184.1.3.1 TWebRequestHandler Members

The following tables list the members exposed by TWebRequestHandler.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	ActivateWebModules (see page 25453)	Activates a Web module for the application and returns it.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	DeactivateWebModules (see page 25453)	Deactivates the Web module of the application.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	HandleRequest (see page 25454)	Responds to an HTTP request message received by the server.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.

	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddWebModuleFactory (see page 25453)	Adds a Web module factory to the request handler.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25452)	Creates an instance of TWebRequestHandler (see page 25448).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25452)	Destroys the TWebRequestHandler (see page 25448) instance and frees its memory.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HandleException (see page 25454)	Responds to exceptions related to TWebRequestHandler (see page 25448) objects.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ActiveCount (see page 25455)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 25455)	Determines whether the Web modules used by the application are cached for re-use.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	InactiveCount (see page 25456)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 25457)	Sets or returns the MaxConnections used by the socket.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	WebModuleClass (see page 25457)	Contains a reference to a Web module.
R	WebModuleFactory (see page 25457)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 25458)	The number of Web module factories in use by the request handler.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

184.1.3.2 TWebRequestHandler.Create Constructor

Creates an instance of TWebRequestHandler (see page 25448).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebRequestHandler(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebRequestHandler (see page 25448) object.

See Also

Destroy (see page 25452)

184.1.3.3 TWebRequestHandler.Destroy Destructor

Destroys the TWebRequestHandler (see page 25448) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestHandler();
```

Description

Destroy cleans up references in the global fix-up list for form linking. It then calls the inherited destructor.

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

Free (see page 22300)

Destroy (see page 22287)

184.1.3.4 TWebRequestHandler Methods

The methods of the TWebRequestHandler class are listed here.

Protected Methods

	Name	Description
	ActivateWebModules (see page 25453)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 25453)	Deactivates the Web module of the application.
	HandleRequest (see page 25454)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 25453)	Adds a Web module factory to the request handler.
	HandleException (see page 25454)	Responds to exceptions related to TWebRequestHandler (see page 25448) objects.

184.1.3.4.1 TWebRequestHandler.ActivateWebModules Method

Activates a Web module for the application and returns it.

Pascal

```
function ActivateWebModules: TWebModuleList;
```

C++

```
__fastcall TWebModuleList ActivateWebModules();
```

Description

ActivateWebModules is called internally when the application receives an HTTP request message. If the InactiveCount (see page 25456) property is greater than zero, a cached Web module is reactivated. Otherwise, a new instance of the Web module is created.

Before ActivateWebModules is called, the CreateForm method must be called to register the data module.

Note: In cross-platform applications, a Web application object contains only a single Web module. Usually, that Web module is a TWebModule object, but it may also be an ordinary data module that contains a TWebDispatcher object. If no Web module is associated with the Web application, ActivateWebModule raises an exception. If the ActiveCount (see page 25455) property is already at MaxConnections (see page 25457) when ActivateWebModules is called, ActivateWebModules raises an exception.

See Also

CreateForm (see page 24623)

ActiveCount (see page 25455)

InactiveCount (see page 25456)

MaxConnections (see page 25457)

184.1.3.4.2 TWebRequestHandler.AddWebModuleFactory Method

Adds a Web module factory to the request handler.

Pascal

```
procedure AddWebModuleFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddWebModuleFactory(TAbstractWebModuleFactory AFactory);
```

Description

AddWebModuleFactory is used to add a Web module factory to the Web request handler. Web module factories are for internal use, and should not require any attention from developers.

184.1.3.4.3 TWebRequestHandler.DeactivateWebModules Method

Deactivates the Web module of the application.

Pascal

```
procedure DeactivateWebModules(WebModules: TWebModuleList);
```

C++

```
__fastcall DeactivateWebModules(TWebModuleList WebModules);
```

Description

Do not call DeactivateWebModules directly. The Web application calls DeactivateWebModules internally after handling an HTTP request message. When CacheConnections (see page 25455) is true, the Web module remains inactive until the next request message is received. When CacheConnections (see page 25455) is false, the runtime instance of the Web module is destroyed.

See Also

ActivateWebModules (see page 25453)

CacheConnections (see page 25455)

HandleRequest (see page 25454)

InactiveCount (see page 25456)

184.1.3.4.4 TWebRequestHandler.HandleException Method

Responds to exceptions related to TWebRequestHandler (see page 25448) objects.

Pascal

```
procedure HandleException(Sender: TObject);
```

C++

```
__fastcall HandleException(TObject * Sender);
```

Description

When exceptions occur in TWebRequestHandler (see page 25448) and descendant objects, HandleException will attempt to deal with it. If it cannot do so, it displays an error message to the user.

184.1.3.4.5 TWebRequestHandler.HandleRequest Method

Responds to an HTTP request message received by the server.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

When a descendant of TWebApplication receives an HTTP request message, it creates a TWebRequest object to represent the message, and a TWebResponse message to match the request. It then calls HandleRequest, passing those objects as the Request and Response parameters.

HandleRequest activates the Web module associated with the Web application. It then passes the request and response objects to the dispatcher, so that it can dispatch the request to the appropriate action items. When the dispatcher returns, HandleRequest checks whether the response was handled but not sent, and if not, sends it. Finally, HandleRequest deactivates the data module.

HandleRequest returns a Boolean value indicating whether the request message was handled and sent.

See Also

ActivateWebModules (see page 25453)

DeactivateWebModules (see page 25453)

184.1.3.5 TWebRequestHandler Properties

The properties of the TWebRequestHandler class are listed here.

Public Properties

	Name	Description
R	ActiveCount (see page 25455)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 25455)	Determines whether the Web modules used by the application are cached for re-use.
R	InactiveCount (see page 25456)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 25457)	Sets or returns the MaxConnections used by the socket.
	WebModuleClass (see page 25457)	Contains a reference to a Web module.
R	WebModuleFactory (see page 25457)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 25458)	The number of Web module factories in use by the request handler.

184.1.3.5.1 TWebRequestHandler.ActiveCount Property

Indicates the number of active connections currently being serviced by the application.

Pascal

```
property ActiveCount: Integer;
```

C++

```
__property int ActiveCount;
```

Description

Use ActiveCount to monitor the number of HTTP request messages the application is servicing at any one time. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 25457) property.

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it generates a new instance of the Web module. After the response is returned to the Web client, the Web module is either destroyed or deactivated and cached for later reuse. Each active Web module resides in a separate execution thread.

ActiveCount is the number of Web modules currently in use. InactiveCount (see page 25456) is the number of deactivated Web modules cached for later reuse. MaxConnections (see page 25457) is the maximum number of Web modules that can be active at any time. ActiveCount can never exceed MaxConnections (see page 25457).

Note: ActiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message.

See Also

InactiveCount (see page 25456)

184.1.3.5.2 TWebRequestHandler.CacheConnections Property

Determines whether the Web modules used by the application are cached for re-use.

Pascal

```
property CacheConnections: Boolean;
```

C++

```
__property Boolean CacheConnections;
```

Description

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it spawns a thread to handle the request and creates a new Web module that contains instances of all the objects used in the Web application. To improve performance, these Web modules can be saved in a cache when the thread associated with the HTTP request message finishes executing.

Set CacheConnections to true to have the Web application save inactive Web modules in a cache. Caching the Web modules speeds performance as new instances of the Web module and its contents do not need to be created every time a request message is received. Set CacheConnections to false to have the Web application create a new Web module for every request thread. Recreating the Web module ensures that changes made to the module or its contents when servicing the last request do not cause unexpected behavior the next time the module is activated.

CacheConnections is only relevant to Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) Web applications.

See Also

MaxConnections (see page 25457)

184.1.3.5.3 TWebRequestHandler.InactiveCount Property

Indicates the number of Web modules cached for later reuse.

Pascal

```
property InactiveCount: Integer;
```

C++

```
__property int InactiveCount;
```

Description

Use InactiveCount to monitor the number of unused Web modules. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 25457) property.

When CacheConnections (see page 25455) is true, each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it reactivates one of the inactive Web modules. The application generates a new instance of the Web module if InactiveCount is 0. After the response is returned to the Web client, the Web module is deactivated again, and counted by the InactiveCount property.

When CacheConnections (see page 25455) is false, a new Web module is created for each HTTP request message and destroyed when the response is returned. InactiveCount is always 0 when CacheConnections (see page 25455) is false.

Note: InactiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

ActiveCount (see page 25455)

184.1.3.5.4 TWebRequestHandler.MaxConnections Property

Sets or returns the MaxConnections used by the socket.

Pascal

```
property MaxConnections: Integer;
```

C++

```
__property int MaxConnections;
```

Description

Set MaxConnections to adjust the number of HTTP request messages the application can handle simultaneously. Use the ActiveCount (see page 25455) and InactiveCount (see page 25456) properties to get a sense of the frequency and duration of request messages. Then set MaxConnections so that it is high enough to avoid exceptions when the application runs out of Web modules, but low enough not to degrade performance too severely by running too many simultaneous threads.

If a request message is received when ActiveCount (see page 25455) is already at MaxConnections, the application raises an exception.

Note: InactiveCount (see page 25456) is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

CacheConnections (see page 25455)

184.1.3.5.5 TWebRequestHandler.WebModuleClass Property

Contains a reference to a Web module.

Pascal

```
property WebModuleClass: TComponentClass;
```

C++

```
__property TComponentClass WebModuleClass;
```

Description

WebModuleClass is a reference to a Web module, and is for internal use only. When ActivateWebModules (see page 25453) is called, it is used in that method to help generate infrastructure for a Web module.

See Also

ActivateWebModules (see page 25453)

184.1.3.5.6 TWebRequestHandler.WebModuleFactory Property

A list of Web module factory objects.

Pascal

```
property WebModuleFactory [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory WebModuleFactory[int I];
```

Description

This is a list of Web module factory objects, which are intended for internal use.

See Also

WebModuleFactoryCount (see page 25458)

184.1.3.5.7 TWebRequestHandler.WebModuleFactoryCount Property

The number of Web module factories in use by the request handler.

Pascal

```
property WebModuleFactoryCount: Integer;
```

C++

```
__property int WebModuleFactoryCount;
```

Description

WebModuleFactoryCount is the number of Web module factories in use by the request handler. This property is intended for internal use.

See Also

WebModuleFactory (see page 25457)

184.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WebRequestHandler (see page 25459)	Returns a TWebRequestHandler (see page 25448) object.

184.2.1 WebReq.WebRequestHandler Function

Returns a TWebRequestHandler (see page 25448) object.

Pascal

```
function WebRequestHandler: TWebRequestHandler;
```

C++

```
TWebRequestHandler WebRequestHandler();
```

File

WebReq

Description

Use the WebRequestHandler function to obtain a reference to the global TWebRequestHandler (see page 25448) object. This object manages all the Web modules in the application, and creates Web request and response objects when the application receives HTTP request messages.

See Also

TWebApplication

TWebModule

184.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRequestNotification (see page 25460)	This is record WebReq.TRequestNotification.

184.3.1 WebReq.TRequestNotification Enumeration

Pascal

```
TRequestNotification = (
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
);
```

C++

```
enum TRequestNotification {
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
};
```

File

WebReq

Description

This is record WebReq.TRequestNotification.

184.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
WebRequestHandlerProc (see page 25461)	This is variable WebReq.WebRequestHandlerProc.

184.4.1 WebReq.WebRequestHandlerProc Variable

Pascal

```
WebRequestHandlerProc: function: TWebRequestHandler = nil;
```

C++

```
function: TWebRequestHandler WebRequestHandlerProc = nil;
```

File

WebReq

Description

This is variable WebReq.WebRequestHandlerProc.

185 WebScript Namespace

This is namespace WebScript.

Topics

Name	Description
Classes (see page 25465)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 25544)	The following table lists structs, records, enums in this documentation.
Types (see page 25546)	The following table lists types in this documentation.
Constants (see page 25547)	The following table lists constants in this documentation.

Classes

	Name	Description
	ERecursiveIncludeFile (see page 25465)	This is class WebScript.ERecursiveIncludeFile.
	EScriptEvalError (see page 25466)	This is class WebScript.EScriptEvalError.
	TAbstractScriptEngine (see page 25466)	This is class WebScript.TAbstractScriptEngine.
	TAbstractScriptObjectFactories (see page 25470)	This is class WebScript.TAbstractScriptObjectFactories.
	TAbstractScriptObjectFactory (see page 25473)	This is class WebScript.TAbstractScriptObjectFactory.
	TCurrentWebPageInfo (see page 25475)	This is class WebScript.TCurrentWebPageInfo.
	THTMLItem (see page 25480)	This is class WebScript.THTMLItem.
	THTMLItems (see page 25483)	This is class WebScript.THTMLItems.
	TLineNumberMap (see page 25488)	This is class WebScript.TLineNumberMap.
	TScriptCodeItem (see page 25490)	This is class WebScript.TScriptCodeItem.
	TScriptEnginesList (see page 25492)	This is class WebScript.TScriptEnginesList.
	TScriptError (see page 25497)	This is class WebScript.TScriptError.
	TScriptErrors (see page 25501)	This is class WebScript.TScriptErrors.
	TScriptFile (see page 25505)	This is class WebScript.TScriptFile.
	TScriptGlobalObjects (see page 25508)	This is class WebScript.TScriptGlobalObjects.
	TScriptIncludeFile (see page 25513)	This is class WebScript.TScriptIncludeFile.
	TScriptIncludeFiles (see page 25514)	This is class WebScript.TScriptIncludeFiles.
	TScriptIncludeItem (see page 25518)	This is class WebScript.TScriptIncludeItem.
	TScriptItem (see page 25520)	This is class WebScript.TScriptItem.
	TScriptItems (see page 25522)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 25526)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 25530)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 25540)	This is class WebScript.TVariableLookup.

Constants

Name	Description
GlobalScriptVariableNames (see page 25547)	This is constant WebScript.GlobalScriptVariableNames.

Structs, Records, Enums

	Name	Description
	TGlobalScriptVariables (see page 25544)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 25545)	This is record WebScript.TIncludeType.
	TLineNumbers (see page 25545)	This is record WebScript.TLineNumbers.

Types

Name	Description
CreateComponentStubFactory (see page 25546)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 25546)	This is type WebScript.PLineNumbers.

185.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERecursiveIncludeFile (see page 25465)	This is class WebScript.ERecursiveIncludeFile.
	EScriptEvalError (see page 25466)	This is class WebScript.EScriptEvalError.
	TAbstractScriptEngine (see page 25466)	This is class WebScript.TAbstractScriptEngine.
	TAbstractScriptObjectFactories (see page 25470)	This is class WebScript.TAbstractScriptObjectFactories.
	TAbstractScriptObjectFactory (see page 25473)	This is class WebScript.TAbstractScriptObjectFactory.
	TCurrentWebPageInfo (see page 25475)	This is class WebScript.TCurrentWebPageInfo.
	THTMLItem (see page 25480)	This is class WebScript.THTMLItem.
	THTMLItems (see page 25483)	This is class WebScript.THTMLItems.
	TLineNumberMap (see page 25488)	This is class WebScript.TLineNumberMap.
	TScriptCodeItem (see page 25490)	This is class WebScript.TScriptCodeItem.
	TScriptEnginesList (see page 25492)	This is class WebScript.TScriptEnginesList.
	TScriptError (see page 25497)	This is class WebScript.TScriptError.
	TScriptErrors (see page 25501)	This is class WebScript.TScriptErrors.
	TScriptFile (see page 25505)	This is class WebScript.TScriptFile.
	TScriptGlobalObjects (see page 25508)	This is class WebScript.TScriptGlobalObjects.
	TScriptIncludeFile (see page 25513)	This is class WebScript.TScriptIncludeFile.
	TScriptIncludeFiles (see page 25514)	This is class WebScript.TScriptIncludeFiles.
	TScriptIncludeItem (see page 25518)	This is class WebScript.TScriptIncludeItem.
	TScriptItem (see page 25520)	This is class WebScript.TScriptItem.
	TScriptItems (see page 25522)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 25526)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 25530)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 25540)	This is class WebScript.TVariableLookup.

185.1.1 ERecursiveIncludeFile Class

Class Hierarchy

Pascal

```
ERecursiveIncludeFile = class(EScriptError);
```

C++

```
class ERecursiveIncludeFile : public EScriptError;
```

File

WebScript

Description

This is class WebScript.ERecursiveIncludeFile.

185.1.2 EScriptEvalError Class

Class Hierarchy

Pascal

```
EScriptEvalError = class(EWebBrokerException);
```

C++

```
class EScriptEvalError : public EWebBrokerException;
```

File

WebScript

Description

This is class WebScript.EScriptEvalError.

185.1.3 TAbstractScriptEngine Class

Class Hierarchy

Pascal

```
TAbstractScriptEngine = class(TObject);
```

C++

```
class TAbstractScriptEngine : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptEngine.

185.1.3.1 TAbstractScriptEngine Members

The following tables list the members exposed by TAbstractScriptEngine.

Public Methods

	Name	Description
	AddObjectFactory (see page 25468)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25467)	This is Create, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 25468)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25467)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
A	ListLanguageNames (see page 25469)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
A	SupportsLanguage (see page 25469)	This is SupportsLanguage, a member of class TAbstractScriptEngine.

Public Properties

	Name	Description
R	Name (see page 25469)	This is Name, a member of class TAbstractScriptEngine.
R	ScriptObjectFactories (see page 25470)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 25470)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

185.1.3.2 TAbstractScriptEngine.Create Constructor

Pascal

```
constructor Create(const AName: string);
```

C++

```
__fastcall TAbstractScriptEngine(const AnsiString AName);
```

Description

This is Create, a member of class TAbstractScriptEngine.

185.1.3.3 TAbstractScriptEngine.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractScriptEngine();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.3.4 TAbstractScriptEngine Methods

The methods of the TAbstractScriptEngine class are listed here.

Public Methods

	Name	Description
	AddObjectFactory (see page 25468)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 25468)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
	ListLanguageNames (see page 25469)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	SupportsLanguage (see page 25469)	This is SupportsLanguage, a member of class TAbstractScriptEngine.

185.1.3.4.1 TAbstractScriptEngine.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory);
```

Description

This is AddObjectFactory, a member of class TAbstractScriptEngine.

185.1.3.4.2 TAbstractScriptEngine.CreateComponentStub Method

Pascal

```
function CreateComponentStub(AObject: TObject): IInterface;
```

C++

```
__fastcall IInterface CreateComponentStub(TObject * AObject);
```

Description

This is CreateComponentStub, a member of class TAbstractScriptEngine.

185.1.3.4.3 TAbstractScriptEngine.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ListLanguageNames(TStrings AList) = 0;
```

Description

This is ListLanguageNames, a member of class TAbstractScriptEngine.

185.1.3.4.4 TAbstractScriptEngine.SupportsLanguage Method

Pascal

```
function SupportsLanguage(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean SupportsLanguage(const AnsiString AName) = 0;
```

Description

This is SupportsLanguage, a member of class TAbstractScriptEngine.

185.1.3.5 TAbstractScriptEngine Properties

The properties of the TAbstractScriptEngine class are listed here.

Public Properties

	Name	Description
R	Name (see page 25469)	This is Name, a member of class TAbstractScriptEngine.
R	ScriptObjectFactories (see page 25470)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 25470)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

185.1.3.5.1 TAbstractScriptEngine.Name Property

Pascal

```
property Name: string;
```

C++

```
__property AnsiString Name;
```

Description

This is Name, a member of class TAbstractScriptEngine.

185.1.3.5.2 TAbstractScriptEngine.ScriptObjectFactories Property

Pascal

```
property ScriptObjectFactories: TAbstractScriptObjectFactories;
```

C++

```
__property TAbstractScriptObjectFactories ScriptObjectFactories;
```

Description

This is ScriptObjectFactories, a member of class TAbstractScriptEngine.

185.1.3.5.3 TAbstractScriptEngine.ScriptProducerClass Property

Pascal

```
property ScriptProducerClass: TScriptProducerClass;
```

C++

```
__property TScriptProducerClass ScriptProducerClass;
```

Description

This is ScriptProducerClass, a member of class TAbstractScriptEngine.

185.1.4 TAbstractScriptObjectFactories Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactories = class(TObject);
```

C++

```
class TAbstractScriptObjectFactories : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactories.

185.1.4.1 TAbstractScriptObjectFactories Members

The following tables list the members exposed by TAbstractScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 25472)	This is GetCount, a member of class TAbstractScriptObjectFactories.
	GetFactory (see page 25472)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
	GetObjectList (see page 25472)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 25472)	This is Count, a member of class TAbstractScriptObjectFactories.
R	Factories (see page 25473)	This is Factories, a member of class TAbstractScriptObjectFactories.
R	ObjectList (see page 25473)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

185.1.4.2 TAbstractScriptObjectFactories Methods

The methods of the TAbstractScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
A	GetCount (see page 25472)	This is GetCount, a member of class TAbstractScriptObjectFactories.
A	GetFactory (see page 25472)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
A	GetObjectList (see page 25472)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

185.1.4.2.1 TAbstractScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

This is GetCount, a member of class TAbstractScriptObjectFactories.

185.1.4.2.2 TAbstractScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I) = 0;
```

Description

This is GetFactory, a member of class TAbstractScriptObjectFactories.

185.1.4.2.3 TAbstractScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; virtual; abstract;
```

C++

```
virtual __fastcall TObjectList GetObjectList() = 0;
```

Description

This is GetObjectList, a member of class TAbstractScriptObjectFactories.

185.1.4.3 TAbstractScriptObjectFactories Properties

The properties of the TAbstractScriptObjectFactories class are listed here.

Public Properties

	Name	Description
R	Count (see page 25472)	This is Count, a member of class TAbstractScriptObjectFactories.
R	Factories (see page 25473)	This is Factories, a member of class TAbstractScriptObjectFactories.
R	ObjectList (see page 25473)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

185.1.4.3.1 TAbstractScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAbstractScriptObjectFactories.

185.1.4.3.2 TAbstractScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TAbstractScriptObjectFactories.

185.1.4.3.3 TAbstractScriptObjectFactories.ObjectList Property

Pascal

```
property ObjectList: TObjectList;
```

C++

```
__property TObjectList ObjectList;
```

Description

This is ObjectList, a member of class TAbstractScriptObjectFactories.

185.1.5 TAbstractScriptObjectFactory Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactory = class;
```

C++

```
class TAbstractScriptObjectFactory;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactory.

185.1.5.1 TAbstractScriptObjectFactory Members

The following tables list the members exposed by TAbstractScriptObjectFactory.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 25474)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 25474)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 25475)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 25475)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 25475)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

185.1.5.2 TAbstractScriptObjectFactory Methods

The methods of the TAbstractScriptObjectFactory class are listed here.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 25474)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 25474)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 25475)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 25475)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 25475)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

185.1.5.2.1 TAbstractScriptObjectFactory.AddGlobalObjects Method

Pascal

```
procedure AddGlobalObjects(AScriptGlobalObjects: TScriptGlobalObjects); virtual;
```

C++

```
virtual __fastcall AddGlobalObjects(TScriptGlobalObjects AScriptGlobalObjects);
```

Description

This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.

185.1.5.2.2 TAbstractScriptObjectFactory.CreateComponentObject Method

Pascal

```
function CreateComponentObject(AComponent: TObject; AClassKey: TClass): IInterface; virtual;
abstract;
```

C++

```
virtual __fastcall IInterface CreateComponentObject(TObject * AComponent, TClass AClassKey) =
0;
```

Description

This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.

185.1.5.2.3 TAbstractScriptObjectFactory.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable,
IScriptContext AContext) = 0;
```

Description

This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

185.1.5.2.4 TAbstractScriptObjectFactory.CreateProducerObject Method

Pascal

```
function CreateProducerObject(AVariable: TGlobalScriptVariables; AProducer: IScriptProducer):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateProducerObject(TGlobalScriptVariables AVariable,
IScriptProducer AProducer) = 0;
```

Description

This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.

185.1.5.2.5 TAbstractScriptObjectFactory.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

185.1.6 TCurrentWebPageInfo Class

Class Hierarchy

Pascal

```
TCurrentWebPageInfo = class(TInterfacedObject, IWebPageInfo);
```

C++

```
class TCurrentWebPageInfo : public TInterfacedObject, public IWebPageInfo;
```

File

WebScript

Description

This is class WebScript.TCurrentWebPageInfo.

185.1.6.1 TCurrentWebPageInfo Members

The following tables list the members exposed by TCurrentWebPageInfo.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetHasViewAccess (see page 25478)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 25478)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 25478)	Returns the value of the PageDescription property.
	GetPageHREF (see page 25479)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 25479)	Returns the value of the PageIsPublished property.
	GetPageName (see page 25479)	Returns the value of the PageName property.
	GetPageTitle (see page 25479)	Returns the value of the PageTitle property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	WebPageInfo (see page 25480)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25477)	This is Create, a member of class TCurrentWebPageInfo.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.

	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	HasViewAccess (see page 24684)	Indicates whether the current user has access rights to view the Web page.
R	LoginRequired (see page 24684)	Indicates whether callers must log in before accessing this Web page.
R	PageDescription (see page 24684)	Describes the Web page.
R	PageHREF (see page 24685)	Identifies the HREF to use for references to the associated Web page.
R	PageIsPublished (see page 24685)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 24686).
R	PageName (see page 24686)	Denotes the logical name for the Web page.
R	PageTitle (see page 24686)	Indicates the title that appears on the Web page.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

185.1.6.2 TCurrentWebPageInfo.Create Constructor

Pascal

```
constructor Create(AContext: IScriptContext);
```

C++

```
__fastcall TCurrentWebPageInfo(IScriptContext AContext);
```

Description

This is Create, a member of class TCurrentWebPageInfo.

185.1.6.3 TCurrentWebPageInfo Methods

The methods of the TCurrentWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetHasViewAccess (see page 25478)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 25478)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 25478)	Returns the value of the PageDescription property.
	GetPageHREF (see page 25479)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 25479)	Returns the value of the PageIsPublished property.

	GetPageName (see page 25479)	Returns the value of the PageName property.
	GetPageTitle (see page 25479)	Returns the value of the PageTitle property.
	WebPageInfo (see page 25480)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

185.1.6.3.1 TCurrentWebPageInfo.GetHasViewAccess Method

Returns the value of the HasViewAccess property.

Pascal

```
function GetHasViewAccess: Boolean;
```

C++

```
__fastcall Boolean GetHasViewAccess();
```

Description

GetHasViewAccess is the read implementation of the HasViewAccess property.

See Also

HasViewAccess (see page 24684)

185.1.6.3.2 TCurrentWebPageInfo.GetLoginRequired Method

Returns the value of the LoginRequired property.

Pascal

```
function GetLoginRequired: Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired();
```

Description

GetLoginRequired is the read implementation of the LoginRequired property.

See Also

LoginRequired (see page 24684)

185.1.6.3.3 TCurrentWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription property.

Pascal

```
function GetPageDescription: string;
```

C++

```
__fastcall AnsiString GetPageDescription();
```

Description

GetPageDescription is the read implementation of the PageDescription property.

See Also

PageDescription (see page 24684)

185.1.6.3.4 TCurrentWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF property.

Pascal

```
function GetPageHREF: string;
```

C++

```
__fastcall AnsiString GetPageHREF();
```

Description

GetPageHREF is the read implementation of the PageHREF property.

See Also

PageHREF (see page 24685)

185.1.6.3.5 TCurrentWebPageInfo.GetPageIsPublished Method

Returns the value of the PageIsPublished property.

Pascal

```
function GetPageIsPublished: Boolean;
```

C++

```
__fastcall Boolean GetPageIsPublished();
```

Description

GetPageIsPublished is the read implementation of the PageIsPublished property.

See Also

PageIsPublished (see page 24685)

185.1.6.3.6 TCurrentWebPageInfo.GetPageName Method

Returns the value of the PageName property.

Pascal

```
function GetPageName: string;
```

C++

```
__fastcall AnsiString GetPageName();
```

Description

GetPageName is the read implementation of the PageName property.

See Also

PageName (see page 24686)

185.1.6.3.7 TCurrentWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle property.

Pascal

```
function GetPageTitle: string;
```

C++

```
__fastcall AnsiString GetPageTitle();
```

Description

GetPageTitle is the read implementation of the PageTitle property.

See Also

PageTitle (see page 24686)

185.1.6.3.8 TCurrentWebPageInfo.WebPageInfo Method

Pascal

```
function WebPageInfo: IWebPageInfo;
```

C++

```
__fastcall IWebPageInfo WebPageInfo();
```

Description

This is WebPageInfo, a member of class TCurrentWebPageInfo.

185.1.7 THTMLItem Class

Class Hierarchy

Pascal

```
THTMLItem = class(TObject);
```

C++

```
class THTMLItem : public TObject;
```

File

WebScript

Description

This is class WebScript.THTMLItem.

185.1.7.1 THTMLItem Members

The following tables list the members exposed by THTMLItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignString (see page 25482)	This is AssignString, a member of class THTMLItem.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25481)	This is Create, a member of class THTMLItem.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	HTML (see page 25482)	This is HTML, a member of class THTMLItem.
R	Ident (see page 25482)	This is Ident, a member of class THTMLItem.
R	Length (see page 25483)	This is Length, a member of class THTMLItem.
R	Offset (see page 25483)	This is Offset, a member of class THTMLItem.
	TagToken (see page 25483)	This is TagToken, a member of class THTMLItem.

185.1.7.2 THTMLItem.Create Constructor

Pascal

```
constructor Create(AItems: THTMLItems);
```

C++

```
__fastcall THTMLItem(THTMLItems AItems);
```

Description

This is Create, a member of class THTMLItem.

185.1.7.3 THTMLItem Methods

The methods of the THTMLItem class are listed here.

Public Methods

	Name	Description
	AssignString (see page 25482)	This is AssignString, a member of class THTMLItem.

185.1.7.3.1 THTMLItem.AssignString Method

Pascal

```
procedure AssignString(AOffset: Integer; AHTML: PChar; ALength: Integer);
```

C++

```
__fastcall AssignString(int AOffset, const char * AHTML, int ALength);
```

Description

This is AssignString, a member of class THTMLItem.

185.1.7.4 THTMLItem Properties

The properties of the THTMLItem class are listed here.

Public Properties

	Name	Description
R	HTML (see page 25482)	This is HTML, a member of class THTMLItem.
R	Ident (see page 25482)	This is Ident, a member of class THTMLItem.
R	Length (see page 25483)	This is Length, a member of class THTMLItem.
R	Offset (see page 25483)	This is Offset, a member of class THTMLItem.
	TagToken (see page 25483)	This is TagToken, a member of class THTMLItem.

185.1.7.4.1 THTMLItem.HTML Property

Pascal

```
property HTML: string;
```

C++

```
__property AnsiString HTML;
```

Description

This is HTML, a member of class THTMLItem.

185.1.7.4.2 THTMLItem.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property AnsiString Ident;
```

Description

This is Ident, a member of class THTMLItem.

185.1.7.4.3 THTMLItem.Length Property

Pascal

```
property Length: Integer;
```

C++

```
__property int Length;
```

Description

This is Length, a member of class THTMLItem.

185.1.7.4.4 THTMLItem.Offset Property

Pascal

```
property Offset: Integer;
```

C++

```
__property int Offset;
```

Description

This is Offset, a member of class THTMLItem.

185.1.7.4.5 THTMLItem.TagToken Property

Pascal

```
property TagToken: Boolean;
```

C++

```
__property Boolean TagToken;
```

Description

This is TagToken, a member of class THTMLItem.

185.1.8 THTMLItems Class

Class Hierarchy

Pascal

```
THTMLItems = class(TObjectList);
```

C++

```
class THTMLItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.THTMLItems.

185.1.8.1 THTMLItems Members

The following tables list the members exposed by THTMLItems.

Protected Methods

	Name	Description
	Get (see page 2878)	This is Get, a member of class TList.
	GetItem (see page 5682)	This is GetItem, a member of class TObjectList.
V	Grow (see page 2879)	This is Grow, a member of class TList.
V	Notify (see page 2884)	Responds when items are added, removed, or extracted from the list.
V	Notify (see page 5684)	Responds when items are added, removed, or extracted from the list.
	Put (see page 2887)	This is Put, a member of class TList.
	SetCapacity (see page 2891)	This is SetCapacity, a member of class TList.
	SetCount (see page 2892)	This is SetCount, a member of class TList.
	SetItem (see page 5685)	This is SetItem, a member of class TObjectList.

Public Methods

	Name	Description
	Add (see page 2871)	Inserts a new item at the end of the list.
	Add (see page 5680)	Inserts an object at the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2874)	Copies elements of one list to another.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 2874)	Deletes all items from the list.
	Create (see page 25485)	This is Create, a member of class THTMLItems.
	Create (see page 5679)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2874)	Removes the item at the position given by the Index parameter.
V	Destroy (see page 25485)	Destroys an instance of TList.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Error (see page 2875)	This is the overview for the Error method overload.
	Exchange (see page 2876)	Swaps the position of two items in the Items (see page 2898) array.
	Expand (see page 2877)	Increases the Capacity (see page 2895) of the list.
	Extract (see page 2877)	Removes a specified item from the list.
	Extract (see page 5681)	Removes a specified object from the list without freeing it.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindInstanceOf (see page 5682)	Finds the first instance of a specified class in the list.
	First (see page 2878)	Returns Items (see page 2898)[0].
	First (see page 5682)	Returns Items (see page 5685)[0].
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2878)	Returns a TList (see page 2868) enumerator.
	GetHTMLItem (see page 25486)	This is GetHTMLItem, a member of class THTMLItems.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 2879)	Returns the index of the first entry in the Items (see page 2898) array with a specified value.
	IndexOf (see page 5683)	Returns the index of the first object in the list with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2882)	Adds an object to the Items (see page 2898) array at the position specified by Index.
	Insert (see page 5683)	Adds an object to the list at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Last (see page 2882)	Returns Items (see page 2898)[Count (see page 2896) - 1].
	Last (see page 5684)	Returns the object at the end of the Items (see page 5685) array.
	MakeIdentifier (see page 25486)	This is MakeIdentifier, a member of class THTMLItems.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 2884)	Changes the position of an item in the Items (see page 2898) array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Pack (see page 2885)	Deletes all nil (Delphi) or NULL (C++) items from the Items (see page 2898) array.
	Prepare (see page 25486)	This is Prepare, a member of class THTMLItems.
	Remove (see page 2887)	Deletes the first reference to the Item parameter from the Items (see page 2898) array.
	Remove (see page 5684)	Removes a specified object from the list and (if OwnsObjects (see page 5686) is true) frees the object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 2892)	Performs a QuickSort on the list based on the comparison function Compare.

Public Properties

	Name	Description
	Capacity (see page 2895)	Specifies the allocated size of the array of pointers maintained by the TList (see page 2868) object.
	Count (see page 2896)	Indicates the number of entries in the list that are in use.
R	Items (see page 25487)	Lists the object references.
R	List (see page 2900)	Specifies the array of pointers that make up the Items (see page 2898) array.
	OwnsObjects (see page 5686)	Allows TObjectList (see page 5677) to free objects when they are deleted from the list or the list is destroyed.

185.1.8.2 THTMLItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall THTMLItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class THTMLItems.

185.1.8.3 THTMLItems.Destroy Destructor

Destroys an instance of TList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTMLItems();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the TList reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store the list of items.

Note: Destroy does not free the memory pointed to by the elements of the list.

See Also

Free (see page 22300)

185.1.8.4 THTMLItems Methods

The methods of the THTMLItems class are listed here.

Public Methods

	Name	Description
	GetHTMLItem (see page 25486)	This is GetHTMLItem, a member of class THTMLItems.
	MakeIdentifier (see page 25486)	This is MakeIdentifier, a member of class THTMLItems.
	Prepare (see page 25486)	This is Prepare, a member of class THTMLItems.

185.1.8.4.1 THTMLItems.GetHTMLItem Method

Pascal

```
function GetHTMLItem(I: Integer): THTMLItem;
```

C++

```
__fastcall THTMLItem GetHTMLItem(int I);
```

Description

This is GetHTMLItem, a member of class THTMLItems.

185.1.8.4.2 THTMLItems.MakeIdentifier Method

Pascal

```
function MakeIdentifier(AItem: THTMLItem): string;
```

C++

```
__fastcall AnsiString MakeIdentifier(THTMLItem AItem);
```

Description

This is MakeIdentifier, a member of class THTMLItems.

185.1.8.4.3 THTMLItems.Prepare Method

Pascal

```
procedure Prepare;
```

C++

```
__fastcall Prepare();
```

Description

This is Prepare, a member of class THTMLItems.

185.1.8.5 THTMLItems Properties

The properties of the THTMLItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 25487)	Lists the object references.

185.1.8.5.1 THTMLItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: THTMLItem;
```

C++

```
__property THTMLItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

See Also

OwnsObjects (see page 5686)

Add (see page 5680)

Insert (see page 5683)

185.1.9 TLineNumberMap Class

Class Hierarchy

Pascal

```
TLineNumberMap = class(TObject);
```

C++

```
class TLineNumberMap : public TObject;
```

File

WebScript

Description

This is class WebScript.TLineNumberMap.

185.1.9.1 TLineNumberMap Members

The following tables list the members exposed by TLineNumberMap.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	DestLineToSourceLine (see page 25489)	This is DestLineToSourceLine, a member of class TLineNumberMap.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	New (see page 25489)	This is New, a member of class TLineNumberMap.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 25490)	This is Count, a member of class TLineNumberMap.
R	Items (see page 25490)	This is Items, a member of class TLineNumberMap.

185.1.9.2 TLineNumberMap Methods

The methods of the TLineNumberMap class are listed here.

Public Methods

	Name	Description
	DestLineToSourceLine (see page 25489)	This is DestLineToSourceLine, a member of class TLineNumberMap.
	New (see page 25489)	This is New, a member of class TLineNumberMap.

185.1.9.2.1 TLineNumberMap.DestLineToSourceLine Method

Pascal

```
function DestLineToSourceLine(ALine: Integer; var AFileName: string): Integer;
```

C++

```
__fastcall int DestLineToSourceLine(int ALine, AnsiString AFileName);
```

Description

This is DestLineToSourceLine, a member of class TLineNumberMap.

185.1.9.2.2 TLineNumberMap.New Method

Pascal

```
function New: PLineNumbers;
```

C++

```
__fastcall PLineNumbers New();
```

Description

This is New, a member of class TLineNumberMap.

185.1.9.3 TLineNumberMap Properties

The properties of the TLineNumberMap class are listed here.

Public Properties

	Name	Description
R	Count (see page 25490)	This is Count, a member of class TLineNumberMap.
R	Items (see page 25490)	This is Items, a member of class TLineNumberMap.

185.1.9.3.1 TLineNumberMap.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TLineNumberMap.

185.1.9.3.2 TLineNumberMap.Items Property

Pascal

```
property Items [I: Integer]: PLineNumbers;
```

C++

```
__property PLineNumbers Items[int I];
```

Description

This is Items, a member of class TLineNumberMap.

185.1.10 TScriptCodeItem Class

Class Hierarchy

Pascal

```
TScriptCodeItem = class(TScriptItem);
```

C++

```
class TScriptCodeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptCodeItem.

185.1.10.1 TScriptCodeItem Members

The following tables list the members exposed by TScriptCodeItem.

Protected Methods

	Name	Description
	GetScript (see page 25492)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	AssignString (see page 25492)	This is AssignString, a member of class TScriptCodeItem.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 25521)	This is Create, a member of class TScriptItem.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Script (see page 25522)	This is Script, a member of class TScriptItem.

185.1.10.2 TScriptCodeItem Methods

The methods of the TScriptCodeItem class are listed here.

Protected Methods

	Name	Description
	GetScript (see page 25492)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AssignString (see page 25492)	This is AssignString, a member of class TScriptCodeItem.

185.1.10.2.1 TScriptCodeItem.AssignString Method

Pascal

```
procedure AssignString(const AValue: string);
```

C++

```
__fastcall AssignString(const AnsiString AValue);
```

Description

This is AssignString, a member of class TScriptCodeItem.

185.1.10.2.2 TScriptCodeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall AnsiString GetScript();
```

Description

This is GetScript, a member of class TScriptCodeItem.

185.1.11 TScriptEnginesList Class

Class Hierarchy

System::TObject → HTTPProd.TAbstractScriptEnginesList → WebScript.TScriptEnginesList

Pascal

```
TScriptEnginesList = class(TAbstractScriptEnginesList);
```

C++

```
class TScriptEnginesList : public TAbstractScriptEnginesList;
```

File

WebScript

Description

This is class WebScript.TScriptEnginesList.

185.1.11.1 TScriptEnginesList Members

The following tables list the members exposed by TScriptEnginesList.

Public Methods

	Name	Description
	AddEngine (see page 25495)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 25495)	This is AddObjectFactory, a member of class TScriptEnginesList.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25493)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25494)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Find (see page 25495)	This is Find, a member of class TScriptEnginesList.
V	FindScriptProducerClass (see page 25495)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	ListLanguageNames (see page 25496)	This is ListLanguageNames, a member of class TScriptEnginesList.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RemoveEngine (see page 25496)	This is RemoveEngine, a member of class TScriptEnginesList.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 25496)	This is Count, a member of class TScriptEnginesList.
R	Items (see page 25496)	This is Items, a member of class TScriptEnginesList.

185.1.11.2 TScriptEnginesList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptEnginesList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

185.1.11.3 TScriptEnginesList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptEnginesList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.11.4 TScriptEnginesList Methods

The methods of the TScriptEnginesList class are listed here.

Public Methods

	Name	Description
	AddEngine (see page 25495)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 25495)	This is AddObjectFactory, a member of class TScriptEnginesList.
	Find (see page 25495)	This is Find, a member of class TScriptEnginesList.
V	FindScriptProducerClass (see page 25495)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	ListLanguageNames (see page 25496)	This is ListLanguageNames, a member of class TScriptEnginesList.
	RemoveEngine (see page 25496)	This is RemoveEngine, a member of class TScriptEnginesList.

185.1.11.4.1 TScriptEnginesList.AddEngine Method

Pascal

```
procedure AddEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall AddEngine(TAbstractScriptEngine AEngine);
```

Description

This is AddEngine, a member of class TScriptEnginesList.

185.1.11.4.2 TScriptEnginesList.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory; const AEngineName: string);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory, const AnsiString
AEngineName);
```

Description

This is AddObjectFactory, a member of class TScriptEnginesList.

185.1.11.4.3 TScriptEnginesList.Find Method

Pascal

```
function Find(const AName: string): TAbstractScriptEngine;
```

C++

```
__fastcall TAbstractScriptEngine Find(const AnsiString AName);
```

Description

This is Find, a member of class TScriptEnginesList.

185.1.11.4.4 TScriptEnginesList.FindScriptProducerClass Method

Pascal

```
function FindScriptProducerClass(const ALanguageName: string): TScriptProducerClass; override;
```

C++

```
virtual __fastcall TScriptProducerClass FindScriptProducerClass(const AnsiString
ALanguageName);
```

Description

This is FindScriptProducerClass, a member of class TScriptEnginesList.

185.1.11.4.5 TScriptEnginesList.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings);
```

C++

```
__fastcall ListLanguageNames(TStrings AList);
```

Description

This is ListLanguageNames, a member of class TScriptEnginesList.

185.1.11.4.6 TScriptEnginesList.RemoveEngine Method

Pascal

```
procedure RemoveEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall RemoveEngine(TAbstractScriptEngine AEngine);
```

Description

This is RemoveEngine, a member of class TScriptEnginesList.

185.1.11.5 TScriptEnginesList Properties

The properties of the TScriptEnginesList class are listed here.

Public Properties

	Name	Description
R	Count (see page 25496)	This is Count, a member of class TScriptEnginesList.
R	Items (see page 25496)	This is Items, a member of class TScriptEnginesList.

185.1.11.5.1 TScriptEnginesList.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptEnginesList.

185.1.11.5.2 TScriptEnginesList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine Items[int I];
```

Description

This is Items, a member of class TScriptEnginesList.

185.1.12 TScriptError Class

Class Hierarchy

System::TObject → HTTPProd.TAbstractScriptError → WebScript.TScriptError

Pascal

```
TScriptError = class(TAbstractScriptError);
```

C++

```
class TScriptError : public TAbstractScriptError;
```

File

WebScript

Description

This is class WebScript.TScriptError.

185.1.12.1 TScriptError Members

The following tables list the members exposed by TScriptError.

Protected Fields

	Name	Description
	FCharPos (see page 25499)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 25499)	This is FDescription, a member of class TScriptError.
	FFileName (see page 25499)	This is FFileName, a member of class TScriptError.
	FLine (see page 25499)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 25500)	This is FSourceLine, a member of class TScriptError.

Protected Methods

	Name	Description
V	GetCharPos (see page 25500)	This is GetCharPos, a member of class TScriptError.
V	GetDescription (see page 25500)	This is GetDescription, a member of class TScriptError.
V	GetFileName (see page 25500)	This is GetFileName, a member of class TScriptError.
V	GetLine (see page 25501)	This is GetLine, a member of class TScriptError.
V	GetSourceLine (see page 25501)	This is GetSourceLine, a member of class TScriptError.
V	SetDescription (see page 25501)	This is SetDescription, a member of class TScriptError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25498)	This is Create, a member of class TScriptError.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	CharPos (see page 15263)	This is CharPos, a member of class TAbstractScriptError.
	Description (see page 15263)	This is Description, a member of class TAbstractScriptError.
R	FileName (see page 15264)	This is FileName, a member of class TAbstractScriptError.
R	Line (see page 15264)	This is Line, a member of class TAbstractScriptError.
R	SourceLine (see page 15264)	This is SourceLine, a member of class TAbstractScriptError.

185.1.12.2 TScriptError.Create Constructor

Pascal

```
constructor Create(E: Exception); overload;
```

C++

```
__fastcall TScriptError(Exception E);
```

Description

This is Create, a member of class TScriptError.

185.1.12.3 TScriptError Fields

The fields of the TScriptError class are listed here.

Protected Fields

	Name	Description
	FCharPos (see page 25499)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 25499)	This is FDescription, a member of class TScriptError.
	FFileName (see page 25499)	This is FFileName, a member of class TScriptError.
	FLine (see page 25499)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 25500)	This is FSourceLine, a member of class TScriptError.

185.1.12.3.1 TScriptError.FCharPos Field

Pascal

```
FCharPos: Integer;
```

C++

```
int FCharPos;
```

Description

This is FCharPos, a member of class TScriptError.

185.1.12.3.2 TScriptError.FDescription Field

Pascal

```
FDescription: string;
```

C++

```
AnsiString FDescription;
```

Description

This is FDescription, a member of class TScriptError.

185.1.12.3.3 TScriptError.FFileName Field

Pascal

```
FFileName: string;
```

C++

```
AnsiString FFileName;
```

Description

This is FFileName, a member of class TScriptError.

185.1.12.3.4 TScriptError.FLine Field

Pascal

```
FLine: Integer;
```

C++

```
int FLine;
```

Description

This is FLine, a member of class TScriptError.

185.1.12.3.5 TScriptError.FSourceLine Field

Pascal

```
FSourceLine: string;
```

C++

```
AnsiString FSourceLine;
```

Description

This is FSourceLine, a member of class TScriptError.

185.1.12.4 TScriptError Methods

The methods of the TScriptError class are listed here.

Protected Methods

	Name	Description
	GetCharPos (see page 25500)	This is GetCharPos, a member of class TScriptError.
	GetDescription (see page 25500)	This is GetDescription, a member of class TScriptError.
	GetFileName (see page 25500)	This is GetFileName, a member of class TScriptError.
	GetLine (see page 25501)	This is GetLine, a member of class TScriptError.
	GetSourceLine (see page 25501)	This is GetSourceLine, a member of class TScriptError.
	SetDescription (see page 25501)	This is SetDescription, a member of class TScriptError.

185.1.12.4.1 TScriptError.GetCharPos Method

Pascal

```
function GetCharPos: Integer; override;
```

C++

```
virtual __fastcall int GetCharPos();
```

Description

This is GetCharPos, a member of class TScriptError.

185.1.12.4.2 TScriptError.GetDescription Method

Pascal

```
function GetDescription: string; override;
```

C++

```
virtual __fastcall AnsiString GetDescription();
```

Description

This is GetDescription, a member of class TScriptError.

185.1.12.4.3 TScriptError.GetFileName Method

Pascal

```
function GetFileName: string; override;
```

C++

```
virtual __fastcall AnsiString GetFileName();
```

Description

This is GetFileName, a member of class TScriptError.

185.1.12.4.4 TScriptError.GetLine Method

Pascal

```
function GetLine: Integer; override;
```

C++

```
virtual __fastcall int GetLine();
```

Description

This is GetLine, a member of class TScriptError.

185.1.12.4.5 TScriptError.GetSourceLine Method

Pascal

```
function GetSourceLine: string; override;
```

C++

```
virtual __fastcall AnsiString GetSourceLine();
```

Description

This is GetSourceLine, a member of class TScriptError.

185.1.12.4.6 TScriptError.SetDescription Method

Pascal

```
procedure SetDescription(const AValue: string); override;
```

C++

```
virtual __fastcall SetDescription(const AnsiString AValue);
```

Description

This is SetDescription, a member of class TScriptError.

185.1.13 TScriptErrors Class

Class Hierarchy

Pascal

```
TScriptErrors = class(TAbstractScriptErrors);
```

C++

```
class TScriptErrors : public TAbstractScriptErrors;
```

File

WebScript

Description

This is class WebScript.TScriptErrors.

185.1.13.1 TScriptErrors Members

The following tables list the members exposed by TScriptErrors.

Protected Methods

	Name	Description
	GetError (see page 25504)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 25504)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 25504)	This is Add, a member of class TScriptErrors.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25503)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25503)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Count (see page 15267)	This is Count, a member of class TAbstractScriptErrors.

	Errors (see page 15267)	This is Errors, a member of class TAbstractScriptErrors.

185.1.13.2 TScriptErrors.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptErrors();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

185.1.13.3 TScriptErrors.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptErrors();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.13.4 TScriptErrors Methods

The methods of the TScriptErrors class are listed here.

Protected Methods

	Name	Description
	GetError (see page 25504)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 25504)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 25504)	This is Add, a member of class TScriptErrors.

185.1.13.4.1 TScriptErrors.Add Method

Pascal

```
procedure Add(const AError: TAbstractScriptError); override;
```

C++

```
virtual __fastcall Add(const TAbstractScriptError AError);
```

Description

This is Add, a member of class TScriptErrors.

185.1.13.4.2 TScriptErrors.GetError Method

Pascal

```
function GetError(I: Integer): TAbstractScriptError; override;
```

C++

```
virtual __fastcall TAbstractScriptError GetError(int I);
```

Description

This is GetError, a member of class TScriptErrors.

185.1.13.4.3 TScriptErrors.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int GetErrorCount();
```

Description

This is GetErrorCount, a member of class TScriptErrors.

185.1.14 TScriptFile Class

Class Hierarchy

WebScript.TScriptFile

Pascal

```
TScriptFile = class;
```

C++

```
class TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptFile.

185.1.14.1 TScriptFile Members

The following tables list the members exposed by TScriptFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 25506)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 25505)	This is Create, a member of class TScriptFile.
V	Destroy (see page 25506)	This is Destroy, a member of class TScriptFile.
	ParseStream (see page 25506)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 25507)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 25507)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 25507)	This is LongName, a member of class TScriptFile.
R	Script (see page 25508)	This is Script, a member of class TScriptFile.
R	ShortName (see page 25508)	This is ShortName, a member of class TScriptFile.
R	Source (see page 25508)	This is Source, a member of class TScriptFile.

185.1.14.2 TScriptFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptFile(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptFile.

185.1.14.3 TScriptFile.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptFile();
```

Description

This is Destroy, a member of class TScriptFile.

185.1.14.4 TScriptFile Fields

The fields of the TScriptFile class are listed here.

Public Fields

	Name	Description
	FLineNumberMap (see page 25506)	This is FLineNumberMap, a member of class TScriptFile.

185.1.14.4.1 TScriptFile.FLineNumberMap Field

Pascal

```
FLineNumberMap: TLineNumberMap;
```

C++

```
TLineNumberMap FLineNumberMap;
```

Description

This is FLineNumberMap, a member of class TScriptFile.

185.1.14.5 TScriptFile Methods

The methods of the TScriptFile class are listed here.

Public Methods

	Name	Description
	ParseStream (see page 25506)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 25507)	This is ParseString, a member of class TScriptFile.

185.1.14.5.1 TScriptFile.ParseStream Method

Pascal

```
procedure ParseStream(ASource: TStream; AOwned: Boolean);
```

C++

```
__fastcall ParseStream(TStream ASource, Boolean AOwned);
```

Description

This is ParseStream, a member of class TScriptFile.

185.1.14.5.2 TScriptFile.ParseString Method

Pascal

```
procedure ParseString(const ASource: string);
```

C++

```
__fastcall ParseString(const AnsiString ASource);
```

Description

This is ParseString, a member of class TScriptFile.

185.1.14.6 TScriptFile Properties

The properties of the TScriptFile class are listed here.

Public Properties

	Name	Description
R	ApplicationName (see page 25507)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 25507)	This is LongName, a member of class TScriptFile.
R	Script (see page 25508)	This is Script, a member of class TScriptFile.
R	ShortName (see page 25508)	This is ShortName, a member of class TScriptFile.
R	Source (see page 25508)	This is Source, a member of class TScriptFile.

185.1.14.6.1 TScriptFile.ApplicationName Property

Pascal

```
property ApplicationName: string;
```

C++

```
__property AnsiString ApplicationName;
```

Description

This is ApplicationName, a member of class TScriptFile.

185.1.14.6.2 TScriptFile.LongName Property

Pascal

```
property LongName: string;
```

C++

```
__property AnsiString LongName;
```

Description

This is LongName, a member of class TScriptFile.

185.1.14.6.3 TScriptFile.Script Property

Pascal

```
property Script: string;
```

C++

```
__property AnsiString Script;
```

Description

This is Script, a member of class TScriptFile.

185.1.14.6.4 TScriptFile.ShortName Property

Pascal

```
property ShortName: string;
```

C++

```
__property AnsiString ShortName;
```

Description

This is ShortName, a member of class TScriptFile.

185.1.14.6.5 TScriptFile.Source Property

Pascal

```
property Source: string;
```

C++

```
__property AnsiString Source;
```

Description

This is Source, a member of class TScriptFile.

185.1.15 TScriptGlobalObjects Class

Class Hierarchy

Pascal

```
TScriptGlobalObjects = class(TObject);
```

C++

```
class TScriptGlobalObjects : public TObject;
```

File

WebScript

Description

This is class WebScript.TScriptGlobalObjects.

185.1.15.1 TScriptGlobalObjects Members

The following tables list the members exposed by TScriptGlobalObjects.

Protected Methods

	Name	Description
	GetScriptEngine (see page 25512)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 25511)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25510)	This is Create, a member of class TScriptGlobalObjects.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25510)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindNamedItemIntf (see page 25511)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamedItemCount (see page 25511)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 25511)	This is GetNamedItemName, a member of class TScriptGlobalObjects.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	NamedItemCount (see page 25512)	This is NamedItemCount, a member of class TScriptGlobalObjects.
	NamedItemName (see page 25512)	This is NamedItemName, a member of class TScriptGlobalObjects.
	Producer (see page 25512)	This is Producer, a member of class TScriptGlobalObjects.
	ScriptEngine (see page 25513)	This is ScriptEngine, a member of class TScriptGlobalObjects.

185.1.15.2 TScriptGlobalObjects.Create Constructor

Pascal

```
constructor Create(AProducer: IScriptProducer);
```

C++

```
__fastcall TScriptGlobalObjects(IScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptGlobalObjects.

185.1.15.3 TScriptGlobalObjects.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptGlobalObjects();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.15.4 TScriptGlobalObjects Methods

The methods of the TScriptGlobalObjects class are listed here.

Protected Methods

	Name	Description
	GetScriptEngine (see page 25512)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 25511)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
	FindNamedItemIntf (see page 25511)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	GetNamedItemCount (see page 25511)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 25511)	This is GetNamedItemName, a member of class TScriptGlobalObjects.

185.1.15.4.1 TScriptGlobalObjects.AddNamedIntf Method

Pascal

```
procedure AddNamedIntf(const AName: string; AIntf: IUnknown);
```

C++

```
__fastcall AddNamedIntf(const AnsiString AName, IUnknown AIntf);
```

Description

This is AddNamedIntf, a member of class TScriptGlobalObjects.

185.1.15.4.2 TScriptGlobalObjects.FindNamedItemIntf Method

Pascal

```
function FindNamedItemIntf(const AName: string): IUnknown;
```

C++

```
__fastcall IUnknown FindNamedItemIntf(const AnsiString AName);
```

Description

This is FindNamedItemIntf, a member of class TScriptGlobalObjects.

185.1.15.4.3 TScriptGlobalObjects.GetNamedItemCount Method

Pascal

```
function GetNamedItemCount: Integer;
```

C++

```
__fastcall int GetNamedItemCount();
```

Description

This is GetNamedItemCount, a member of class TScriptGlobalObjects.

185.1.15.4.4 TScriptGlobalObjects.GetNamedItemName Method

Pascal

```
function GetNamedItemName(I: Integer): string;
```

C++

```
__fastcall AnsiString GetNamedItemName(int I);
```

Description

This is GetNamedItemName, a member of class TScriptGlobalObjects.

185.1.15.4.5 TScriptGlobalObjects.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TScriptGlobalObjects.

185.1.15.5 TScriptGlobalObjects Properties

The properties of the TScriptGlobalObjects class are listed here.

Public Properties

	Name	Description
R	NamedItemCount (see page 25512)	This is NamedItemCount, a member of class TScriptGlobalObjects.
R	NamedItemName (see page 25512)	This is NamedItemName, a member of class TScriptGlobalObjects.
R	Producer (see page 25512)	This is Producer, a member of class TScriptGlobalObjects.
R	ScriptEngine (see page 25513)	This is ScriptEngine, a member of class TScriptGlobalObjects.

185.1.15.5.1 TScriptGlobalObjects.NamedItemCount Property

Pascal

```
property NamedItemCount: Integer;
```

C++

```
__property int NamedItemCount;
```

Description

This is NamedItemCount, a member of class TScriptGlobalObjects.

185.1.15.5.2 TScriptGlobalObjects.NamedItemName Property

Pascal

```
property NamedItemName [I: Integer]: string;
```

C++

```
__property AnsiString NamedItemName[int I];
```

Description

This is NamedItemName, a member of class TScriptGlobalObjects.

185.1.15.5.3 TScriptGlobalObjects.Producer Property

Pascal

```
property Producer: IScriptProducer;
```

C++

```
__property IScriptProducer Producer;
```

Description

This is Producer, a member of class TScriptGlobalObjects.

185.1.15.5.4 TScriptGlobalObjects.ScriptEngine Property

Pascal

```
property ScriptEngine: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine ScriptEngine;
```

Description

This is ScriptEngine, a member of class TScriptGlobalObjects.

185.1.16 TScriptIncludeFile Class

Class Hierarchy

Pascal

```
TScriptIncludeFile = class(TScriptFile);
```

C++

```
class TScriptIncludeFile : public TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFile.

185.1.16.1 TScriptIncludeFile Members

The following tables list the members exposed by TScriptIncludeFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 25506)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 25514)	This is Create, a member of class TScriptIncludeFile.
V	Destroy (see page 25506)	This is Destroy, a member of class TScriptFile.
	LoadFile (see page 25514)	This is LoadFile, a member of class TScriptIncludeFile.
	ParseStream (see page 25506)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 25507)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 25507)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 25507)	This is LongName, a member of class TScriptFile.
R	Script (see page 25508)	This is Script, a member of class TScriptFile.
R	ShortName (see page 25508)	This is ShortName, a member of class TScriptFile.
R	Source (see page 25508)	This is Source, a member of class TScriptFile.

185.1.16.2 TScriptIncludeFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer; AIncludeType: TIncludeType; const AFileName:
string);
```

C++

```
__fastcall TScriptIncludeFile(TScriptProducer AProducer, TIncludeType AIncludeType, const
AnsiString AFileName);
```

Description

This is Create, a member of class TScriptIncludeFile.

185.1.16.3 TScriptIncludeFile Methods

The methods of the TScriptIncludeFile class are listed here.

Public Methods

	Name	Description
	LoadFile (see page 25514)	This is LoadFile, a member of class TScriptIncludeFile.

185.1.16.3.1 TScriptIncludeFile.LoadFile Method

Pascal

```
procedure LoadFile;
```

C++

```
__fastcall LoadFile();
```

Description

This is LoadFile, a member of class TScriptIncludeFile.

185.1.17 TScriptIncludeFiles Class

Class Hierarchy

Pascal

```
TScriptIncludeFiles = class(TObjectList);
```

C++

```
class TScriptIncludeFiles : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFiles.

185.1.17.1 TScriptIncludeFiles Members

The following tables list the members exposed by TScriptIncludeFiles.

Protected Methods

	Name	Description
	Get (see page 2878)	This is Get, a member of class TList.
	GetItem (see page 5682)	This is GetItem, a member of class TObjectList.
V	Grow (see page 2879)	This is Grow, a member of class TList.
V	Notify (see page 2884)	Responds when items are added, removed, or extracted from the list.
V	Notify (see page 5684)	Responds when items are added, removed, or extracted from the list.
	Put (see page 2887)	This is Put, a member of class TList.
	SetCapacity (see page 2891)	This is SetCapacity, a member of class TList.
	SetCount (see page 2892)	This is SetCount, a member of class TList.
	SetItem (see page 5685)	This is SetItem, a member of class TObjectList.

Public Methods

	Name	Description
	Add (see page 2871)	Inserts a new item at the end of the list.
	Add (see page 5680)	Inserts an object at the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2874)	Copies elements of one list to another.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 2874)	Deletes all items from the list.
	Create (see page 25516)	This is Create, a member of class TScriptIncludeFiles.
	Create (see page 5679)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2874)	Removes the item at the position given by the Index parameter.
V	Destroy (see page 2870)	Destroys an instance of TList (see page 2868).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Error (see page 2875)	This is the overview for the Error method overload.
	Exchange (see page 2876)	Swaps the position of two items in the Items (see page 2898) array.
	Expand (see page 2877)	Increases the Capacity (see page 2895) of the list.
	Extract (see page 2877)	Removes a specified item from the list.

	Extract (see page 5681)	Removes a specified object from the list without freeing it.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindInstanceOf (see page 5682)	Finds the first instance of a specified class in the list.
	First (see page 2878)	Returns Items (see page 2898)[0].
	First (see page 5682)	Returns Items (see page 5685)[0].
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2878)	Returns a TList (see page 2868) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetScriptIncludeFile (see page 25517)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.
	IndexOf (see page 2879)	Returns the index of the first entry in the Items (see page 2898) array with a specified value.
	IndexOf (see page 5683)	Returns the index of the first object in the list with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2882)	Adds an object to the Items (see page 2898) array at the position specified by Index.
	Insert (see page 5683)	Adds an object to the list at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Last (see page 2882)	Returns Items (see page 2898)[Count (see page 2896) - 1].
	Last (see page 5684)	Returns the object at the end of the Items (see page 5685) array.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 2884)	Changes the position of an item in the Items (see page 2898) array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Pack (see page 2885)	Deletes all nil (Delphi) or NULL (C++) items from the Items (see page 2898) array.
	Remove (see page 2887)	Deletes the first reference to the Item parameter from the Items (see page 2898) array.
	Remove (see page 5684)	Removes a specified object from the list and (if OwnsObjects (see page 5686) is true) frees the object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 2892)	Performs a QuickSort on the list based on the comparison function Compare.

Public Properties

	Name	Description
	Capacity (see page 2895)	Specifies the allocated size of the array of pointers maintained by the TList (see page 2868) object.
	Count (see page 2896)	Indicates the number of entries in the list that are in use.
R	Items (see page 25517)	Lists the object references.
R	List (see page 2900)	Specifies the array of pointers that make up the Items (see page 2898) array.
	OwnsObjects (see page 5686)	Allows TObjectList (see page 5677) to free objects when they are deleted from the list or the list is destroyed.

185.1.17.2 TScriptIncludeFiles.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptIncludeFiles(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptIncludeFiles.

185.1.17.3 TScriptIncludeFiles Methods

The methods of the TScriptIncludeFiles class are listed here.

Public Methods

	Name	Description
	GetScriptIncludeFile (see page 25517)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

185.1.17.3.1 TScriptIncludeFiles.GetScriptIncludeFile Method

Pascal

```
function GetScriptIncludeFile(I: Integer): TScriptIncludeFile;
```

C++

```
__fastcall TScriptIncludeFile GetScriptIncludeFile(int I);
```

Description

This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

185.1.17.4 TScriptIncludeFiles Properties

The properties of the TScriptIncludeFiles class are listed here.

Public Properties

	Name	Description
R	Items (see page 25517)	Lists the object references.

185.1.17.4.1 TScriptIncludeFiles.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptIncludeFile;
```

C++

```
__property TScriptIncludeFile Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following

two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

185.1.18 TScriptIncludeItem Class

Class Hierarchy

Pascal

```
TScriptIncludeItem = class(TScriptItem);
```

C++

```
class TScriptIncludeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeItem.

185.1.18.1 TScriptIncludeItem Members

The following tables list the members exposed by TScriptIncludeItem.

Protected Methods

	Name	Description
	GetScript (see page 25520)	This is GetScript, a member of class TScriptIncludeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25519)	This is Create, a member of class TScriptIncludeItem.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Script (see page 25522)	This is Script, a member of class TScriptItem.

185.1.18.2 TScriptIncludeItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems; AIncludeFile: TScriptIncludeFile);
```

C++

```
__fastcall TScriptIncludeItem(TScriptItems AItems, TScriptIncludeFile AIncludeFile);
```

Description

This is Create, a member of class TScriptIncludeItem.

185.1.18.3 TScriptIncludeItem Methods

The methods of the TScriptIncludeItem class are listed here.

Protected Methods

	Name	Description
	GetScript (see page 25520)	This is GetScript, a member of class TScriptIncludeItem.

185.1.18.3.1 TScriptIncludeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall AnsiString GetScript();
```

Description

This is GetScript, a member of class TScriptIncludeItem.

185.1.19 TScriptItem Class

Class Hierarchy

Pascal

```
TScriptItem = class(TObject);
```

C++

```
class TScriptItem : public TObject;
```

File

WebScript

Description

This is class WebScript.TScriptItem.

185.1.19.1 TScriptItem Members

The following tables list the members exposed by TScriptItem.

Protected Methods

	Name	Description
	GetScript (see page 25522)	This is GetScript, a member of class TScriptItem.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25521)	This is Create, a member of class TScriptItem.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Script (see page 25522)	This is Script, a member of class TScriptItem.

185.1.19.2 TScriptItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems);
```

C++

```
__fastcall TScriptItem(TScriptItems AItems);
```

Description

This is Create, a member of class TScriptItem.

185.1.19.3 TScriptItem Methods

The methods of the TScriptItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 25522)	This is GetScript, a member of class TScriptItem.

185.1.19.3.1 TScriptItem.GetScript Method

Pascal

```
function GetScript: string; virtual;
```

C++

```
virtual __fastcall AnsiString GetScript();
```

Description

This is GetScript, a member of class TScriptItem.

185.1.19.4 TScriptItem Properties

The properties of the TScriptItem class are listed here.

Public Properties

	Name	Description
	Script (see page 25522)	This is Script, a member of class TScriptItem.

185.1.19.4.1 TScriptItem.Script Property

Pascal

```
property Script: string;
```

C++

```
__property AnsiString Script;
```

Description

This is Script, a member of class TScriptItem.

185.1.20 TScriptItems Class

Class Hierarchy

Pascal

```
TScriptItems = class(TObjectList);
```

C++

```
class TScriptItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptItems.

185.1.20.1 TScriptItems Members

The following tables list the members exposed by TScriptItems.

Protected Methods

	Name	Description
	Get (see page 2878)	This is Get, a member of class TList.
	GetItem (see page 5682)	This is GetItem, a member of class TObjectList.
V	Grow (see page 2879)	This is Grow, a member of class TList.
V	Notify (see page 2884)	Responds when items are added, removed, or extracted from the list.
V	Notify (see page 5684)	Responds when items are added, removed, or extracted from the list.
	Put (see page 2887)	This is Put, a member of class TList.
	SetCapacity (see page 2891)	This is SetCapacity, a member of class TList.
	SetCount (see page 2892)	This is SetCount, a member of class TList.
	SetItem (see page 5685)	This is SetItem, a member of class TObjectList.

Public Methods

	Name	Description
	Add (see page 2871)	Inserts a new item at the end of the list.
	Add (see page 5680)	Inserts an object at the end of the list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2874)	Copies elements of one list to another.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Clear (see page 2874)	Deletes all items from the list.
	Create (see page 25524)	This is Create, a member of class TScriptItems.
	Create (see page 5679)	This is the overview for the Create constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2874)	Removes the item at the position given by the Index parameter.
V	Destroy (see page 2870)	Destroys an instance of TList (see page 2868).
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Error (see page 2875)	This is the overview for the Error method overload.
	Exchange (see page 2876)	Swaps the position of two items in the Items (see page 2898) array.
	Expand (see page 2877)	Increases the Capacity (see page 2895) of the list.
	Extract (see page 2877)	Removes a specified item from the list.
	Extract (see page 5681)	Removes a specified object from the list without freeing it.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindInstanceOf (see page 5682)	Finds the first instance of a specified class in the list.
	First (see page 2878)	Returns Items (see page 2898)[0].
	First (see page 5682)	Returns Items (see page 5685)[0].
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2878)	Returns a TList (see page 2868) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.

	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetScriptItem (see page 25525)	This is GetScriptItem, a member of class TScriptItems.
	IndexOf (see page 2879)	Returns the index of the first entry in the Items (see page 2898) array with a specified value.
	IndexOf (see page 5683)	Returns the index of the first object in the list with a specified value.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2882)	Adds an object to the Items (see page 2898) array at the position specified by Index.
	Insert (see page 5683)	Adds an object to the list at a specified position.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	Last (see page 2882)	Returns Items (see page 2898)[Count (see page 2896) - 1].
	Last (see page 5684)	Returns the object at the end of the Items (see page 5685) array.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	Move (see page 2884)	Changes the position of an item in the Items (see page 2898) array.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Pack (see page 2885)	Deletes all nil (Delphi) or NULL (C++) items from the Items (see page 2898) array.
	Remove (see page 2887)	Deletes the first reference to the Item parameter from the Items (see page 2898) array.
	Remove (see page 5684)	Removes a specified object from the list and (if OwnsObjects (see page 5686) is true) frees the object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Sort (see page 2892)	Performs a QuickSort on the list based on the comparison function Compare.

Public Properties

	Name	Description
	Capacity (see page 2895)	Specifies the allocated size of the array of pointers maintained by the TList (see page 2868) object.
	Count (see page 2896)	Indicates the number of entries in the list that are in use.
R	Items (see page 25525)	Lists the object references.
R	List (see page 2900)	Specifies the array of pointers that make up the Items (see page 2898) array.
	OwnsObjects (see page 5686)	Allows TObjectList (see page 5677) to free objects when they are deleted from the list or the list is destroyed.

185.1.20.2 TScriptItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptItems.

185.1.20.3 TScriptItems Methods

The methods of the TScriptItems class are listed here.

Public Methods

	Name	Description
	GetScriptItem (see page 25525)	This is GetScriptItem, a member of class TScriptItems.

185.1.20.3.1 TScriptItems.GetScriptItem Method

Pascal

```
function GetScriptItem(I: Integer): TScriptItem;
```

C++

```
__fastcall TScriptItem GetScriptItem(int I);
```

Description

This is GetScriptItem, a member of class TScriptItems.

185.1.20.4 TScriptItems Properties

The properties of the TScriptItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 25525)	Lists the object references.

185.1.20.4.1 TScriptItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptItem;
```

C++

```
__property TScriptItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

185.1.21 TScriptObjectFactories Class

Class Hierarchy

System::TObject → WebScript.TAbstractScriptObjectFactories → WebScript.TScriptObjectFactories

Pascal

```
TScriptObjectFactories = class(TAbstractScriptObjectFactories);
```

C++

```
class TScriptObjectFactories : public TAbstractScriptObjectFactories;
```

File

WebScript

Description

This is class WebScript.TScriptObjectFactories.

185.1.21.1 TScriptObjectFactories Members

The following tables list the members exposed by TScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 25529)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 25529)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 25529)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25527)	Constructs an object and initializes its data before the object is first used.
	CreateGlobalObject (see page 25529)	This is CreateGlobalObject, a member of class TScriptObjectFactories.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25528)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Count (see page 25530)	This is Count, a member of class TScriptObjectFactories.
R	Factories (see page 25530)	This is Factories, a member of class TScriptObjectFactories.
R	ObjectList (see page 25473)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

185.1.21.2 TScriptObjectFactories.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptObjectFactories();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

185.1.21.3 TScriptObjectFactories.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptObjectFactories();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.21.4 TScriptObjectFactories Methods

The methods of the TScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 25529)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 25529)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 25529)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	CreateGlobalObject (see page 25529)	This is CreateGlobalObject, a member of class TScriptObjectFactories.

185.1.21.4.1 TScriptObjectFactories.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface;
```

C++

```
__fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable, IScriptContext
AContext);
```

Description

This is CreateGlobalObject, a member of class TScriptObjectFactories.

185.1.21.4.2 TScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TScriptObjectFactories.

185.1.21.4.3 TScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; override;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TScriptObjectFactories.

185.1.21.4.4 TScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; override;
```

C++

```
virtual __fastcall TObjectList GetObjectList();
```

Description

This is GetObjectList, a member of class TScriptObjectFactories.

185.1.21.5 TScriptObjectFactories Properties

The properties of the TScriptObjectFactories class are listed here.

Public Properties

	Name	Description
R	Count (see page 25530)	This is Count, a member of class TScriptObjectFactories.
R	Factories (see page 25530)	This is Factories, a member of class TScriptObjectFactories.

185.1.21.5.1 TScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptObjectFactories.

185.1.21.5.2 TScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TScriptObjectFactories.

185.1.22 TScriptProducer Class

Class Hierarchy

Pascal

```
TScriptProducer = class(TAbstractScriptProducer, IScriptProducer, IScriptContext);
```

C++

```
class TScriptProducer : public TAbstractScriptProducer, public IScriptProducer, public
IScriptContext;
```

File

WebScript

Description

This is class WebScript.TScriptProducer.

185.1.22.1 TScriptProducer Members

The following tables list the members exposed by TScriptProducer.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Fields

	Name	Description
	FErrors (see page 25534)	This is FErrors, a member of class TScriptProducer.
	FScriptEngine (see page 25534)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 25534)	This is FScriptFile, a member of class TScriptProducer.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Evaluate (see page 25535)	This is Evaluate, a member of class TScriptProducer.
A	EvaluateExpression (see page 25535)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 25535)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 25535)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 25536)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 25536)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 25536)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 25536)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 25536)	This is HandleScriptError, a member of class TScriptProducer.
A	ImplHandleScriptError (see page 25537)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 25537)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 25537)	This is ParseString, a member of class TScriptProducer.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	ReplaceTags (see page 25537)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 25538)	This is SetContent, a member of class TScriptProducer.
	Write (see page 25538)	This is the overview for the Write method overload.
	WriteItem (see page 25539)	This is WriteItem, a member of class TScriptProducer.

Protected Properties

	Name	Description
R	Component (see page 25539)	This is Component, a member of class TScriptProducer.
R	Content (see page 25539)	This is Content, a member of class TScriptProducer.
R	Designing (see page 25540)	This is Designing, a member of class TScriptProducer.
R	Errors (see page 25540)	This is Errors, a member of class TScriptProducer.
R	Script (see page 25540)	This is Script, a member of class TScriptProducer.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.

	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25532)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 25533)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	Write (see page 15326)	This is the overview for the Write method overload.

Public Properties

	Name	Description
	HTMLBlockCount (see page 15328)	This is HTMLBlockCount, a member of class IScriptProducer.
	HTMLBlocks (see page 15328)	This is HTMLBlocks, a member of class IScriptProducer.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	WebModuleContext (see page 15322)	This is WebModuleContext, a member of class IScriptContext.

185.1.22.2 TScriptProducer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create(AWebModuleContext: TWebModuleContext; AStripParamQuotes: Boolean;
AHandleTag: THandleTagProc; const AScriptEngine: string; ALocateFileService:
ILocateFileService); override;
```

C++

```
virtual __fastcall TScriptProducer(TWebModuleContext AWebModuleContext, Boolean
AStripParamQuotes, THandleTagProc AHandleTag, const AnsiString AScriptEngine,
ILocateFileService ALocateFileService);
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

Destroy (see page 22287)

new

185.1.22.3 TScriptProducer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptProducer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

185.1.22.4 TScriptProducer Fields

The fields of the TScriptProducer class are listed here.

Protected Fields

	Name	Description
	FErrors (see page 25534)	This is FErrors, a member of class TScriptProducer.

	FScriptEngine (see page 25534)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 25534)	This is FScriptFile, a member of class TScriptProducer.

185.1.22.4.1 TScriptProducer.FErrors Field

Pascal

```
FErrors: TAbstractScriptErrors;
```

C++

```
TAbstractScriptErrors FErrors;
```

Description

This is FErrors, a member of class TScriptProducer.

185.1.22.4.2 TScriptProducer.FScriptEngine Field

Pascal

```
FScriptEngine: string;
```

C++

```
AnsiString FScriptEngine;
```

Description

This is FScriptEngine, a member of class TScriptProducer.

185.1.22.4.3 TScriptProducer.FScriptFile Field

Pascal

```
FScriptFile: TScriptFile;
```

C++

```
TScriptFile FScriptFile;
```

Description

This is FScriptFile, a member of class TScriptProducer.

185.1.22.5 TScriptProducer Methods

The methods of the TScriptProducer class are listed here.

Protected Methods

	Name	Description
	Evaluate (see page 25535)	This is Evaluate, a member of class TScriptProducer.
	EvaluateExpression (see page 25535)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 25535)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 25535)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 25536)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 25536)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 25536)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 25536)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 25536)	This is HandleScriptError, a member of class TScriptProducer.

	ImplHandleScriptError (see page 25537)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 25537)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 25537)	This is ParseString, a member of class TScriptProducer.
	ReplaceTags (see page 25537)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 25538)	This is SetContent, a member of class TScriptProducer.
	Write (see page 25538)	This is the overview for the Write method overload.
	WriteItem (see page 25539)	This is WriteItem, a member of class TScriptProducer.

185.1.22.5.1 TScriptProducer.Evaluate Method

Pascal

```
function Evaluate: string;
```

C++

```
__fastcall AnsiString Evaluate();
```

Description

This is Evaluate, a member of class TScriptProducer.

185.1.22.5.2 TScriptProducer.EvaluateExpression Method

Pascal

```
function EvaluateExpression(AScriptFile: TScriptFile): string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString EvaluateExpression(TScriptFile AScriptFile) = 0;
```

Description

This is EvaluateExpression, a member of class TScriptProducer.

185.1.22.5.3 TScriptProducer.GetContent Method

Pascal

```
function GetContent: string;
```

C++

```
__fastcall AnsiString GetContent();
```

Description

This is GetContent, a member of class TScriptProducer.

185.1.22.5.4 TScriptProducer.GetErrors Method

Pascal

```
function GetErrors: TAbstractScriptErrors;
```

C++

```
__fastcall TAbstractScriptErrors GetErrors();
```

Description

This is GetErrors, a member of class TScriptProducer.

185.1.22.5.5 TScriptProducer.GetHTMLBlock Method

Pascal

```
function GetHTMLBlock(I: Integer): string;
```

C++

```
__fastcall AnsiString GetHTMLBlock(int I);
```

Description

This is GetHTMLBlock, a member of class TScriptProducer.

185.1.22.5.6 TScriptProducer.GetHTMLBlockCount Method

Pascal

```
function GetHTMLBlockCount: Integer;
```

C++

```
__fastcall int GetHTMLBlockCount();
```

Description

This is GetHTMLBlockCount, a member of class TScriptProducer.

185.1.22.5.7 TScriptProducer.GetWebModuleContext Method

Pascal

```
function GetWebModuleContext: TWebModuleContext;
```

C++

```
__fastcall TWebModuleContext GetWebModuleContext();
```

Description

This is GetWebModuleContext, a member of class TScriptProducer.

185.1.22.5.8 TScriptProducer.HandleParserError Method

Pascal

```
procedure HandleParserError(E: Exception);
```

C++

```
__fastcall HandleParserError(Exception E);
```

Description

This is HandleParserError, a member of class TScriptProducer.

185.1.22.5.9 TScriptProducer.HandleScriptError Method

Pascal

```
function HandleScriptError(const ScriptError: IUnknown): HRESULT;
```

C++

```
__fastcall HRESULT HandleScriptError(const IUnknown ScriptError);
```

Description

This is HandleScriptError, a member of class TScriptProducer.

185.1.22.5.10 TScriptProducer.ImplHandleScriptError Method

Pascal

```
function ImplHandleScriptError(const ScriptError: IUnknown): HRESULT; virtual; abstract;
```

C++

```
virtual __fastcall HRESULT ImplHandleScriptError(const IUnknown ScriptError) = 0;
```

Description

This is ImplHandleScriptError, a member of class TScriptProducer.

185.1.22.5.11 TScriptProducer.ParseStream Method

Pascal

```
procedure ParseStream(Stream: TStream; Owned: Boolean);
```

C++

```
__fastcall ParseStream(TStream Stream, Boolean Owned);
```

Description

This is ParseStream, a member of class TScriptProducer.

185.1.22.5.12 TScriptProducer.ParseString Method

Pascal

```
procedure ParseString(const S: string);
```

C++

```
__fastcall ParseString(const AnsiString S);
```

Description

This is ParseString, a member of class TScriptProducer.

185.1.22.5.13 TScriptProducer.ReplaceTags Method

Pascal

```
function ReplaceTags(const AValue: string): string;
```

C++

```
__fastcall AnsiString ReplaceTags(const AnsiString AValue);
```

Description

This is ReplaceTags, a member of class TScriptProducer.

185.1.22.5.14 TScriptProducer.SetContent Method

Pascal

```
procedure SetContent(const Value: string);
```

C++

```
__fastcall SetContent(const AnsiString Value);
```

Description

This is SetContent, a member of class TScriptProducer.

185.1.22.5.15 Write Method

This is the overview for the Write method overload.

Overload List

	Name	Description
	TScriptProducer.Write (PChar) (see page 25538)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (PWideChar, Integer) (see page 25538)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (string) (see page 25538)	This is Write, a member of class TScriptProducer.

185.1.22.5.15.1 TScriptProducer.Write Method (PChar)

Pascal

```
procedure Write(Value: PChar); overload;
```

C++

```
__fastcall Write(const char * Value);
```

Description

This is Write, a member of class TScriptProducer.

185.1.22.5.15.2 TScriptProducer.Write Method (PWideChar, Integer)

Pascal

```
procedure Write(const AValue: PWideChar; ALength: Integer); overload;
```

C++

```
__fastcall Write(const PWideChar AValue, int ALength);
```

Description

This is Write, a member of class TScriptProducer.

185.1.22.5.15.3 TScriptProducer.Write Method (string)

Pascal

```
procedure Write(const Value: string); overload;
```

C++

```
__fastcall Write(const AnsiString Value);
```

Description

This is Write, a member of class TScriptProducer.

185.1.22.5.16 TScriptProducer.WriteItem Method

Pascal

```
procedure WriteItem(Index: Integer);
```

C++

```
__fastcall WriteItem(int Index);
```

Description

This is WriteItem, a member of class TScriptProducer.

185.1.22.6 TScriptProducer Properties

The properties of the TScriptProducer class are listed here.

Protected Properties

	Name	Description
R	Component (see page 25539)	This is Component, a member of class TScriptProducer.
R	Content (see page 25539)	This is Content, a member of class TScriptProducer.
R	Designing (see page 25540)	This is Designing, a member of class TScriptProducer.
R	Errors (see page 25540)	This is Errors, a member of class TScriptProducer.
R	Script (see page 25540)	This is Script, a member of class TScriptProducer.

185.1.22.6.1 TScriptProducer.Component Property

Pascal

```
property Component: TComponent;
```

C++

```
__property TComponent * Component;
```

Description

This is Component, a member of class TScriptProducer.

185.1.22.6.2 TScriptProducer.Content Property

Pascal

```
property Content: string;
```

C++

```
__property AnsiString Content;
```

Description

This is Content, a member of class TScriptProducer.

185.1.22.6.3 TScriptProducer.Designing Property

Pascal

```
property Designing: Boolean;
```

C++

```
__property Boolean Designing;
```

Description

This is Designing, a member of class TScriptProducer.

185.1.22.6.4 TScriptProducer.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class TScriptProducer.

185.1.22.6.5 TScriptProducer.Script Property

Pascal

```
property Script: string;
```

C++

```
__property AnsiString Script;
```

Description

This is Script, a member of class TScriptProducer.

185.1.23 TVariableLookup Class

Class Hierarchy

Pascal

```
TVariableLookup = class(TObject);
```

C++

```
class TVariableLookup : public TObject;
```

File

WebScript

Description

This is class WebScript.TVariableLookup.

185.1.23.1 TVariableLookup Members

The following tables list the members exposed by TVariableLookup.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25541)	This is Create, a member of class TVariableLookup.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindGlobalVariable (see page 25542)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 25542)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	LookupObject (see page 25542)	This is LookupObject, a member of class TVariableLookup.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Ident (see page 25543)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 25543)	This is Obj, a member of class TVariableLookup.

185.1.23.2 TVariableLookup.Create Constructor

Pascal

```
constructor Create(const AIdent: string; AWebModuleContext: TWebModuleContext);
```

C++

```
__fastcall TVariableLookup(const AnsiString AIdent, TWebModuleContext AWebModuleContext);
```

Description

This is Create, a member of class TVariableLookup.

185.1.23.3 TVariableLookup Methods

The methods of the TVariableLookup class are listed here.

Public Methods

	Name	Description
	FindGlobalVariable (see page 25542)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 25542)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	LookupObject (see page 25542)	This is LookupObject, a member of class TVariableLookup.

185.1.23.3.1 TVariableLookup.FindGlobalVariable Method

Pascal

```
function FindGlobalVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariable(const AnsiString AName);
```

Description

This is FindGlobalVariable, a member of class TVariableLookup.

185.1.23.3.2 TVariableLookup.FindGlobalVariableContainer Method

Pascal

```
function FindGlobalVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariableContainer(const AnsiString AName);
```

Description

This is FindGlobalVariableContainer, a member of class TVariableLookup.

185.1.23.3.3 TVariableLookup.LookupObject Method

Pascal

```
function LookupObject: Boolean;
```

C++

```
__fastcall Boolean LookupObject();
```

Description

This is LookupObject, a member of class TVariableLookup.

185.1.23.4 TVariableLookup Properties

The properties of the TVariableLookup class are listed here.

Public Properties

	Name	Description
	Ident (see page 25543)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 25543)	This is Obj, a member of class TVariableLookup.

185.1.23.4.1 TVariableLookup.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property AnsiString Ident;
```

Description

This is Ident, a member of class TVariableLookup.

185.1.23.4.2 TVariableLookup.Obj Property

Pascal

```
property Obj: TObject;
```

C++

```
__property TObject * Obj;
```

Description

This is Obj, a member of class TVariableLookup.

185.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TGlobalScriptVariables (see page 25544)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 25545)	This is record WebScript.TIncludeType.

Records

	Name	Description
	TLineNumbers (see page 25545)	This is record WebScript.TLineNumbers.

185.2.1 WebScript.TGlobalScriptVariables Enumeration

Pascal

```
TGlobalScriptVariables = (
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
);
```

C++

```
enum TGlobalScriptVariables {
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
};
```

File

WebScript

Description

This is record WebScript.TGlobalScriptVariables.

185.2.2 WebScript.TIncludeType Enumeration

Pascal

```
TIncludeType = (
  incFile,
  incPage
);
```

C++

```
enum TIncludeType {
  incFile,
  incPage
};
```

File

WebScript

Description

This is record WebScript.TIncludeType.

185.2.3 WebScript.TLineNumbers Record

Pascal

```
TLineNumbers = record
  SourceStartLine: Integer;
  SourceLineCount: Integer;
  DestStartLine: Integer;
  DestLineCount: Integer;
  ScriptIncludeFile: TScriptIncludeFile;
end;
```

C++

```
struct TLineNumbers {
  int SourceStartLine;
  int SourceLineCount;
  int DestStartLine;
  int DestLineCount;
  TScriptIncludeFile ScriptIncludeFile;
};
```

File

WebScript

Description

This is record WebScript.TLineNumbers.

185.3 Types

The following table lists types in this documentation.

Types

Name	Description
CreateComponentStubFactory (see page 25546)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 25546)	This is type WebScript.PLineNumbers.

185.3.1 WebScript.CreateComponentStubFactory Type

Pascal

```
CreateComponentStubFactory = function (AComponent: TObject; AComponentClass: TClass):
IInterface;
```

C++

```
(AComponent: TObject; AComponentClass: TClass): IInterface ( CreateComponentStubFactory)();
```

File

WebScript

Description

This is type WebScript.CreateComponentStubFactory.

185.3.2 WebScript.PLineNumbers Type

Pascal

```
PLineNumbers = ^TLineNumbers;
```

C++

```
^TLineNumbers PLineNumbers;
```

File

WebScript

Description

This is type WebScript.PLineNumbers.

185.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
GlobalScriptVariableNames (see page 25547)	This is constant WebScript.GlobalScriptVariableNames.

185.4.1 WebScript.GlobalScriptVariableNames Constant

Pascal

```
GlobalScriptVariableNames: array[TGlobalScriptVariables] of PChar = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

C++

```
array[TGlobalScriptVariables] of PChar GlobalScriptVariableNames = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

File

WebScript

Description

This is constant WebScript.GlobalScriptVariableNames.

186 WebServExp Namespace

This is namespace WebServExp.

Topics

Name	Description
Classes (see page 25551)	The following table lists classes in this documentation.
Interfaces (see page 25559)	The following table lists interfaces in this documentation.
Functions (see page 25562)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 25564)	The following table lists structs, records, enums in this documentation.
Types (see page 25566)	The following table lists types in this documentation.

Classes

	Name	Description
	TWebServExp (see page 25551)	This is class WebServExp.TWebServExp.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 25562)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 25562)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 25563)	This is function WebServExp.IsBaseClassTypeInfo.

Interfaces

	Name	Description
	IWebServExp (see page 25559)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 25561)	This is class WebServExp.IWebServExpAccess.

Structs, Records, Enums

	Name	Description
	ArgumentType (see page 25564)	This is record WebServExp.ArgumentType.
	MessageType (see page 25564)	This is record WebServExp.MessageType.
	TSchemaType (see page 25565)	This is record WebServExp.TSchemaType.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 25566)	This is type WebServExp.TAfterPublishingWSDLEvent.

TBeforePublishingTypesEvent (see page 25566)	This is type WebServExp.TBeforePublishingTypesEvent.
TPublishingTypeEvent (see page 25567)	This is type WebServExp.TPublishingTypeEvent.
TSchemaTypeArray (see page 25567)	This is type WebServExp.TSchemaTypeArray.

186.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebServExp (see page 25551)	This is class WebServExp.TWebServExp.

186.1.1 TWebServExp Class

Class Hierarchy

Pascal

```
TWebServExp = class(TInterfacedObject, IWebServExp, IWebServExpAccess);
```

C++

```
class TWebServExp : public TInterfacedObject, public IWebServExp, public IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.TWebServExp.

186.1.1.1 TWebServExp Members

The following tables list the members exposed by TWebServExp.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25553)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25553)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindOrAddSchema (see page 25560)	Ensures that a schema is eventually generated for a specified type.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GenerateXMLSchema (see page 25554)	Adds schema information to represent a specified type.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetWebServExp (see page 25554)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 25555)	This is GetWSDLForInterface, a member of class TWebServExp.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	ImportLocations (see page 25556)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 25556)	This is ImportNames, a member of class TWebServExp.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	TargetNameSpace (see page 25556)	This is TargetNameSpace, a member of class TWebServExp.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 25557)	This is OnAfterPublishingWSDL, a member of class TWebServExp.

	OnBeforePublishingTypes (see page 25557)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 25557)	This is OnPublishingType, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 25555)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 25555)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 25556)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 25557)	This is WSDLElements, a member of class TWebServExp.

186.1.1.2 TWebServExp.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebServExp();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

186.1.1.3 TWebServExp.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebServExp();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance

that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

186.1.1.4 TWebServExp Methods

The methods of the TWebServExp class are listed here.

Public Methods

	Name	Description
	GenerateXMLSchema (see page 25554)	Adds schema information to represent a specified type.
	GetWebServExp (see page 25554)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 25555)	This is GetWSDLForInterface, a member of class TWebServExp.

186.1.1.4.1 TWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: WideString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, BSTR Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

See Also

FindOrAddSchema (see page 25560)

186.1.1.4.2 TWebServExp.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class TWebServExp.

186.1.1.4.3 TWebServExp.GetWSDLForInterface Method

Pascal

```
procedure GetWSDLForInterface(const IntfTypeInfo: Pointer; WSDLDoc: IWSDLDocument; PortNames:
array of WideString; Locations: array of WideString);
```

C++

```
__fastcall GetWSDLForInterface(const void * IntfTypeInfo, IWSDLDocument WSDLDoc, array of
WideString PortNames, array of WideString Locations);
```

Description

This is GetWSDLForInterface, a member of class TWebServExp.

186.1.1.5 TWebServExp Properties

The properties of the TWebServExp class are listed here.

Public Properties

	Name	Description
	ImportLocations (see page 25556)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 25556)	This is ImportNames, a member of class TWebServExp.
	TargetNameSpace (see page 25556)	This is TargetNameSpace, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 25555)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 25555)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 25556)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 25557)	This is WSDLElements, a member of class TWebServExp.

186.1.1.5.1 TWebServExp.ArrayAsComplexContent Property

Pascal

```
property ArrayAsComplexContent: Boolean;
```

C++

```
__property Boolean ArrayAsComplexContent;
```

Description

This is ArrayAsComplexContent, a member of class TWebServExp.

186.1.1.5.2 TWebServExp.BindingType Property

Pascal

```
property BindingType: TWebServiceBindingType;
```

C++

```
__property TWebServiceBindingType BindingType;
```

Description

This is BindingType, a member of class TWebServExp.

186.1.1.5.3 TWebServExp.ImportLocations Property

Pascal

```
property ImportLocations [const Index: Integer]: WideString;
```

C++

```
__property BSTR ImportLocations[int const Index];
```

Description

This is ImportLocations, a member of class TWebServExp.

186.1.1.5.4 TWebServExp.ImportNames Property

Pascal

```
property ImportNames [const Index: Integer]: WideString;
```

C++

```
__property BSTR ImportNames[int const Index];
```

Description

This is ImportNames, a member of class TWebServExp.

186.1.1.5.5 TWebServExp.ServiceAddress Property

Pascal

```
property ServiceAddress: WideString;
```

C++

```
__property BSTR ServiceAddress;
```

Description

This is ServiceAddress, a member of class TWebServExp.

186.1.1.5.6 TWebServExp.TargetNameSpace Property

Pascal

```
property TargetNameSpace: WideString;
```

C++

```
__property BSTR TargetNameSpace;
```

Description

This is TargetNameSpace, a member of class TWebServExp.

186.1.1.5.7 TWebServExp.WSDLElements Property

Pascal

```
property WSDLElements: TWSDLElements;
```

C++

```
__property TWSDLElements WSDLElements;
```

Description

This is WSDLElements, a member of class TWebServExp.

186.1.1.6 TWebServExp Events

The events of the TWebServExp class are listed here.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 25557)	This is OnAfterPublishingWSDL, a member of class TWebServExp.
	OnBeforePublishingTypes (see page 25557)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 25557)	This is OnPublishingType, a member of class TWebServExp.

186.1.1.6.1 TWebServExp.OnAfterPublishingWSDL Event

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

This is OnAfterPublishingWSDL, a member of class TWebServExp.

186.1.1.6.2 TWebServExp.OnBeforePublishingTypes Event

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

This is OnBeforePublishingTypes, a member of class TWebServExp.

186.1.1.6.3 TWebServExp.OnPublishingType Event

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

This is OnPublishingType, a member of class TWebServExp.

186.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebServExp (see page 25559)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 25561)	This is class WebServExp.IWebServExpAccess.

186.2.1 IWebServExp Interface

IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.

Class Hierarchy

WebServExp.IWebServExp

Pascal

```
IWebServExp = interface;
```

C++

```
__interface IWebServExp;
```

File

WebServExp

Description

IWebServExp is an interface for generating the schema definitions that represent types in a WSDL document.

Note: C++ method declarations that use IWebServExp use the _di_IWebServExp type instead. This type is a DelphiInterface wrapper around the IWebServExp interface:

Note: typedef System::DelphiInterface (see page 22167)< IWebServExp > _di_IWebServExp;

186.2.1.1 IWebServExp Members

The following tables list the members exposed by IWebServExp.

Public Methods

	Name	Description
	FindOrAddSchema (see page 25560)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 25560)	Adds schema information to represent a specified type.

186.2.1.2 IWebServExp Methods

The methods of the IWebServExp class are listed here.

Public Methods

	Name	Description
	FindOrAddSchema (see page 25560)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 25560)	Adds schema information to represent a specified type.

186.2.1.2.1 IWebServExp.FindOrAddSchema Method

Ensures that a schema is eventually generated for a specified type.

Pascal

```
function FindOrAddSchema(const ATypeInfo: PTypeinfo; const TnsURI: string): Boolean;
```

C++

```
__fastcall Boolean FindOrAddSchema(const PTypeinfo ATypeInfo, const AnsiString TnsURI);
```

Description

Call FindOrAddSchema to indicate that a schema should be generated for a given type.

ATypeInfo is the runtime type information (RTTI) for the type.

TnsURI is the namespace URI in which the schema for the type should be defined.

FindOrAddSchema returns true if there is already a schema for the specified type. It returns false if the type has not previously been added.

See Also

GenerateXMLSchema (see page 25560)

186.2.1.2.2 IWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: WideString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, BSTR Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

FindOrAddSchema (see page 25560)

186.2.2 IWebServExpAccess Interface

Class Hierarchy

WebServExp.IWebServExpAccess

Pascal

```
IWebServExpAccess = interface;
```

C++

```
__interface IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.IWebServExpAccess.

186.2.2.1 IWebServExpAccess Members

The following tables list the members exposed by IWebServExpAccess.

Public Methods

	Name	Description
	GetWebServExp (see page 25561)	This is GetWebServExp, a member of class IWebServExpAccess.

186.2.2.2 IWebServExpAccess Methods

The methods of the IWebServExpAccess class are listed here.

Public Methods

	Name	Description
	GetWebServExp (see page 25561)	This is GetWebServExp, a member of class IWebServExpAccess.

186.2.2.2.1 IWebServExpAccess.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class IWebServExpAccess.

186.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 25562)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 25562)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 25563)	This is function WebServExp.IsBaseClassTypeInfo.

186.3.1 WebServExp.GetAliasBaseTypeInfo Function

Pascal

```
function GetAliasBaseTypeInfo(const ParamType: TTypeKind): PTypeInfo;
```

C++

```
PTypeInfo GetAliasBaseTypeInfo(const TTypeKind ParamType);
```

File

WebServExp

Description

This is function WebServExp.GetAliasBaseTypeInfo.

186.3.2 WebServExp.GetBindingType Function

Pascal

```
function GetBindingType(const MethEntry: TIntfMethEntry; Input: Boolean):
TWebServiceBindingType; overload;
```

C++

```
TWebServiceBindingType GetBindingType(const TIntfMethEntry MethEntry, Boolean Input);
```

File

WebServExp

Description

This is function WebServExp.GetBindingType.

186.3.3 WebServExp.IsBaseClassTypeInfo Function

Pascal

```
function IsBaseClassTypeInfo(const ATypeInfo: PTypeInfo): Boolean;
```

C++

```
Boolean IsBaseClassTypeInfo(const PTypeInfo ATypeInfo);
```

File

WebServExp

Description

This is function WebServExp.IsBaseClassTypeInfo.

186.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	ArgumentType (see page 25564)	This is record WebServExp.ArgumentType.
	MessageType (see page 25564)	This is record WebServExp.MessageType.

Records

	Name	Description
	TSchemaType (see page 25565)	This is record WebServExp.TSchemaType.

186.4.1 WebServExp.ArgumentType Enumeration

Pascal

```
ArgumentType = (
  argIn,
  argOut,
  argInOut,
  argReturn
);
```

C++

```
enum ArgumentType {
  argIn,
  argOut,
  argInOut,
  argReturn
};
```

File

WebServExp

Description

This is record WebServExp.ArgumentType.

186.4.2 WebServExp.MessageType Enumeration

Pascal

```
MessageType = (
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
);
```

C++

```
enum MessageType {
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
};
```

File

WebServExp

Description

This is record WebServExp.MessageType.

186.4.3 WebServExp.TSchemaType Record

Pascal

```
TSchemaType = record
  TypeName: WideString;
  NameSpace: WideString;
  TypeInfo: PTypeinfo;
  NSPrefix: WideString;
  XSGenerated: Boolean;
end;
```

C++

```
struct TSchemaType {
  BSTR TypeName;
  BSTR NameSpace;
  PTypeinfo TypeInfo;
  BSTR NSPrefix;
  Boolean XSGenerated;
};
```

File

WebServExp

Description

This is record WebServExp.TSchemaType.

186.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 25566)	This is type WebServExp.TAfterPublishingWSDLEvent.
TBeforePublishingTypesEvent (see page 25566)	This is type WebServExp.TBeforePublishingTypesEvent.
TPublishingTypeEvent (see page 25567)	This is type WebServExp.TPublishingTypeEvent.
TSchemaTypeArray (see page 25567)	This is type WebServExp.TSchemaTypeArray.

186.5.1 WebServExp.TAfterPublishingWSDLEvent Type

Pascal

```
TAfterPublishingWSDLEvent = procedure (const WSDLDoc: IWSDLDocument) of object;
```

C++

```
(const WSDLDoc: IWSDLDocument) ( TAfterPublishingWSDLEvent)();
```

File

WebServExp

Description

This is type WebServExp.TAfterPublishingWSDLEvent.

186.5.2 WebServExp.TBeforePublishingTypesEvent Type

Pascal

```
TBeforePublishingTypesEvent = procedure (const WebServ: IWebServExp) of object;
```

C++

```
(const WebServ: IWebServExp) ( TBeforePublishingTypesEvent)();
```

File

WebServExp

Description

This is type WebServExp.TBeforePublishingTypesEvent.

186.5.3 WebServExp.TPublishingTypeEvent Type

Pascal

```
TPublishingTypeEvent = procedure (const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef;
const ATypeInfo: PTypeinfo; Namespace: WideString) of object;
```

C++

```
(const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo;
Namespace: WideString) ( TPublishingTypeEvent)();
```

File

WebServExp

Description

This is type WebServExp.TPublishingTypeEvent.

186.5.4 WebServExp.TSchemaTypeArray Type

Pascal

```
TSchemaTypeArray = array of TSchemaType;
```

C++

```
array of TSchemaType TSchemaTypeArray;
```

File

WebServExp

Description

This is type WebServExp.TSchemaTypeArray.

187 WebSess Namespace

This is namespace WebSess.

Topics

Name	Description
Classes (see page 25570)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 25601)	The following table lists structs, records, enums in this documentation.
Types (see page 25602)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomSessionsService (see page 25570)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 25582)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 25588)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 25592)	This is class WebSess.TWebSessionImpl.

Structs, Records, Enums

	Name	Description
	TEndSessionReason (see page 25601)	This is record WebSess.TEndSessionReason.

Types

Name	Description
TEndSessionEvent (see page 25602)	This is type WebSess.TEndSessionEvent.
TStartSessionEvent (see page 25602)	This is type WebSess.TStartSessionEvent.

187.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomSessionsService (see page 25570)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 25582)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 25588)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 25592)	This is class WebSess.TWebSessionImpl.

187.1.1 TCustomSessionsService Class

TCustomSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy

Pascal

```
TCustomSessionsService = class(TComponent, ISessionsService, ISessionsServiceConnectID,
IWebGetSessionIDs, ISessionsServicePersist);
```

C++

```
class TCustomSessionsService : public TComponent, public ISessionsService, public
ISessionsServiceConnectID, public IWebGetSessionIDs, public ISessionsServicePersist;
```

File

WebSess

Description

TCustomSessionsService is the base class for classes that manage the sessions in a WebSnap application. When a WebSnap application contains a TCustomSessionsService descendant, then each HTTP request is associated with a session. TCustomSessionsService can manage multiple sessions on behalf of different users, each on a separate thread of execution. Only one session is available when handling a request. This is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TCustomSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Thus, Web application types that do not remain in memory between requests, such as CGI, do not support TCustomSessionsService.

TCustomSessionsService implements the ISessionsService interface.

187.1.1.1 TCustomSessionsService Members

The following tables list the members exposed by TCustomSessionsService.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckStatusChange (see page 25575)	Checks whether any sessions have started or terminated.
	Clear (see page 25575)	Deletes all sessions from memory.
	Connect (see page 25575)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 25576)	Obtains the interface for an active Web session, given its Session ID.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoEndSession (see page 25576)	Triggers the OnEndSession (see page 25581) event when appropriate.
V	DoStartSession (see page 25577)	Triggers the OnStartSession (see page 25582) event when appropriate.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSessionIDs (see page 25577)	Returns a list of the session IDs for all sessions currently in memory.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LoadFromFile (see page 25577)	Loads the list of sessions from a file.
	LoadFromStream (see page 25578)	Loads the list of sessions from a stream.

	NewSession (see page 25578)	Starts a new session.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyStatusChange (see page 25579)	Generates an OnEndSession (see page 25581) or OnStartSession (see page 25582) event, as approrpriate.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SaveToFile (see page 25579)	Saves the list of sessions to a file.
	SaveToStream (see page 25580)	Saves the list of sessions to a stream.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnEndSession (see page 25581)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 25582)	Occurs when the sessions service detects that a new session has started.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25574)	Creates and initializes an instance of TCustomSessionsService (see page 25570).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.

	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DefaultTimeout (see page 25580)	Specifies the number of minutes a session can persist without being accessed.
	DesignInfo (see page 2805)	Contains information used by the Form designer.

	MaxSessions (see page 25581)	Indicates the maximum number of sessions the TCustomSessionsService (see page 25570) can keep in memory.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

187.1.1.2 TCustomSessionsService.Create Constructor

Creates and initializes an instance of TCustomSessionsService (see page 25570).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomSessionsService(TComponent * AOwner);
```

Description

Call Create to instantiate a sessions service at runtime. Typically, this is unnecessary, because a WebSnap application needs at most a single sessions service component, and in most cases that is added at design time.

AOwner is the component that becomes the value of the TCustomSessionsService (see page 25570) object's Owner property. This should be the Web application module.

See Also

Owner (see page 2807)

187.1.1.3 TCustomSessionsService Methods

The methods of the TCustomSessionsService class are listed here.

Protected Methods

	Name	Description
	CheckStatusChange (see page 25575)	Checks whether any sessions have started or terminated.
	Clear (see page 25575)	Deletes all sessions from memory.
	Connect (see page 25575)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 25576)	Obtains the interface for an active Web session, given its Session ID.
V	DoEndSession (see page 25576)	Triggers the OnEndSession (see page 25581) event when appropriate.
V	DoStartSession (see page 25577)	Triggers the OnStartSession (see page 25582) event when appropriate.
	GetSessionIDs (see page 25577)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 25577)	Loads the list of sessions from a file.
	LoadFromStream (see page 25578)	Loads the list of sessions from a stream.
	NewSession (see page 25578)	Starts a new session.
	NotifyStatusChange (see page 25579)	Generates an OnEndSession (see page 25581) or OnStartSession (see page 25582) event, as approrpriate.
	SaveToFile (see page 25579)	Saves the list of sessions to a file.
	SaveToStream (see page 25580)	Saves the list of sessions to a stream.

187.1.1.3.1 TCustomSessionsService.CheckStatusChange Method

Checks whether any sessions have started or terminated.

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

CheckStatusChange is called automatically when the application creates a new Web context or initializes a new Web module. That is, this method is called at least once every time the application receives a new HTTP request message.

If CheckStatusChange detects that a session has started or terminated since the last call, it returns true. Otherwise, it returns false.

See Also

NotifyStatusChange (see page 25579)

TWebContext (see page 24660)

187.1.1.3.2 TCustomSessionsService.Clear Method

Deletes all sessions from memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the sessions service of all the sessions it has stored in memory.

Clear does not generate an OnEndSession (see page 25581) event for the sessions it deletes when it frees their memory, it simply removes them from memory. To shut down all sessions in a more orderly fashion, iterate through all the active sessions by calling ConnectActive (see page 25576) for every session ID that the GetSessionIDs (see page 25577) method returns, and terminate each one. Then call NotifyStatusChange (see page 25579) to generate the OnEndSession (see page 25581) events for every terminated session. At that point, calling Clear does not prevent the application from receiving an OnEndSession (see page 25581) event for any session that the sessions service manages.

See Also

NewSession (see page 25578)

GetSessionIDs (see page 25577)

ConnectActive (see page 25576)

NotifyStatusChange (see page 25579)

187.1.1.3.3 TCustomSessionsService.Connect Method

Obtains the interface for a Web session, given its Session ID.

Pascal

```
function Connect(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession Connect(TSessionID AID);
```

Description

Call Connect to access the session that has a specified Session ID. Unlike the ConnectActive (see page 25576) method, Connect may return a session that has expired or been terminated but that has not yet been freed from memory.

AID is the session ID of the session to locate.

Connect returns the IWebSession interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have a session with the specified session ID, Connect returns nil (Delphi) or NULL (C++).

Note: Calling Connect does not count as accessing a session. That is, if you call Connect for any session, it does not affect the time when that session times out.

See Also

ConnectActive (see page 25576)

GetSessionIDs (see page 25577)

187.1.1.3.4 TCustomSessionsService.ConnectActive Method

Obtains the interface for an active Web session, given its Session ID.

Pascal

```
function ConnectActive(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession ConnectActive(TSessionID AID);
```

Description

Call ConnectActive to access the session that has a specified Session ID. Unlike the Connect (see page 25575) method, ConnectActive never returns a session that has expired or been terminated.

AID is the session ID of the session to locate.

ConnectActive returns the IWebSession interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have an active session with the specified session ID, ConnectActive returns nil (Delphi) or NULL (C++).

Note: Calling ConnectActive counts as accessing a session. That is, if you call ConnectActive for any session, the session will not time out until the entire time-out period elapses after the call to ConnectActive.

See Also

Connect (see page 25575)

GetSessionIDs (see page 25577)

187.1.1.3.5 TCustomSessionsService.DoEndSession Method

Triggers the OnEndSession (see page 25581) event when appropriate.

Pascal

```
procedure DoEndSession(ASession: TAbstractWebSession; AReason: TEndSessionReason); virtual;
```

C++

```
virtual __fastcall DoEndSession(TAbstractWebSession ASession, TEndSessionReason AReason);
```

Description

Use DoEndSession to trigger an OnEndSession (see page 25581) event, if it is appropriate to do so.

See Also

OnEndSession (see page 25581)

187.1.1.3.6 TCustomSessionsService.DoStartSession Method

Triggers the OnStartSession (see page 25582) event when appropriate.

Pascal

```
procedure DoStartSession(ASession: TAbstractWebSession); virtual;
```

C++

```
virtual __fastcall DoStartSession(TAbstractWebSession ASession);
```

Description

Use DoStartSession to trigger an OnStartSession (see page 25582) event, if it is appropriate to do so.

See Also

OnStartSession (see page 25582)

187.1.1.3.7 TCustomSessionsService.GetSessionIDs Method

Returns a list of the session IDs for all sessions currently in memory.

Pascal

```
function GetSessionIDs: IWebSessionIDs;
```

C++

```
__fastcall IWebSessionIDs GetSessionIDs();
```

Description

Call GetSessionIDs to obtain a list of the session IDs for all the sessions that the sessions service is storing. GetSessionIDs returns an IWebSessionIDs interface, which lists the session IDs.

See Also

Connect (see page 25575)

GetSessionIDs

187.1.1.3.8 TCustomSessionsService.LoadFromFile Method

Loads the list of sessions from a file.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const AnsiString Filename);
```

Description

Call LoadFromFile to replace the current list of sessions with a set of sessions stored in a file. The file must be previously created by a call to the SaveToFile (see page 25579) method.

Filename is the name of the file that contains the saved list of sessions.

See Also

SaveToFile (see page 25579)

LoadFromStream (see page 25578)

187.1.1.3.9 TCustomSessionsService.LoadFromStream Method

Loads the list of sessions from a stream.

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

Call LoadFromStream to replace the current list of sessions with a set of sessions read from a stream. The sessions must be previously saved by a call to the SaveToStream (see page 25580) method.

S is the stream from which to read the list of sessions.

See Also

SaveToStream (see page 25580)

LoadFromFile (see page 25577)

187.1.1.3.10 TCustomSessionsService.NewSession Method

Starts a new session.

Pascal

```
function NewSession: IWebSession;
```

C++

```
__fastcall IWebSession NewSession();
```

Description

Call NewSession to generate a new session. NewSession starts a new session and returns an interface that can be used to terminate that session.

If the sessions service already has MaxSessions (see page 25581) sessions, NewSession raises an ESessionsException exception.

Note: The OnStartSession (see page 25582) event does not occur immediately when you call NewSession to start a new session. It occurs on the next call to NotifyStatusChange (see page 25579).

Tip: To reconnect to an existing session, call the ConnectActive (see page 25576) method instead.

See Also

MaxSessions (see page 25581)

OnStartSession (see page 25582)

ConnectActive (see page 25576)

NotifyStatusChange (see page 25579)

187.1.1.3.11 TCustomSessionsService.NotifyStatusChange Method

Generates an OnEndSession (see page 25581) or OnStartSession (see page 25582) event, as approrpriate.

Pascal

```
procedure NotifyStatusChange;
```

C++

```
__fastcall NotifyStatusChange();
```

Description

Call NotifyStatusChange to generate the OnStartSession (see page 25582) event for any new sessions that have been created since the last call and to generate the OnEndSession (see page 25581) event for any sessions that terminated since the last call. For any terminated sessions, NotifyStatusChange frees the memory allocated to the session after the OnEndSession (see page 25581) event handler exits.

NotifyStatusChange is called automatically every time the WebSnap application initializes a new Web module.

See Also

OnEndSession (see page 25581)

OnStartSession (see page 25582)

CheckStatusChange (see page 25575)

187.1.1.3.12 TCustomSessionsService.SaveToFile Method

Saves the list of sessions to a file.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const AnsiString Filename);
```

Description

Call SaveToFile to save the current list of sessions to a file. SaveToFile saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The file can be read back into a sessions service by calling the LoadFromFile (see page 25577) method.

Filename is the name of the file to which the list of sessions is saved.

See Also

SaveToStream (see page 25580)

LoadFromFile (see page 25577)

187.1.1.3.13 TCustomSessionsService.SaveToStream Method

Saves the list of sessions to a stream.

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

Call SaveToStream to write the current list of sessions to a stream. SaveToStream saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The sessions can be read back into a sessions service by calling the LoadFromStream (see page 25578) method.

S is the stream to which the list of sessions is written.

See Also

LoadFromStream (see page 25578)

SaveToFile (see page 25579)

187.1.1.4 TCustomSessionsService Properties

The properties of the TCustomSessionsService class are listed here.

Public Properties

	Name	Description
	DefaultTimeout (see page 25580)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 25581)	Indicates the maximum number of sessions the TCustomSessionsService (see page 25570) can keep in memory.

187.1.1.4.1 TCustomSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

187.1.1.4.2 TCustomSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService (see page 25570) can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException exception. The Exception occurs before the OnStartSession (see page 25582) event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 19012)

OnStartSession (see page 25582)

Terminate (see page 24973)

187.1.1.5 TCustomSessionsService Events

The events of the TCustomSessionsService class are listed here.

Public Events

	Name	Description
	OnEndSession (see page 25581)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 25582)	Occurs when the sessions service detects that a new session has started.

187.1.1.5.1 TCustomSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 25582)

Terminate (see page 24973)

TimeoutMinutes

187.1.1.5.2 TCustomSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

```
__property TStartSessionEvent OnStartSession;
```

Description

Write an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

See Also

OnStartSession

187.1.2 TSessionsService Class

TSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy

Pascal

```
TSessionsService = class(TCustomSessionsService);
```

C++

```
class TSessionsService : public TCustomSessionsService;
```

File

WebSess

Description

Add TSessionsService to a WebSnap application when you want to store temporary end user data in a WebSnap session. For example, TSessionsService can keep track of all users that are currently logged in and automatically log a user out after a period of inactivity.

When a WebSnap application contains a TSessionsService component, each HTTP request is associated with a session. The WebSnap application can manage multiple sessions on behalf of different users, each on a separate thread of execution. When handling a request, only one session is available, which is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Web application types that do not remain in memory between requests, such as CGI, do not support TSessionsService. When testing Web App Debugger executables, be sure to start the executables before browsing so that the executable remains running between requests.

Use TEndUserSessionsAdapter and TSessionsAdapter together to keep track of end user name and login state.

See Also

TEndUserSessionAdapter (see page 24458)

TAbstractWebContext (see page 24644)

TWebSession (see page 24968)

WebContext

Adding Login Support

Using the Sessions Service

187.1.2.1 TSessionsService Members

The following tables list the members exposed by TSessionsService.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckStatusChange (see page 25575)	Checks whether any sessions have started or terminated.
	Clear (see page 25575)	Deletes all sessions from memory.
	Connect (see page 25575)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 25576)	Obtains the interface for an active Web session, given its Session ID.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoEndSession (see page 25576)	Triggers the OnEndSession (see page 25581) event when appropriate.
V	DoStartSession (see page 25577)	Triggers the OnStartSession (see page 25582) event when appropriate.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetSessionIDs (see page 25577)	Returns a list of the session IDs for all sessions currently in memory.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).

	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	LoadFromFile (see page 25577)	Loads the list of sessions from a file.
	LoadFromStream (see page 25578)	Loads the list of sessions from a stream.
	NewSession (see page 25578)	Starts a new session.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	NotifyStatusChange (see page 25579)	Generates an OnEndSession (see page 25581) or OnStartSession (see page 25582) event, as approrpriate.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SaveToFile (see page 25579)	Saves the list of sessions to a file.
	SaveToStream (see page 25580)	Saves the list of sessions to a stream.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckStatusChange (see page 19734)	Checks whether any sessions have started or terminated.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 19734)	Deletes all sessions from memory.
	Connect (see page 19736)	This is Connect, a member of class ISessionsServiceConnectID.
	ConnectActive (see page 19737)	This is ConnectActive, a member of class ISessionsServiceConnectID.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	Create (see page 25574)	Creates and initializes an instance of TCustomSessionsService (see page 25570).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetSessionIDs (see page 19764)	This is GetSessionIDs, a member of class IWebGetSessionIDs.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 19738)	This is LoadFromFile, a member of class ISessionsServicePersist.
	LoadFromStream (see page 19738)	This is LoadFromStream, a member of class ISessionsServicePersist.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NewSession (see page 19735)	Starts a new session.
	NotifyStatusChange (see page 19735)	Generates an OnEndSession or OnStartSession event, as approrpriate.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 19738)	This is SaveToFile, a member of class ISessionsServicePersist.
	SaveToStream (see page 19738)	This is SaveToStream, a member of class ISessionsServicePersist.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnEndSession (see page 25587)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 25588)	Occurs when the sessions service detects that a new session has started.

Published Properties

	Name	Description
	DefaultTimeout (see page 25586)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 25587)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

187.1.2.2 TSessionsService Properties

The properties of the TSessionsService class are listed here.

Published Properties

	Name	Description
	DefaultTimeout (see page 25586)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 25587)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

187.1.2.2.1 TSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

187.1.2.2.2 TSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException exception. The Exception occurs before the OnStartSession event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 19012)

OnStartSession (see page 25582)

Terminate (see page 24973)

187.1.2.3 TSessionsService Events

The events of the TSessionsService class are listed here.

Published Events

	Name	Description
	OnEndSession (see page 25587)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 25588)	Occurs when the sessions service detects that a new session has started.

187.1.2.3.1 TSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 25582)

Terminate (see page 24973)

TimeoutMinutes

187.1.2.3.2 TSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

```
__property TStartSessionEvent OnStartSession;
```

Description

Write an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

See Also

OnStartSession (see page 25582)

187.1.3 TWebSessionIDsImpl Class

Class Hierarchy

Pascal

```
TWebSessionIDsImpl = class(TInterfacedObject, IWebSessionIDs);
```

C++

```
class TWebSessionIDsImpl : public TInterfacedObject, public IWebSessionIDs;
```

File

WebSess

Description

This is class WebSess.TWebSessionIDsImpl.

187.1.3.1 TWebSessionIDsImpl Members

The following tables list the members exposed by TWebSessionIDsImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetID (see page 25591)	Returns the value of the IDs property.
	GetIDCount (see page 25591)	Returns the value of the IDCount property.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25590)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25590)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	IDCount (see page 19779)	Indicates the number of session IDs (see page 19779) available.
R	IDs (see page 19779)	Lists the session IDs for all the sessions stored by the sessions service.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

187.1.3.2 TWebSessionIDsImpl.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebSessionIDsImpl();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 22287)

System::TObject::Free (see page 22300)

187.1.3.3 TWebSessionIDsImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionIDsImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the

object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

187.1.3.4 TWebSessionIDsImpl Methods

The methods of the TWebSessionIDsImpl class are listed here.

Protected Methods

	Name	Description
	GetID (see page 25591)	Returns the value of the IDs property.
	GetIDCount (see page 25591)	Returns the value of the IDCount property.

187.1.3.4.1 TWebSessionIDsImpl.GetID Method

Returns the value of the IDs property.

Pascal

```
function GetID(I: Integer): TSessionID;
```

C++

```
__fastcall TSessionID GetID(int I);
```

Description

GetID is the read implementation of the IDs property.

I is the index of the session ID to return.

See Also

IDs (see page 19779)

187.1.3.4.2 TWebSessionIDsImpl.GetIDCount Method

Returns the value of the IDCount property.

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

GetIDCount is the read implementation of the IDCount property.

See Also

IDCount (see page 19779)

187.1.4 TWebSessionImpl Class

Class Hierarchy

Pascal

```
TWebSessionImpl = class(TInterfacedObject, IWebSession, IWebSessionID, IWebSessionValues,
IWebSessionAttributes);
```

C++

```
class TWebSessionImpl : public TInterfacedObject, public IWebSession, public IWebSessionID,
public IWebSessionValues, public IWebSessionAttributes;
```

File

WebSess

Description

This is class WebSess.TWebSessionImpl.

187.1.4.1 TWebSessionImpl Members

The following tables list the members exposed by TWebSessionImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	GetExpirationTime (see page 25595)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 25595)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 25595)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 25596)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 25596)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 25596)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 25596)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 25597)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 25597)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 25597)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 25597)	This is GetValue, a member of class TWebSessionImpl.

	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	SetTimeoutMinutes (see page 25597)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 25598)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 25598)	Terminates the session.

Protected Properties

	Name	Description
R	ExpirationTime (see page 25599)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 25599)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 25599)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 25599)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 25599)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 25600)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 25600)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 25600)	This is Values, a member of class TWebSessionImpl.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 25594)	This is Create, a member of class TWebSessionImpl.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25594)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	IsActive (see page 19775)	This is IsActive, a member of class IWebSessionAttributes.
	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

187.1.4.2 TWebSessionImpl.Create Constructor

Pascal

```
constructor Create(AID: TSessionID);
```

C++

```
__fastcall TWebSessionImpl(TSessionID AID);
```

Description

This is Create, a member of class TWebSessionImpl.

187.1.4.3 TWebSessionImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

187.1.4.4 TWebSessionImpl Methods

The methods of the TWebSessionImpl class are listed here.

Protected Methods

	Name	Description
	GetExpirationTime (see page 25595)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 25595)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 25595)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 25596)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 25596)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 25596)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 25596)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 25597)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 25597)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 25597)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 25597)	This is GetValue, a member of class TWebSessionImpl.
	SetTimeoutMinutes (see page 25597)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 25598)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 25598)	Terminates the session.

187.1.4.4.1 TWebSessionImpl.GetExpirationTime Method

Pascal

```
function GetExpirationTime: TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime();
```

Description

This is GetExpirationTime, a member of class TWebSessionImpl.

187.1.4.4.2 TWebSessionImpl.GetExpired Method

Pascal

```
function GetExpired: Boolean;
```

C++

```
__fastcall Boolean GetExpired();
```

Description

This is GetExpired, a member of class TWebSessionImpl.

187.1.4.4.3 TWebSessionImpl.GetID Method

Pascal

```
function GetID: TSessionID;
```

C++

```
__fastcall TSessionID GetID();
```

Description

This is GetID, a member of class TWebSessionImpl.

187.1.4.4.4 TWebSessionImpl.GetIsActive Method

Pascal

```
function GetIsActive: Boolean;
```

C++

```
__fastcall Boolean GetIsActive();
```

Description

This is GetIsActive, a member of class TWebSessionImpl.

187.1.4.4.5 TWebSessionImpl.GetItemCount Method

Pascal

```
function GetItemCount: Integer;
```

C++

```
__fastcall int GetItemCount();
```

Description

This is GetItemCount, a member of class TWebSessionImpl.

187.1.4.4.6 TWebSessionImpl.GetItems Method

Pascal

```
procedure GetItems(var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TAbstractNamedVariants AItems);
```

Description

This is GetItems, a member of class TWebSessionImpl.

187.1.4.4.7 TWebSessionImpl.GetStartTime Method

Pascal

```
function GetStartTime: TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime();
```

Description

This is GetStartTime, a member of class TWebSessionImpl.

187.1.4.4.8 TWebSessionImpl.GetTerminated Method

Pascal

```
function GetTerminated: Boolean;
```

C++

```
__fastcall Boolean GetTerminated();
```

Description

This is GetTerminated, a member of class TWebSessionImpl.

187.1.4.4.9 TWebSessionImpl.GetTimeoutMinutes Method

Pascal

```
function GetTimeoutMinutes: Integer;
```

C++

```
__fastcall int GetTimeoutMinutes();
```

Description

This is GetTimeoutMinutes, a member of class TWebSessionImpl.

187.1.4.4.10 TWebSessionImpl.GetTouchTime Method

Pascal

```
function GetTouchTime: TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime();
```

Description

This is GetTouchTime, a member of class TWebSessionImpl.

187.1.4.4.11 TWebSessionImpl.GetValue Method

Pascal

```
function GetValue(const AName: string): Variant;
```

C++

```
__fastcall Variant GetValue(const AnsiString AName);
```

Description

This is GetValue, a member of class TWebSessionImpl.

187.1.4.4.12 TWebSessionImpl.SetTimeoutMinutes Method

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(int AValue);
```

Description

This is SetTimeoutMinutes, a member of class TWebSessionImpl.

187.1.4.4.13 TWebSessionImpl.SetValue Method

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetValue(const AnsiString AName, const Variant AValue);
```

Description

This is SetValue, a member of class TWebSessionImpl.

187.1.4.4.14 TWebSessionImpl.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate;
```

C++

```
__fastcall Terminate();
```

Description

Call Terminate to terminate a session. Once a session terminates, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimeOutMinutes minutes.

TimeoutMinutes

Values

187.1.4.5 TWebSessionImpl Properties

The properties of the TWebSessionImpl class are listed here.

Protected Properties

	Name	Description
R	ExpirationTime (see page 25599)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 25599)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 25599)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 25599)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 25599)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 25600)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 25600)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 25600)	This is Values, a member of class TWebSessionImpl.

187.1.4.5.1 TWebSessionImpl.ExpirationTime Property

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

This is ExpirationTime, a member of class TWebSessionImpl.

187.1.4.5.2 TWebSessionImpl.Expired Property

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

This is Expired, a member of class TWebSessionImpl.

187.1.4.5.3 TWebSessionImpl.ID Property

Pascal

```
property ID: TSessionID;
```

C++

```
__property TSessionID ID;
```

Description

This is ID, a member of class TWebSessionImpl.

187.1.4.5.4 TWebSessionImpl.StartTime Property

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

This is StartTime, a member of class TWebSessionImpl.

187.1.4.5.5 TWebSessionImpl.Terminated Property

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

This is Terminated, a member of class TWebSessionImpl.

187.1.4.5.6 TWebSessionImpl.TimeoutMinutes Property

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

This is TimeoutMinutes, a member of class TWebSessionImpl.

187.1.4.5.7 TWebSessionImpl.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

Description

This is TouchTime, a member of class TWebSessionImpl.

187.1.4.5.8 TWebSessionImpl.Values Property

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[AnsiString const AName];
```

Description

This is Values, a member of class TWebSessionImpl.

187.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEndSessionReason (see page 25601)	This is record WebSess.TEndSessionReason.

187.2.1 WebSess.TEndSessionReason Enumeration

Pascal

```
TEndSessionReason = (
  esTimeout,
  esTerminate
);
```

C++

```
enum TEndSessionReason {
  esTimeout,
  esTerminate
};
```

File

WebSess

Description

This is record WebSess.TEndSessionReason.

187.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEndSessionEvent (see page 25602)	This is type WebSess.TEndSessionEvent.
TStartSessionEvent (see page 25602)	This is type WebSess.TStartSessionEvent.

187.3.1 WebSess.TEndSessionEvent Type

Pascal

```
TEndSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession; AReason:
TEndSessionReason) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession; AReason: TEndSessionReason) (
TEndSessionEvent)();
```

File

WebSess

Description

This is type WebSess.TEndSessionEvent.

187.3.2 WebSess.TStartSessionEvent Type

Pascal

```
TStartSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession) ( TStartSessionEvent)();
```

File

WebSess

Description

This is type WebSess.TStartSessionEvent.

188 WebUsers Namespace

This is namespace WebUsers.

Topics

Name	Description
Classes (see page 25604)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 25633)	The following table lists structs, records, enums in this documentation.
Types (see page 25634)	The following table lists types in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 25604)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 25604)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 25605)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 25625) raises.
	TCustomWebUserList (see page 25606)	The TCustomWebUserList component uses a TWebUserItems (see page 25620) object to store the account information about a collection of users.
	TWebUserItem (see page 25615)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 25620)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 25625)	TWebUserList validates login and checks access rights for a particular user.

Structs, Records, Enums

	Name	Description
	TValidateUserError (see page 25633)	This is record WebUsers.TValidateUserError.

Types

Name	Description
TCheckAccessRightsEvent (see page 25634)	This is type WebUsers.TCheckAccessRightsEvent.
TCheckAccessRightsHandledEvent (see page 25634)	This is type WebUsers.TCheckAccessRightsHandledEvent.
TValidateUserErrorEvent (see page 25635)	This is type WebUsers.TValidateUserErrorEvent.
TValidateUserEvent (see page 25635)	This is type WebUsers.TValidateUserEvent.
TValidateUserHandledEvent (see page 25635)	This is type WebUsers.TValidateUserHandledEvent.

188.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 25604)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 25604)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 25605)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 25625) raises.
	TCustomWebUserList (see page 25606)	The TCustomWebUserList component uses a TWebUserItems (see page 25620) object to store the account information about a collection of users.
	TWebUserItem (see page 25615)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 25620)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 25625)	TWebUserList validates login and checks access rights for a particular user.

188.1.1 EUserIDNotFoundException Class

EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.

Class Hierarchy

Pascal

```
EUserIDNotFoundException = class(EWebUsersListException);
```

C++

```
class EUserIDNotFoundException : public EWebUsersListException;
```

File

WebUsers

Description

When a Web user list (TWebUserList (see page 25625)) attempts to look up information about a user and fails to find an entry for that user, it generates an OnUserIDNotFound event. If that event handler does not handle the situation, then the Web user list raises an EUserIDNotFoundException exception.

See Also

TWebUserList (see page 25625)

TCustomWebUserList (see page 25606)

188.1.2 EValidateUserException Class

EValidateUserException is raised when a Web user list fails to validate a user.

Class Hierarchy

System::TObject → SysUtils.Exception → HTTPApp.EWebBrokerException → WebUsers.EWebUsersListException → WebUsers.EValidateUserException

Pascal

```
EValidateUserException = class(EWebUsersListException);
```

C++

```
class EValidateUserException : public EWebUsersListException;
```

File

WebUsers

Description

When a WebSnap application that contains a Web user list (TWebUserList (see page 25625)) tries to log a user in, the Web user list raises an EValidateUserException if it can't validate the supplied user ID and password and its OnValidateUserError event handler does not handle the situation.

The Web user list may fail to validate a user ID and password for any of the following reasons:

The WebSnap application failed to supply a password or user ID when trying to validate the user.

The supplied user ID does not refer to a user in the list.

The supplied password is not correct for the specified user.

See Also

TWebUserList (see page 25625)

TCustomWebUserList (see page 25606)

TCustomWebUserList (see page 25606)

188.1.3 EWebUsersListException Class

EWebUsersListException is the base class for exceptions that TWebUserList (see page 25625) raises.

Class Hierarchy

System::TObject → SysUtils.Exception → HTTPApp.EWebBrokerException → WebUsers.EWebUsersListException

Pascal

```
EWebUsersListException = class(EWebBrokerException);
```

C++

```
class EWebUsersListException : public EWebBrokerException;
```

File

WebUsers

Description

EWebUsersListException is the common base class for all exceptions that represent errors which TWebUserList (see page 25625) encounters. Its descendants include

EUserIDNotFoundException (see page 25604), which is raised when a WebSnap application tries to use the Web user list to look up information about a user that is not listed.

EValidateUserException (see page 25604), which is raised when the WebSnap application tries to log in a user and the Web user list fails to validate the supplied user id and password.

See Also

TWebUserList (see page 25625)

EUserIDNotFoundException (see page 25604)

EValidateUserException (see page 25604)

188.1.4 TCustomWebUserList Class

The TCustomWebUserList component uses a TWebUserItems (see page 25620) object to store the account information about a collection of users.

Class Hierarchy

Pascal

```
TCustomWebUserList = class(TComponent, IWebUserList);
```

C++

```
class TCustomWebUserList : public TComponent, public IWebUserList;
```

File

WebUsers

Description

The TCustomWebUserList component uses a TWebUserItems (see page 25620) object to store the account information about a collection of users. It also provides a way to save and load the user list from a file. Several events are triggered at stages that occur when a user is logging in that allow checks to be performed during the user validation process, including the verification of user rights.

See Also

TWebUserItems (see page 25620)

TWebUserList (see page 25625)

188.1.4.1 TCustomWebUserList Members

The following tables list the members exposed by TCustomWebUserList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckAccessRights (see page 25610)	Checks whether a specified user has a given access rights string.
	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateUser (see page 25611)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 25606) object.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 25613)	Triggered at the start of the CheckAccessRights (see page 25610) protected function.
	OnAfterValidateUser (see page 25613)	Occurs after a user has been validated.

	OnBeforeCheckAccessRights (see page 25613)	Triggered at the end of the CheckAccessRights (see page 25610) protected function.
	OnBeforeValidateUser (see page 25614)	Triggered at the beginning of the ValidateUser (see page 25611) function.
	OnUserIDNotFound (see page 25614)	Triggered if the UserID is not found in the TCustomWebUserList (see page 25606) object.
	OnValidateUserError (see page 25614)	Triggered if an error occurs during the validation process.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25609)	Creates a newTCustomWebUserList object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25610)	Frees the TCustomWebUserList (see page 25606) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 25611)	Loads the data from the file with the given filename.

	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 25611)	This procedure saves the collection of the user's account information to a file with the given filename.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	UserItems (see page 25612)	Stores the account information about a collection of users.
R	Users (see page 25612)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 25615).
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.

188.1.4.2 TCustomWebUserList.Create Constructor

Creates a newTCustomWebUserList object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebUserList(TComponent * AOwner);
```

Description

Creates a newTCustomWebUserList object and initializes the TWebUserItems (see page 25620) object that will store the user's account information.

188.1.4.3 TCustomWebUserList.Destroy Destructor

Frees the TCustomWebUserList (see page 25606) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebUserList();
```

Description

Frees the TCustomWebUserList (see page 25606) object initialized by the constructor.

188.1.4.4 TCustomWebUserList Methods

The methods of the TCustomWebUserList class are listed here.

Protected Methods

	Name	Description
	CheckAccessRights (see page 25610)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 25611)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 25606) object.

Public Methods

	Name	Description
	LoadFromFile (see page 25611)	Loads the data from the file with the given filename.
	SaveToFile (see page 25611)	This procedure saves the collection of the user's account information to a file with the given filename.

188.1.4.4.1 TCustomWebUserList.CheckAccessRights Method

Checks whether a specified user has a given access rights string.

Pascal

```
function CheckAccessRights(AUserID: Variant; ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckAccessRights(Variant AUserID, AnsiString ARights);
```

Description

Call CheckAccessRights to determine whether the current end user is authorized to view Web pages or adapters whose access rights string is Rights. The end user must be logged in before CheckAccessRights can determine the user's access rights.

UserID is the user ID of the user to check.

Rights is the access rights string that CheckAccessRights must look for. Typically, this is the value of the ViewRights property on a Web page information object that describes the page the user wants to access or on an adapter that the user wants to call.

See Also

HasViewRights (see page 24112)

HasModifyRights (see page 24112)

HasExecuteRights (see page 24111)

ViewAccess (see page 15069)

ViewAccess (see page 24183)

188.1.4.4.2 TCustomWebUserList.LoadFromFile Method

Loads the data from the file with the given filename.

Pascal

```
procedure LoadFromFile(FileName: string);
```

C++

```
__fastcall LoadFromFile(AnsiString FileName);
```

Description

Loads the data from the file with the given filename into the TCustomWebUserList (see page 25606) object.

188.1.4.4.3 TCustomWebUserList.SaveToFile Method

This procedure saves the collection of the user's account information to a file with the given filename.

Pascal

```
procedure SaveToFile(FileName: string);
```

C++

```
__fastcall SaveToFile(AnsiString FileName);
```

Description

Saves the collection of the user's account information to a file with the given filename. This file can later be reloaded by calling LoadFromFile (see page 25611).

188.1.4.4.4 TCustomWebUserList.ValidateUser Method

Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 25606) object.

Pascal

```
function ValidateUser(Strings: TStrings): Variant;
```

C++

```
__fastcall Variant ValidateUser(TStrings Strings);
```

Description

This function verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 25606) object. Before the validation begins, it triggers the OnBeforeValidateUser (see page 25614) event. If an error occurs during the validation check, the OnValidateUserError (see page 25614) event will be triggered and a description of the error is sent, which could be either a missing or invalid password, or a missing or unknown user name. After the validation is complete, this function triggers the OnAfterValidateUser (see page 25613) event.

188.1.4.5 TCustomWebUserList Properties

The properties of the TCustomWebUserList class are listed here.

Public Properties

	Name	Description
	UserItems (see page 25612)	Stores the account information about a collection of users.
R	Users (see page 25612)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 25615).

188.1.4.5.1 TCustomWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 25612)

188.1.4.5.2 TCustomWebUserList.Users Property

Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 25615).

Pascal

```
property Users [I: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Users[int I];
```

Description

Use this property to provide read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 25615). An individual TWebUserItem (see page 25615) object can be indexed from the array using the standard bracketed array notation.

See Also

UserItems (see page 25612)

188.1.4.6 TCustomWebUserList Events

The events of the TCustomWebUserList class are listed here.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 25613)	Triggered at the start of the CheckAccessRights (see page 25610) protected function.
	OnAfterValidateUser (see page 25613)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 25613)	Triggered at the end of the CheckAccessRights (see page 25610) protected function.
	OnBeforeValidateUser (see page 25614)	Triggered at the beginning of the ValidateUser (see page 25611) function.

	OnUserIDNotFound (see page 25614)	Triggered if the UserID is not found in the TCustomWebUserList (see page 25606) object.
	OnValidateUserError (see page 25614)	Triggered if an error occurs during the validation process.

188.1.4.6.1 TCustomWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights (see page 25610) protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights (see page 25610) protected function. This event can be used if any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 25613)

188.1.4.6.2 TCustomWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser (see page 25611) function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 25614)

ValidateUser (see page 25611)

188.1.4.6.3 TCustomWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights (see page 25610) protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights (see page 25610) protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 25613)

188.1.4.6.4 TCustomWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser (see page 25611) function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser (see page 25611) function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 25613)

188.1.4.6.5 TCustomWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList (see page 25606) object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList (see page 25606) object. The CheckAccessRights (see page 25610) protected function triggers this function if the UserID is not found while checking the access rights.

188.1.4.6.6 TCustomWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser (see page 25611) function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 25611)

188.1.5 TWebUserItem Class

TWebUserItem stores the user identification, password, and access rights for a single user.

Class Hierarchy

Pascal

```
TWebUserItem = class(TCollectionItem);
```

C++

```
class TWebUserItem : public TCollectionItem;
```

File

WebUsers

Description

TWebUserItem stores the user ID and password along with the associated access rights for a single user. Methods are provided to set the access rights as well as methods to retrieve the access rights in the form of a single delimited string, or as a collection in the form of a TString.

See Also

TWebUserList (see page 25625)

TWebUserItems (see page 25620)

188.1.5.1 TWebUserItem Members

The following tables list the members exposed by TWebUserItem.

Protected Methods

	Name	Description
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2758)	Updates the collection to reflect changes to the collection item.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetDisplayName (see page 2758)	Returns the name of the collection item as it appears in the collection editor.
	GetOwner (see page 2759)	Returns the collection to which this item belongs.
	GetOwner (see page 2932)	Returns the owner of an object.
	SetCollection (see page 2759)	Sets the value of the Collection (see page 2761) property.
	SetDisplayName (see page 2760)	Sets the name of the collection item as it appears in the collection editor.
	SetIndex (see page 2760)	Moves the collection item to a specified position in the parent collection.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 25617)	Copies the UserName (see page 25620), Password (see page 25619), and AccessRights (see page 25618) from the given TWebUserItem (see page 25615).
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckRights (see page 25618)	Checks the user's stored access rights against the access rights passed in.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 25616)	Creates an instance of Create.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 25617)	Destroys an instance of TWebUserItem (see page 25615).
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2759)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AccessRightsStrings (see page 25619)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
	Collection (see page 2761)	Specifies the TCollection (see page 2731) instance to which the TCollectionItem (see page 2755) belongs.
	DisplayName (see page 2761)	The name displayed in the Collection (see page 2761) editor.
R	ID (see page 2761)	A unique, permanent index for the item.
	Index (see page 2762)	Returns the item's position in the Items array of TCollection (see page 2731).
R	UserID (see page 25619)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 25618)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 25619)	Stores the user's password as a string.
	UserName (see page 25620)	Stores the user's name.

188.1.5.2 TWebUserItem.Create Constructor

Creates an instance of Create.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TWebUserItem(TCollection Collection);
```

Description

Do not call Create. It is called automatically when the Create object is created.

See Also

Create_c

188.1.5.3 TWebUserItem.Destroy Destructor

Destroys an instance of TWebUserItem (see page 25615).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebUserItem();
```

Description

The Destroy destructor frees all objects owned by the TWebUserItem (see page 25615) object. Never call the destructor explicitly; it is called automatically when the TWebUserItem (see page 25615) object is destroyed (for example, when the object falls out of the scope of the program).

See Also

delete

188.1.5.4 TWebUserItem Methods

The methods of the TWebUserItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 25617)	Copies the UserName (see page 25620), Password (see page 25619), and AccessRights (see page 25618) from the given TWebUserItem (see page 25615).
	CheckRights (see page 25618)	Checks the user's stored access rights against the access rights passed in.

188.1.5.4.1 TWebUserItem.Assign Method

Copies the UserName (see page 25620), Password (see page 25619), and AccessRights (see page 25618) from the given TWebUserItem (see page 25615).

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

The Assign procedure copies the UserName (see page 25620), Password (see page 25619), and AccessRights (see page 25618) from the given TWebUserItem (see page 25615).

See Also

UserName (see page 25620)

Password (see page 25619)

AccessRights (see page 25618)

188.1.5.4.2 TWebUserItem.CheckRights Method

Checks the user's stored access rights against the access rights passed in.

Pascal

```
function CheckRights(const ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckRights(const AnsiString ARights);
```

Description

This function checks the user's stored access rights against the access rights passed in. If the user has a matching right, then the function returns true or it will return false if the rights do not match.

See Also

AccessRights (see page 25618)

188.1.5.5 TWebUserItem Properties

The properties of the TWebUserItem class are listed here.

Public Properties

	Name	Description
R	AccessRightsStrings (see page 25619)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
R	UserID (see page 25619)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 25618)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 25619)	Stores the user's password as a string.
	UserName (see page 25620)	Stores the user's name.

188.1.5.5.1 TWebUserItem.AccessRights Property

Stores the user rights as a comma, semicolon, or space delimited string.

Pascal

```
property AccessRights: string;
```

C++

```
__property AnsiString AccessRights;
```

Description

The AccessRights property stores the user rights as a comma, semicolon, or space delimited string. This variable can be read or written directly or set as a single string using SetAccessRights. The individual rights can be obtained as a collection in the form

of a TString by calling the GetAccessRightsStrings function.

See Also

CheckRights (see page 25618)

188.1.5.5.2 TWebUserItem.AccessRightsStrings Property

Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

Pascal

```
property AccessRightsStrings: TStrings;
```

C++

```
__property TStrings AccessRightsStrings;
```

Description

The AccessRightsStrings property stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

See Also

AccessRights (see page 25618)

TStrings (see page 3029)

188.1.5.5.3 TWebUserItem.Password Property

Stores the user's password as a string.

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

The Password property stores the user's password as a string.

188.1.5.5.4 TWebUserItem.UserID Property

Provides read-only access to the user ID.

Pascal

```
property UserID: Variant;
```

C++

```
__property Variant UserID;
```

Description

The UserID property provides read-only access to the user ID.

See Also

Variant (see page 22307)

188.1.5.5.5 TWebUserItem.UserName Property

Stores the user's name.

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

The UserName property stores the user's name. This property can be read or written directly.

188.1.6 TWebUserItems Class

TWebUserItems stores multiple sets of user information.

Class Hierarchy

Pascal

```
TWebUserItems = class(TCollection);
```

C++

```
class TWebUserItems : public TCollection;
```

File

WebUsers

Description

The TWebUserItems stores multiple TWebUserItem (see page 25615) modules as an array. It also provides methods to access a particular user's information by giving the user name or user ID.

188.1.6.1 TWebUserItems Members

The following tables list the members exposed by TWebUserItems.

Protected Methods

	Name	Description
	Added (see page 2736)	Responds when items are added to the collection.
	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 25623)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 25624)	Returns the number of custom attributes associated with items in the collection.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 25624)	Returns the value of a custom attribute assigned to one of the collection's items.

V	GetOwner (see page 25624)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.
V	Update (see page 2747)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 25622)	Constructor used for the TWebUserItems (see page 25620) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	FindUserID (see page 25623)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 25623)	Returns the user ID, password, and access rights information for the user.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 25625)	Allows public read and write access to individual TWebUserItem (see page 25615) records as if they were stored in an array.

188.1.6.2 TWebUserItems.Create Constructor

Constructor used for the TWebUserItems (see page 25620) object.

Pascal

```
constructor Create(AOwner: TComponent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TWebUserItems(TComponent * AOwner, TCollectionItemClass ItemClass);
```

Description

The constructor used for the TWebUserItems (see page 25620) object. This method creates a new TWebUserItem (see page 25615) and sets the owner.

188.1.6.3 TWebUserItems Methods

The methods of the TWebUserItems class are listed here.

Protected Methods

	Name	Description
V	GetAttr (see page 25623)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
V	GetAttrCount (see page 25624)	Returns the number of custom attributes associated with items in the collection.
V	GetItemAttr (see page 25624)	Returns the value of a custom attribute assigned to one of the collection's items.
V	GetOwner (see page 25624)	Returns the owner of an object.

Public Methods

	Name	Description
	FindUserID (see page 25623)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 25623)	Returns the user ID, password, and access rights information for the user.

188.1.6.3.1 TWebUserItems.FindUserID Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserID(AUserID: Variant): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserID(Variant AUserID);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user name in the form of a TWebUserItem (see page 25615) object.

188.1.6.3.2 TWebUserItems.FindUserName Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserName(AUserName: string): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserName(AnsiString AUserName);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user ID in the form of a TWebUserItem (see page 25615) object.

188.1.6.3.3 TWebUserItems.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount (see page 2744)

GetItemAttr (see page 2745)

188.1.6.3.4 TWebUserItems.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetItemAttr (see page 2745)

188.1.6.3.5 TWebUserItems.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall AnsiString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr (see page 2743)

GetAttrCount (see page 2744)

188.1.6.3.6 TWebUserItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath (see page 2932)

TCollection (see page 2731)

TComponent (see page 2762)

Owner (see page 2807)

188.1.6.4 TWebUserItems Properties

The properties of the TWebUserItems class are listed here.

Public Properties

	Name	Description
	Items (see page 25625)	Allows public read and write access to individual TWebUserItem (see page 25615) records as if they were stored in an array.

188.1.6.4.1 TWebUserItems.Items Property

Allows public read and write access to individual TWebUserItem (see page 25615) records as if they were stored in an array.

Pascal

```
property Items [Index: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Items[int Index];
```

Description

The Items property allows public read and write access to individual TWebUserItem (see page 25615) records as if they were stored in an array. It also provides methods to access a particular user's information by giving the user name or user ID.

See Also

operator_sb

188.1.7 TWebUserList Class

TWebUserList validates login and checks access rights for a particular user.

Class Hierarchy

Pascal

```
TWebUserList = class(TCustomWebUserList);
```

C++

```
class TWebUserList : public TCustomWebUserList;
```

File

WebUsers

Description

Use TWebUserList, which contains a list of user names, passwords, and access rights, to validate login and to check a user's access rights.

The TWebUserList component provides events that are triggered during the initial stages when a user is logging in, before and after the user is validated, before and after the user's access rights are checked, in the case of an error, and when detecting an invalid user.

Adding Login Support

188.1.7.1 TWebUserList Members

The following tables list the members exposed by TWebUserList.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckAccessRights (see page 25610)	Checks whether a specified user has a given access rights string.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.

	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	ValidateUser (see page 25611)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 25606) object.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckAccessRights (see page 19785)	Checks whether a specified user has a given access rights string.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 25609)	Creates a newTCustomWebUserList object.

V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 25610)	Frees the TCustomWebUserList (see page 25606) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 25611)	Loads the data from the file with the given filename.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 25611)	This procedure saves the collection of the user's account information to a file with the given filename.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.
	ValidateUser (see page 19785)	Validates a user login.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.

R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	Users (see page 25612)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 25615).
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 25630)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 25630)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 25630)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 25631)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 25631)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 25631)	Triggered if an error occurs during the validation process.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UserItems (see page 25629)	Stores the account information about a collection of users.

188.1.7.2 TWebUserList Properties

The properties of the TWebUserList class are listed here.

Published Properties

	Name	Description
	UserItems (see page 25629)	Stores the account information about a collection of users.

188.1.7.2.1 TWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 25612)

188.1.7.3 TWebUserList Events

The events of the TWebUserList class are listed here.

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 25630)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 25630)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 25630)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 25631)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 25631)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 25631)	Triggered if an error occurs during the validation process.

188.1.7.3.1 TWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights protected function. This event can be used if any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 25613)

188.1.7.3.2 TWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 25614)

ValidateUser (see page 25611)

188.1.7.3.3 TWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 25613)

188.1.7.3.4 TWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 25613)

188.1.7.3.5 TWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList object. The CheckAccessRights protected function triggers this function if the UserID is not found while checking the access rights.

188.1.7.3.6 TWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 25611)

188.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TValidateUserError (see page 25633)	This is record WebUsers.TValidateUserError.

188.2.1 WebUsers.TValidateUserError Enumeration

Pascal

```
TValidateUserError = (
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
);
```

C++

```
enum TValidateUserError {
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
};
```

File

WebUsers

Description

This is record WebUsers.TValidateUserError.

188.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCheckAccessRightsEvent (see page 25634)	This is type WebUsers.TCheckAccessRightsEvent.
TCheckAccessRightsHandledEvent (see page 25634)	This is type WebUsers.TCheckAccessRightsHandledEvent.
TValidateUserErrorEvent (see page 25635)	This is type WebUsers.TValidateUserErrorEvent.
TValidateUserEvent (see page 25635)	This is type WebUsers.TValidateUserEvent.
TValidateUserHandledEvent (see page 25635)	This is type WebUsers.TValidateUserHandledEvent.

188.3.1 WebUsers.TCheckAccessRightsEvent Type

Pascal

```
TCheckAccessRightsEvent = procedure (UserID: Variant; Rights: string; var HasRight: Boolean)
of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean) ( TCheckAccessRightsEvent)();
```

File

WebUsers

Description

This is type WebUsers.TCheckAccessRightsEvent.

188.3.2 WebUsers.TCheckAccessRightsHandledEvent Type

Pascal

```
TCheckAccessRightsHandledEvent = procedure (UserID: Variant; Rights: string; var HasRight:
Boolean; var Handled: Boolean) of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean; var Handled: Boolean) (
TCheckAccessRightsHandledEvent)();
```

File

WebUsers

Description

This is type WebUsers.TCheckAccessRightsHandledEvent.

188.3.3 WebUsers.TValidateUserErrorEvent Type

Pascal

```
TValidateUserErrorEvent = procedure (Error: TValidateUserError; Strings: TStrings; var UserID:
Variant; var Handled: Boolean) of object;
```

C++

```
(Error: TValidateUserError; Strings: TStrings; var UserID: Variant; var Handled: Boolean) (
TValidateUserErrorEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserErrorEvent.

188.3.4 WebUsers.TValidateUserEvent Type

Pascal

```
TValidateUserEvent = procedure (Strings: TStrings; var UserID: Variant) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant) ( TValidateUserEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserEvent.

188.3.5 WebUsers.TValidateUserHandledEvent Type

Pascal

```
TValidateUserHandledEvent = procedure (Strings: TStrings; var UserID: Variant; var Handled:
Boolean) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant; var Handled: Boolean) ( TValidateUserHandledEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserHandledEvent.

189 WSDLBind Namespace

This is namespace WSDLBind.

Topics

Name	Description
Classes (see page 25640)	The following table lists classes in this documentation.
Interfaces (see page 25815)	The following table lists interfaces in this documentation.
Functions (see page 25908)	The following table lists functions in this documentation.
Constants (see page 25910)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBinding (see page 25640)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 25647)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 25654)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 25661)	This is class WSDLBind.TBindings.
	TDefinition (see page 25667)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 25676)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 25676)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 25683)	This is class WSDLBind.TDocumented.
	TFault (see page 25689)	This is class WSDLBind.TFault.
	TFaults (see page 25689)	This is class WSDLBind.TFaults.
	TImport (see page 25696)	This is class WSDLBind.TImport.
	TImports (see page 25702)	This is class WSDLBind.TImports.
	TMessage (see page 25708)	This is class WSDLBind.TMessage.
	TMessages (see page 25715)	This is class WSDLBind.TMessages.
	TOperation (see page 25721)	This is class WSDLBind.TOperation.
	TOperations (see page 25728)	This is class WSDLBind.TOperations.
	TParam (see page 25735)	This is class WSDLBind.TParam.
	TPart (see page 25741)	This is class WSDLBind.TPart.
	TParts (see page 25748)	This is class WSDLBind.TParts.
	TPort (see page 25755)	This is class WSDLBind.TPort.
	TPorts (see page 25761)	This is class WSDLBind.TPorts.
	TPortType (see page 25767)	This is class WSDLBind.TPortType.
	TPortTypes (see page 25774)	This is class WSDLBind.TPortTypes.
	TService (see page 25780)	This is class WSDLBind.TService.

	TServices (see page 25787)	This is class WSDLBind.TServices.
	TTypes (see page 25793)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 25799)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 25808)	This is class WSDLBind.TXMLSchemaDefs.

Constants

Name	Description
SBinding (see page 25910)	This is constant WSDLBind.SBinding.
SDefinitions (see page 25910)	This is constant WSDLBind.SDefinitions.
SFault (see page 25911)	This is constant WSDLBind.SFault.
SImport (see page 25911)	This is constant WSDLBind.SImport.
SInput (see page 25911)	This is constant WSDLBind.SInput.
SLocation (see page 25912)	This is constant WSDLBind.SLocation.
SMessage (see page 25912)	This is constant WSDLBind.SMessage.
SNamespace (see page 25912)	This is constant WSDLBind.SNamespace.
SOperation (see page 25913)	This is constant WSDLBind.SOperation.
SOutput (see page 25913)	This is constant WSDLBind.SOutput.
SPart (see page 25913)	This is constant WSDLBind.SPart.
SPort (see page 25914)	This is constant WSDLBind.SPort.
SPortType (see page 25914)	This is constant WSDLBind.SPortType.
SService (see page 25914)	This is constant WSDLBind.SService.
SType (see page 25915)	This is constant WSDLBind.SType.
STypes (see page 25915)	This is constant WSDLBind.STypes.

Functions

	Name	Description
	GetDefinition (see page 25908)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 25908)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 25908)	This is function WSDLBind.NewWSDLDoc.

Interfaces

	Name	Description
	IBinding (see page 25815)	This is class WSDLBind.IBinding.
	IBindingInput (see page 25819)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 25820)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 25824)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 25827)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 25828)	This is class WSDLBind.IBindings.
	IDefinition (see page 25831)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 25837)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 25838)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 25841)	This is class WSDLBind.IDocumented.
	IFault (see page 25843)	This is class WSDLBind.IFault.
	IFaults (see page 25844)	This is class WSDLBind.IFaults.
	IImport (see page 25847)	This is class WSDLBind.IImport.
	IImports (see page 25850)	This is class WSDLBind.IImports.
	IMessage (see page 25853)	This is class WSDLBind.IMessage.
	IMessages (see page 25857)	This is class WSDLBind.IMessages.
	IOperation (see page 25860)	This is class WSDLBind.IOperation.
	IOperations (see page 25864)	This is class WSDLBind.IOperations.
	IParam (see page 25868)	This is class WSDLBind.IParam.
	IPart (see page 25871)	This is class WSDLBind.IPart.
	IParts (see page 25876)	This is class WSDLBind.IParts.
	IPort (see page 25879)	This is class WSDLBind.IPort.
	IPorts (see page 25882)	This is class WSDLBind.IPorts.

	IPortType (see page 25885)	This is class WSDLBind.IPortType.
	IPortTypes (see page 25889)	This is class WSDLBind.IPortTypes.
	IService (see page 25892)	This is class WSDLBind.IService.
	IServices (see page 25895)	This is class WSDLBind.IServices.
	ITypes (see page 25898)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 25901)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 25905)	This is class WSDLBind.IXMLSchemaDefs.

189.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBinding (see page 25640)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 25647)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 25654)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 25661)	This is class WSDLBind.TBindings.
	TDefinition (see page 25667)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 25676)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 25676)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 25683)	This is class WSDLBind.TDocumented.
	TFault (see page 25689)	This is class WSDLBind.TFault.
	TFaults (see page 25689)	This is class WSDLBind.TFaults.
	TImport (see page 25696)	This is class WSDLBind.TImport.
	TImports (see page 25702)	This is class WSDLBind.TImports.
	TMessage (see page 25708)	This is class WSDLBind.TMessage.
	TMessages (see page 25715)	This is class WSDLBind.TMessages.
	TOperation (see page 25721)	This is class WSDLBind.TOperation.
	TOperations (see page 25728)	This is class WSDLBind.TOperations.
	TParam (see page 25735)	This is class WSDLBind.TParam.
	TPart (see page 25741)	This is class WSDLBind.TPart.
	TParts (see page 25748)	This is class WSDLBind.TParts.
	TPort (see page 25755)	This is class WSDLBind.TPort.
	TPorts (see page 25761)	This is class WSDLBind.TPorts.
	TPortType (see page 25767)	This is class WSDLBind.TPortType.
	TPortTypes (see page 25774)	This is class WSDLBind.TPortTypes.
	TService (see page 25780)	This is class WSDLBind.TService.
	TServices (see page 25787)	This is class WSDLBind.TServices.
	TTypes (see page 25793)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 25799)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 25808)	This is class WSDLBind.TXMLSchemaDefs.

189.1.1 TBinding Class

Class Hierarchy

Pascal

```
TBinding = class(TDocumented, IBinding);
```

C++

```
class TBinding : public TDocumented, public IBinding;
```

File

WSDLBind

Description

This is class WSDLBind.TBinding.

189.1.1.1 TBinding Members

The following tables list the members exposed by TBinding.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.

	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperations (see page 25646)	This is GetBindingOperations, a member of class TBinding.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25646)	This is GetName, a member of class TBinding.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetType_ (see page 25647)	This is GetType_, a member of class TBinding.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.

	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25647)	This is SetName, a member of class TBinding.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	SetType_ (see page 25647)	This is SetType_, a member of class TBinding.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25646)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	BindingOperations (see page 25819)	This is BindingOperations, a member of class IBinding.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25819)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
	Type_ (see page 25819)	This is Type_, a member of class IBinding.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.1.2 TBinding Methods

The methods of the TBinding class are listed here.

Protected Methods

	Name	Description
	GetBindingOperations (see page 25646)	This is GetBindingOperations, a member of class TBinding.
	GetName (see page 25646)	This is GetName, a member of class TBinding.
	GetType_ (see page 25647)	This is GetType_, a member of class TBinding.

	SetName (see page 25647)	This is SetName, a member of class TBinding.
	SetType_ (see page 25647)	This is SetType_, a member of class TBinding.

Public Methods

	Name	Description
	AfterConstruction (see page 25646)	Responds after the last constructor executes.

189.1.1.2.1 TBinding.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.1.2.2 TBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class TBinding.

189.1.1.2.3 TBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBinding.

189.1.1.2.4 TBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TBinding.

189.1.1.2.5 TBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBinding.

189.1.1.2.6 TBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TBinding.

189.1.2 TBindingOperation Class

Class Hierarchy

Pascal

```
TBindingOperation = class(TDocumented, IBindingOperation);
```

C++

```
class TBindingOperation : public TDocumented, public IBindingOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperation.

189.1.2.1 TBindingOperation Members

The following tables list the members exposed by TBindingOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetFaults (see page 25653)	This is GetFaults, a member of class TBindingOperation.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetInput (see page 25653)	This is GetInput, a member of class TBindingOperation.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25654)	This is GetName, a member of class TBindingOperation.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOutput (see page 25654)	This is GetOutput, a member of class TBindingOperation.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.

	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25654)	This is SetName, a member of class TBindingOperation.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25653)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.

	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.

	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Faults (see page 25823)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 25823)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25824)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Output (see page 25824)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.2.2 TBindingOperation Methods

The methods of the TBindingOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 25653)	This is GetFaults, a member of class TBindingOperation.
	GetInput (see page 25653)	This is GetInput, a member of class TBindingOperation.
	GetName (see page 25654)	This is GetName, a member of class TBindingOperation.
	GetOutput (see page 25654)	This is GetOutput, a member of class TBindingOperation.

	SetName (see page 25654)	This is SetName, a member of class TBindingOperation.

Public Methods

	Name	Description
	AfterConstruction (see page 25653)	Responds after the last constructor executes.

189.1.2.2.1 TBindingOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.2.2.2 TBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TBindingOperation.

189.1.2.2.3 TBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class TBindingOperation.

189.1.2.2.4 TBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBindingOperation.

189.1.2.2.5 TBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class TBindingOperation.

189.1.2.2.6 TBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBindingOperation.

189.1.3 TBindingOperations Class

Class Hierarchy

Pascal

```
TBindingOperations = class(TXMLNodeCollection, IBindingOperations);
```

C++

```
class TBindingOperations : public TXMLNodeCollection, public IBindingOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperations.

189.1.3.1 TBindingOperations Members

The following tables list the members exposed by TBindingOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25660)	This is Add, a member of class TBindingOperations.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.

	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperation (see page 25660)	This is GetBindingOperation, a member of class TBindingOperations.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25660)	This is Insert, a member of class TBindingOperations.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.

	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.

	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	BindingOperation (see page 25827)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.

R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.3.2 TBindingOperations Methods

The methods of the TBindingOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 25660)	This is Add, a member of class TBindingOperations.
	GetBindingOperation (see page 25660)	This is GetBindingOperation, a member of class TBindingOperations.
	Insert (see page 25660)	This is Insert, a member of class TBindingOperations.

189.1.3.2.1 TBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TBindingOperations.

189.1.3.2.2 TBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class TBindingOperations.

189.1.3.2.3 TBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class TBindingOperations.

189.1.4 TBindings Class

Class Hierarchy

Pascal

```
TBindings = class(TXMLNodeCollection, IBindings);
```

C++

```
class TBindings : public TXMLNodeCollection, public IBindings;
```

File

WSDLBind

Description

This is class WSDLBind.TBindings.

189.1.4.1 TBindings Members

The following tables list the members exposed by TBindings.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25666)	This is Add, a member of class TBindings.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.

	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 25667)	This is GetBinding, a member of class TBindings.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.

	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25667)	This is Insert, a member of class TBindings.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.

	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.

	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	Binding (see page 25831)	This is Binding, a member of class IBindings.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.4.2 TBindings Methods

The methods of the TBindings class are listed here.

Protected Methods

	Name	Description
	Add (see page 25666)	This is Add, a member of class TBindings.
	GetBinding (see page 25667)	This is GetBinding, a member of class TBindings.
	Insert (see page 25667)	This is Insert, a member of class TBindings.

189.1.4.2.1 TBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class TBindings.

189.1.4.2.2 TBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class TBindings.

189.1.4.2.3 TBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class TBindings.

189.1.5 TDefinition Class

Class Hierarchy

Pascal

```
TDefinition = class(TDocumented, IDefinition);
```

C++

```
class TDefinition : public TDocumented, public IDefinition;
```

File

WSDLBind

Description

This is class WSDLBind.TDefinition.

189.1.5.1 TDefinition Members

The following tables list the members exposed by TDefinition.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindings (see page 25673)	This is GetBindings, a member of class TDefinition.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetImports (see page 25673)	This is GetImports, a member of class TDefinition.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 25674)	This is GetMessages, a member of class TDefinition.
	GetName (see page 25674)	This is GetName, a member of class TDefinition.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPortTypes (see page 25674)	This is GetPortTypes, a member of class TDefinition.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetServices (see page 25674)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 25675)	This is GetTargetNamespace, a member of class TDefinition.
	GetText (see page 26177)	Returns the text value of the node.
	GetTypes (see page 25675)	This is GetTypes, a member of class TDefinition.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25675)	This is SetName, a member of class TDefinition.
	SetNodeValue (see page 26186)	Sets the value of this node.
	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 25675)	This is SetTargetNamespace, a member of class TDefinition.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25673)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.

	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	Bindings (see page 25836)	This is Bindings, a member of class IDefinition.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	Imports (see page 25836)	This is Imports, a member of class IDefinition.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	Messages (see page 25836)	This is Messages, a member of class IDefinition.
	Name (see page 25836)	This is Name, a member of class IDefinition.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	PortTypes (see page 25836)	This is PortTypes, a member of class IDefinition.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Services (see page 25837)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 25837)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 26439)	Represents the Text of the node.
R	Types (see page 25837)	This is Types, a member of class IDefinition.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.5.2 TDefinition Methods

The methods of the TDefinition class are listed here.

Protected Methods

	Name	Description
	GetBindings (see page 25673)	This is GetBindings, a member of class TDefinition.
	GetImports (see page 25673)	This is GetImports, a member of class TDefinition.
	GetMessages (see page 25674)	This is GetMessages, a member of class TDefinition.
	GetName (see page 25674)	This is GetName, a member of class TDefinition.
	GetPortTypes (see page 25674)	This is GetPortTypes, a member of class TDefinition.
	GetServices (see page 25674)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 25675)	This is GetTargetNamespace, a member of class TDefinition.

	GetTypes (see page 25675)	This is GetTypes, a member of class TDefinition.
	SetName (see page 25675)	This is SetName, a member of class TDefinition.
	SetTargetNamespace (see page 25675)	This is SetTargetNamespace, a member of class TDefinition.

Public Methods

	Name	Description
	AfterConstruction (see page 25673)	Responds after the last constructor executes.

189.1.5.2.1 TDefinition.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.5.2.2 TDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class TDefinition.

189.1.5.2.3 TDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class TDefinition.

189.1.5.2.4 TDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class TDefinition.

189.1.5.2.5 TDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TDefinition.

189.1.5.2.6 TDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class TDefinition.

189.1.5.2.7 TDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class TDefinition.

189.1.5.2.8 TDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class TDefinition.

189.1.5.2.9 TDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class TDefinition.

189.1.5.2.10 TDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TDefinition.

189.1.5.2.11 TDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class TDefinition.

189.1.6 TDocumentation Class

Class Hierarchy

Pascal

```
TDocumentation = class(TXMLNode, IDocumentation);
```

C++

```
class TDocumentation : public TXMLNode, public IDocumentation;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumentation.

189.1.7 TDocumentationCollection Class

Class Hierarchy

Pascal

```
TDocumentationCollection = class(TXMLNodeCollection, IDocumentationCollection);
```

C++

```
class TDocumentationCollection : public TXMLNodeCollection, public IDocumentationCollection;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumentationCollection.

189.1.7.1 TDocumentationCollection Members

The following tables list the members exposed by TDocumentationCollection.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25682)	This is Add, a member of class TDocumentationCollection.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.

	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDocumentation (see page 25682)	This is GetDocumentation, a member of class TDocumentationCollection.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25682)	This is Insert, a member of class TDocumentationCollection.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.

	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.

	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	Documentation (see page 25841)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.7.2 TDocumentationCollection Methods

The methods of the TDocumentationCollection class are listed here.

Protected Methods

	Name	Description
	Add (see page 25682)	This is Add, a member of class TDocumentationCollection.
	GetDocumentation (see page 25682)	This is GetDocumentation, a member of class TDocumentationCollection.
	Insert (see page 25682)	This is Insert, a member of class TDocumentationCollection.

189.1.7.2.1 TDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class TDocumentationCollection.

189.1.7.2.2 TDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class TDocumentationCollection.

189.1.7.2.3 TDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class TDocumentationCollection.

189.1.8 TDocumented Class

Class Hierarchy

Pascal

```
TDocumented = class(TXMLNode, IDocumented);
```

C++

```
class TDocumented : public TXMLNode, public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumented.

189.1.8.1 TDocumented Members

The following tables list the members exposed by TDocumented.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.

	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.

	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25688)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.

	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.

	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.8.2 TDocumented Methods

The methods of the TDocumented class are listed here.

Protected Methods

	Name	Description
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.

Public Methods

	Name	Description
	AfterConstruction (see page 25688)	Responds after the last constructor executes.

189.1.8.2.1 TDocumented.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.8.2.2 TDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class TDocumented.

189.1.9 TFault Class

Class Hierarchy

Pascal

```
TFault = class(TParam, IParam, IFault, IBindingInput, IBindingOutput);
```

C++

```
class TFault : public TParam, public IParam, public IFault, public IBindingInput, public
IBindingOutput;
```

File

WSDLBind

Description

This is class WSDLBind.TFault.

189.1.10 TFaults Class

Class Hierarchy

Pascal

```
TFaults = class(TXMLNodeCollection, IFaults);
```

C++

```
class TFaults : public TXMLNodeCollection, public IFaults;
```

File

WSDLBind

Description

This is class WSDLBind.TFaults.

189.1.10.1 TFaults Members

The following tables list the members exposed by TFaults.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25695)	This is Add, a member of class TFaults.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetFault (see page 25695)	This is GetFault, a member of class TFaults.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25695)	This is Insert, a member of class TFaults.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.

	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.

	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Fault (see page 25847)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.

R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.10.2 TFaults Methods

The methods of the TFaults class are listed here.

Protected Methods

	Name	Description
	Add (see page 25695)	This is Add, a member of class TFaults.
	GetFault (see page 25695)	This is GetFault, a member of class TFaults.
	Insert (see page 25695)	This is Insert, a member of class TFaults.

189.1.10.2.1 TFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class TFaults.

189.1.10.2.2 TFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class TFaults.

189.1.10.2.3 TFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class TFaults.

189.1.11 TImport Class

Class Hierarchy

Pascal

```
TImport = class(TDocumented, IImport);
```

C++

```
class TImport : public TDocumented, public IImport;
```

File

WSDLBind

Description

This is class WSDLBind.TImport.

189.1.11.1 TImport Members

The following tables list the members exposed by TImport.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.

	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 25701)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 25701)	This is GetNamespace, a member of class TImport.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetLocation (see page 25701)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 25702)	This is SetNamespace, a member of class TImport.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 25688)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Location (see page 25850)	This is Location, a member of class IImport.
	Namespace (see page 25850)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.

R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.11.2 TImport Methods

The methods of the TImport class are listed here.

Protected Methods

	Name	Description
	GetLocation (see page 25701)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 25701)	This is GetNamespace, a member of class TImport.
	SetLocation (see page 25701)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 25702)	This is SetNamespace, a member of class TImport.

189.1.11.2.1 TImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class TImport.

189.1.11.2.2 TImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class TImport.

189.1.11.2.3 TImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class TImport.

189.1.11.2.4 TImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class TImport.

189.1.12 TImports Class

Class Hierarchy

Pascal

```
TImports = class(TXMLNodeCollection, IImports);
```

C++

```
class TImports : public TXMLNodeCollection, public IImports;
```

File

WSDLBind

Description

This is class WSDLBind.TImports.

189.1.12.1 TImports Members

The following tables list the members exposed by TImports.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25708)	This is Add, a member of class TImports.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetImport (see page 25708)	This is GetImport, a member of class TImports.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.

	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25708)	This is Insert, a member of class TImports.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	Import (see page 25853)	This is Import, a member of class IImports.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.12.2 TImports Methods

The methods of the TImports class are listed here.

Protected Methods

	Name	Description
	Add (see page 25708)	This is Add, a member of class TImports.
	GetImport (see page 25708)	This is GetImport, a member of class TImports.

	Insert (see page 25708)	This is Insert, a member of class TImports.

189.1.12.2.1 TImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class TImports.

189.1.12.2.2 TImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class TImports.

189.1.12.2.3 TImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class TImports.

189.1.13 TMessage Class

Class Hierarchy

Pascal

```
TMessage = class(TDocumented, IMessage);
```

C++

```
class TMessage : public TDocumented, public IMessage;
```

File

WSDLBind

Description

This is class WSDLBind.TMessage.

189.1.13.1 TMessage Members

The following tables list the members exposed by TMessage.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25714)	This is GetName, a member of class TMessage.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetParts (see page 25714)	This is GetParts, a member of class TMessage.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25714)	This is SetName, a member of class TMessage.

	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25714)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.

	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25856)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Parts (see page 25856)	This is Parts, a member of class IMessage.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.13.2 TMessage Methods

The methods of the TMessage class are listed here.

Protected Methods

	Name	Description
	GetName (see page 25714)	This is GetName, a member of class TMessage.
	GetParts (see page 25714)	This is GetParts, a member of class TMessage.
	SetName (see page 25714)	This is SetName, a member of class TMessage.

Public Methods

	Name	Description
V	AfterConstruction (see page 25714)	Responds after the last constructor executes.

189.1.13.2.1 TMessage.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.13.2.2 TMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TMessage.

189.1.13.2.3 TMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class TMessage.

189.1.13.2.4 TMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TMessage.

189.1.14 TMessages Class

Class Hierarchy

Pascal

```
TMessages = class(TXMLNodeCollection, IMessages);
```

C++

```
class TMessages : public TXMLNodeCollection, public IMessages;
```

File

WSDLBind

Description

This is class WSDLBind.TMessages.

189.1.14.1 TMessages Members

The following tables list the members exposed by TMessages.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25720)	This is Add, a member of class TMessages.

	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 25721)	This is GetMessage, a member of class TMessages.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.

	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25721)	This is Insert, a member of class TMessages.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.

	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.

	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.

	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	Message (see page 25860)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.14.2 TMessages Methods

The methods of the TMessages class are listed here.

Protected Methods

	Name	Description
	Add (see page 25720)	This is Add, a member of class TMessages.
	GetMessage (see page 25721)	This is GetMessage, a member of class TMessages.
	Insert (see page 25721)	This is Insert, a member of class TMessages.

189.1.14.2.1 TMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class TMessages.

189.1.14.2.2 TMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class TMessages.

189.1.14.2.3 TMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class TMessages.

189.1.15 TOperation Class

Class Hierarchy

Pascal

```
TOperation = class(TDocumented, IOperation);
```

C++

```
class TOperation : public TDocumented, public IOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TOperation.

189.1.15.1 TOperation Members

The following tables list the members exposed by TOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.

	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetFaults (see page 25727)	This is GetFaults, a member of class TOperation.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetInput (see page 25727)	This is GetInput, a member of class TOperation.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25727)	This is GetName, a member of class TOperation.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOutput (see page 25728)	This is GetOutput, a member of class TOperation.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25728)	This is SetName, a member of class TOperation.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25727)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.

	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Faults (see page 25863)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 25863)	This is Input, a member of class IOperation.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25864)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Output (see page 25864)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.15.2 TOperation Methods

The methods of the TOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 25727)	This is GetFaults, a member of class TOperation.
	GetInput (see page 25727)	This is GetInput, a member of class TOperation.
	GetName (see page 25727)	This is GetName, a member of class TOperation.
	GetOutput (see page 25728)	This is GetOutput, a member of class TOperation.
	SetName (see page 25728)	This is SetName, a member of class TOperation.

Public Methods

	Name	Description
V	AfterConstruction (see page 25727)	Responds after the last constructor executes.

189.1.15.2.1 TOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.15.2.2 TOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TOperation.

189.1.15.2.3 TOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class TOperation.

189.1.15.2.4 TOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TOperation.

189.1.15.2.5 TOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class TOperation.

189.1.15.2.6 TOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TOperation.

189.1.16 TOperations Class

Class Hierarchy

Pascal

```
TOperations = class(TXMLNodeCollection, IOperations);
```

C++

```
class TOperations : public TXMLNodeCollection, public IOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TOperations.

189.1.16.1 TOperations Members

The following tables list the members exposed by TOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25734)	This is the overview for the Add method overload.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOperation (see page 25735)	This is GetOperation, a member of class TOperations.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25735)	This is Insert, a member of class TOperations.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.

	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Add (see page 25866)	This is the overview for the Add method overload.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.

	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Operation (see page 25867)	This is Operation, a member of class IOperations.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.

R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.16.2 TOperations Methods

The methods of the TOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 25734)	This is the overview for the Add method overload.
	GetOperation (see page 25735)	This is GetOperation, a member of class TOperations.
	Insert (see page 25735)	This is Insert, a member of class TOperations.

189.1.16.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TOperations.Add (WideString) (see page 25734)	This is Add, a member of class TOperations.
	TOperations.Add (WideString, WideString, WideString, WideString) (see page 25734)	This is Add, a member of class TOperations.

189.1.16.2.1.1 TOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TOperations.

189.1.16.2.1.2 TOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class TOperations.

189.1.16.2.2 TOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class TOperations.

189.1.16.2.3 TOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class TOperations.

189.1.17 TParam Class

Class Hierarchy

Pascal

```
TParam = class(TDocumented, IParam, IBindingInput, IBindingOutput);
```

C++

```
class TParam : public TDocumented, public IParam, public IBindingInput, public IBindingOutput;
```

File

WSDLBind

Description

This is class WSDLBind.TParam.

189.1.17.1 TParam Members

The following tables list the members exposed by TParam.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 25740)	This is GetMessage, a member of class TParam.
	GetName (see page 25741)	This is GetName, a member of class TParam.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetMessage (see page 25741)	This is SetMessage, a member of class TParam.
	SetName (see page 25741)	This is SetName, a member of class TParam.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.

R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 25688)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.

	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Message (see page 25871)	This is Message, a member of class IParam.
	Name (see page 25871)	This is Name, a member of class IParam.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.17.2 TParam Methods

The methods of the TParam class are listed here.

Protected Methods

	Name	Description
	GetMessage (see page 25740)	This is GetMessage, a member of class TParam.
	GetName (see page 25741)	This is GetName, a member of class TParam.
	SetMessage (see page 25741)	This is SetMessage, a member of class TParam.
	SetName (see page 25741)	This is SetName, a member of class TParam.

189.1.17.2.1 TParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class TParam.

189.1.17.2.2 TParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TParam.

189.1.17.2.3 TParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class TParam.

189.1.17.2.4 TParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TParam.

189.1.18 TPart Class

Class Hierarchy

Pascal

```
TPart = class(TDocumented, IPart);
```

C++

```
class TPart : public TDocumented, public IPart;
```

File

WSDLBind

Description

This is class WSDLBind.TPart.

189.1.18.1 TPart Members

The following tables list the members exposed by TPart.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetElement (see page 25747)	This is GetElement, a member of class TPart.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25747)	This is GetName, a member of class TPart.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetType_ (see page 25747)	This is GetType_, a member of class TPart.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.

	SetElement (see page 25747)	This is SetElement, a member of class TPart.
	SetName (see page 25748)	This is SetName, a member of class TPart.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	SetType_ (see page 25748)	This is SetType_, a member of class TPart.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 25688)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.

	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
	Element (see page 25875)	This is Element, a member of class IPart.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25875)	This is Name, a member of class IPart.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
	Type_ (see page 25875)	This is Type_, a member of class IPart.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.18.2 TPart Methods

The methods of the TPart class are listed here.

Protected Methods

	Name	Description
	GetElement (see page 25747)	This is GetElement, a member of class TPart.
	GetName (see page 25747)	This is GetName, a member of class TPart.

	GetType_ (see page 25747)	This is GetType_, a member of class TPart.
	SetElement (see page 25747)	This is SetElement, a member of class TPart.
	SetName (see page 25748)	This is SetName, a member of class TPart.
	SetType_ (see page 25748)	This is SetType_, a member of class TPart.

189.1.18.2.1 TPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class TPart.

189.1.18.2.2 TPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPart.

189.1.18.2.3 TPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TPart.

189.1.18.2.4 TPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class TPart.

189.1.18.2.5 TPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPart.

189.1.18.2.6 TPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TPart.

189.1.19 TParts Class

Class Hierarchy

Pascal

```
TParts = class(TXMLNodeCollection, IParts);
```

C++

```
class TParts : public TXMLNodeCollection, public IParts;
```

File

WSDLBind

Description

This is class WSDLBind.TParts.

189.1.19.1 TParts Members

The following tables list the members exposed by TParts.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25754)	This is Add, a member of class TParts.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.

	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPart (see page 25754)	This is GetPart, a member of class TParts.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25754)	This is Insert, a member of class TParts.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.

	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.

	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.

	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Part (see page 25879)	This is Part, a member of class IParts.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.19.2 TParts Methods

The methods of the TParts class are listed here.

Protected Methods

	Name	Description
	Add (see page 25754)	This is Add, a member of class TParts.
	GetPart (see page 25754)	This is GetPart, a member of class TParts.
	Insert (see page 25754)	This is Insert, a member of class TParts.

189.1.19.2.1 TParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class TParts.

189.1.19.2.2 TParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class TParts.

189.1.19.2.3 TParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class TParts.

189.1.20 TPort Class

Class Hierarchy

Pascal

```
TPort = class(TDocumented, IPort);
```

C++

```
class TPort : public TDocumented, public IPort;
```

File

WSDLBind

Description

This is class WSDLBind.TPort.

189.1.20.1 TPort Members

The following tables list the members exposed by TPort.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.

	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 25760)	This is GetBinding, a member of class TPort.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25760)	This is GetName, a member of class TPort.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 25760)	This is SetBinding, a member of class TPort.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25761)	This is SetName, a member of class TPort.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 25688)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.

	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
	Binding (see page 25882)	This is Binding, a member of class IPort.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25882)	This is Name, a member of class IPort.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.

R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.20.2 TPort Methods

The methods of the TPort class are listed here.

Protected Methods

	Name	Description
	GetBinding (see page 25760)	This is GetBinding, a member of class TPort.
	GetName (see page 25760)	This is GetName, a member of class TPort.
	SetBinding (see page 25760)	This is SetBinding, a member of class TPort.
	SetName (see page 25761)	This is SetName, a member of class TPort.

189.1.20.2.1 TPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class TPort.

189.1.20.2.2 TPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPort.

189.1.20.2.3 TPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class TPort.

189.1.20.2.4 TPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPort.

189.1.21 TPorts Class

Class Hierarchy

Pascal

```
TPorts = class(TXMLNodeCollection, IPorts);
```

C++

```
class TPorts : public TXMLNodeCollection, public IPorts;
```

File

WSDLBind

Description

This is class WSDLBind.TPorts.

189.1.21.1 TPorts Members

The following tables list the members exposed by TPorts.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25767)	This is Add, a member of class TPorts.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.

	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPort (see page 25767)	This is GetPort, a member of class TPorts.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25767)	This is Insert, a member of class TPorts.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.

	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Port (see page 25885)	This is Port, a member of class IPorts.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.21.2 TPorts Methods

The methods of the TPorts class are listed here.

Protected Methods

	Name	Description
	Add (see page 25767)	This is Add, a member of class TPorts.
	GetPort (see page 25767)	This is GetPort, a member of class TPorts.

	Insert (see page 25767)	This is Insert, a member of class TPorts.

189.1.21.2.1 TPorts.Add Method

Pascal

```
function Add(const Name: WideString; const Binding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR Binding);
```

Description

This is Add, a member of class TPorts.

189.1.21.2.2 TPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class TPorts.

189.1.21.2.3 TPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class TPorts.

189.1.22 TPortType Class

Class Hierarchy

Pascal

```
TPortType = class(TDocumented, IPortType);
```

C++

```
class TPortType : public TDocumented, public IPortType;
```

File

WSDLBind

Description

This is class WSDLBind.TPortType.

189.1.22.1 TPortType Members

The following tables list the members exposed by TPortType.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25773)	This is GetName, a member of class TPortType.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOperations (see page 25773)	This is GetOperations, a member of class TPortType.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25773)	This is SetName, a member of class TPortType.

	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25773)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.

	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25888)	This is Name, a member of class IPortType.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Operations (see page 25888)	This is Operations, a member of class IPortType.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.22.2 TPortType Methods

The methods of the TPortType class are listed here.

Protected Methods

	Name	Description
	GetName (see page 25773)	This is GetName, a member of class TPortType.
	GetOperations (see page 25773)	This is GetOperations, a member of class TPortType.
	SetName (see page 25773)	This is SetName, a member of class TPortType.

Public Methods

	Name	Description
V	AfterConstruction (see page 25773)	Responds after the last constructor executes.

189.1.22.2.1 TPortType.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.22.2.2 TPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPortType.

189.1.22.2.3 TPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class TPortType.

189.1.22.2.4 TPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPortType.

189.1.23 TPortTypes Class

Class Hierarchy

Pascal

```
TPortTypes = class(TXMLNodeCollection, IPortTypes);
```

C++

```
class TPortTypes : public TXMLNodeCollection, public IPortTypes;
```

File

WSDLBind

Description

This is class WSDLBind.TPortTypes.

189.1.23.1 TPortTypes Members

The following tables list the members exposed by TPortTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25779)	This is Add, a member of class TPortTypes.

	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.

	GetPortType (see page 25780)	This is GetPortType, a member of class TPortTypes.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25780)	This is Insert, a member of class TPortTypes.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.

	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.

	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.

	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	PortType (see page 25892)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.23.2 TPortTypes Methods

The methods of the TPortTypes class are listed here.

Protected Methods

	Name	Description
	Add (see page 25779)	This is Add, a member of class TPortTypes.
	GetPortType (see page 25780)	This is GetPortType, a member of class TPortTypes.
	Insert (see page 25780)	This is Insert, a member of class TPortTypes.

189.1.23.2.1 TPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType; overload;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class TPortTypes.

189.1.23.2.2 TPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class TPortTypes.

189.1.23.2.3 TPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class TPortTypes.

189.1.24 TService Class

Class Hierarchy

Pascal

```
TService = class(TDocumented, IService);
```

C++

```
class TService : public TDocumented, public IService;
```

File

WSDLBind

Description

This is class WSDLBind.TService.

189.1.24.1 TService Members

The following tables list the members exposed by TService.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.

	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetName (see page 25786)	This is GetName, a member of class TService.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPorts (see page 25786)	This is GetPorts, a member of class TService.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetName (see page 25786)	This is SetName, a member of class TService.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25785)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.

	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.

	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25895)	This is Name, a member of class IService.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Ports (see page 25895)	This is Ports, a member of class IService.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.24.2 TService Methods

The methods of the TService class are listed here.

Protected Methods

	Name	Description
	GetName (see page 25786)	This is GetName, a member of class TService.
	GetPorts (see page 25786)	This is GetPorts, a member of class TService.
	SetName (see page 25786)	This is SetName, a member of class TService.

Public Methods

	Name	Description
V	AfterConstruction (see page 25785)	Responds after the last constructor executes.

189.1.24.2.1 TService.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.24.2.2 TService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TService.

189.1.24.2.3 TService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class TService.

189.1.24.2.4 TService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TService.

189.1.25 TServices Class

Class Hierarchy

Pascal

```
TServices = class(TXMLNodeCollection, IServices);
```

C++

```
class TServices : public TXMLNodeCollection, public IServices;
```

File

WSDLBind

Description

This is class WSDLBind.TServices.

189.1.25.1 TServices Members

The following tables list the members exposed by TServices.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25792)	This is Add, a member of class TServices.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.

	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.

	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetService (see page 25793)	This is GetService, a member of class TServices.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	Insert (see page 25793)	This is Insert, a member of class TServices.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.

	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.

	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.

	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	Service (see page 25898)	This is Service, a member of class IServices.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.25.2 TServices Methods

The methods of the TServices class are listed here.

Protected Methods

	Name	Description
	Add (see page 25792)	This is Add, a member of class TServices.
	GetService (see page 25793)	This is GetService, a member of class TServices.
	Insert (see page 25793)	This is Insert, a member of class TServices.

189.1.25.2.1 TServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class TServices.

189.1.25.2.2 TServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class TServices.

189.1.25.2.3 TServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class TServices.

189.1.26 TTypes Class

Class Hierarchy

Pascal

```
TTypes = class(TDocumented, ITypes);
```

C++

```
class TTypes : public TDocumented, public ITypes;
```

File

WSDLBind

Description

This is class WSDLBind.TTypes.

189.1.26.1 TTypes Members

The following tables list the members exposed by TTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDocumentationCollection (see page 25688)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetSchemaDefs (see page 25799)	This is GetSchemaDefs, a member of class TTypes.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.

R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25798)	Responds after the last constructor executes.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.

	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SchemaDefs (see page 25900)	This is SchemaDefs, a member of class ITypes.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.26.2 TTypes Methods

The methods of the TTypes class are listed here.

Protected Methods

	Name	Description
	GetSchemaDefs (see page 25799)	This is GetSchemaDefs, a member of class TTypes.

Public Methods

	Name	Description
V	AfterConstruction (see page 25798)	Responds after the last constructor executes.

189.1.26.2.1 TTypes.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 22279)

System::TInterfacedObject::NewInstance (see page 22280)

System::TInterfacedObject::RefCount (see page 22281)

189.1.26.2.2 TTypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

Description

This is GetSchemaDefs, a member of class TTypes.

189.1.27 TWSDLDocument Class

TWSDLDocument represents a WSDL document.

Class Hierarchy

Pascal

```
TWSDLDocument = class(TXMLDocument, IWSDLDocument);
```

C++

```
class TWSDLDocument : public TXMLDocument, public IWSDLDocument;
```

File

WSDLBind

Description

Use TWSDLDocument to represent a WSDL (Web Services Definition (see page 25808) Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements.

TWSDLDocument can read an existing WSDL document from a file, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLDocument uses an external DOM

(Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLDocument uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLDocument is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLDocument instance is automatically freed. When TWSDLDocument is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

Tip: Although you can work directly with TWSDLDocument to access a WSDL document, it is often easier to use TWSDLItems, a TWSDLDocument descendant. TWSDLItems implements a number of methods for getting at the definitions in a WSDL document.

See Also

TWSDLItems (see page 25951)

TWSDLView (see page 26013)

189.1.27.1 TWSDLDocument Members

The following tables list the members exposed by TWSDLDocument.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 26113)	Returns the value of the Active property.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDefinition (see page 25807)	Returns the value of the Definition property.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetModified (see page 26116)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	LoadData (see page 25807)	This is LoadData, a member of class TWSDLDocument.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDefinition (see page 25807)	Sets the value of the Definition property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.

	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.
	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 25807)	Initializes the TWSDLDocument (see page 25799) object after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26103)	This is the overview for the Create constructor overload.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.

	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26104)	Disposes of a TXMLDocument (see page 26097) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.

	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.

	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Definition (see page 25808)	Provides access to the definitions contained in the WSDL document.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 26408)	Influences various aspects of the document's behavior.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.

	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

189.1.27.2 TWSDLDocument Methods

The methods of the TWSDLDocument class are listed here.

Protected Methods

	Name	Description
	GetDefinition (see page 25807)	Returns the value of the Definition property.
	LoadData (see page 25807)	This is LoadData, a member of class TWSDLDocument.
	SetDefinition (see page 25807)	Sets the value of the Definition property.

Public Methods

	Name	Description
	AfterConstruction (see page 25807)	Initializes the TWSDLDocument (see page 25799) object after the last constructor has executed.

189.1.27.2.1 TWSDLDocument.AfterConstruction Method

Initializes the TWSDLDocument (see page 25799) object after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

The AfterConstruction method is called automatically after the last constructor has finished executing. TWSDLDocument (see page 25799) overrides this method to register an implementation class for the document element. That class implements the IDefinition (see page 25831) interface that is the value of the Definition (see page 25808) property.

See Also

RegisterDocBinding (see page 26124)

Definition (see page 25808)

189.1.27.2.2 TWSDLDocument.GetDefinition Method

Returns the value of the Definition property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition property.

See Also

Definition (see page 25904)

189.1.27.2.3 TWSDLDocument.LoadData Method

Pascal

```
procedure LoadData; override;
```

C++

```
virtual __fastcall LoadData();
```

Description

This is LoadData, a member of class TWSDLDocument.

189.1.27.2.4 TWSDLDocument.SetDefinition Method

Sets the value of the Definition property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition property.

See Also

Definition (see page 25904)

189.1.27.3 TWSDLDocument Properties

The properties of the TWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 25808)	Provides access to the definitions contained in the WSDL document.

189.1.27.3.1 TWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 25831) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 25831) interface to access the Bindings, Messages (see page 16211), PortTypes, Services, and Types (see page 23293) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems (a TWSDLDocument (see page 25799) descendant) to access those definitions.

DocumentElement (see page 26135)

TWSDLItems (see page 25951)

189.1.28 TXMLSchemaDefs Class

Class Hierarchy

Pascal

```
TXMLSchemaDefs = class(TXMLNodeCollection, IXMLSchemaDefs);
```

C++

```
class TXMLSchemaDefs : public TXMLNodeCollection, public IXMLSchemaDefs;
```

File

WSDLBind

Description

This is class WSDLBind.TXMLSchemaDefs.

189.1.28.1 TXMLSchemaDefs Members

The following tables list the members exposed by TXMLSchemaDefs.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	Add (see page 25814)	This is Add, a member of class TXMLSchemaDefs.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.

	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	GetXMLSchemaDef (see page 25814)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.

	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.

	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.

R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
R	SchemaDef (see page 25907)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.1.28.2 TXMLSchemaDefs Methods

The methods of the TXMLSchemaDefs class are listed here.

Protected Methods

	Name	Description
	Add (see page 25814)	This is Add, a member of class TXMLSchemaDefs.
	GetXMLSchemaDef (see page 25814)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

189.1.28.2.1 TXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class TXMLSchemaDefs.

189.1.28.2.2 TXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

189.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IBinding (see page 25815)	This is class WSDLBind.IBinding.
	IBindingInput (see page 25819)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 25820)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 25824)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 25827)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 25828)	This is class WSDLBind.IBindings.
	IDefinition (see page 25831)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 25837)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 25838)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 25841)	This is class WSDLBind.IDocumented.
	IFault (see page 25843)	This is class WSDLBind.IFault.
	IFaults (see page 25844)	This is class WSDLBind.IFaults.
	IImport (see page 25847)	This is class WSDLBind.IImport.
	IImports (see page 25850)	This is class WSDLBind.IImports.
	IMessage (see page 25853)	This is class WSDLBind.IMessage.
	IMessages (see page 25857)	This is class WSDLBind.IMessages.
	IOperation (see page 25860)	This is class WSDLBind.IOperation.
	IOperations (see page 25864)	This is class WSDLBind.IOperations.
	IParam (see page 25868)	This is class WSDLBind.IParam.
	IPart (see page 25871)	This is class WSDLBind.IPart.
	IParts (see page 25876)	This is class WSDLBind.IParts.
	IPort (see page 25879)	This is class WSDLBind.IPort.
	IPorts (see page 25882)	This is class WSDLBind.IPorts.
	IPortType (see page 25885)	This is class WSDLBind.IPortType.
	IPortTypes (see page 25889)	This is class WSDLBind.IPortTypes.
	IService (see page 25892)	This is class WSDLBind.IService.
	IServices (see page 25895)	This is class WSDLBind.IServices.
	ITypes (see page 25898)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 25901)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 25905)	This is class WSDLBind.IXMLSchemaDefs.

189.2.1 IBinding Interface

Class Hierarchy

Pascal

```
IBinding = interface(IDocumented);
```

C++

```
__interface IBinding : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBinding.

189.2.1.1 IBinding Members

The following tables list the members exposed by IBinding.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetBindingOperations (see page 25817)	This is GetBindingOperations, a member of class IBinding.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25818)	This is GetName, a member of class IBinding.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetType_ (see page 25818)	This is GetType_, a member of class IBinding.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25818)	This is SetName, a member of class IBinding.

	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	SetType_ (see page 25818)	This is SetType_, a member of class IBinding.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	BindingOperations (see page 25819)	This is BindingOperations, a member of class IBinding.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25819)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
	Type_ (see page 25819)	This is Type_, a member of class IBinding.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.1.2 IBinding Methods

The methods of the IBinding class are listed here.

Public Methods

	Name	Description
	GetBindingOperations (see page 25817)	This is GetBindingOperations, a member of class IBinding.
	GetName (see page 25818)	This is GetName, a member of class IBinding.
	GetType_ (see page 25818)	This is GetType_, a member of class IBinding.
	SetName (see page 25818)	This is SetName, a member of class IBinding.
	SetType_ (see page 25818)	This is SetType_, a member of class IBinding.

189.2.1.2.1 IBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class IBinding.

189.2.1.2.2 IBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBinding.

189.2.1.2.3 IBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IBinding.

189.2.1.2.4 IBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBinding.

189.2.1.2.5 IBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IBinding.

189.2.1.3 IBinding Properties

The properties of the IBinding class are listed here.

Public Properties

	Name	Description
	BindingOperations (see page 25819)	This is BindingOperations, a member of class IBinding.
	Name (see page 25819)	This is Name, a member of class IBinding.
	Type_ (see page 25819)	This is Type_, a member of class IBinding.

189.2.1.3.1 IBinding.BindingOperations Property

Pascal

```
property BindingOperations: IBindingOperations;
```

C++

```
__property IBindingOperations BindingOperations;
```

Description

This is BindingOperations, a member of class IBinding.

189.2.1.3.2 IBinding.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBinding.

189.2.1.3.3 IBinding.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IBinding.

189.2.2 IBindingInput Interface

Class Hierarchy

Pascal

```
IBindingInput = interface(IParam);
```

C++

```
__interface IBindingInput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingInput.

189.2.3 IBindingOperation Interface

Class Hierarchy

Pascal

```
IBindingOperation = interface(IDocumented);
```

C++

```
__interface IBindingOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperation.

189.2.3.1 IBindingOperation Members

The following tables list the members exposed by IBindingOperation.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetFaults (see page 25822)	This is GetFaults, a member of class IBindingOperation.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetInput (see page 25822)	This is GetInput, a member of class IBindingOperation.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25822)	This is GetName, a member of class IBindingOperation.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.

	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOutput (see page 25822)	This is GetOutput, a member of class IBindingOperation.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25823)	This is SetName, a member of class IBindingOperation.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Faults (see page 25823)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	Input (see page 25823)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25824)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Output (see page 25824)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.3.2 IBindingOperation Methods

The methods of the IBindingOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 25822)	This is GetFaults, a member of class IBindingOperation.
	GetInput (see page 25822)	This is GetInput, a member of class IBindingOperation.
	GetName (see page 25822)	This is GetName, a member of class IBindingOperation.
	GetOutput (see page 25822)	This is GetOutput, a member of class IBindingOperation.
	SetName (see page 25823)	This is SetName, a member of class IBindingOperation.

189.2.3.2.1 IBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IBindingOperation.

189.2.3.2.2 IBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class IBindingOperation.

189.2.3.2.3 IBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBindingOperation.

189.2.3.2.4 IBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class IBindingOperation.

189.2.3.2.5 IBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBindingOperation.

189.2.3.3 IBindingOperation Properties

The properties of the IBindingOperation class are listed here.

Public Properties

	Name	Description
R	Faults (see page 25823)	This is Faults, a member of class IBindingOperation.
R	Input (see page 25823)	This is Input, a member of class IBindingOperation.
	Name (see page 25824)	This is Name, a member of class IBindingOperation.
R	Output (see page 25824)	This is Output, a member of class IBindingOperation.

189.2.3.3.1 IBindingOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IBindingOperation.

189.2.3.3.2 IBindingOperation.Input Property

Pascal

```
property Input: IBindingInput;
```

C++

```
__property IBindingInput Input;
```

Description

This is Input, a member of class IBindingOperation.

189.2.3.3.3 IBindingOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBindingOperation.

189.2.3.3.4 IBindingOperation.Output Property

Pascal

```
property Output: IBindingOutput;
```

C++

```
__property IBindingOutput Output;
```

Description

This is Output, a member of class IBindingOperation.

189.2.4 IBindingOperations Interface

Class Hierarchy

Pascal

```
IBindingOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IBindingOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperations.

189.2.4.1 IBindingOperations Members

The following tables list the members exposed by IBindingOperations.

Public Methods

	Name	Description
	Add (see page 25826)	This is Add, a member of class IBindingOperations.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.

	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetBindingOperation (see page 25826)	This is GetBindingOperation, a member of class IBindingOperations.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25827)	This is Insert, a member of class IBindingOperations.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	BindingOperation (see page 25827)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.

R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.4.2 IBindingOperations Methods

The methods of the IBindingOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 25826)	This is Add, a member of class IBindingOperations.
	GetBindingOperation (see page 25826)	This is GetBindingOperation, a member of class IBindingOperations.
	Insert (see page 25827)	This is Insert, a member of class IBindingOperations.

189.2.4.2.1 IBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IBindingOperations.

189.2.4.2.2 IBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class IBindingOperations.

189.2.4.2.3 IBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class IBindingOperations.

189.2.4.3 IBindingOperations Properties

The properties of the IBindingOperations class are listed here.

Public Properties

	Name	Description
	BindingOperation (see page 25827)	This is BindingOperation, a member of class IBindingOperations.

189.2.4.3.1 IBindingOperations.BindingOperation Property

Pascal

```
property BindingOperation [Index: Integer]: IBindingOperation;
```

C++

```
__property IBindingOperation BindingOperation[int Index];
```

Description

This is BindingOperation, a member of class IBindingOperations.

189.2.5 IBindingOutput Interface

Class Hierarchy

Pascal

```
IBindingOutput = interface(IParam);
```

C++

```
__interface IBindingOutput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOutput.

189.2.6 IBindings Interface

Class Hierarchy

Pascal

```
IBindings = interface(IXMLNodeCollection);
```

C++

```
__interface IBindings : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindings.

189.2.6.1 IBindings Members

The following tables list the members exposed by IBindings.

Public Methods

	Name	Description
	Add (see page 25830)	This is Add, a member of class IBindings.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetBinding (see page 25830)	This is GetBinding, a member of class IBindings.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.

	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25830)	This is Insert, a member of class IBindings.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	Binding (see page 25831)	This is Binding, a member of class IBindings.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.6.2 IBindings Methods

The methods of the IBindings class are listed here.

Public Methods

	Name	Description
	Add (see page 25830)	This is Add, a member of class IBindings.
	GetBinding (see page 25830)	This is GetBinding, a member of class IBindings.
	Insert (see page 25830)	This is Insert, a member of class IBindings.

189.2.6.2.1 IBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class IBindings.

189.2.6.2.2 IBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class IBindings.

189.2.6.2.3 IBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class IBindings.

189.2.6.3 IBindings Properties

The properties of the IBindings class are listed here.

Public Properties

	Name	Description
R	Binding (see page 25831)	This is Binding, a member of class IBindings.

189.2.6.3.1 IBindings.Binding Property

Pascal

```
property Binding [Index: Integer]: IBinding;
```

C++

```
__property IBinding Binding[int Index];
```

Description

This is Binding, a member of class IBindings.

189.2.7 IDefinition Interface

Class Hierarchy

Pascal

```
IDefinition = interface(IXMLNode);
```

C++

```
__interface IDefinition : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDefinition.

189.2.7.1 IDefinition Members

The following tables list the members exposed by IDefinition.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetBindings (see page 25833)	This is GetBindings, a member of class IDefinition.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetImports (see page 25833)	This is GetImports, a member of class IDefinition.

	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 25834)	This is GetMessages, a member of class IDefinition.
	GetName (see page 25834)	This is GetName, a member of class IDefinition.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPortTypes (see page 25834)	This is GetPortTypes, a member of class IDefinition.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetServices (see page 25834)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 25834)	This is GetTargetNamespace, a member of class IDefinition.
	GetText (see page 26423)	Returns the text value of the node.
	GetTypes (see page 25835)	This is GetTypes, a member of class IDefinition.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25835)	This is SetName, a member of class IDefinition.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 25835)	This is SetTargetNamespace, a member of class IDefinition.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	Bindings (see page 25836)	This is Bindings, a member of class IDefinition.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	Imports (see page 25836)	This is Imports, a member of class IDefinition.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	Messages (see page 25836)	This is Messages, a member of class IDefinition.
	Name (see page 25836)	This is Name, a member of class IDefinition.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.

R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	PortTypes (see page 25836)	This is PortTypes, a member of class IDefinition.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	Services (see page 25837)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 25837)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 26439)	Represents the Text of the node.
R	Types (see page 25837)	This is Types, a member of class IDefinition.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.7.2 IDefinition Methods

The methods of the IDefinition class are listed here.

Public Methods

	Name	Description
	GetBindings (see page 25833)	This is GetBindings, a member of class IDefinition.
	GetImports (see page 25833)	This is GetImports, a member of class IDefinition.
	GetMessages (see page 25834)	This is GetMessages, a member of class IDefinition.
	GetName (see page 25834)	This is GetName, a member of class IDefinition.
	GetPortTypes (see page 25834)	This is GetPortTypes, a member of class IDefinition.
	GetServices (see page 25834)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 25834)	This is GetTargetNamespace, a member of class IDefinition.
	GetTypes (see page 25835)	This is GetTypes, a member of class IDefinition.
	SetName (see page 25835)	This is SetName, a member of class IDefinition.
	SetTargetNamespace (see page 25835)	This is SetTargetNamespace, a member of class IDefinition.

189.2.7.2.1 IDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class IDefinition.

189.2.7.2.2 IDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class IDefinition.

189.2.7.2.3 IDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class IDefinition.

189.2.7.2.4 IDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IDefinition.

189.2.7.2.5 IDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class IDefinition.

189.2.7.2.6 IDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class IDefinition.

189.2.7.2.7 IDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class IDefinition.

189.2.7.2.8 IDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class IDefinition.

189.2.7.2.9 IDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IDefinition.

189.2.7.2.10 IDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class IDefinition.

189.2.7.3 IDefinition Properties

The properties of the IDefinition class are listed here.

Public Properties

	Name	Description
R	Bindings (see page 25836)	This is Bindings, a member of class IDefinition.
R	Imports (see page 25836)	This is Imports, a member of class IDefinition.
R	Messages (see page 25836)	This is Messages, a member of class IDefinition.
	Name (see page 25836)	This is Name, a member of class IDefinition.
R	PortTypes (see page 25836)	This is PortTypes, a member of class IDefinition.
R	Services (see page 25837)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 25837)	This is TargetNamespace, a member of class IDefinition.
R	Types (see page 25837)	This is Types, a member of class IDefinition.

189.2.7.3.1 IDefinition.Bindings Property

Pascal

```
property Bindings: IBindings;
```

C++

```
__property IBindings Bindings;
```

Description

This is Bindings, a member of class IDefinition.

189.2.7.3.2 IDefinition.Imports Property

Pascal

```
property Imports: IImports;
```

C++

```
__property IImports Imports;
```

Description

This is Imports, a member of class IDefinition.

189.2.7.3.3 IDefinition.Messages Property

Pascal

```
property Messages: IMessages;
```

C++

```
__property IMessages Messages;
```

Description

This is Messages, a member of class IDefinition.

189.2.7.3.4 IDefinition.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IDefinition.

189.2.7.3.5 IDefinition.PortTypes Property

Pascal

```
property PortTypes: IPortTypes;
```

C++

```
__property IPortTypes PortTypes;
```

Description

This is PortTypes, a member of class IDefinition.

189.2.7.3.6 IDefinition.Services Property

Pascal

```
property Services: IServices;
```

C++

```
__property IServices Services;
```

Description

This is Services, a member of class IDefinition.

189.2.7.3.7 IDefinition.TargetNamespace Property

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

This is TargetNamespace, a member of class IDefinition.

189.2.7.3.8 IDefinition.Types Property

Pascal

```
property Types: ITypes;
```

C++

```
__property ITypes Types;
```

Description

This is Types, a member of class IDefinition.

189.2.8 IDocumentation Interface

Class Hierarchy

Pascal

```
IDocumentation = interface(IXMLNode);
```

C++

```
__interface IDocumentation : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentation.

189.2.9 IDocumentationCollection Interface

Class Hierarchy

Pascal

```
IDocumentationCollection = interface(IXMLNodeCollection);
```

C++

```
__interface IDocumentationCollection : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentationCollection.

189.2.9.1 IDocumentationCollection Members

The following tables list the members exposed by IDocumentationCollection.

Public Methods

	Name	Description
	Add (see page 25840)	This is Add, a member of class IDocumentationCollection.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDocumentation (see page 25840)	This is GetDocumentation, a member of class IDocumentationCollection.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25840)	This is Insert, a member of class IDocumentationCollection.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	Documentation (see page 25841)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.9.2 IDocumentationCollection Methods

The methods of the IDocumentationCollection class are listed here.

Public Methods

	Name	Description
	Add (see page 25840)	This is Add, a member of class IDocumentationCollection.
	GetDocumentation (see page 25840)	This is GetDocumentation, a member of class IDocumentationCollection.
	Insert (see page 25840)	This is Insert, a member of class IDocumentationCollection.

189.2.9.2.1 IDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class IDocumentationCollection.

189.2.9.2.2 IDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class IDocumentationCollection.

189.2.9.2.3 IDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class IDocumentationCollection.

189.2.9.3 IDocumentationCollection Properties

The properties of the IDocumentationCollection class are listed here.

Public Properties

	Name	Description
R	Documentation (see page 25841)	This is Documentation, a member of class IDocumentationCollection.

189.2.9.3.1 IDocumentationCollection.Documentation Property

Pascal

```
property Documentation [Index: Integer]: IDocumentation;
```

C++

```
__property IDocumentation Documentation[int Index];
```

Description

This is Documentation, a member of class IDocumentationCollection.

189.2.10 IDocumented Interface

Class Hierarchy

Pascal

```
IDocumented = interface(IXMLNode);
```

C++

```
__interface IDocumented : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumented.

189.2.10.1 IDocumented Members

The following tables list the members exposed by IDocumented.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.

	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.10.2 IDocumented Methods

The methods of the IDocumented class are listed here.

Public Methods

	Name	Description
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.

189.2.10.2.1 IDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class IDocumented.

189.2.10.3 IDocumented Properties

The properties of the IDocumented class are listed here.

Public Properties

	Name	Description
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.

189.2.10.3.1 IDocumented.Documentation Property

Pascal

```
property Documentation: IDocumentationCollection;
```

C++

```
__property IDocumentationCollection Documentation;
```

Description

This is Documentation, a member of class IDocumented.

189.2.11 IFault Interface

Class Hierarchy

Pascal

```
IFault = interface(IParam);
```

C++

```
__interface IFault : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IFault.

189.2.12 IFaults Interface

Class Hierarchy

Pascal

```
IFaults = interface(IXMLNodeCollection);
```

C++

```
__interface IFaults : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IFaults.

189.2.12.1 IFaults Members

The following tables list the members exposed by IFaults.

Public Methods

	Name	Description
	Add (see page 25846)	This is Add, a member of class IFaults.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetFault (see page 25846)	This is GetFault, a member of class IFaults.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25846)	This is Insert, a member of class IFaults.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Fault (see page 25847)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.12.2 IFaults Methods

The methods of the IFaults class are listed here.

Public Methods

	Name	Description
	Add (see page 25846)	This is Add, a member of class IFaults.
	GetFault (see page 25846)	This is GetFault, a member of class IFaults.
	Insert (see page 25846)	This is Insert, a member of class IFaults.

189.2.12.2.1 IFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class IFaults.

189.2.12.2.2 IFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class IFaults.

189.2.12.2.3 IFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class IFaults.

189.2.12.3 IFaults Properties

The properties of the IFaults class are listed here.

Public Properties

	Name	Description
R	Fault (see page 25847)	This is Fault, a member of class IFaults.

189.2.12.3.1 IFaults.Fault Property

Pascal

```
property Fault [Index: Integer]: IFault;
```

C++

```
__property IFault Fault[int Index];
```

Description

This is Fault, a member of class IFaults.

189.2.13 IImport Interface

Class Hierarchy

Pascal

```
IImport = interface(IDocumented);
```

C++

```
__interface IImport : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IImport.

189.2.13.1 IImport Members

The following tables list the members exposed by IImport.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.

	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 25849)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 25849)	This is GetNamespace, a member of class IImport.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetLocation (see page 25849)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 25849)	This is SetNamespace, a member of class IImport.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Location (see page 25850)	This is Location, a member of class IImport.
	Namespace (see page 25850)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.13.2 IImport Methods

The methods of the IImport class are listed here.

Public Methods

	Name	Description
	GetLocation (see page 25849)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 25849)	This is GetNamespace, a member of class IImport.
	SetLocation (see page 25849)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 25849)	This is SetNamespace, a member of class IImport.

189.2.13.2.1 IImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class IImport.

189.2.13.2.2 IImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class IImport.

189.2.13.2.3 IImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class IImport.

189.2.13.2.4 IImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class IImport.

189.2.13.3 IImport Properties

The properties of the IImport class are listed here.

Public Properties

	Name	Description
	Location (see page 25850)	This is Location, a member of class IImport.
	Namespace (see page 25850)	This is Namespace, a member of class IImport.

189.2.13.3.1 IImport.Location Property

Pascal

```
property Location: WideString;
```

C++

```
__property BSTR Location;
```

Description

This is Location, a member of class IImport.

189.2.13.3.2 IImport.Namespace Property

Pascal

```
property Namespace: WideString;
```

C++

```
__property BSTR Namespace;
```

Description

This is Namespace, a member of class IImport.

189.2.14 IImports Interface

Class Hierarchy

Pascal

```
IImports = interface(IXMLNodeCollection);
```

C++

```
__interface IImports : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IImports.

189.2.14.1 IImports Members

The following tables list the members exposed by IImports.

Public Methods

	Name	Description
	Add (see page 25852)	This is Add, a member of class IImports.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetImport (see page 25853)	This is GetImport, a member of class IImports.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25853)	This is Insert, a member of class IImports.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	Import (see page 25853)	This is Import, a member of class IImports.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.14.2 IImports Methods

The methods of the IImports class are listed here.

Public Methods

	Name	Description
	Add (see page 25852)	This is Add, a member of class IImports.
	GetImport (see page 25853)	This is GetImport, a member of class IImports.
	Insert (see page 25853)	This is Insert, a member of class IImports.

189.2.14.2.1 IImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class IImports.

189.2.14.2.2 IImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class IImports.

189.2.14.2.3 IImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class IImports.

189.2.14.3 IImports Properties

The properties of the IImports class are listed here.

Public Properties

	Name	Description
	Import (see page 25853)	This is Import, a member of class IImports.

189.2.14.3.1 IImports.Import Property

Pascal

```
property Import [Index: Integer]: IImport;
```

C++

```
__property IImport Import[int Index];
```

Description

This is Import, a member of class IImports.

189.2.15 IMessage Interface

Class Hierarchy

Pascal

```
IMessage = interface(IDocumented);
```

C++

```
__interface IMessage : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IMessage.

189.2.15.1 IMessage Members

The following tables list the members exposed by IMessage.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25855)	This is GetName, a member of class IMessage.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetParts (see page 25856)	This is GetParts, a member of class IMessage.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25856)	This is SetName, a member of class IMessage.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25856)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Parts (see page 25856)	This is Parts, a member of class IMessage.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.15.2 IMessage Methods

The methods of the IMessage class are listed here.

Public Methods

	Name	Description
	GetName (see page 25855)	This is GetName, a member of class IMessage.
	GetParts (see page 25856)	This is GetParts, a member of class IMessage.
	SetName (see page 25856)	This is SetName, a member of class IMessage.

189.2.15.2.1 IMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IMessage.

189.2.15.2.2 IMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class IMessage.

189.2.15.2.3 IMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IMessage.

189.2.15.3 IMessage Properties

The properties of the IMessage class are listed here.

Public Properties

	Name	Description
	Name (see page 25856)	This is Name, a member of class IMessage.
R	Parts (see page 25856)	This is Parts, a member of class IMessage.

189.2.15.3.1 IMessage.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IMessage.

189.2.15.3.2 IMessage.Parts Property

Pascal

```
property Parts: IParts;
```

C++

```
__property IParts Parts;
```

Description

This is Parts, a member of class IMessage.

189.2.16 IMessages Interface

Class Hierarchy

Pascal

```
IMessages = interface(IXMLNodeCollection);
```

C++

```
__interface IMessages : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IMessages.

189.2.16.1 IMessages Members

The following tables list the members exposed by IMessages.

Public Methods

	Name	Description
	Add (see page 25859)	This is Add, a member of class IMessages.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 25859)	This is GetMessage, a member of class IMessages.

	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25859)	This is Insert, a member of class IMessages.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	Message (see page 25860)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.16.2 IMessages Methods

The methods of the IMessages class are listed here.

Public Methods

	Name	Description
	Add (see page 25859)	This is Add, a member of class IMessages.
	GetMessage (see page 25859)	This is GetMessage, a member of class IMessages.
	Insert (see page 25859)	This is Insert, a member of class IMessages.

189.2.16.2.1 IMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class IMessages.

189.2.16.2.2 IMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class IMessages.

189.2.16.2.3 IMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class IMessages.

189.2.16.3 IMessages Properties

The properties of the IMessages class are listed here.

Public Properties

	Name	Description
R	Message (see page 25860)	This is Message, a member of class IMessages.

189.2.16.3.1 IMessages.Message Property

Pascal

```
property Message [Index: Integer]: IMessage;
```

C++

```
__property IMessage Message[int Index];
```

Description

This is Message, a member of class IMessages.

189.2.17 IOperation Interface

Class Hierarchy

Pascal

```
IOperation = interface(IDocumented);
```

C++

```
__interface IOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IOperation.

189.2.17.1 IOperation Members

The following tables list the members exposed by IOperation.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetFaults (see page 25862)	This is GetFaults, a member of class IOperation.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.

	GetInput (see page 25862)	This is GetInput, a member of class IOperation.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25862)	This is GetName, a member of class IOperation.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOutput (see page 25863)	This is GetOutput, a member of class IOperation.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25863)	This is SetName, a member of class IOperation.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	Faults (see page 25863)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	Input (see page 25863)	This is Input, a member of class IOperation.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25864)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Output (see page 25864)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.

	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.17.2 IOperation Methods

The methods of the IOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 25862)	This is GetFaults, a member of class IOperation.
	GetInput (see page 25862)	This is GetInput, a member of class IOperation.
	GetName (see page 25862)	This is GetName, a member of class IOperation.
	GetOutput (see page 25863)	This is GetOutput, a member of class IOperation.
	SetName (see page 25863)	This is SetName, a member of class IOperation.

189.2.17.2.1 IOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IOperation.

189.2.17.2.2 IOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class IOperation.

189.2.17.2.3 IOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IOperation.

189.2.17.2.4 IOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class IOperation.

189.2.17.2.5 IOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IOperation.

189.2.17.3 IOperation Properties

The properties of the IOperation class are listed here.

Public Properties

	Name	Description
R	Faults (see page 25863)	This is Faults, a member of class IOperation.
R	Input (see page 25863)	This is Input, a member of class IOperation.
	Name (see page 25864)	This is Name, a member of class IOperation.
R	Output (see page 25864)	This is Output, a member of class IOperation.

189.2.17.3.1 IOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IOperation.

189.2.17.3.2 IOperation.Input Property

Pascal

```
property Input: IParam;
```

C++

```
__property IParam Input;
```

Description

This is Input, a member of class IOperation.

189.2.17.3.3 IOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IOperation.

189.2.17.3.4 IOperation.Output Property

Pascal

```
property Output: IParam;
```

C++

```
__property IParam Output;
```

Description

This is Output, a member of class IOperation.

189.2.18 IOperations Interface

Class Hierarchy

Pascal

```
IOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IOperations.

189.2.18.1 IOperations Members

The following tables list the members exposed by IOperations.

Public Methods

	Name	Description
	Add (see page 25866)	This is the overview for the Add method overload.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOperation (see page 25867)	This is GetOperation, a member of class IOperations.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25867)	This is Insert, a member of class IOperations.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.

	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Operation (see page 25867)	This is Operation, a member of class IOperations.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.18.2 IOperations Methods

The methods of the IOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 25866)	This is the overview for the Add method overload.
	GetOperation (see page 25867)	This is GetOperation, a member of class IOperations.
	Insert (see page 25867)	This is Insert, a member of class IOperations.

189.2.18.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	IOperations.Add (WideString) (see page 25866)	This is Add, a member of class IOperations.
	IOperations.Add (WideString, WideString, WideString, WideString) (see page 25867)	This is Add, a member of class IOperations.

189.2.18.2.1.1 IOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IOperations.

189.2.18.2.1.2 IOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class IOperations.

189.2.18.2.2 IOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class IOperations.

189.2.18.2.3 IOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class IOperations.

189.2.18.3 IOperations Properties

The properties of the IOperations class are listed here.

Public Properties

	Name	Description
R	Operation (see page 25867)	This is Operation, a member of class IOperations.

189.2.18.3.1 IOperations.Operation Property

Pascal

```
property Operation [Index: Integer]: IOperation;
```

C++

```
__property IOperation Operation[int Index];
```

Description

This is Operation, a member of class IOperations.

189.2.19 IParam Interface

Class Hierarchy

Pascal

```
IParam = interface(IDocumented);
```

C++

```
__interface IParam : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IParam.

189.2.19.1 IParam Members

The following tables list the members exposed by IParam.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 25870)	This is GetMessage, a member of class IParam.
	GetName (see page 25870)	This is GetName, a member of class IParam.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.

	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetMessage (see page 25870)	This is SetMessage, a member of class IParam.
	SetName (see page 25870)	This is SetName, a member of class IParam.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Message (see page 25871)	This is Message, a member of class IParam.
	Name (see page 25871)	This is Name, a member of class IParam.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.19.2 IParam Methods

The methods of the IParam class are listed here.

Public Methods

	Name	Description
	GetMessage (see page 25870)	This is GetMessage, a member of class IParam.
	GetName (see page 25870)	This is GetName, a member of class IParam.
	SetMessage (see page 25870)	This is SetMessage, a member of class IParam.
	SetName (see page 25870)	This is SetName, a member of class IParam.

189.2.19.2.1 IParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class IParam.

189.2.19.2.2 IParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IParam.

189.2.19.2.3 IParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class IParam.

189.2.19.2.4 IParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IParam.

189.2.19.3 IParam Properties

The properties of the IParam class are listed here.

Public Properties

	Name	Description
	Message (see page 25871)	This is Message, a member of class IParam.
	Name (see page 25871)	This is Name, a member of class IParam.

189.2.19.3.1 IParam.Message Property

Pascal

```
property Message: WideString;
```

C++

```
__property BSTR Message;
```

Description

This is Message, a member of class IParam.

189.2.19.3.2 IParam.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IParam.

189.2.20 IPart Interface

Class Hierarchy

Pascal

```
IPart = interface(IDocumented);
```

C++

```
__interface IPart : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPart.

189.2.20.1 IPart Members

The following tables list the members exposed by IPart.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetElement (see page 25873)	This is GetElement, a member of class IPart.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25874)	This is GetName, a member of class IPart.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetType_ (see page 25874)	This is GetType_, a member of class IPart.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetElement (see page 25874)	This is SetElement, a member of class IPart.
	SetName (see page 25874)	This is SetName, a member of class IPart.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	SetType_ (see page 25874)	This is SetType_, a member of class IPart.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
	Element (see page 25875)	This is Element, a member of class IPart.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25875)	This is Name, a member of class IPart.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
	Type_ (see page 25875)	This is Type_, a member of class IPart.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.20.2 IPart Methods

The methods of the IPart class are listed here.

Public Methods

	Name	Description
	GetElement (see page 25873)	This is GetElement, a member of class IPart.
	GetName (see page 25874)	This is GetName, a member of class IPart.
	GetType_ (see page 25874)	This is GetType_, a member of class IPart.
	SetElement (see page 25874)	This is SetElement, a member of class IPart.
	SetName (see page 25874)	This is SetName, a member of class IPart.
	SetType_ (see page 25874)	This is SetType_, a member of class IPart.

189.2.20.2.1 IPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class IPart.

189.2.20.2.2 IPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPart.

189.2.20.2.3 IPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IPart.

189.2.20.2.4 IPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class IPart.

189.2.20.2.5 IPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPart.

189.2.20.2.6 IPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IPart.

189.2.20.3 IPart Properties

The properties of the IPart class are listed here.

Public Properties

	Name	Description
	Element (see page 25875)	This is Element, a member of class IPart.
	Name (see page 25875)	This is Name, a member of class IPart.
	Type_ (see page 25875)	This is Type_, a member of class IPart.

189.2.20.3.1 IPart.Element Property

Pascal

```
property Element: WideString;
```

C++

```
__property BSTR Element;
```

Description

This is Element, a member of class IPart.

189.2.20.3.2 IPart.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPart.

189.2.20.3.3 IPart.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IPart.

189.2.21 IParts Interface

Class Hierarchy

Pascal

```
IParts = interface(IXMLNodeCollection);
```

C++

```
__interface IParts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IParts.

189.2.21.1 IParts Members

The following tables list the members exposed by IParts.

Public Methods

	Name	Description
	Add (see page 25878)	This is Add, a member of class IParts.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.

	GetPart (see page 25878)	This is GetPart, a member of class IParts.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25878)	This is Insert, a member of class IParts.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Part (see page 25879)	This is Part, a member of class IParts.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.21.2 IParts Methods

The methods of the IParts class are listed here.

Public Methods

	Name	Description
	Add (see page 25878)	This is Add, a member of class IParts.
	GetPart (see page 25878)	This is GetPart, a member of class IParts.
	Insert (see page 25878)	This is Insert, a member of class IParts.

189.2.21.2.1 IParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class IParts.

189.2.21.2.2 IParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class IParts.

189.2.21.2.3 IParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class IParts.

189.2.21.3 IParts Properties

The properties of the IParts class are listed here.

Public Properties

	Name	Description
R	Part (see page 25879)	This is Part, a member of class IParts.

189.2.21.3.1 IParts.Part Property

Pascal

```
property Part [Index: Integer]: IPart;
```

C++

```
__property IPart Part[int Index];
```

Description

This is Part, a member of class IParts.

189.2.22 IPort Interface

Class Hierarchy

Pascal

```
IPort = interface(IDocumented);
```

C++

```
__interface IPort : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPort.

189.2.22.1 IPort Members

The following tables list the members exposed by IPort.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetBinding (see page 25881)	This is GetBinding, a member of class IPort.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.

	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25881)	This is GetName, a member of class IPort.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 25881)	This is SetBinding, a member of class IPort.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25881)	This is SetName, a member of class IPort.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
	Binding (see page 25882)	This is Binding, a member of class IPort.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25882)	This is Name, a member of class IPort.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.22.2 IPort Methods

The methods of the IPort class are listed here.

Public Methods

	Name	Description
	GetBinding (see page 25881)	This is GetBinding, a member of class IPort.
	GetName (see page 25881)	This is GetName, a member of class IPort.
	SetBinding (see page 25881)	This is SetBinding, a member of class IPort.
	SetName (see page 25881)	This is SetName, a member of class IPort.

189.2.22.2.1 IPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class IPort.

189.2.22.2.2 IPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPort.

189.2.22.2.3 IPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class IPort.

189.2.22.2.4 IPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPort.

189.2.22.3 IPort Properties

The properties of the IPort class are listed here.

Public Properties

	Name	Description
	Binding (see page 25882)	This is Binding, a member of class IPort.
	Name (see page 25882)	This is Name, a member of class IPort.

189.2.22.3.1 IPort.Binding Property

Pascal

```
property Binding: WideString;
```

C++

```
__property BSTR Binding;
```

Description

This is Binding, a member of class IPort.

189.2.22.3.2 IPort.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPort.

189.2.23 IPorts Interface

Class Hierarchy

Pascal

```
IPorts = interface(IXMLNodeCollection);
```

C++

```
__interface IPorts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPorts.

189.2.23.1 IPorts Members

The following tables list the members exposed by IPorts.

Public Methods

	Name	Description
	Add (see page 25884)	This is Add, a member of class IPorts.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPort (see page 25885)	This is GetPort, a member of class IPorts.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25885)	This is Insert, a member of class IPorts.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Port (see page 25885)	This is Port, a member of class IPorts.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.23.2 IPorts Methods

The methods of the IPorts class are listed here.

Public Methods

	Name	Description
	Add (see page 25884)	This is Add, a member of class IPorts.
	GetPort (see page 25885)	This is GetPort, a member of class IPorts.
	Insert (see page 25885)	This is Insert, a member of class IPorts.

189.2.23.2.1 IPorts.Add Method

Pascal

```
function Add(const Name: WideString; const ABinding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR ABinding);
```

Description

This is Add, a member of class IPorts.

189.2.23.2.2 IPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class IPorts.

189.2.23.2.3 IPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class IPorts.

189.2.23.3 IPorts Properties

The properties of the IPorts class are listed here.

Public Properties

	Name	Description
R	Port (see page 25885)	This is Port, a member of class IPorts.

189.2.23.3.1 IPorts.Port Property

Pascal

```
property Port [Index: Integer]: IPort;
```

C++

```
__property IPort Port[int Index];
```

Description

This is Port, a member of class IPorts.

189.2.24 IPortType Interface

Class Hierarchy

Pascal

```
IPortType = interface(IDocumented);
```

C++

```
__interface IPortType : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPortType.

189.2.24.1 IPortType Members

The following tables list the members exposed by IPortType.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25887)	This is GetName, a member of class IPortType.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOperations (see page 25888)	This is GetOperations, a member of class IPortType.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25888)	This is SetName, a member of class IPortType.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25888)	This is Name, a member of class IPortType.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	Operations (see page 25888)	This is Operations, a member of class IPortType.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.24.2 IPortType Methods

The methods of the IPortType class are listed here.

Public Methods

	Name	Description
	GetName (see page 25887)	This is GetName, a member of class IPortType.
	GetOperations (see page 25888)	This is GetOperations, a member of class IPortType.
	SetName (see page 25888)	This is SetName, a member of class IPortType.

189.2.24.2.1 IPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPortType.

189.2.24.2.2 IPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class IPortType.

189.2.24.2.3 IPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPortType.

189.2.24.3 IPortType Properties

The properties of the IPortType class are listed here.

Public Properties

	Name	Description
	Name (see page 25888)	This is Name, a member of class IPortType.
R	Operations (see page 25888)	This is Operations, a member of class IPortType.

189.2.24.3.1 IPortType.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPortType.

189.2.24.3.2 IPortType.Operations Property

Pascal

```
property Operations: IOperations;
```

C++

```
__property IOperations Operations;
```

Description

This is Operations, a member of class IPortType.

189.2.25 IPortTypes Interface

Class Hierarchy

Pascal

```
IPortTypes = interface(IXMLNodeCollection);
```

C++

```
__interface IPortTypes : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPortTypes.

189.2.25.1 IPortTypes Members

The following tables list the members exposed by IPortTypes.

Public Methods

	Name	Description
	Add (see page 25891)	This is Add, a member of class IPortTypes.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.

	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPortType (see page 25891)	This is GetPortType, a member of class IPortTypes.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25891)	This is Insert, a member of class IPortTypes.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	PortType (see page 25892)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.25.2 IPortTypes Methods

The methods of the IPortTypes class are listed here.

Public Methods

	Name	Description
	Add (see page 25891)	This is Add, a member of class IPortTypes.
	GetPortType (see page 25891)	This is GetPortType, a member of class IPortTypes.
	Insert (see page 25891)	This is Insert, a member of class IPortTypes.

189.2.25.2.1 IPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class IPortTypes.

189.2.25.2.2 IPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class IPortTypes.

189.2.25.2.3 IPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class IPortTypes.

189.2.25.3 IPortTypes Properties

The properties of the IPortTypes class are listed here.

Public Properties

	Name	Description
R	PortType (see page 25892)	This is PortType, a member of class IPortTypes.

189.2.25.3.1 IPortTypes.PortType Property

Pascal

```
property PortType [Index: Integer]: IPortType;
```

C++

```
__property IPortType PortType[int Index];
```

Description

This is PortType, a member of class IPortTypes.

189.2.26 IService Interface

Class Hierarchy

Pascal

```
IService = interface(IDocumented);
```

C++

```
__interface IService : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IService.

189.2.26.1 IService Members

The following tables list the members exposed by IService.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.

	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetName (see page 25894)	This is GetName, a member of class IService.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPorts (see page 25894)	This is GetPorts, a member of class IService.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetName (see page 25894)	This is SetName, a member of class IService.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
	Name (see page 25895)	This is Name, a member of class IService.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Ports (see page 25895)	This is Ports, a member of class IService.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.26.2 IService Methods

The methods of the IService class are listed here.

Public Methods

	Name	Description
	GetName (see page 25894)	This is GetName, a member of class IService.
	GetPorts (see page 25894)	This is GetPorts, a member of class IService.
	SetName (see page 25894)	This is SetName, a member of class IService.

189.2.26.2.1 IService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IService.

189.2.26.2.2 IService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class IService.

189.2.26.2.3 IService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IService.

189.2.26.3 IService Properties

The properties of the IService class are listed here.

Public Properties

	Name	Description
	Name (see page 25895)	This is Name, a member of class IService.

	Ports (see page 25895)	This is Ports, a member of class IService.

189.2.26.3.1 IService.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IService.

189.2.26.3.2 IService.Ports Property

Pascal

```
property Ports: IPorts;
```

C++

```
__property IPorts Ports;
```

Description

This is Ports, a member of class IService.

189.2.27 IServices Interface

Class Hierarchy

Pascal

```
IServices = interface(IXMLNodeCollection);
```

C++

```
__interface IServices : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IServices.

189.2.27.1 IServices Members

The following tables list the members exposed by IServices.

Public Methods

	Name	Description
	Add (see page 25897)	This is Add, a member of class IServices.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.

	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetService (see page 25897)	This is GetService, a member of class IServices.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	Insert (see page 25898)	This is Insert, a member of class IServices.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.

R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	Service (see page 25898)	This is Service, a member of class IServices.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.27.2 IServices Methods

The methods of the IServices class are listed here.

Public Methods

	Name	Description
	Add (see page 25897)	This is Add, a member of class IServices.
	GetService (see page 25897)	This is GetService, a member of class IServices.
	Insert (see page 25898)	This is Insert, a member of class IServices.

189.2.27.2.1 IServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class IServices.

189.2.27.2.2 IServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class IServices.

189.2.27.2.3 IServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class IServices.

189.2.27.3 IServices Properties

The properties of the IServices class are listed here.

Public Properties

	Name	Description
	Service (see page 25898)	This is Service, a member of class IServices.

189.2.27.3.1 IServices.Service Property

Pascal

```
property Service [Index: Integer]: IService;
```

C++

```
__property IService Service[int Index];
```

Description

This is Service, a member of class IServices.

189.2.28 ITypes Interface

Class Hierarchy

Pascal

```
ITypes = interface(IDocumented);
```

C++

```
__interface ITypes : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.ITypes.

189.2.28.1 ITypes Members

The following tables list the members exposed by ITypes.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDocumentationCollection (see page 25843)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetSchemaDefs (see page 25900)	This is GetSchemaDefs, a member of class ITypes.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.

	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Documentation (see page 25843)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	SchemaDefs (see page 25900)	This is SchemaDefs, a member of class ITypes.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.28.2 ITypes Methods

The methods of the ITypes class are listed here.

Public Methods

	Name	Description
	GetSchemaDefs (see page 25900)	This is GetSchemaDefs, a member of class ITypes.

189.2.28.2.1 ITypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

Description

This is GetSchemaDefs, a member of class ITypes.

189.2.28.3 ITypes Properties

The properties of the ITypes class are listed here.

Public Properties

	Name	Description
R	SchemaDefs (see page 25900)	This is SchemaDefs, a member of class ITypes.

189.2.28.3.1 ITypes.SchemaDefs Property

Pascal

```
property SchemaDefs: IXMLSchemaDefs;
```

C++

```
__property IXMLSchemaDefs SchemaDefs;
```

Description

This is SchemaDefs, a member of class ITypes.

189.2.29 IWSDLDocument Interface

IWSDLDocument provides low-level access to the definitions in a WSDL document.

Class Hierarchy

Pascal

```
IWSDLDocument = interface(IXMLDocument);
```

C++

```
__interface IWSDLDocument : public IXMLDocument;
```

File

WSDLBind

Description

IWSDLDocument is an interface to the TWSDLDocument (see page 25799) class. It is primarily for internal use, because it only provides access to the Definitions property, which is used for low-level access to the definitions in a WSDL document. It is generally easier to work with a TWSDLItems object. You can often obtain this from an IWSDLDocument interface by using the global Supports function (Delphi) or the Supports method (C++) to obtain an IWSDLItems interface from this one, and then obtaining a TWSDLItems object from that interface.

Note: C++ method declarations that use IWSDLDocument use the _di_IWSDLDocument type instead. This type is a DelphiInterface wrapper around the IWSDLDocument interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLDocument (see page 25799)

IWSDLItems (see page 25998)

TWSDLItems (see page 25951)

189.2.29.1 IWSDLDocument Members

The following tables list the members exposed by IWSDLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.

	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetDefinition (see page 25903)	Returns the value of the Definition (see page 25904) property.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDefinition (see page 25903)	Sets the value of the Definition (see page 25904) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.

R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
	Definition (see page 25904)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	Options (see page 26408)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

189.2.29.2 IWSDLDocument Methods

The methods of the IWSDLDocument class are listed here.

Public Methods

	Name	Description
	GetDefinition (see page 25903)	Returns the value of the Definition (see page 25904) property.
	SetDefinition (see page 25903)	Sets the value of the Definition (see page 25904) property.

189.2.29.2.1 IWSDLDocument.GetDefinition Method

Returns the value of the Definition (see page 25904) property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition (see page 25904) property.

See Also

Definition (see page 25904)

189.2.29.2.2 IWSDLDocument.SetDefinition Method

Sets the value of the Definition (see page 25904) property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition (see page 25904) property.

See Also

Definition (see page 25904)

189.2.29.3 IWSDLDocument Properties

The properties of the IWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 25904)	Provides access to the definitions contained in the WSDL document.

189.2.29.3.1 IWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 25831) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 25831) interface to access the Bindings, Messages (see page 16211), PortTypes, Services, and Types (see page 23293) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems. To obtain a TWSDLItems instance for this document,

1.Cast this interface to IWSDLItems using the global Supports function (C++) or the inherited Supports method (C++).

2.Use the GetWSDLItems method of that interface.

See Also

DocumentElement (see page 26405)

TWSDLItems (see page 25951)

Supports

Supports (see page 22973)

189.2.30 IXMLSchemaDefs Interface

Class Hierarchy

Pascal

```
IXMLSchemaDefs = interface(IXMLNodeCollection);
```

C++

```
__interface IXMLSchemaDefs : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IXMLSchemaDefs.

189.2.30.1 IXMLSchemaDefs Members

The following tables list the members exposed by IXMLSchemaDefs.

Public Methods

	Name	Description
	Add (see page 25907)	This is Add, a member of class IXMLSchemaDefs.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.

	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	GetXMLSchemaDef (see page 25907)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	SchemaDef (see page 25907)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

189.2.30.2 IXMLSchemaDefs Methods

The methods of the IXMLSchemaDefs class are listed here.

Public Methods

	Name	Description
	Add (see page 25907)	This is Add, a member of class IXMLSchemaDefs.

	GetXMLSchemaDef (see page 25907)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

189.2.30.2.1 IXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class IXMLSchemaDefs.

189.2.30.2.2 IXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

189.2.30.3 IXMLSchemaDefs Properties

The properties of the IXMLSchemaDefs class are listed here.

Public Properties

	Name	Description
R	SchemaDef (see page 25907)	This is SchemaDef, a member of class IXMLSchemaDefs.

189.2.30.3.1 IXMLSchemaDefs.SchemaDef Property

Pascal

```
property SchemaDef [Index: Integer]: IXMLSchemaDef;
```

C++

```
__property IXMLSchemaDef SchemaDef[int Index];
```

Description

This is SchemaDef, a member of class IXMLSchemaDefs.

189.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetDefinition (see page 25908)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 25908)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 25908)	This is function WSDLBind.NewWSDLDoc.

189.3.1 WSDLBind.GetDefinition Function

Pascal

```
function GetDefinition(Doc: TXMLDocument): IDefinition;
```

C++

```
IDefinition GetDefinition(TXMLDocument Doc);
```

File

WSDLBind

Description

This is function WSDLBind.GetDefinition.

189.3.2 WSDLBind.LoadWSDLDoc Function

Pascal

```
function LoadWSDLDoc(const FileName: WideString): IWSDLDocument;
```

C++

```
IWSDLDocument LoadWSDLDoc(const BSTR FileName);
```

File

WSDLBind

Description

This is function WSDLBind.LoadWSDLDoc.

189.3.3 WSDLBind.NewWSDLDoc Function

Pascal

```
function NewWSDLDoc: IWSDLDocument;
```

C++

```
IWSDLDocument NewWSDLDoc();
```

File

WSDLBind

Description

This is function WSDLBind.NewWSDLDoc.

189.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SBinding (see page 25910)	This is constant WSDLBind.SBinding.
SDefinitions (see page 25910)	This is constant WSDLBind.SDefinitions.
SFault (see page 25911)	This is constant WSDLBind.SFault.
SImport (see page 25911)	This is constant WSDLBind.SImport.
SInput (see page 25911)	This is constant WSDLBind.SInput.
SLocation (see page 25912)	This is constant WSDLBind.SLocation.
SMessage (see page 25912)	This is constant WSDLBind.SMessage.
SNamespace (see page 25912)	This is constant WSDLBind.SNamespace.
SOperation (see page 25913)	This is constant WSDLBind.SOperation.
SOutput (see page 25913)	This is constant WSDLBind.SOutput.
SPart (see page 25913)	This is constant WSDLBind.SPart.
SPort (see page 25914)	This is constant WSDLBind.SPort.
SPortType (see page 25914)	This is constant WSDLBind.SPortType.
SService (see page 25914)	This is constant WSDLBind.SService.
SType (see page 25915)	This is constant WSDLBind.SType.
STypes (see page 25915)	This is constant WSDLBind.STypes.

189.4.1 WSDLBind.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLBind

Description

This is constant WSDLBind.SBinding.

189.4.2 WSDLBind.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLBind

Description

This is constant WSDLBind.SDefinitions.

189.4.3 WSDLBind.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLBind

Description

This is constant WSDLBind.SFault.

189.4.4 WSDLBind.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLBind

Description

This is constant WSDLBind.SImport.

189.4.5 WSDLBind.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLBind

Description

This is constant WSDLBind.SInput.

189.4.6 WSDLBind.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLBind

Description

This is constant WSDLBind.SLocation.

189.4.7 WSDLBind.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLBind

Description

This is constant WSDLBind.SMessage.

189.4.8 WSDLBind.SNamespace Constant

Pascal

```
SNamespace = 'namespace';
```

C++

```
SNamespace = 'namespace';
```

File

WSDLBind

Description

This is constant WSDLBind.SNamespace.

189.4.9 WSDLBind.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLBind

Description

This is constant WSDLBind.SOperation.

189.4.10 WSDLBind.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLBind

Description

This is constant WSDLBind.SOutput.

189.4.11 WSDLBind.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLBind

Description

This is constant WSDLBind.SPart.

189.4.12 WSDLBind.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLBind

Description

This is constant WSDLBind.SPort.

189.4.13 WSDLBind.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLBind

Description

This is constant WSDLBind.SPortType.

189.4.14 WSDLBind.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLBind

Description

This is constant WSDLBind.SService.

189.4.15 WSDLBind.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLBind

Description

This is constant WSDLBind.SType.

189.4.16 WSDLBind.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLBind

Description

This is constant WSDLBind.STypes.

190 WSDLIntf Namespace

This is namespace WSDLIntf.

Topics

Name	Description
Classes (see page 25919)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 25925)	The following table lists structs, records, enums in this documentation.
Types (see page 25927)	The following table lists types in this documentation.
Constants (see page 25928)	The following table lists constants in this documentation.

Classes

	Name	Description
	TWideStrings (see page 25919)	TWideStrings represents a list of WideString values.

Constants

Name	Description
Directives (see page 25929)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 25929)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 25930)	This is constant WSDLIntf.Httpns.
Operators (see page 25930)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 25930)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 25931)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 25931)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 25932)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 25932)	This is constant WSDLIntf.SAnyType.
SArray (see page 25932)	This is constant WSDLIntf.SArray.
SArrayOf (see page 25933)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 25933)	This is constant WSDLIntf.SArrayType.
SBinding (see page 25933)	This is constant WSDLIntf.SBinding.
SBody (see page 25934)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 25934)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 25934)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 25935)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 25935)	This is constant WSDLIntf.SDynArray.
SElement (see page 25935)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 25936)	This is constant WSDLIntf.SEncodingStyle.

SFault (see page 25936)	This is constant WSDLIntf.SFault.
SHeader (see page 25936)	This is constant WSDLIntf.SHeader.
SImport (see page 25937)	This is constant WSDLIntf.SImport.
SInOut (see page 25937)	This is constant WSDLIntf.SInOut.
SInput (see page 25937)	This is constant WSDLIntf.SInput.
SLocation (see page 25938)	This is constant WSDLIntf.SLocation.
SMessage (see page 25938)	This is constant WSDLIntf.SMessage.
SName (see page 25938)	This is constant WSDLIntf.SName.
SNameSpace (see page 25939)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 25939)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 25939)	This is constant WSDLIntf.Soapns.
SOperation (see page 25940)	This is constant WSDLIntf.SOperation.
SOutput (see page 25940)	This is constant WSDLIntf.SOutput.
SPart (see page 25940)	This is constant WSDLIntf.SPart.
SParts (see page 25941)	This is constant WSDLIntf.SParts.
SPort (see page 25941)	This is constant WSDLIntf.SPort.
SPortType (see page 25941)	This is constant WSDLIntf.SPortType.
SRequest (see page 25942)	This is constant WSDLIntf.SRequest.
SResponse (see page 25942)	This is constant WSDLIntf.SResponse.
SReturn (see page 25942)	This is constant WSDLIntf.SReturn.
SSchema (see page 25943)	This is constant WSDLIntf.SSchema.
SService (see page 25943)	This is constant WSDLIntf.SService.
SSoapAction (see page 25943)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 25944)	This is constant WSDLIntf.SStyle.
STns (see page 25944)	This is constant WSDLIntf.STns.
STransport (see page 25944)	This is constant WSDLIntf.STransport.
SType (see page 25945)	This is constant WSDLIntf.SType.
STypes (see page 25945)	This is constant WSDLIntf.STypes.
SUnknown (see page 25945)	This is constant WSDLIntf.SUnknown.
SUse (see page 25946)	This is constant WSDLIntf.SUse.
SVerb (see page 25946)	This is constant WSDLIntf.SVerb.
tns (see page 25946)	This is constant WSDLIntf.tns.
Wsdlns (see page 25947)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 25947)	This is constant WSDLIntf.xsdns.

Structs, Records, Enums

	Name	Description
	TWebServiceBindingType (see page 25925)	This is record WSDLIntf.TWebServiceBindingType.
	TWSDLElement (see page 25925)	This is record WSDLIntf.TWSDLElement.
	TWString (see page 25926)	This is record WSDLIntf.TWString.

Types

Name	Description
TWSDLElements (see page 25927)	This is type WSDLIntf.TWSDLElements.

190.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWideStrings (see page 25919)	TWideStrings represents a list of WideString values.

190.1.1 TWideStrings Class

TWideStrings represents a list of WideString values.

Class Hierarchy

WSDLIntf.TWideStrings

Pascal

```
TWideStrings = class;
```

C++

```
class TWideStrings;
```

File

WSDLIntf

Description

TWideStrings manages a list of WideString values. It is used for handling the strings in a WSDL document.

TWideStrings introduces properties and methods to

Add (see page 25921) a WideString to the list.

Read or set the WideString at a particular location.

Find the position of a specified WideString.

See Also

TStringList (see page 3006)

TList (see page 2868)

THashedStringList (see page 15450)

TWSDLDocument (see page 25799)

TWSDLItems (see page 25951)

WideString (see page 22377)

190.1.1.1 TWideStrings Members

The following tables list the members exposed by TWideStrings.

Public Methods

	Name	Description
	Add (see page 25921)	Adds a WideString at the end of the list.
	Clear (see page 25921)	Empties the list of all its strings.
	Count (see page 25922)	Returns the number of WideStrings in the list.
	Create (see page 25920)	Creates an instance of TWideStrings (see page 25919).
V	Destroy (see page 25920)	Destroys an instance of TWideStrings (see page 25919).
	IndexOf (see page 25922)	Returns the position of a string in the list.
	IndexOfIgnoreCase (see page 25922)	Returns the position of a string (or one that differs only in case) in the list.
	Insert (see page 25923)	Inserts a WideString at a specified position in the list.

Public Properties

	Name	Description
	Strings (see page 25923)	References the WideStrings in the list by position.

190.1.1.2 TWideStrings.Create Constructor

Creates an instance of TWideStrings (see page 25919).

Pascal

```
constructor Create;
```

C++

```
__fastcall TWideStrings();
```

Description

Call Create to create a TWideStrings (see page 25919) object at runtime.

190.1.1.3 TWideStrings.Destroy Destructor

Destroys an instance of TWideStrings (see page 25919).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWideStrings();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWideStrings (see page 25919) reference is not nil, and only then calls Destroy.

See Also

Free (see page 22300)

190.1.1.4 TWideStrings Methods

The methods of the TWideStrings class are listed here.

Public Methods

	Name	Description
	Add (see page 25921)	Adds a WideString at the end of the list.
	Clear (see page 25921)	Empties the list of all its strings.
	Count (see page 25922)	Returns the number of WideStrings in the list.
	IndexOf (see page 25922)	Returns the position of a string in the list.
	IndexOfIgnoreCase (see page 25922)	Returns the position of a string (or one that differs only in case) in the list.
	Insert (see page 25923)	Inserts a WideString at a specified position in the list.

190.1.1.4.1 TWideStrings.Add Method

Adds a WideString at the end of the list.

Pascal

```
function Add(const S: WideString): Integer;
```

C++

```
__fastcall int Add(const BSTR S);
```

Description

Call Add to add a string to the end of the list. Add returns the index of the new string.

See Also

Clear (see page 25921)

Count (see page 25922)

Strings (see page 25923)

Insert (see page 25923)

190.1.1.4.2 TWideStrings.Clear Method

Empties the list of all its strings.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear method to delete all the strings in the list.

See Also

Add (see page 25921)

Strings (see page 25923)

190.1.1.4.3 TWideStrings.Count Method

Returns the number of WideStrings in the list.

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

Call Count method to determine the number of strings in the list. This value provides an upper bound to the Index parameter of the Strings (see page 25923) property.

See Also

Strings (see page 25923)

190.1.1.4.4 TWideStrings.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: WideString): Integer;
```

C++

```
__fastcall int IndexOf(const BSTR S);
```

Description

Call IndexOf to obtain the position of the first occurrence of the string S. IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string is not in the string list, IndexOf returns -1.

IndexOf uses a case-sensitive search. To locate a string case-insensitively, use the IndexOfIgnoreCase (see page 25922) method instead.

Note: If the string appears in the list more than once, IndexOf returns the position of the first occurrence.

See Also

Strings (see page 25923)

IndexOfIgnoreCase (see page 25922)

190.1.1.4.5 TWideStrings.IndexOfIgnoreCase Method

Returns the position of a string (or one that differs only in case) in the list.

Pascal

```
function IndexOfIgnoreCase(const S: WideString): Integer;
```

C++

```
__fastcall int IndexOfIgnoreCase(const BSTR S);
```

Description

Call IndexOfIgnoreCase to obtain the position of the first occurrence of the string S, or of a string that differs from S only by case.

IndexOfIgnoreCase returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOfIgnoreCase returns 0, if S is the second string, IndexOfIgnoreCase returns 1, and so on. If the string is not in the string list, IndexOfIgnoreCase returns -1.

IndexOfIgnoreCase uses a case-insensitive search. To locate a string case-sensitively, use the IndexOf (see page 25922) method instead.

Note: If the string appears in the list more than once, IndexOfIgnoreCase returns the position of the first occurrence.

See Also

Strings (see page 25923)

IndexOf (see page 25922)

190.1.1.4.6 TWideStrings.Insert Method

Inserts a WideString at a specified position in the list.

Pascal

```
procedure Insert(Index: Integer; const S: WideString);
```

C++

```
__fastcall Insert(int Index, const BSTR S);
```

Description

Call Insert to add a WideString to a specified position in the list. Insert adds the string specified by S so that it has the index specified by Index. The string previously at that position, as well as all subsequent strings in the list are moved so that their indexes are one greater than before.

See Also

Clear (see page 25921)

Count (see page 25922)

Strings (see page 25923)

Add (see page 25921)

190.1.1.5 TWideStrings Properties

The properties of the TWideStrings class are listed here.

Public Properties

	Name	Description
	Strings (see page 25923)	References the WideStrings in the list by position.

190.1.1.5.1 TWideStrings.Strings Property

References the WideStrings in the list by position.

Pascal

```
property Strings [Index: Integer]: WideString;
```

C++

```
__property BSTR Strings[int Index];
```

Description

Use the Strings property to get or set the string at a particular position.

Note: In Delphi, Strings is the default property for TWideStrings (see page 25919). This means that the property name can be omitted in code. That is, the statement

```
WString := MyStrings.Strings[0];
```

Can be written

```
WString := MyStrings[0];
```

Note: In C++, Strings can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

IndexOf (see page 25922)

operator_sb

190.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TWebServiceBindingType (see page 25925)	This is record WSDLIntf.TWebServiceBindingType.
	TWSDLElement (see page 25925)	This is record WSDLIntf.TWSDLElement.

Records

	Name	Description
	TWString (see page 25926)	This is record WSDLIntf.TWString.

190.2.1 WSDLIntf.TWebServiceBindingType Enumeration

Pascal

```
TWebServiceBindingType = (
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
);
```

C++

```
enum TWebServiceBindingType {
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
};
```

File

WSDLIntf

Description

This is record WSDLIntf.TWebServiceBindingType.

190.2.2 WSDLIntf.TWSDLElement Enumeration

Pascal

```
TWSDLElement = (
  weServiceIntf,
  weServiceImpl,
  weMessage,
  wePortType,
  weBinding,
```

```
    weService,
    weTypes,
    WeImport,
    weOperation,
    wePart
  );
```

C++

```
  enum TWSDLElement {
    weServiceIntf,
    weServiceImpl,
    weMessage,
    wePortType,
    weBinding,
    weService,
    weTypes,
    WeImport,
    weOperation,
    wePart
  };
```

File

WSDLIntf

Description

This is record WSDLIntf.TWSDLElement.

190.2.3 WSDLIntf.TWString Record

Pascal

```
  TWString = record
    WString: WideString;
  end;
```

C++

```
  struct TWString {
    BSTR WString;
  };
```

File

WSDLIntf

Description

This is record WSDLIntf.TWString.

190.3 Types

The following table lists types in this documentation.

Types

Name	Description
TWSDLElements (see page 25927)	This is type WSDLIntf.TWSDLElements.

190.3.1 WSDLIntf.TWSDLElements Type

Pascal

```
TWSDLElements = set of TWSDLElement;
```

C++

```
TWSDLElement TWSDLElements;
```

File

WSDLIntf

Description

This is type WSDLIntf.TWSDLElements.

190.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Directives (see page 25929)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 25929)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 25930)	This is constant WSDLIntf.Httpns.
Operators (see page 25930)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 25930)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 25931)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 25931)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 25932)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 25932)	This is constant WSDLIntf.SAnyType.
SArray (see page 25932)	This is constant WSDLIntf.SArray.
SArrayOf (see page 25933)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 25933)	This is constant WSDLIntf.SArrayType.
SBinding (see page 25933)	This is constant WSDLIntf.SBinding.
SBody (see page 25934)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 25934)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 25934)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 25935)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 25935)	This is constant WSDLIntf.SDynArray.
SElement (see page 25935)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 25936)	This is constant WSDLIntf.SEncodingStyle.
SFault (see page 25936)	This is constant WSDLIntf.SFault.
SHeader (see page 25936)	This is constant WSDLIntf.SHeader.
SImport (see page 25937)	This is constant WSDLIntf.SImport.
SInOut (see page 25937)	This is constant WSDLIntf.SInOut.
SInput (see page 25937)	This is constant WSDLIntf.SInput.
SLocation (see page 25938)	This is constant WSDLIntf.SLocation.
SMessage (see page 25938)	This is constant WSDLIntf.SMessage.
SName (see page 25938)	This is constant WSDLIntf.SName.
SNameSpace (see page 25939)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 25939)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 25939)	This is constant WSDLIntf.Soapns.
SOperation (see page 25940)	This is constant WSDLIntf.SOperation.
SOutput (see page 25940)	This is constant WSDLIntf.SOutput.
SPart (see page 25940)	This is constant WSDLIntf.SPart.
SParts (see page 25941)	This is constant WSDLIntf.SParts.
SPort (see page 25941)	This is constant WSDLIntf.SPort.
SPortType (see page 25941)	This is constant WSDLIntf.SPortType.
SRequest (see page 25942)	This is constant WSDLIntf.SRequest.
SResponse (see page 25942)	This is constant WSDLIntf.SResponse.
SReturn (see page 25942)	This is constant WSDLIntf.SReturn.
SSchema (see page 25943)	This is constant WSDLIntf.SSchema.
SService (see page 25943)	This is constant WSDLIntf.SService.
SSoapAction (see page 25943)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 25944)	This is constant WSDLIntf.SStyle.

STns (see page 25944)	This is constant WSDLIntf.STns.
STransport (see page 25944)	This is constant WSDLIntf.STransport.
SType (see page 25945)	This is constant WSDLIntf.SType.
STypes (see page 25945)	This is constant WSDLIntf.STypes.
SUnknown (see page 25945)	This is constant WSDLIntf.SUnknown.
SUse (see page 25946)	This is constant WSDLIntf.SUse.
SVerb (see page 25946)	This is constant WSDLIntf.SVerb.
tns (see page 25946)	This is constant WSDLIntf.tns.
Wsdlns (see page 25947)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 25947)	This is constant WSDLIntf.xsdns.

190.4.1 WSDLIntf.Directives Constant

Pascal

```
Directives: array[0..43] of string =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',
'name','near','nodefault','overload','override','package','pascal','private','protected','publi
c',
'published','read','readonly','register','reintroduce','requires','resident','safecall','stdcal
l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

C++

```
array[0..43] of string Directives =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',
'name','near','nodefault','overload','override','package','pascal','private','protected','publi
c',
'published','read','readonly','register','reintroduce','requires','resident','safecall','stdcal
l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Directives.

190.4.2 WSDLIntf.DynArrayTypes Constant

Pascal

```
DynArrayTypes: array[0..12] of string =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

C++

```
array[0..12] of string DynArrayTypes =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
```

```
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

File

WSDLIntf

Description

This is constant WSDLIntf.DynArrayTypes.

190.4.3 WSDLIntf.Httpns Constant

Pascal

```
Httpns = Wsdlns +'http/';
```

C++

```
Httpns = Wsdlns +'http/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Httpns.

190.4.4 WSDLIntf.Operators Constant

Pascal

```
Operators: array[0..12] of string = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

C++

```
array[0..12] of string Operators = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Operators.

190.4.5 WSDLIntf.OtherReservedWords Constant

Pascal

```
OtherReservedWords: array[0..0] of string = ('Application');
```

C++

```
array[0..0] of string OtherReservedWords = ('Application');
```

File

WSDLIntf

Description

This is constant WSDLIntf.OtherReservedWords.

190.4.6 WSDLIntf.ReservedWords Constant

Pascal

```
ReservedWords: array[0..66] of string = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

C++

```
array[0..66] of string ReservedWords = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ReservedWords.

190.4.7 WSDLIntf.SAddress Constant

Pascal

```
SAddress = 'address';
```

C++

```
SAddress = 'address';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAddress.

190.4.8 WSDLIntf.SAnySimpleType Constant

Pascal

```
SAnySimpleType = 'anySimpleType';
```

C++

```
SAnySimpleType = 'anySimpleType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnySimpleType.

190.4.9 WSDLIntf.SAnyType Constant

Pascal

```
SAnyType = 'anyType';
```

C++

```
SAnyType = 'anyType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnyType.

190.4.10 WSDLIntf.SArray Constant

Pascal

```
SArray = 'Array';
```

C++

```
SArray = 'Array';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArray.

190.4.11 WSDLIntf.SArrayOf Constant

Pascal

```
SArrayOf = 'ArrayOf';
```

C++

```
SArrayOf = 'ArrayOf';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayOf.

190.4.12 WSDLIntf.SArrayType Constant

Pascal

```
SArrayType = 'arrayType';
```

C++

```
SArrayType = 'arrayType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayType.

190.4.13 WSDLIntf.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBinding.

190.4.14 WSDLIntf.SBody Constant

Pascal

```
SBody = 'body';
```

C++

```
SBody = 'body';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBody.

190.4.15 WSDLIntf.ScalarArrayTypes Constant

Pascal

```
ScalarArrayTypes: array[0..12] of string =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

C++

```
array[0..12] of string ScalarArrayTypes =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ScalarArrayTypes.

190.4.16 WSDLIntf.SComplexType Constant

Pascal

```
SComplexType = 'complexType';
```

C++

```
SComplexType = 'complexType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SComplexType.

190.4.17 WSDLIntf.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDefinitions.

190.4.18 WSDLIntf.SDynArray Constant

Pascal

```
SDynArray = 'array of ';
```

C++

```
SDynArray = 'array of ';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDynArray.

190.4.19 WSDLIntf.SElement Constant

Pascal

```
SElement = 'element';
```

C++

```
SElement = 'element';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SElement.

190.4.20 WSDLIntf.SEncodingStyle Constant

Pascal

```
SEncodingStyle = 'encodingStyle';
```

C++

```
SEncodingStyle = 'encodingStyle';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SEncodingStyle.

190.4.21 WSDLIntf.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SFault.

190.4.22 WSDLIntf.SHeader Constant

Pascal

```
SHeader = 'header';
```

C++

```
SHeader = 'header';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SHeader.

190.4.23 WSDLIntf.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SImport.

190.4.24 WSDLIntf.SInOut Constant

Pascal

```
SInOut = 'inout';
```

C++

```
SInOut = 'inout';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInOut.

190.4.25 WSDLIntf.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInput.

190.4.26 WSDLIntf.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SLocation.

190.4.27 WSDLIntf.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SMessage.

190.4.28 WSDLIntf.SName Constant

Pascal

```
SName = 'name';
```

C++

```
SName = 'name';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SName.

190.4.29 WSDLIntf.SNameSpace Constant

Pascal

```
SNameSpace = 'namespace';
```

C++

```
SNameSpace = 'namespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNameSpace.

190.4.30 WSDLIntf.SNsPrefix Constant

Pascal

```
SNsPrefix = 'ns';
```

C++

```
SNsPrefix = 'ns';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNsPrefix.

190.4.31 WSDLIntf.Soapns Constant

Pascal

```
Soapns = Wsdlns +'soap/';
```

C++

```
Soapns = Wsdlns +'soap/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Soapns.

190.4.32 WSDLIntf.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOperation.

190.4.33 WSDLIntf.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOutput.

190.4.34 WSDLIntf.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPart.

190.4.35 WSDLIntf.SParts Constant

Pascal

```
SParts = 'parts';
```

C++

```
SParts = 'parts';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SParts.

190.4.36 WSDLIntf.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPort.

190.4.37 WSDLIntf.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPortType.

190.4.38 WSDLIntf.SRequest Constant

Pascal

```
SRequest = 'Request';
```

C++

```
SRequest = 'Request';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SRequest.

190.4.39 WSDLIntf.SResponse Constant

Pascal

```
SResponse = 'Response';
```

C++

```
SResponse = 'Response';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SResponse.

190.4.40 WSDLIntf.SReturn Constant

Pascal

```
SReturn = 'return';
```

C++

```
SReturn = 'return';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SReturn.

190.4.41 WSDLIntf.SSchema Constant

Pascal

```
SSchema = 'schema';
```

C++

```
SSchema = 'schema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSchema.

190.4.42 WSDLIntf.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SService.

190.4.43 WSDLIntf.SSoapAction Constant

Pascal

```
SSoapAction = 'soapAction';
```

C++

```
SSoapAction = 'soapAction';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSoapAction.

190.4.44 WSDLIntf.SStyle Constant

Pascal

```
SStyle = 'style';
```

C++

```
SStyle = 'style';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SStyle.

190.4.45 WSDLIntf.STns Constant

Pascal

```
STns = 'targetNamespace';
```

C++

```
STns = 'targetNamespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STns.

190.4.46 WSDLIntf.STransport Constant

Pascal

```
STransport = 'transport';
```

C++

```
STransport = 'transport';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STransport.

190.4.47 WSDLIntf.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SType.

190.4.48 WSDLIntf.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STypes.

190.4.49 WSDLIntf.SUnknown Constant

Pascal

```
SUnknown = 'Unknown';
```

C++

```
SUnknown = 'Unknown';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUnknown.

190.4.50 WSDLIntf.SUse Constant

Pascal

```
SUse = 'use';
```

C++

```
SUse = 'use';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUse.

190.4.51 WSDLIntf.SVerb Constant

Pascal

```
SVerb = 'verb';
```

C++

```
SVerb = 'verb';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SVerb.

190.4.52 WSDLIntf.tns Constant

Pascal

```
tns = 'http:/'+'/tempuri.org/';
```

C++

```
tns = 'http:/'+'/tempuri.org/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.tns.

190.4.53 WSDLIntf.Wsdlns Constant

Pascal

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

C++

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Wsdlns.

190.4.54 WSDLIntf.xsdns Constant

Pascal

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

C++

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.xsdns.

191 WSDLItems Namespace

This is namespace WSDLItems.

Topics

Name	Description
Classes (see page 25951)	The following table lists classes in this documentation.
Interfaces (see page 25989)	The following table lists interfaces in this documentation.
Functions (see page 26000)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 26002)	The following table lists structs, records, enums in this documentation.
Types (see page 26003)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLItems (see page 25951)	TWSDLItems represents the definitions in a WSDL document.

Functions

	Name	Description
	HasDefinition (see page 26000)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 26000)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 26000)	This is function WSDLItems.NewQualifiedName.

Interfaces

	Name	Description
	IHeaderInfo (see page 25989)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 25994)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 25998)	IWSDLItems provides access to a WSDL document.

Structs, Records, Enums

	Name	Description
	IterateImportOptions (see page 26002)	This is record WSDLItems.IterateImportOptions.

Types

Name	Description
IHeaderInfoArray (see page 26003)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 26003)	This is type WSDLItems.IQualifiedNameArray.

TWSDLIterateProc (see page 26003)	This is type WSDLItems.TWSDLIterateProc.

191.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWSDLItems (see page 25951)	TWSDLItems represents the definitions in a WSDL document.

191.1.1 TWSDLItems Class

TWSDLItems represents the definitions in a WSDL document.

Class Hierarchy

Pascal

```
TWSDLItems = class(TWSDLDocument, IWSDLItems);
```

C++

```
class TWSDLItems : public TWSDLDocument, public IWSDLItems;
```

File

WSDLItems

Description

Use TWSDLItems to represent a WSDL (Web Services Definition Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements. TWSDLItems augments its immediate ancestor (TWSDLDocument) by introducing methods that provide easier access to the definitions in the WSDL document.

TWSDLItems can read an existing WSDL document from a file or server, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLItems uses an external DOM (Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLItems uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLItems is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLItems instance is automatically freed. When TWSDLItems is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

191.1.1.1 TWSDLItems Members

The following tables list the members exposed by TWSDLItems.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 26113)	Returns the value of the Active property.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDefinition (see page 25807)	Returns the value of the Definition property.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetModified (see page 26116)	Returns the value of the Modified property.

	GetName (see page 25967)	Returns the name of the definitions node in the WSDL document.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetTargetNamespace (see page 25984)	Returns the value of the TargetNamespace (see page 25988) property.
	GetTargetNamespacePrefix (see page 25985)	Returns the prefix string that represents the target namespace of the WSDL document.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	LoadData (see page 25807)	This is LoadData, a member of class TWSDLDocument.
	LoadData (see page 26120)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDefinition (see page 25807)	Sets the value of the Definition property.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.

	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 25807)	Initializes the TWSDLDocument (see page 25799) object after the last constructor has executed.
V	AfterConstruction (see page 26107)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CompareName (see page 25962)	Indicates whether two node names refer to the same element.
V	Create (see page 25959)	This is the overview for the Create constructor overload.
	Create (see page 26103)	This is the overview for the Create constructor overload.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.
	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.

	Destroy (see page 26104)	Disposes of a TXMLDocument (see page 26097) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetBindingForServicePort (see page 25962)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 25963)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 25963)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 25964)	Fills a WideString list with the names of all bindings defined in the WSDL document.
	GetBindingType (see page 25964)	Returns the port type to which a specified binding applies.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDefinition (see page 25903)	Returns the value of the Definition (see page 25904) property.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetHttpBindingAttribute (see page 25965)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 25965)	Fills a WideString list with the namespaces of all documents imported by this one.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetLocationForImport (see page 25966)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 25966)	Returns the interface for the node that describes a message.
	GetMessages (see page 25967)	Fills a WideString list with the names of all messages defined in the WSDL document.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOperationNode (see page 25967)	Returns the interface for the node that describes an operation.

	GetOperations (see page 25968)	Fills a WideString list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 25968)	This is GetOperationsForBinding, a member of class TWSDLItems.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetPartNode (see page 25969)	Returns the interface for the node that describes a part of a message.
	GetParts (see page 25969)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 25970)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 25970)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 25971)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 25971)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 25972)	Returns the interface for the schema node that defines a type.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetSchemas (see page 25972)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 25973)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 25973)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 25974)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 25974)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 25975)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 25975)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 25976)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 25976)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 25977)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 25978)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 25978)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.
	GetSoapBodyInputAttribute (see page 25979)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.
	GetSoapBodyNamespace (see page 25980)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 25980)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 25981)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 25982)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 25982)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 25983)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 25983)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetWSDLDoc (see page 25985)	Returns the interface for this TWSDLItems (see page 25951) instance.
	GetWSDLItems (see page 25985)	Returns a reference to this TWSDLItems (see page 25951) instance.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasTypesNode (see page 25986)	Indicates whether the WSDL document includes any type definitions.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.

	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	IsPortTypeHTTPBound (see page 25986)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 25986)	Executes a callback for every WSDL document that this one imports.
	Load (see page 25987)	Loads a WSDL document and activates it.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDefinition (see page 25903)	Sets the value of the Definition (see page 25904) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.

	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	Definition (see page 25904)	Provides access to the definitions contained in the WSDL document.
	Definition (see page 25808)	Provides access to the definitions contained in the WSDL document.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 26408)	Influences various aspects of the document's behavior.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.

	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
R	StreamLoader (see page 25987)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 25988)	Provides access to an interface for loading the WSDL document.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

191.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
V	TWSDLItems.Create (TComponent) (see page 25960)	Creates and initializes a TWSDLItems (see page 25951) object.
V	TWSDLItems.Create (TWSDLItems, IStreamLoader) (see page 25960)	Creates and initializes a TWSDLItems (see page 25951) object.

191.1.1.2.1 TWSDLItems.Create Constructor (TComponent)

Creates and initializes a TWSDLItems (see page 25951) object.

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
constructor Create(const WSDLItems: TWSDLItems; const StreamLoader: IStreamLoader); virtual;
overload;
```

C++

```
virtual __fastcall TWSDLItems(TComponent * AOwner);
virtual __fastcall TWSDLItems(const TWSDLItems WSDLItems, const IStreamLoader StreamLoader);
```

Description

Call Create to instantiate a TWSDLItems (see page 25951) component at runtime. Typically, TWSDLItems (see page 25951) instances are created by other components, such as THTTPRIO, that use them.

AOwner is another component, typically a form or data module, that is responsible for freeing the TWSDLItems (see page 25951) instance. It becomes the value of the Owner property.

WSDLItems (see page 25949) is another TWSDLItems (see page 25951) object that the new instance can use to extract a stream loader if none is specified using the StreamLoader (see page 25987) property,

StreamLoader (see page 25987) is an interface to use for loading the WSDL document from a server. It includes properties for specifying the user name, password, and proxy server needed to connect to the server that hosts the WSDL document.

If you do not specify a stream loader, the TWSDLItems (see page 25951) constructor creates one as follows: Using the first syntax, it creates a default stream loader object. Using the second syntax, it uses the stream loader from the TWSDLItems (see page 25951) instance that is the first parameter. Thus, when using the second syntax, you must supply either the WSDLItems (see page 25949) or StreamLoader (see page 25987) argument.

THTTPRio

Owner (see page 2807)

191.1.1.3 TWSDLItems Methods

The methods of the TWSDLItems class are listed here.

Protected Methods

	Name	Description
	GetName (see page 25967)	Returns the name of the definitions node in the WSDL document.
	GetTargetNamespace (see page 25984)	Returns the value of the TargetNamespace (see page 25988) property.
	GetTargetNamespacePrefix (see page 25985)	Returns the prefix string that represents the target namespace of the WSDL document.

Public Methods

	Name	Description
	CompareName (see page 25962)	Indicates whether two node names refer to the same element.
	GetBindingForServicePort (see page 25962)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 25963)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 25963)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 25964)	Fills a WideString list with the names of all bindings defined in the WSDL document.

	GetBindingType (see page 25964)	Returns the port type to which a specified binding applies.
	GetHttpBindingAttribute (see page 25965)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 25965)	Fills a WideString list with the namespaces of all documents imported by this one.
	GetLocationForImport (see page 25966)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 25966)	Returns the interface for the node that describes a message.
	GetMessages (see page 25967)	Fills a WideString list with the names of all messages defined in the WSDL document.
	GetOperationNode (see page 25967)	Returns the interface for the node that describes an operation.
	GetOperations (see page 25968)	Fills a WideString list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 25968)	This is GetOperationsForBinding, a member of class TWSDLItems.
	GetPartNode (see page 25969)	Returns the interface for the node that describes a part of a message.
	GetParts (see page 25969)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 25970)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 25970)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 25971)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 25971)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 25972)	Returns the interface for the schema node that defines a type.
	GetSchemas (see page 25972)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 25973)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 25973)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 25974)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 25974)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 25975)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 25975)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 25976)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 25976)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 25977)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 25978)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 25978)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.
	GetSoapBodyInputAttribute (see page 25979)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.
	GetSoapBodyNamespace (see page 25980)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 25980)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 25981)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 25982)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 25982)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 25983)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 25983)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetWSDLDoc (see page 25985)	Returns the interface for this TWSDLItems (see page 25951) instance.
	GetWSDLItems (see page 25985)	Returns a reference to this TWSDLItems (see page 25951) instance.
	HasTypesNode (see page 25986)	Indicates whether the WSDL document includes any type definitions.
	IsPortTypeHTTPBound (see page 25986)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 25986)	Executes a callback for every WSDL document that this one imports.
	Load (see page 25987)	Loads a WSDL document and activates it.

191.1.1.3.1 TWSDLItems.CompareName Method

Indicates whether two node names refer to the same element.

Pascal

```
function CompareName(const NodeName: WideString; const OtherName: WideString; const TNS:
WideString = ''): boolean;
```

C++

```
__fastcall boolean CompareName(const BSTR NodeName, const BSTR OtherName, const BSTR TNS = '');
```

Description

Call CompareName to compare the names of two nodes to determine whether they match. CompareName compares the node names, taking into account any namespace prefix added to the node names. CompareName uses the namespace prefix to look up the corresponding namespace URI. If either node name does not have a namespace prefix, CompareName uses the TargetNamespace (see page 25988) property for the first node name, and the supplied namespace for the second. CompareName can find a match between two node names that have different namespace prefixes, as long as both prefixes map to the same namespace URI.

NodeName and OtherName are the two node names to compare.

TNS is the target namespace for OtherName. If this is a nonempty string, it is used to replace the namespace of OtherName. If it is an empty string, OtherName uses the namespace associated with its namespace prefix, or the TargetNamespace (see page 25988) property if it has no namespace prefix.

CompareName returns true if the two names match, false if they differ (either in the local name, or in the namespace to which the names belong).

See Also

NodeName (see page 26435)

TargetNamespace (see page 25988)

191.1.1.3.2 TWSDLItems.GetBindingForServicePort Method

Returns the name of the binding associated with a specified service and port.

Pascal

```
function GetBindingForServicePort(const ServiceName: WideString; const PortName: WideString):
IQualifiedName;
```

C++

```
__fastcall IQualifiedName GetBindingForServicePort(const BSTR ServiceName, const BSTR
PortName);
```

Description

Call GetBindingForServicePort to retrieve the name of a binding that is associated with the specified service and port. The binding is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

ServiceName is the name of the service to which the desired binding belongs.

PortName is the name of a port within the specified service that uses the binding.

See Also

GetBindings (see page 25964)

GetBindingType (see page 25964)

GetPortsForService (see page 25970)

GetServices (see page 25974)

GetBindingOfType (see page 25963)

GetServiceAndPortOfBinding (see page 25973)

191.1.1.3.3 TWSDLItems.GetBindingOfType Method

Returns the names of all bindings associated with a specified port type.

Pascal

```
function GetBindingOfType(const BindingTypeName: WideString; const TNS: WideString = ''):
IQualifiedNameArray; overload;
```

C++

```
__fastcall IQualifiedNameArray GetBindingOfType(const BSTR BindingTypeName, const BSTR TNS =
'');
```

Description

Call GetBindingOfType to retrieve the names of the bindings that are associated with the specified port type. Each bindings is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingTypeName is the type of the binding. This is the name of a port type for which the binding describes an encoding format and communications protocol.

TNS is the namespace in which BindingTypeName is defined. If this parameter is omitted, GetBindingOfType assumes the value of the TargetNamespace (see page 25988) property.

GetBindingOfType returns an array of qualified names for each binding defined for the specified type.

See Also

GetBindings (see page 25964)

GetPortTypes (see page 25971)

GetBindingType (see page 25964)

TargetNamespace (see page 25988)

191.1.1.3.4 TWSDLItems.GetBindingOperationNode Method

Returns the interface for a specified operation on a specified binding.

Pascal

```
function GetBindingOperationNode(const BindingName: WideString; const Operation: WideString;
OverloadIndex: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperationNode(const BSTR BindingName, const BSTR
Operation, int OverloadIndex);
```

Description

Call GetBindingOperationNode to retrieve the operation interface for a SOAP binding. GetBindingOperationNode locates a binding with the specified name, and searches its child nodes for an operation node with the specified name. If there is more

than one operation with the specified name (that is, if the method is overloaded), GetBindingOperationNode locates the desired overload based on its position.

BindingName is the name of the binding. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that binding node. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node to choose if there are overloaded methods. 0 indicates the first operation node with the specified name, 1 indicates the second operation node with that name, and so on.

GetBindingOperationNode returns an IBindingOperation interface, which can be used to access the name, inputs, outputs, and faults associated with the operation. If GetBindingOperationNode is unable to locate an operation node for the specified binding and operation names, it returns nil (Delphi) or NULL (C++).

See Also

GetOperationNode (see page 25967)

191.1.1.3.5 TWSDLItems.GetBindings Method

Fills a WideString list with the names of all bindings defined in the WSDL document.

Pascal

```
procedure GetBindings(BindingNames: TWideStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetBindings(TWideStrings BindingNames, Boolean QualifiedNames = False);
```

Description

Call GetBindings to retrieve the names of all bindings defined in the WSDL document. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingNames is an existing TWideStrings object to which the names of any defined bindings are added.

QualifiedNames indicates whether the binding names should be qualified using the target namespace prefix.

Note: GetBindings does not clear the WideString list before adding the names of all defined bindings.

See Also

GetBindingForServicePort (see page 25962)

GetBindingType (see page 25964)

GetPortTypes (see page 25971)

191.1.1.3.6 TWSDLItems.GetBindingType Method

Returns the port type to which a specified binding applies.

Pascal

```
function GetBindingType(const BindingName: WideString): WideString;
```

C++

```
__fastcall BSTR GetBindingType(const BSTR BindingName);
```

Description

Call GetBindingType to retrieve the names of the port type to which a specified binding applies.

BindingName is the name of a binding defined in the WSDL document.

See Also

GetBindingForServicePort (see page 25962)

GetBindings (see page 25964)

GetPortTypes (see page 25971)

GetBindingOfType (see page 25963)

191.1.1.3.7 GetHttpBindingAttribute Method

This is the overview for the GetHttpBindingAttribute method overload.

Overload List

	Name	Description
	TWSDLItems.GetHttpBindingAttribute (IQualifiedName, WideString) (see page 25965)	Returns the value of a specified attribute of a binding's <http:binding> node.
	TWSDLItems.GetHttpBindingAttribute (WideString, WideString) (see page 25965)	Returns the value of a specified attribute of a binding's <http:binding> node.

191.1.1.3.7.1 TWSDLItems.GetHttpBindingAttribute Method (IQualifiedName, WideString)

Returns the value of a specified attribute of a binding's <http:binding> node.

Pascal

```
function GetHttpBindingAttribute(const BindingName: WideString; Attribute: WideString):
WideString; overload;
function GetHttpBindingAttribute(const QualifiedName: IQualifiedName; Attribute: WideString):
WideString; overload;
```

C++

```
__fastcall BSTR GetHttpBindingAttribute(const BSTR BindingName, BSTR Attribute);
__fastcall BSTR GetHttpBindingAttribute(const IQualifiedName QualifiedName, BSTR Attribute);
```

Description

Call GetHttpBindingAttribute to retrieve value of an attribute on the http binding tag of a specified binding. The http binding tag can come from the WSDL document or another document that it imports.

BindingName or QualifiedName is the name of the binding that includes the <http:binding> tag.

Attribute is the name of the desired attribute on the <http:binding> tag.

See Also

GetSoapBindingAttribute (see page 25976)

GetSoapFaultAttribute

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 25982)

GetSoapBodyAttribute (see page 25978)

191.1.1.3.8 TWSDLItems.GetImports Method

Fills a WideString list with the namespaces of all documents imported by this one.

Pascal

```
procedure GetImports(ImportNames: TWideStrings);
```

C++

```
__fastcall GetImports(TWideStrings ImportNames);
```

Description

Call GetImports to retrieve the namespaces for of all documents that are imported into this one using an <import> tag. The location of these imported documents can be retrieved from the namespace using the GetLocationForImport (see page 25966) method.

ImportNames is an existing TWideStrings object to which the namespaces for any imports are added.

Note: GetImports does not clear the WideString list before adding the namespaces for all imported documents.

See Also

GetLocationForImport (see page 25966)

191.1.1.3.9 TWSDLItems.GetLocationForImport Method

Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.

Pascal

```
function GetLocationForImport(const ImportNameSpace: WideString): WideString;
```

C++

```
__fastcall BSTR GetLocationForImport(const BSTR ImportNameSpace);
```

Description

Call GetLocationForImport to retrieve the URI that indicates the location of an imported document, given its namespace.

ImportNameSpace is the namespace that identifies another document that is imported into this WSDL document. It is one of the strings retrieved by the GetImports (see page 25965) method.

See Also

GetImports (see page 25965)

191.1.1.3.10 TWSDLItems.GetMessageNode Method

Returns the interface for the node that describes a message.

Pascal

```
function GetMessageNode(const MessageName: WideString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetMessageNode(const BSTR MessageName);
```

Description

Call GetMessageNode to obtain information about a message defined in the WSDL document. A message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageName is the name of the message whose node is returned.

See Also

GetMessages (see page 25967)

GetParts (see page 25969)

191.1.1.3.11 TWSDLItems.GetMessages Method

Fills a WideString list with the names of all messages defined in the WSDL document.

Pascal

```
procedure GetMessages(MessageNames: TWideStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetMessages(TWideStrings MessageNames, Boolean QualifiedNames = False);
```

Description

Call GetMessages to retrieve the names of all messages defined in the WSDL document. Each message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageNames is an existing TWideStrings object to which the names of all messages are added.

QualifiedNames indicates whether the message names added to the list should be qualified using the target namespace prefix.

Note: GetMessages does not clear the WideString list before adding the message names defined in the WSDL document.

See Also

GetMessageNode (see page 25966)

GetParts (see page 25969)

191.1.1.3.12 TWSDLItems.GetName Method

Returns the name of the definitions node in the WSDL document.

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

The root node of a WSDL document is always a definitions node. This node gives a name to the set of definitions in the WSDL document. Call GetName to retrieve that name.

See Also

Definition (see page 25808)

GetTargetNamespace (see page 25984)

191.1.1.3.13 TWSDLItems.GetOperationNode Method

Returns the interface for the node that describes an operation.

Pascal

```
function GetOperationNode(const PortTypeName: WideString; const OperationName: WideString):
IXMLNode;
```

C++

```
__fastcall IXMLNode GetOperationNode(const BSTR PortTypeName, const BSTR OperationName);
```

Description

Call GetOperationNode to obtain information about an operation defined in the WSDL document. An operation corresponds to a method on the interface that corresponds to a specified port type.

PortTypeName is the name of the port type that contains the specified operation.

OperationName is the name of the operation whose node is returned.

See Also

GetOperations (see page 25968)

getoperationsforbinding (see page 25968)

GetPortTypes (see page 25971)

191.1.1.3.14 TWSDLItems.GetOperations Method

Fills a WideString list with the names of all operations defined for a specified port type.

Pascal

```
procedure GetOperations(const PortTypeName: WideString; OperationNames: TWideStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperations(const BSTR PortTypeName, TWideStrings OperationNames, Boolean
QualifiedNames = False);
```

Description

Call GetOperations to retrieve the names of all operations defined in for the port type specified by PortTypeName. An operation corresponds to a method on the interface that corresponds to the specified port type.

PortTypeName is the name of the port type whose operations are retrieved.

OperationNames is an existing TWideStrings object to which the names of all operations on PortTypeName are added.

QualifiedNames indicates whether the operation names added to the list should be qualified using the target namespace prefix.

Note: GetOperations does not clear the WideString list before adding the names of the operations on the specified port type.

See Also

GetOperationNode (see page 25967)

getoperationsforbinding (see page 25968)

GetPortTypes (see page 25971)

191.1.1.3.15 TWSDLItems.GetOperationsForBinding Method

Pascal

```
procedure GetOperationsForBinding(const BindingName: WideString; OperationNames: TWideStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperationsForBinding(const BSTR BindingName, TWideStrings OperationNames,
Boolean QualifiedNames = False);
```

Description

This is GetOperationsForBinding, a member of class TWSDLItems.

191.1.1.3.16 TWSDLItems.GetPartNode Method

Returns the interface for the node that describes a part of a message.

Pascal

```
function GetPartNode(const MessageName: WideString; const PartName: WideString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPartNode(const BSTR MessageName, const BSTR PartName);
```

Description

Call GetPartNode to obtain information about a part that is defined for a message. Every message consists of one or more parts, each of which is associated with a definition from some type system.

MessageName is the name of the message that is defined using the part.

PartName is the name of the part whose node is returned.

See Also

GetParts (see page 25969)

GetMessages (see page 25967)

GetPartsForOperation (see page 25970)

191.1.1.3.17 TWSDLItems.GetParts Method

Fills a list with the names of all parts defined for a specified message.

Pascal

```
procedure GetParts(const MessageName: WideString; PartNames: TWideStrings; QualifiedNames:
Boolean = False);
```

C++

```
__fastcall GetParts(const BSTR MessageName, TWideStrings PartNames, Boolean QualifiedNames =
False);
```

Description

Call GetParts to retrieve the names of all parts that make up a specified message. A part corresponds to definition from some type system.

MessageName is the name of the message whose parts are retrieved.

PartNames is an existing TWideStrings object to which the names of all parts on MessageName are added.

QualifiedNames indicates whether the part names added to the list should be qualified using the target namespace prefix.

Note: GetParts does not clear the WideString list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 25969)

GetMessages (see page 25967)

GetPartsForOperation (see page 25970)

191.1.1.3.18 TWSDLItems.GetPartsForOperation Method

Fills a list with the names of all parts defined for input messages of a specified operation.

Pascal

```
function GetPartsForOperation(const PortTypeName: WideString; const OperationName: WideString;
OperationIndex: Integer; PartNames: TWideStrings): Boolean;
```

C++

```
__fastcall Boolean GetPartsForOperation(const BSTR PortTypeName, const BSTR OperationName, int
OperationIndex, TWideStrings PartNames);
```

Description

Call GetPartsForOperation to retrieve the names of all parts that make up input messages on a specified operation. The part definition must be in the WSDL document or a document that it imports. A part corresponds to definition from some type system.

PortTypeName is the name of the port type that contains the operation. A port type corresponds to an invokable interface in a Web Service application.

OperationName is the name of the operation from whose input messages the parts are retrieved. An operation corresponds to a method on the interface that corresponds to PortTypeName.

PartNames is an existing TWideStrings object to which the names of all parts on input messages (input parameters) of the operation specified by OperationName.

GetPartsForOperation returns true if it adds any part names to PartNames, false if there are no parts to add.

Note: GetPartsForOperation does not clear the WideString list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 25969)

GetParts (see page 25969)

GetOperations (see page 25968)

191.1.1.3.19 TWSDLItems.GetPortsForService Method

Fills a list with the names of all ports defined within a specified service.

Pascal

```
procedure GetPortsForService(const ServiceName: WideString; PortNames: TWideStrings;
SkipHttpBindings: Boolean = True; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortsForService(const BSTR ServiceName, TWideStrings PortNames, Boolean
SkipHttpBindings = True, Boolean QualifiedNames = False);
```

Description

Call GetPortsForService to retrieve the names of all ports defined for the specified service. A port represents a binding, plus the

address where that binding can be found.

ServiceName is the name of the service whose ports are listed.

PortNames is an existing TWideStrings object to which the names of all ports in the specified service are added.

SkipHttpBindings indicates whether GetPortsForService should include port types whose definitions include an <http:binding> tag. When false, GetPortsForService retrieves all port type definitions. When true, GetPortsForService ignores port type definitions with simple HTTP bindings.

QualifiedNames indicates whether the port names added to the list should be qualified using the target namespace prefix.

Note: GetPortsForService does not clear the WideString list before adding the names of the ports.

See Also

GetBindingForServicePort (see page 25962)

GetServices (see page 25974)

191.1.1.3.20 TWSDLItems.GetPortTypeNode Method

Returns the interface for the node that describes a port type defined in the WSDL document.

Pascal

```
function GetPortTypeNode(const PortTypeName: WideString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPortTypeNode(const BSTR PortTypeName);
```

Description

Call GetPortTypeNode to obtain information about a port type that is defined in the WSDL document or a document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeName is the name of the port type whose node is returned.

See Also

GetPortTypes (see page 25971)

191.1.1.3.21 TWSDLItems.GetPortTypes Method

Fills a list with the names of all port types defined in the WSDL document.

Pascal

```
procedure GetPortTypes(PortTypeNames: TWideStrings; SkipHttpBindings: Boolean = True;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortTypes(TWideStrings PortTypeNames, Boolean SkipHttpBindings = True, Boolean
QualifiedNames = False);
```

Description

Call GetPortTypes to retrieve the names of all port types defined in the WSDL document or any document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeNames is an existing TWideStrings object to which the names of all port types are added.

SkipHttpBindings indicates whether GetPortTypes should include port types whose definitions include an <http:binding> tag. When false, GetPortTypes retrieves all port type definitions. When true, GetPortTypes ignores port type definitions with simple

HTTP bindings.

QualifiedNames indicates whether the port type names added to the list should be qualified using the target namespace prefix.

Note: GetPortTypes does not clear the WideString list before adding the names of the port types.

See Also

GetPortTypeNode (see page 25971)

GetOperations (see page 25968)

191.1.1.3.22 TWSDLItems.GetSchemaNode Method

Returns the interface for the schema node that defines a type.

Pascal

```
function GetSchemaNode(const SchemaTns: WideString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSchemaNode(const BSTR SchemaTns);
```

Description

Call GetSchemaNode to obtain information about a schema definition for a type that is defined in the WSDL document.

SchemaTns is the target namespace of the schema definition for a type.

GetSchemaNode returns the corresponding node.

See Also

GetSchemas (see page 25972)

HasTypesNode (see page 25986)

191.1.1.3.23 TWSDLItems.GetSchemas Method

Fills a list with the namespaces for all schema definitions of types in the WSDL document.

Pascal

```
procedure GetSchemas(SchemaNames: TWideStrings);
```

C++

```
__fastcall GetSchemas(TWideStrings SchemaNames);
```

Description

Call GetSchemaTypes to retrieve the namespaces that correspond to schema definitions of types.

SchemaNames is an existing TWideStrings object to which the namespaces for the schema definitions are added.

Note: GetSchemas does not clear the WideString list before adding the namespaces of the schema definitions.

See Also

GetSchemaNode (see page 25972)

HasTypesNode (see page 25986)

191.1.1.3.24 TWSDLItems.GetServiceAndPortOfBinding Method

Retrieves the names of the service and port associated with a specified binding.

Pascal

```
function GetServiceAndPortOfBinding(const BindingName: IQualifiedName; var ServiceName:
WideString; var PortName: WideString): Boolean;
```

C++

```
__fastcall Boolean GetServiceAndPortOfBinding(const IQualifiedName BindingName, BSTR
ServiceName, BSTR PortName);
```

Description

Call GetServiceAndPortOfBinding to retrieve the name of the service and port associated with a specified binding. GetServiceAndPortOfBinding performs the converse lookup from the GetBindingForServicePort (see page 25962) method.

BindingName specifies the qualified name of the binding for which you want to look up the service and port.

ServiceName returns the name of the service to which the binding belongs.

PortName returns the name of a port within the service that uses the binding.

GetServiceAndPortOfBinding returns true if it locates the specified binding and returns a service and port. It returns false if the specified binding is not defined in the WSDL document.

See Also

GetServices (see page 25974)

GetServiceNode (see page 25973)

GetBindingForServicePort (see page 25962)

GetPortsForService (see page 25970)

GetBindingOfType (see page 25963)

GetBindings (see page 25964)

191.1.1.3.25 TWSDLItems.GetServiceNode Method

Returns the interface for the node that describes a service defined in the WSDL document.

Pascal

```
function GetServiceNode(const ServiceName: WideString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetServiceNode(const BSTR ServiceName);
```

Description

Call GetServiceNode to obtain information about a service that is defined in the WSDL document. A service is a collection of related ports.

ServiceName is the name of the service whose node is returned.

See Also

GetServices (see page 25974)

GetPortsForService (see page 25970)

GetServiceAndPortOfBinding (see page 25973)

191.1.1.3.26 TWSDLItems.GetServices Method

Fills a list with the names of all services defined in the WSDL document.

Pascal

```
procedure GetServices(ServiceNames: TWideStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetServices(TWideStrings ServiceNames, Boolean QualifiedNames = False);
```

Description

Call GetServices to retrieve the names of all services defined in the WSDL document or any document that it imports. Each service is a collection of related ports.

ServiceNames is an existing TWideStrings object to which the names of all services are added.

QualifiedNames indicates whether the service names added to the list should be qualified using the target namespace prefix.

Note: GetServices does not clear the WideString list before adding the names of the services.

See Also

GetServiceNode (see page 25973)

GetPortsForService (see page 25970)

GetServiceAndPortOfBinding (see page 25973)

191.1.1.3.27 TWSDLItems.GetSoapAction Method

Returns the value of the soapAction attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapAction(const BindingName: WideString; const Operation: WideString;
OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapAction(const BSTR BindingName, const BSTR Operation, int OverloadIndex);
```

Description

Call GetSoapAction to retrieve the value of the soapAction attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation is desired when the operation is overloaded.

See Also

GetSoapActionList (see page 25975)

GetBindings (see page 25964)

getoperationsforbinding (see page 25968)

GetSoapOperationAttribute (see page 25982)

191.1.1.3.28 TWSDLItems.GetSoapActionList Method

Fills a list with the soapAction attributes for all operations on a specified SOAP binding.

Pascal

```
procedure GetSoapActionList(const BindingName: WideString; ActionList: TWideStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetSoapActionList(const BSTR BindingName, TWideStrings ActionList, Boolean
QualifiedNames = False);
```

Description

Call GetSoapActionList to retrieve the value of the soapAction attribute of each operation of a specified SOAP binding. Each soapAction is added as a string with the format

```
OperationName = soapActionName
```

where OperationName is the name of the operation with which the soapAction attribute is associated.

BindingName is the name of the binding associated with the port type whose operations are retrieved along with their SOAP actions.

OperationNames is an existing TWideStrings object to which the names of all operations on the binding's port type are added.

QualifiedNames specifies whether the operation names should be qualified using the target namespace prefix.

Note: GetSoapActionList does not clear the WideString list before adding the names of the operations and their corresponding SOAP actions.

See Also

GetSoapAction (see page 25974)

GetBindings (see page 25964)

getoperationsforbinding (see page 25968)

GetSoapOperationAttribute (see page 25982)

191.1.1.3.29 TWSDLItems.GetSoapAddressForServicePort Method

Returns the address of a specified port from a specified service.

Pascal

```
function GetSoapAddressForServicePort(const ServiceName: WideString; const PortName:
WideString): WideString;
```

C++

```
__fastcall BSTR GetSoapAddressForServicePort(const BSTR ServiceName, const BSTR PortName);
```

Description

Call GetSoapAddressForServicePort to retrieve the address to which a SOAP request should be sent if it wants to access a specified port from a specified service.

ServiceName is the name of the service that contains the desired port. It is defined in the WSDL document or another document that it imports.

PortName is the name of the port whose address is returned.

See Also

GetBindingForServicePort (see page 25962)

GetPortsForService (see page 25970)

191.1.1.3.30 TWSDLItems.GetSoapBindingAttribute Method

Returns the value of a specified attribute of a specified SOAP binding.

Pascal

```
function GetSoapBindingAttribute(const BindingName: WideString; Attribute: WideString):
WideString;
```

C++

```
__fastcall BSTR GetSoapBindingAttribute(const BSTR BindingName, BSTR Attribute);
```

Description

Call GetSoapBindingAttribute to retrieve value of an attribute on a SOAP binding. GetSoapBindingAttribute locates a binding with the specified name that includes a <soap:binding> tag, and returns the specified attribute from that <soap:binding> tag.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Attribute is the name of the desired attribute on the <soap:binding> tag.

If BindingName does not identify a binding that includes a <soap:binding> tag that has the specified attribute, GetSoapBindingAttribute returns an empty string.

See Also

GetSoapBodyAttribute (see page 25978)

GetSoapFaultAttribute

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 25982)

GetBindingForServicePort (see page 25962)

191.1.1.3.31 TWSDLItems.GetSoapBindingInputNode Method

Returns the interface for the input node on a specified binding and operation.

Pascal

```
function GetSoapBindingInputNode(const BindingName: WideString; const Operation: WideString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingInputNode(const BSTR BindingName, const BSTR Operation, int
OverloadIndex);
```

Description

Call GetSoapBindingInputNode to retrieve the node for input messages (parameters) on an operation of a SOAP binding. GetSoapBindingInputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the input node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport

protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingInputNode is unable to locate an input node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 25978)

GetSoapBodyAttribute (see page 25978)

GetSoapBindingIONode (see page 25977)

GetBindingForServicePort (see page 25962)

191.1.1.3.32 TWSDLItems.GetSoapBindingIONode Method

Returns the interface for a node on a specified binding and operation.

Pascal

```
function GetSoapBindingIONode(const BindingName: WideString; const Operation: WideString;
Input: Boolean; OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingIONode(const BSTR BindingName, const BSTR Operation, Boolean
Input, int OverloadIndex);
```

Description

Call GetSoapBindingIONode to retrieve a specified node on an operation of a SOAP binding. GetSoapBindingIONode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the child of that node with a specified name. This method provides the underlying implementation for the GetSoapBindingInputNode (see page 25976) and GetSoapBindingOutputNode (see page 25978) methods.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input indicates whether the child node is an input node (true) or an output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingIONode is unable to locate a node for the specified name, binding, and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 25978)

GetSoapBodyAttribute (see page 25978)

GetSoapBindingInputNode (see page 25976)

GetBindingForServicePort (see page 25962)

191.1.1.3.33 TWSDLItems.GetSoapBindingOutputNode Method

Returns the interface for the output node on a specified binding and operation.

Pascal

```
function GetSoapBindingOutputNode(const BindingName: WideString; const Operation: WideString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingOutputNode(const BSTR BindingName, const BSTR Operation, int
OverloadIndex);
```

Description

Call GetSoapBindingOutputNode to retrieve the node for output messages (output parameters or return value) on an operation of a SOAP binding. GetSoapBindingOutputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the output node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingOutputNode is unable to locate an output node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingInputNode (see page 25976)

GetSoapBodyAttribute (see page 25978)

GetSoapBindingIONode (see page 25977)

GetBindingForServicePort (see page 25962)

191.1.1.3.34 TWSDLItems.GetSoapBodyAttribute Method

Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyAttribute(const BindingName: WideString; const Operation: WideString;
const IOType: WideString; const Attribute: WideString; OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapBodyAttribute(const BSTR BindingName, const BSTR Operation, const BSTR
IOType, const BSTR Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyAttribute to retrieve value of an attribute on the body tag for a message type that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the message.

IOType indicates the type of the message (input or output).

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

GetSoapBodyOutputAttribute (see page 25980)

191.1.1.3.35 TWSDLItems.GetSoapBodyInputAttribute Method

Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyInputAttribute(const BindingName: WideString; const Operation: WideString;
const Attribute: WideString; OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapBodyInputAttribute(const BSTR BindingName, const BSTR Operation, const
BSTR Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyInputAttribute to retrieve value of an attribute on the body tag for an input message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the input message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyInputAttribute returns the same value as GetSoapBodyAttribute (see page 25978) with an IOType of 'input'.

See Also

GetSoapBodyAttribute (see page 25978)

GetSoapBodyOutputAttribute (see page 25980)

getoperationsforbinding (see page 25968)

GetInOutMessagesForOperation

191.1.1.3.36 TWSDLItems.GetSoapBodyNamespace Method

Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.

Pascal

```
function GetSoapBodyNamespace(const BindingPortType: WideString): WideString;
```

C++

```
__fastcall BSTR GetSoapBodyNamespace(const BSTR BindingPortType);
```

Description

GetSoapBodyNamespace searches the bindings in the WSDL document and any documents it imports for one that has a port type that matches BindingPortType. It then searches the operations of that binding to find one whose messages include a SOAP body node. It returns the namespace attribute of that SOAP body node.

PortTypeName is the name of the port type (interface) that must appear in the binding.

See Also

GetSoapBodyAttribute (see page 25978)

GetPortTypes (see page 25971)

191.1.1.3.37 TWSDLItems.GetSoapBodyOutputAttribute Method

Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyOutputAttribute(const BindingName: WideString; const Operation:
WideString; const Attribute: WideString; OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapBodyOutputAttribute(const BSTR BindingName, const BSTR Operation, const
BSTR Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyOutputAttribute to retrieve value of an attribute on the body tag for an output message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the output message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyOutputAttribute returns the same value as GetSoapBodyAttribute (see page 25978) with an IOType of 'output'.

See Also

GetSoapBodyAttribute (see page 25978)

GetSoapBodyInputAttribute (see page 25979)

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 25982)

getoperationsforbinding (see page 25968)

GetInOutMessagesForOperation

191.1.1.3.38 TWSDLItems.GetSoapHeaders Method

Returns an interface for accessing a specified set of header nodes.

Pascal

```
function GetSoapHeaders(BindingName: IQualifiedName; const Operation: WideString; Input:
Boolean; OverloadIndex: Integer; const MessageName: WideString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapHeaders(IQualifiedName BindingName, const BSTR Operation,
Boolean Input, int OverloadIndex, const BSTR MessageName = '');
```

Description

Call GetSoapHeaders to retrieve a dynamic array of interfaces for accessing information about the header nodes of a specified operation on a specified binding. This method provides the underlying implementation for the GetSoapInputHeaders (see page 25982) and GetSoapOutputHeaders (see page 25983) methods.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input indicates whether the header node should belong to the operation's input node (true) or output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapHeaders does not check the message with which the header is associated.

If GetSoapHeaders is unable to locate a header node for the specified name, binding, and IOType, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapOutputHeaders (see page 25983)

GetSoapBindingIONode (see page 25977)

GetSoapInputHeaders (see page 25982)

GetBindingForServicePort (see page 25962)

GetPartNode (see page 25969)

191.1.1.3.39 TWSDLItems.GetSoapInputHeaders Method

Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.

Pascal

```
function GetSoapInputHeaders(BindingName: IQualifiedName; const Operation: WideString;
OverloadIndex: Integer; const MessageName: WideString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapInputHeaders(IQualifiedName BindingName, const BSTR
Operation, int OverloadIndex, const BSTR MessageName = '');
```

Description

Call GetSoapInputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the input node on a specified binding. GetSoapInputHeaders locates the specified input node using the GetSoapBindingIONode (see page 25977) method, and extracts all of its child header nodes. It then checks the message and part attributes of that input node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapInputHeaders does not check the message with which the header is associated.

If GetSoapInputHeaders is unable to locate an input header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapOutputHeaders (see page 25983)

GetSoapBindingIONode (see page 25977)

GetSoapHeaders (see page 25981)

GetBindingForServicePort (see page 25962)

GetPartNode (see page 25969)

191.1.1.3.40 TWSDLItems.GetSoapOperationAttribute Method

Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.

Pascal

```
function GetSoapOperationAttribute(const BindingName: WideString; const Operation: WideString;
const Attribute: WideString; OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapOperationAttribute(const BSTR BindingName, const BSTR Operation, const
BSTR Attribute, int OverloadIndex);
```

Description

Call GetSoapOperationAttribute to retrieve value of an attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

Attribute is the name of the desired attribute on the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetSoapBindingAttribute (see page 25976)

GetSoapBodyAttribute (see page 25978)

GetSoapHeaderAttribute

GetSoapOperationAttribute

GetSoapFaultsForOperation

191.1.1.3.41 TWSDLItems.GetSoapOperationStyle Method

Returns the value of the style attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapOperationStyle(const BindingName: WideString; const Operation: WideString;
OverloadIndex: Integer): WideString;
```

C++

```
__fastcall BSTR GetSoapOperationStyle(const BSTR BindingName, const BSTR Operation, int
OverloadIndex);
```

Description

Call GetSoapOperationStyle to retrieve the value of the style attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetBindings (see page 25964)

getoperationsforbinding (see page 25968)

GetSoapOperationAttribute (see page 25982)

191.1.1.3.42 TWSDLItems.GetSoapOutputHeaders Method

Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.

Pascal

```
function GetSoapOutputHeaders(BindingName: IQualifiedName; const Operation: WideString;
OverloadIndex: Integer; const MessageName: WideString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapOutputHeaders(IQualifiedName BindingName, const BSTR
Operation, int OverloadIndex, const BSTR MessageName = '');
```

Description

Call GetSoapOutputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the output node on a specified binding. GetSoapOutputHeaders locates the specified output node using the GetSoapBindingIONode (see page 25977) method, and extracts all of its child header nodes. It then checks the message and part attributes of that output node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapOutputHeaders does not check the message with which the header is associated.

If GetSoapOutputHeaders is unable to locate an output header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapInputHeaders (see page 25982)

GetSoapBindingIONode (see page 25977)

GetSoapHeaders (see page 25981)

GetBindingForServicePort (see page 25962)

GetPartNode (see page 25969)

191.1.1.3.43 TWSDLItems.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 25988) property.

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

GetTargetNamespace is the read access method for the TargetNamespace (see page 25988) property.

See Also

Definition (see page 25808)

GetTargetNamespacePrefix (see page 25985)

TargetNamespace (see page 25988)

191.1.1.3.44 TWSDLItems.GetTargetNamespacePrefix Method

Returns the prefix string that represents the target namespace of the WSDL document.

Pascal

```
function GetTargetNamespacePrefix: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespacePrefix();
```

Description

Call GetTargetNamespacePrefix to retrieve the prefix string that should be added to node names so that they explicitly use the target namespace of the WSDL document. Node names that include this prefix are defined in the namespace identified by the URL that is the value of the TargetNamespace (see page 25988) property.

See Also

TargetNamespace (see page 25988)

191.1.1.3.45 TWSDLItems.GetWSDLDoc Method

Returns the interface for this TWSDLItems (see page 25951) instance.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns the IWSDLDocument for this TWSDLItems (see page 25951) instance. This interface can be used to access the Definition property, which supplies uninterpreted access to the definitions in the WSDL document.

See Also

Definition (see page 25808)

191.1.1.3.46 TWSDLItems.GetWSDLItems Method

Returns a reference to this TWSDLItems (see page 25951) instance.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the TWSDLItems (see page 25951) instance. This method is mostly used by code that holds an IWSDLItems (see page 25998) interface and needs to use the methods of the object itself.

See Also

IWSDLItems (see page 25998)

191.1.1.3.47 TWSDLItems.HasTypesNode Method

Indicates whether the WSDL document includes any type definitions.

Pascal

```
function HasTypesNode: Boolean;
```

C++

```
__fastcall Boolean HasTypesNode();
```

Description

HasTypesNode returns true if the WSDL document includes any type definitions, false otherwise.

191.1.1.3.48 TWSDLItems.IsPortTypeHTTPBound Method

Indicates whether a specified port type has an HTTP binding.

Pascal

```
function IsPortTypeHTTPBound(const PortType: WideString): Boolean;
```

C++

```
__fastcall Boolean IsPortTypeHTTPBound(const BSTR PortType);
```

Description

Call IsPortTypeHTTPBound to determine whether there is an HTTP binding for a specified port type. A port type corresponds to an invokable interface.

PortType is the port type you want to check.

IsPortTypeHTTPBound returns true if the specified port type has an HTTP binding, false otherwise.

See Also

GetPortTypes (see page 25971)

GetPortTypeNode (see page 25971)

GetBindingOfType (see page 25963)

191.1.1.3.49 TWSDLItems.IterateImports Method

Executes a callback for every WSDL document that this one imports.

Pascal

```
procedure IterateImports(IterateProc: TWSDLIterateProc);
```

C++

```
__fastcall IterateImports(TWSDLIterateProc IterateProc);
```

Description

IterateImports is used to execute a callback before and after loading each WSDL document that this one imports, including those documents that are imported by documents that this one imports.

191.1.1.3.50 TWSDLItems.Load Method

Loads a WSDL document and activates it.

Pascal

```
procedure Load(const WSDLFileName: WideString);
```

C++

```
__fastcall Load(const BSTR WSDLFileName);
```

Description

Load uses the stream loader specified by the StreamLoader (see page 25987) property to load a WSDL document into memory. It then sets itself to represent that WSDL document and activates it.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

See Also

StreamLoader (see page 25987)

LoadFromFile (see page 26121)

LoadFromStream (see page 26121)

LoadFromXML (see page 26122)

191.1.1.4 TWSDLItems Properties

The properties of the TWSDLItems class are listed here.

Public Properties

	Name	Description
R	StreamLoader (see page 25987)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 25988)	Provides access to an interface for loading the WSDL document.

191.1.1.4.1 TWSDLItems.StreamLoader Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property StreamLoader: IStreamLoader;
```

C++

```
__property IStreamLoader StreamLoader;
```

Description

StreamLoader is set by the TWSDLItems (see page 25951) constructor. It is an interface that specifies basic authentication information that can be used to load a WSDL document that is on another server. The IStreamLoader interface specifies the password, user name, and proxy server that can be used to connect to the server that hosts the WSDL document. TWSDLItems (see page 25951) uses this to load the WSDL document.

See Also

Create (see page 25960)

191.1.1.4.2 TWSDLItems.TargetNamespace Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

The root node of a WSDL document is always a definitions node. This node includes a TargetNamespace attribute that uniquely identifies the set of definitions in the WSDL document. Read TargetNamespace to retrieve that namespace.

See Also

Definition (see page 25808)

GetTargetNamespacePrefix (see page 25985)

191.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeaderInfo (see page 25989)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 25994)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 25998)	IWSDLItems provides access to a WSDL document.

191.2.1 IHeaderInfo Interface

Class Hierarchy

WSDLItems.IHeaderInfo

Pascal

```
IHeaderInfo = interface;
```

C++

```
__interface IHeaderInfo;
```

File

WSDLItems

Description

This is class WSDLItems.IHeaderInfo.

191.2.1.1 IHeaderInfo Members

The following tables list the members exposed by IHeaderInfo.

Public Methods

	Name	Description
	GetEncodingStyle (see page 25990)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 25990)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 25991)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 25991)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 25991)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 25991)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 25991)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 25992)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 25992)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 25992)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 25992)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 25993)	This is SetUse, a member of class IHeaderInfo.

Public Properties

	Name	Description
	EncodingStyle (see page 25993)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 25993)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 25993)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 25994)	This is Part, a member of class IHeaderInfo.
	Required (see page 25994)	This is Required, a member of class IHeaderInfo.
	Use (see page 25994)	This is Use, a member of class IHeaderInfo.

191.2.1.2 IHeaderInfo Methods

The methods of the IHeaderInfo class are listed here.

Public Methods

	Name	Description
	GetEncodingStyle (see page 25990)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 25990)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 25991)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 25991)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 25991)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 25991)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 25991)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 25992)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 25992)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 25992)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 25992)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 25993)	This is SetUse, a member of class IHeaderInfo.

191.2.1.2.1 IHeaderInfo.GetEncodingStyle Method

Pascal

```
function GetEncodingStyle: WideString;
```

C++

```
__fastcall BSTR GetEncodingStyle();
```

Description

This is GetEncodingStyle, a member of class IHeaderInfo.

191.2.1.2.2 IHeaderInfo.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IHeaderInfo.

191.2.1.2.3 IHeaderInfo.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class IHeaderInfo.

191.2.1.2.4 IHeaderInfo.GetPart Method

Pascal

```
function GetPart: IPart;
```

C++

```
__fastcall IPart GetPart();
```

Description

This is GetPart, a member of class IHeaderInfo.

191.2.1.2.5 IHeaderInfo.GetRequired Method

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This is GetRequired, a member of class IHeaderInfo.

191.2.1.2.6 IHeaderInfo.GetUse Method

Pascal

```
function GetUse: WideString;
```

C++

```
__fastcall BSTR GetUse();
```

Description

This is GetUse, a member of class IHeaderInfo.

191.2.1.2.7 IHeaderInfo.SetEncodingStyle Method

Pascal

```
procedure SetEncodingStyle(const EncStyl: WideString);
```

C++

```
__fastcall SetEncodingStyle(const BSTR EncStyl);
```

Description

This is SetEncodingStyle, a member of class IHeaderInfo.

191.2.1.2.8 IHeaderInfo.SetName Method

Pascal

```
procedure SetName(const N: WideString);
```

C++

```
__fastcall SetName(const BSTR N);
```

Description

This is SetName, a member of class IHeaderInfo.

191.2.1.2.9 IHeaderInfo.SetNamespace Method

Pascal

```
procedure SetNamespace(const N: WideString);
```

C++

```
__fastcall SetNamespace(const BSTR N);
```

Description

This is SetNamespace, a member of class IHeaderInfo.

191.2.1.2.10 IHeaderInfo.SetPart Method

Pascal

```
procedure SetPart(const P: IPart);
```

C++

```
__fastcall SetPart(const IPart P);
```

Description

This is SetPart, a member of class IHeaderInfo.

191.2.1.2.11 IHeaderInfo.SetRequired Method

Pascal

```
procedure SetRequired(Req: Boolean);
```

C++

```
__fastcall SetRequired(Boolean Req);
```

Description

This is SetRequired, a member of class IHeaderInfo.

191.2.1.2.12 IHeaderInfo.SetUse Method

Pascal

```
procedure SetUse(const U: WideString);
```

C++

```
__fastcall SetUse(const BSTR U);
```

Description

This is SetUse, a member of class IHeaderInfo.

191.2.1.3 IHeaderInfo Properties

The properties of the IHeaderInfo class are listed here.

Public Properties

	Name	Description
	EncodingStyle (see page 25993)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 25993)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 25993)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 25994)	This is Part, a member of class IHeaderInfo.
	Required (see page 25994)	This is Required, a member of class IHeaderInfo.
	Use (see page 25994)	This is Use, a member of class IHeaderInfo.

191.2.1.3.1 IHeaderInfo.EncodingStyle Property

Pascal

```
property EncodingStyle: WideString;
```

C++

```
__property BSTR EncodingStyle;
```

Description

This is EncodingStyle, a member of class IHeaderInfo.

191.2.1.3.2 IHeaderInfo.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IHeaderInfo.

191.2.1.3.3 IHeaderInfo.Namespace Property

Pascal

```
property Namespace: WideString;
```

C++

```
__property BSTR Namespace;
```

Description

This is Namespace, a member of class IHeaderInfo.

191.2.1.3.4 IHeaderInfo.Part Property

Pascal

```
property Part: IPart;
```

C++

```
__property IPart Part;
```

Description

This is Part, a member of class IHeaderInfo.

191.2.1.3.5 IHeaderInfo.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IHeaderInfo.

191.2.1.3.6 IHeaderInfo.Use Property

Pascal

```
property Use: WideString;
```

C++

```
__property BSTR Use;
```

Description

This is Use, a member of class IHeaderInfo.

191.2.2 IQualifiedName Interface

IQualifiedName is the interface for obtaining an information about a name in an XML document.

Class Hierarchy

WSDLItems.IQualifiedName

Pascal

```
IQualifiedName = interface;
```

C++

```
__interface IQualifiedName;
```

File

WSDLItems

Description

IQualifiedName introduces two properties, Name (see page 25997) and Namespace (see page 25997), which represent the local name and namespace URI for a name that is used in an XML document. Using IQualifiedName makes it easier to work with names where it is important to know the namespace in which the name is defined.

Note: C++ method declarations that use IQualifiedName use the _di_IQualifiedName type instead. This type is a DelphiInterface wrapper around the IQualifiedName interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IQualifiedName >  _di_IQualifiedName;
```

See Also

TWSDLItems (see page 25951)

TMemoryStream (see page 2902)

191.2.2.1 IQualifiedName Members

The following tables list the members exposed by IQualifiedName.

Public Methods

	Name	Description
	GetName (see page 25995)	Returns the value of the Name (see page 25997) property.
	GetNamespace (see page 25996)	Returns the value of the Namespace (see page 25997) property.
	SetName (see page 25996)	Sets the value of the Name (see page 25997) property.
	SetNamespace (see page 25996)	Sets the value of the Namespace (see page 25997) property.

Public Properties

	Name	Description
	Name (see page 25997)	Specifies the local name.
	Namespace (see page 25997)	Specifies the namespace in which the name is defined.

191.2.2.2 IQualifiedName Methods

The methods of the IQualifiedName class are listed here.

Public Methods

	Name	Description
	GetName (see page 25995)	Returns the value of the Name (see page 25997) property.
	GetNamespace (see page 25996)	Returns the value of the Namespace (see page 25997) property.
	SetName (see page 25996)	Sets the value of the Name (see page 25997) property.
	SetNamespace (see page 25996)	Sets the value of the Namespace (see page 25997) property.

191.2.2.2.1 IQualifiedName.GetName Method

Returns the value of the Name (see page 25997) property.

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

GetName is the read implementation for the Name (see page 25997) property.

See Also

Name (see page 25997)

191.2.2.2.2 IQualifiedName.GetNamespace Method

Returns the value of the Namespace (see page 25997) property.

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

GetNamespace is the read implementation for the Namespace (see page 25997) property.

See Also

Namespace (see page 25997)

191.2.2.2.3 IQualifiedName.SetName Method

Sets the value of the Name (see page 25997) property.

Pascal

```
procedure SetName(const name: WideString);
```

C++

```
__fastcall SetName(const BSTR name);
```

Description

SetName is the write implementation for the Name (see page 25997) property.

Name (see page 25997) is the new name.

See Also

Name (see page 25997)

191.2.2.2.4 IQualifiedName.SetNamespace Method

Sets the value of the Namespace (see page 25997) property.

Pascal

```
procedure SetNamespace(const ns: WideString);
```

C++

```
__fastcall SetNamespace(const BSTR ns);
```

Description

SetNamespace is the write implementation for the Namespace (see page 25997) property.

Namespace (see page 25997) is the new namespace in which to interpret Name (see page 25997).

See Also

Namespace (see page 25997)

191.2.2.3 IQualifiedName Properties

The properties of the IQualifiedName class are listed here.

Public Properties

	Name	Description
	Name (see page 25997)	Specifies the local name.
	Namespace (see page 25997)	Specifies the namespace in which the name is defined.

191.2.2.3.1 IQualifiedName.Name Property

Specifies the local name.

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

Name specifies the local name portion of the qualified name. This name is defined within the context of the namespace that the Namespace (see page 25997) property specifies.

See Also

Namespace (see page 25997)

191.2.2.3.2 IQualifiedName.Namespace Property

Specifies the namespace in which the name is defined.

Pascal

```
property Namespace: WideString;
```

C++

```
__property BSTR Namespace;
```

Description

Namespace specifies the namespace that is used to interpret the value of the Name (see page 25997) property.

See Also

Name (see page 25997)

191.2.3 IWSDLItems Interface

IWSDLItems provides access to a WSDL document.

Class Hierarchy

WSDLItems.IWSDLItems

Pascal

```
IWSDLItems = interface;
```

C++

```
__interface IWSDLItems;
```

File

WSDLItems

Description

IWSDLItems is an interface to the TWSDLItems (see page 25951) class. You can use this interface to load the WSDL document from a file or server, obtain access to the TWSDLItems (see page 25951) object whose methods provide information about the definitions in that document, and obtain an IWSDLDocument interface for low-level access to the definitions in the document.

Note: C++ method declarations that use IWSDLItems use the _di_IWSDLItems type instead. This type is a DelphiInterface wrapper around the IWSDLItems interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLItems (see page 25951)

IWSDLItems

191.2.3.1 IWSDLItems Members

The following tables list the members exposed by IWSDLItems.

Public Methods

	Name	Description
	GetWSDLDoc (see page 25999)	Returns the IWSDLDocument interface for the WSDL document.
	GetWSDLItems (see page 25999)	Returns a reference to the TWSDLItems (see page 25951) instance that implements this interface.
	Load (see page 25999)	Loads a WSDL document so that its definitions are available.

191.2.3.2 IWSDLItems Methods

The methods of the IWSDLItems class are listed here.

Public Methods

	Name	Description
	GetWSDLDoc (see page 25999)	Returns the IWSDLDocument interface for the WSDL document.
	GetWSDLItems (see page 25999)	Returns a reference to the TWSDLItems (see page 25951) instance that implements this interface.
	Load (see page 25999)	Loads a WSDL document so that its definitions are available.

191.2.3.2.1 IWSDLItems.GetWSDLDoc Method

Returns the IWSDLDocument interface for the WSDL document.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns a IWSDLDocument interface, which supplies uninterpreted access to the definitions in the WSDL document. To access these definitions more easily, use the GetWSDLItems (see page 25999) method, which returns a reference to the underlying TWSDLItems (see page 25951) object.

See Also

GetWSDLItems (see page 25999)

191.2.3.2.2 IWSDLItems.GetWSDLItems Method

Returns a reference to the TWSDLItems (see page 25951) instance that implements this interface.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the underlying TWSDLItems (see page 25951) instance. This object has numerous methods that let you access the definitions in the WSDL document.

191.2.3.2.3 IWSDLItems.Load Method

Loads a WSDL document so that its definitions are available.

Pascal

```
procedure Load(const WSDLFileName: WideString);
```

C++

```
__fastcall Load(const BSTR WSDLFileName);
```

Description

Load reads and interprets a specified WSDL document. This method should be called before you attempt to access the definitions in the WSDL document.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

191.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	HasDefinition (see page 26000)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 26000)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 26000)	This is function WSDLItems.NewQualifiedName.

191.3.1 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLDoc: IWSDLDocument): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLDocument WSDLDoc);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

191.3.2 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLItems: IWSDLItems): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLItems WSDLItems);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

191.3.3 WSDLItems.NewQualifiedName Function

Pascal

```
function NewQualifiedName(const Name: WideString = ''; const Namespace: WideString = ''):
```

```
IQualifiedName;
```

C++

```
IQualifiedName NewQualifiedName(const BSTR Name = '', const BSTR Namespace = '');
```

File

WSDLItems

Description

This is function WSDLItems.NewQualifiedName.

191.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	IterateImportOptions (see page 26002)	This is record WSDLItems.IterateImportOptions.

191.4.1 WSDLItems.IterateImportOptions Enumeration

Pascal

```
IterateImportOptions = (
  ioBeforeLoad,
  ioLoaded
);
```

C++

```
enum IterateImportOptions {
  ioBeforeLoad,
  ioLoaded
};
```

File

WSDLItems

Description

This is record WSDLItems.IterateImportOptions.

191.5 Types

The following table lists types in this documentation.

Types

Name	Description
IHeaderInfoArray (see page 26003)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 26003)	This is type WSDLItems.IQualifiedNameArray.
TWSDLIterateProc (see page 26003)	This is type WSDLItems.TWSDLIterateProc.

191.5.1 WSDLItems.IHeaderInfoArray Type

Pascal

```
IHeaderInfoArray = array of IHeaderInfo;
```

C++

```
array of IHeaderInfo IHeaderInfoArray;
```

File

WSDLItems

Description

This is type WSDLItems.IHeaderInfoArray.

191.5.2 WSDLItems.IQualifiedNameArray Type

Pascal

```
IQualifiedNameArray = array of IQualifiedName;
```

C++

```
array of IQualifiedName IQualifiedNameArray;
```

File

WSDLItems

Description

This is type WSDLItems.IQualifiedNameArray.

191.5.3 WSDLItems.TWSDLIterateProc Type

Pascal

```
TWSDLIterateProc = procedure (const Options: IterateImportOptions; const WSDLItems:
```

```
IWSDLItems; const XMLSchemaDoc: IXMLSchemaDoc; const Name: WideString) of object;
```

C++

```
(const Options: IterateImportOptions; const WSDLItems: IWSDLItems; const XMLSchemaDoc:
IXMLSchemaDoc; const Name: WideString) ( TWSDLIterateProc)();
```

File

WSDLItems

Description

This is type WSDLItems.TWSDLIterateProc.

192 WSDLNode Namespace

This is namespace WSDLNode.

Topics

Name	Description
Classes (see page 26006)	The following table lists classes in this documentation.
Functions (see page 26022)	The following table lists functions in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 26006)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 26006)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 26013)	TWSDLView represents a specific binding and operation in a WSDL (see page 26020) document.

Functions

	Name	Description
	ActivateWSDL (see page 26022)	This is function WSDLNode.ActivateWSDL.

192.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 26006)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 26006)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 26013)	TWSDLView represents a specific binding and operation in a WSDL (see page 26020) document.

192.1.1 EWSDLLoadException Class

Class Hierarchy

Pascal

```
EWSDLLoadException = class(Exception);
```

C++

```
class EWSDLLoadException : public Exception;
```

File

WSDLNode

Description

This is class WSDLNode.EWSDLLoadException.

192.1.2 TWSDLClientNode Class

Class Hierarchy

Pascal

```
TWSDLClientNode = class(TComponent, IWebNode);
```

C++

```
class TWSDLClientNode : public TComponent, public IWebNode;
```

File

WSDLNode

Description

This is class WSDLNode.TWSDLClientNode.

192.1.2.1 TWSDLClientNode Members

The following tables list the members exposed by TWSDLClientNode.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetMimeBoundary (see page 26011)	Returns the value of the MimeBoundary property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetMimeBoundary (see page 26012)	Sets the value of the MimeBoundary property.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.

	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	BeforeExecute (see page 26010)	Performs any transport-specific setup before executing an encoded method call.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 2766)	Disposes of the component and its owned components.
	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Execute (see page 25432)	This is the overview for the Execute method overload.
	Execute (see page 26010)	This is the overview for the Execute method overload.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Notification (see page 26012)	Forwards notification messages to all owned components.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	MimeBoundary (see page 25433)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TransportNode (see page 26013)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 26013)	This is WSDLView, a member of class TWSDLClientNode.

192.1.2.2 TWSDLClientNode Methods

The methods of the TWSDLClientNode class are listed here.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 26011)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 26012)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	BeforeExecute (see page 26010)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 26010)	This is the overview for the Execute method overload.
	Notification (see page 26012)	Forwards notification messages to all owned components.

192.1.2.2.1 TWSDLClientNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMetaData: TIntfMetaData; const MethodMetaData:
TIntfMethEntry; MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMetaData, const TIntfMethEntry
MethodMetaData, int MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 25432)

OnBeforeExecute (see page 18730)

192.1.2.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TWSDLClientNode.Execute (String, TStream) (see page 26010)	Executes an encoded method call and returns the encoded results in a stream.
	TWSDLClientNode.Execute (TStream) (see page 26011)	This is Execute, a member of class TWSDLClientNode.
	TWSDLClientNode.Execute (TStream, TStream) (see page 26011)	This is Execute, a member of class TWSDLClientNode.

192.1.2.2.2.1 TWSDLClientNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Resp: TStream); overload;
```

C++

```
__fastcall Execute(const AnsiString DataMsg, TStream Resp);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert (see page 18122)

BeforeExecute (see page 25431)

192.1.2.2.2.2 TWSDLClientNode.Execute Method (TStream)

Pascal

```
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall TStream Execute(const TStream Request);
```

Description

This is Execute, a member of class TWSDLClientNode.

192.1.2.2.2.3 TWSDLClientNode.Execute Method (TStream, TStream)

Pascal

```
procedure Execute(const Request: TStream; Response: TStream); overload;
```

C++

```
__fastcall Execute(const TStream Request, TStream Response);
```

Description

This is Execute, a member of class TWSDLClientNode.

192.1.2.2.3 TWSDLClientNode.GetMimeBoundary Method

Returns the value of the MimeBoundary property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall AnsiString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary property.

See Also

MimeBoundary (see page 25433)

192.1.2.2.4 TWSDLClientNode.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

192.1.2.2.5 TWSDLClientNode.SetMimeBoundary Method

Sets the value of the MimeBoundary property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(AnsiString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary property.

Value is the new value for MimeBoundary.

See Also

MimeBoundary (see page 25433)

192.1.2.3 TWSDLClientNode Properties

The properties of the TWSDLClientNode class are listed here.

Published Properties

	Name	Description
	TransportNode (see page 26013)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 26013)	This is WSDLView, a member of class TWSDLClientNode.

192.1.2.3.1 TWSDLClientNode.TransportNode Property

Pascal

```
property TransportNode: IWebNode;
```

C++

```
__property IWebNode TransportNode;
```

Description

This is TransportNode, a member of class TWSDLClientNode.

192.1.2.3.2 TWSDLClientNode.WSDLView Property

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

This is WSDLView, a member of class TWSDLClientNode.

192.1.3 TWSDLView Class

TWSDLView represents a specific binding and operation in a WSDL (see page 26020) document.

Class Hierarchy

Pascal

```
TWSDLView = class(TComponent);
```

C++

```
class TWSDLView : public TComponent;
```

File

WSDLNode

Description

TWSDLView is used by components that work with WSDL (see page 26020) documents to represent a specific port and/or operation that is defined in a WSDL (see page 26020) document. The WSDL (see page 26020) property provides access to the WSDL (see page 26020) document itself. The other properties give the names of the entities of interest that are defined within that document.

192.1.3.1 TWSDLView Members

The following tables list the members exposed by TWSDLView.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Fields

	Name	Description
	IntfInfo (see page 26017)	This is IntfInfo, a member of class TWSDLView.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Activate (see page 26017)	This is Activate, a member of class TWSDLView.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.

	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetDesignState (see page 26017)	This is SetDesignState, a member of class TWSDLView.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Operation (see page 26018)	Identifies the target operation that is defined in the WSDL (see page 26020) document.
	Password (see page 26018)	This is Password, a member of class TWSDLView.
	Port (see page 26019)	Specifies the target port that is defined in the WSDL (see page 26020) document.
	PortType (see page 26019)	Specifies the target port type that is defined in the WSDL (see page 26020) document.

	Proxy (see page 26020)	This is Proxy, a member of class TWSDLView.
	Service (see page 26020)	Specifies the target service that is defined in the WSDL (see page 26020) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	UserName (see page 26020)	This is UserName, a member of class TWSDLView.
	WSDL (see page 26020)	Provides access to the definitions in the WSDL document.

192.1.3.2 TWSDLView Fields

The fields of the TWSDLView class are listed here.

Public Fields

	Name	Description
	IntfInfo (see page 26017)	This is IntfInfo, a member of class TWSDLView.

192.1.3.2.1 TWSDLView.IntfInfo Field

Pascal

```
IntfInfo: PTypeInfo;
```

C++

```
PTypeInfo IntfInfo;
```

Description

This is IntfInfo, a member of class TWSDLView.

192.1.3.3 TWSDLView Methods

The methods of the TWSDLView class are listed here.

Public Methods

	Name	Description
	Activate (see page 26017)	This is Activate, a member of class TWSDLView.
	SetDesignState (see page 26017)	This is SetDesignState, a member of class TWSDLView.

192.1.3.3.1 TWSDLView.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TWSDLView.

192.1.3.3.2 TWSDLView.SetDesignState Method

Pascal

```
procedure SetDesignState(Designing: Boolean);
```

C++

```
__fastcall SetDesignState(Boolean Designing);
```

Description

This is SetDesignState, a member of class TWSDLView.

192.1.3.4 TWSDLView Properties

The properties of the TWSDLView class are listed here.

Published Properties

	Name	Description
	Operation (see page 26018)	Identifies the target operation that is defined in the WSDL (see page 26020) document.
	Password (see page 26018)	This is Password, a member of class TWSDLView.
	Port (see page 26019)	Specifies the target port that is defined in the WSDL (see page 26020) document.
	PortType (see page 26019)	Specifies the target port type that is defined in the WSDL (see page 26020) document.
	Proxy (see page 26020)	This is Proxy, a member of class TWSDLView.
	Service (see page 26020)	Specifies the target service that is defined in the WSDL (see page 26020) document.
	UserName (see page 26020)	This is UserName, a member of class TWSDLView.
	WSDL (see page 26020)	Provides access to the definitions in the WSDL document.

192.1.3.4.1 TWSDLView.Operation Property

Identifies the target operation that is defined in the WSDL (see page 26020) document.

Pascal

```
property Operation: string;
```

C++

```
__property AnsiString Operation;
```

Description

Operation is the name of an operation that is defined in the WSDL (see page 26020) document identified by the WSDL (see page 26020) property. Operation maps to a method on the interface that corresponds to the PortType (see page 26019) property.

See Also

PortType (see page 26019)

WSDL (see page 26020)

192.1.3.4.2 TWSDLView.Password Property

Pascal

```
property Password: string;
```

C++

```
__property AnsiString Password;
```

Description

This is Password, a member of class TWSDLView.

192.1.3.4.3 TWSDLView.Port Property

Specifies the target port that is defined in the WSDL (see page 26020) document.

Pascal

```
property Port: string;
```

C++

```
__property AnsiString Port;
```

Description

Port is the name of a port that is defined in the WSDL (see page 26020) document identified by the WSDL (see page 26020) property. A Port represents the address of a Web Service (see page 26020) application, a transport protocol that is used for requests to that application, the data format to use for encoding requests, and the port type that defines the operations contained in those requests.

See Also

PortType (see page 26019)

WSDL (see page 26020)

Service (see page 26020)

192.1.3.4.4 TWSDLView.PortType Property

Specifies the target port type that is defined in the WSDL (see page 26020) document.

Pascal

```
property PortType: string;
```

C++

```
__property AnsiString PortType;
```

Description

Port (see page 26019) is the name of a port type that is defined in the WSDL (see page 26020) document identified by the WSDL (see page 26020) property. A port type corresponds to an interface that the Web Service (see page 26020) application implements.

The target method on that interface is identified by the Operation (see page 26018) property. The address and protocols to use when calling this interface are identified by the Port (see page 26019) property.

See Also

WSDL (see page 26020)

Port (see page 26019)

Operation (see page 26018)

192.1.3.4.5 TWSDLView.Proxy Property

Pascal

```
property Proxy: string;
```

C++

```
__property AnsiString Proxy;
```

Description

This is Proxy, a member of class TWSDLView.

192.1.3.4.6 TWSDLView.Service Property

Specifies the target service that is defined in the WSDL (see page 26020) document.

Pascal

```
property Service: string;
```

C++

```
__property AnsiString Service;
```

Description

Service is the name of the service of interest that is defined in the WSDL (see page 26020) document identified by the WSDL (see page 26020) property. A service is a collection of related ports, including the one specified by the Port (see page 26019) property.

See Also

Port (see page 26019)

WSDL (see page 26020)

192.1.3.4.7 TWSDLView.UserName Property

Pascal

```
property UserName: string;
```

C++

```
__property AnsiString UserName;
```

Description

This is UserName, a member of class TWSDLView.

192.1.3.4.8 TWSDLView.WSDL Property

Provides access to the definitions in the WSDL document.

Pascal

```
property WSDL: TWSDLItems;
```

C++

```
__property TWSDLItems WSDL;
```

Description

WSDLItems (see page 25949) is a helper object whose methods return the definitions included in the WSDL document. All the other TWSDLView (see page 26013) properties refer to definitions contained in this WSDL document

192.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ActivateWSDL (see page 26022)	This is function WSDLNode.ActivateWSDL.

192.2.1 WSDLNode.ActivateWSDL Function

Pascal

```
function ActivateWSDL(WSDL: TWSDLItems; const Name: string; const Password: string; const
Proxy: string): Boolean;
```

C++

```
Boolean ActivateWSDL(TWSDLItems WSDL, const AnsiString Name, const AnsiString Password, const
AnsiString Proxy);
```

File

WSDLNode

Description

This is function WSDLNode.ActivateWSDL.

193 WSDLPub Namespace

This is namespace WSDLPub.

Topics

Name	Description
Classes (see page 26024)	The following table lists classes in this documentation.
Interfaces (see page 26042)	The following table lists interfaces in this documentation.
Functions (see page 26044)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 26045)	The following table lists structs, records, enums in this documentation.
Types (see page 26046)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 26024)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 26037)	This is class WSDLPub.TWSDLPublish.

Functions

	Name	Description
	WSDLPubFactory (see page 26044)	This is function WSDLPub.WSDLPubFactory.

Interfaces

	Name	Description
	IWSDLPublish (see page 26042)	This is class WSDLPub.IWSDLPublish.

Structs, Records, Enums

	Name	Description
	SOAPPublishOptions (see page 26045)	This is record WSDLPub.SOAPPublishOptions.

Types

Name	Description
TBeforePublishingWSDLEvent (see page 26046)	This is type WSDLPub.TBeforePublishingWSDLEvent.
TSOAPPublishOptions (see page 26046)	This is type WSDLPub.TSOAPPublishOptions.

193.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 26024)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 26037)	This is class WSDLPub.TWSDLPublish.

193.1.1 TWSDLHTMLPublish Class

TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.

Class Hierarchy

Pascal

```
TWSDLHTMLPublish = class(TComponent, IWebDispatch);
```

C++

```
class TWSDLHTMLPublish : public TComponent, public IWebDispatch;
```

File

WSDLPub

Description

Add TWSDLHTMLPublish to the Web module of a Web Service application to publish a list of WSDL documents that describe how to call that Web Service application. By publishing WSDL documents for your Web Service application, you allow arbitrary clients to call on your Web Services.

TWSDLHTMLPublish publishes definitions it derives from all the invokable interfaces that are registered with the invocation registry (InvRegistry), as well as from all remotable classes and types that are registered with the remotable type registry (RemTypeRegistry). By default, it uses the address where you install the application that contains the TWSDLHTMLPublish component as the address where those services are available. If you deploy the implementation of those Web Services elsewhere, you can enable the WSDL administrator (using the AdminEnabled (see page 26034) property), and then launch the WSDL administrator from a Web browser to change the addresses specified in the generated WSDL documents.

TWSDLHTMLPublish automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the WSDL publisher without requiring the use of Web action items. Those messages include requests for the list of WSDL documents and requests for the WSDL administrator.

193.1.1.1 TWSDLHTMLPublish Members

The following tables list the members exposed by TWSDLHTMLPublish.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AddInterfaceList (see page 26029)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 26029)	This is AddPortList, a member of class TWSDLHTMLPublish.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetHostScriptBaseURL (see page 26031)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.

	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdatePortList (see page 26033)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	WSILInfo (see page 26033)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	Assign (see page 2930)	Copies the contents of another, similar object.
	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 26028)	Creates an instance of TWSDLHTMLPublish (see page 26024).
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 26028)	Destroys the instance of a TWSDLHTMLPublish (see page 26024) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DispatchEnabled (see page 26030)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 26030)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 26030)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 26031)	Responds to an incoming message and generates the appropriate response message.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.

	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetTargetNamespace (see page 26031)	Returns the value of the TargetNamespace (see page 26035) property.
	HandleRequest (see page 26032)	Generates the response for an incoming request message.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	ServiceInfo (see page 26032)	Responds to requests that are otherwise not handled by the application.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Enabled (see page 15232)	
R	Mask (see page 15233)	
R	MethodType (see page 15233)	This is MethodType, a member of class IWebDispatch.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 26035)	Occurs after the publisher generates a WSDL document for the Web Service application.
	OnBeforePublishingTypes (see page 26036)	Occurs before the publisher starts adding type definitions to the WSDL document.
	OnBeforePublishingWSDL (see page 26036)	Occurs before the publisher generates its WSDL document.
	OnPublishingType (see page 26037)	Occurs before the publisher generates the schema for a given type.

Published Properties

	Name	Description
	AdminEnabled (see page 26034)	Enables or disables the WSDL administrator.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	PublishOptions (see page 26034)	Controls (see page 5711) the definitions TWSDLHTMLPublish (see page 26024) creates when it generates its WSDL documents.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TargetNamespace (see page 26035)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 26035)	This is WebDispatch, a member of class TWSDLHTMLPublish.

193.1.1.2 TWSDLHTMLPublish.Create Constructor

Creates an instance of TWSDLHTMLPublish (see page 26024).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWSDLHTMLPublish(TComponent * AOwner);
```

Description

Call Create to instantiate a TWSDLHTMLPublish (see page 26024) object at runtime. TWSDLHTMLPublish (see page 26024) components added to web modules at design time are created automatically.

The AOwner parameter specifies another component (usually the web module) that is responsible for freeing the TWSDLHTMLPublish (see page 26024) instance. It becomes the value of the Owner property.

See Also

Owner (see page 2807)

193.1.1.3 TWSDLHTMLPublish.Destroy Destructor

Destroys the instance of a TWSDLHTMLPublish (see page 26024) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWSDLHTMLPublish();
```

Description

Use the Free method to free a TWSDLHTMLPublish (see page 26024) instance. Unlike the Destroy method, Free guards against a nil reference.

See Also

Free (see page 22300)

193.1.1.4 TWSDLHTMLPublish Methods

The methods of the TWSDLHTMLPublish class are listed here.

Protected Methods

	Name	Description
	AddInterfaceList (see page 26029)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 26029)	This is AddPortList, a member of class TWSDLHTMLPublish.
	GetHostScriptBaseURL (see page 26031)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	UpdatePortList (see page 26033)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	WSILInfo (see page 26033)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	DispatchEnabled (see page 26030)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 26030)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 26030)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 26031)	Responds to an incoming message and generates the appropriate response message.
	GetTargetNamespace (see page 26031)	Returns the value of the TargetNamespace (see page 26035) property.
	HandleRequest (see page 26032)	Generates the response for an incoming request message.
	ServiceInfo (see page 26032)	Responds to requests that are otherwise not handled by the application.

193.1.1.4.1 TWSDLHTMLPublish.AddInterfaceList Method

Pascal

```
procedure AddInterfaceList(htmldoc: TStringList; const WSDLBaseURL: String);
```

C++

```
__fastcall AddInterfaceList(TStringList htmldoc, const AnsiString WSDLBaseURL);
```

Description

This is AddInterfaceList, a member of class TWSDLHTMLPublish.

193.1.1.4.2 TWSDLHTMLPublish.AddPortList Method

Pascal

```
procedure AddPortList(htmldoc: TStringList; const PortType: String);
```

C++

```
__fastcall AddPortList(TStringList htmldoc, const AnsiString PortType);
```

Description

This is AddPortList, a member of class TWSDLHTMLPublish.

193.1.1.4.3 TWSDLHTMLPublish.DispatchEnabled Method

Indicates whether the WSDL publisher is enabled to respond to incoming messages.

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

Description

The DispatchEnabled method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to determine whether it can receive incoming messages. In TWSDLHTMLPublish (see page 26024), DispatchEnabled always returns true.

See Also

webdispatch (see page 26035)

193.1.1.4.4 TWSDLHTMLPublish.DispatchMask Method

Returns a mask that matches the path portion of any URL to which this object responds.

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

Description

The DispatchMask method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns a Mask (see page 15797) derived from the Mask (see page 15797) property of the WebDispatch (see page 26035) property.

See Also

webdispatch (see page 26035)

Mask (see page 1482)

193.1.1.4.5 TWSDLHTMLPublish.DispatchMethodType Method

Returns the method type of all HTTP messages to which this component responds.

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

Description

The DispatchMethodType method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to this component. It returns the MethodType properties of WebDispatch (see page 26035).

See Also

MethodType

webdispatch (see page 26035)

193.1.1.4.6 TWSDLHTMLPublish.DispatchRequest Method

Responds to an incoming message and generates the appropriate response message.

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

The Web Module (or Web Dispatcher) calls DispatchRequest when it identifies an HTTP message that matches the properties of the WebDispatch (see page 26035) property. DispatchRequest responds by generating an HTML page that lists the WSDL documents describing the Web Service, and including a button for the WSDL administrator if the AdminEnabled (see page 26034) property is true.

Sender is not used in the DispatchRequest method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

DispatchRequest returns true if it successfully generates a response. It returns false if it could not handle the request.

See Also

webdispatch (see page 26035)

AdminEnabled (see page 26034)

193.1.1.4.7 TWSDLHTMLPublish.GetHostScriptBaseURL Method

Pascal

```
function GetHostScriptBaseURL(Request: TWebRequest): String;
```

C++

```
__fastcall AnsiString GetHostScriptBaseURL(TWebRequest Request);
```

Description

This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.

193.1.1.4.8 TWSDLHTMLPublish.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 26035) property.

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

GetTargetNamespace is the read implementation for the TargetNamespace (see page 26035) property.

See Also

TargetNamespace (see page 26035)

193.1.1.4.9 TWSDLHTMLPublish.HandleRequest Method

Generates the response for an incoming request message.

Pascal

```
function HandleRequest(Resp: TStringList; const Path: String; const HostScriptBaseURL: String;
var ContentType: String; Request: TWebRequest): integer;
```

C++

```
__fastcall int HandleRequest(TStringList Resp, const AnsiString Path, const AnsiString
HostScriptBaseURL, AnsiString ContentType, TWebRequest Request);
```

Description

The DispatchRequest (see page 26031) method calls HandleRequest to generate the content of the HTTP response message it fills out. Typically, applications should not need to call this method.

Resp is a string list to which HandleRequest writes the content of the response.

Path is the path information taken from the incoming request message.

HostScriptBaseURL is the URL for the script name to which the incoming request is addressed.

ContentType returns the content type of the response that is written to Resp. This becomes the value of a ContentType header on the response message.

Request is the request message for which this method generates a response.

HandleRequest returns the StatusCode for the generated response. This becomes the StatusCode property of the response message.

See Also

DispatchRequest (see page 26031)

StatusCode (see page 15215)

193.1.1.4.10 TWSDLHTMLPublish.ServiceInfo Method

Responds to requests that are otherwise not handled by the application.

Pascal

```
procedure ServiceInfo(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var
Handled: Boolean);
```

C++

```
__fastcall ServiceInfo(TObject * Sender, TWebRequest Request, TWebResponse Response, Boolean
Handled);
```

Description

The Web Module (or Web Dispatcher) calls ServiceInfo when there are no other components in the application to handle an incoming request message. ServiceInfo responds by generating a default Web page that includes a link to the WSDL documents.

Sender is not used in the ServiceInfo method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that ServiceInfo successfully generated a response.

See Also

DispatchRequest (see page 26031)

193.1.1.4.11 TWSDLHTMLPublish.UpdatePortList Method

Pascal

```
procedure UpdatePortList(PortList: TStrings; const PortType: String; const Command: String);
```

C++

```
__fastcall UpdatePortList(TStrings PortList, const AnsiString PortType, const AnsiString
Command);
```

Description

This is UpdatePortList, a member of class TWSDLHTMLPublish.

193.1.1.4.12 TWSDLHTMLPublish.WSILInfo Method

Returns the WS inspection document that describes the Web Service.

Pascal

```
procedure WSILInfo(const HostScriptBaseURL: string; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean);
```

C++

```
__fastcall WSILInfo(const AnsiString HostScriptBaseURL, TWebRequest Request, TWebResponse
Response, Boolean Handled);
```

Description

The Web Module (or Web Dispatcher) calls WSILInfo when a request is made for the WS inspection document for the Web Service (when the path portion of the request ends in the string 'inspection.wisl'.. WSILInfo responds by generating the WSIL description.

HostScriptBaseURL is the base path for accessing the WSDL documents of the Web Service.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that WSILInfo successfully generated a response.

See Also

DispatchRequest (see page 26031)

ServiceInfo (see page 26032)

193.1.1.5 TWSDLHTMLPublish Properties

The properties of the TWSDLHTMLPublish class are listed here.

Published Properties

	Name	Description
	AdminEnabled (see page 26034)	Enables or disables the WSDL administrator.
	PublishOptions (see page 26034)	Controls (see page 5711) the definitions TWSDLHTMLPublish (see page 26024) creates when it generates its WSDL documents.
	TargetNamespace (see page 26035)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 26035)	This is WebDispatch, a member of class TWSDLHTMLPublish.

193.1.1.5.1 TWSDLHTMLPublish.AdminEnabled Property

Enables or disables the WSDL administrator.

Pascal

```
property AdminEnabled: Boolean;
```

C++

```
__property Boolean AdminEnabled;
```

Description

Use AdminEnabled to indicate whether this application implements the WSDL administrator. When AdminEnabled is true, pointing a Web browser at the URL that addresses this application using the path info specified by WebDispatch (see page 26035) launches a Web page that includes a button for the WSDL administrator. The WSDL administrator can then adjust the published WSDL documents to indicate an address other than the one where this application is installed as the location or locations where the Web Services are deployed.

When AdminEnabled is false, the URL that includes WebDispatch (see page 26035) publishes a list of WSDL documents but does not provide access to the WSDL administrator.

Tip: You can set AdminEnabled to true, update the URLs in the resulting WSDL documents, and then rebuild your application, setting AdminEnabled to false. The WSDL administrator stores your changes in a .ini file so that they appear in the list of WSDL documents even after you have changed AdminEnabled.

See Also

webdispatch (see page 26035)

TargetNamespace (see page 26035)

Generating WSDL Documents for a Web Service Application

193.1.1.5.2 TWSDLHTMLPublish.PublishOptions Property

Controls (see page 5711) the definitions TWSDLHTMLPublish (see page 26024) creates when it generates its WSDL documents.

Pascal

```
property PublishOptions: TSOAPPublishOptions;
```

C++

```
__property TSOAPPublishOptions PublishOptions;
```

Description

PublishOptions is a set of flags that customize the generated WSDL document.

See Also

TargetNamespace (see page 26035)

193.1.1.5.3 TWSDLHTMLPublish.TargetNamespace Property

Specifies the target namespace URL of the WSDL document.

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

Use TargetNamespace to specify a namespace for the WSDL documents this component publishes. This is the namespace URL that the WSDL document uses for the definitions it publishes.

See Also

AdminEnabled (see page 26034)

193.1.1.5.4 TWSDLHTMLPublish.WebDispatch Property

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

This is WebDispatch, a member of class TWSDLHTMLPublish.

193.1.1.6 TWSDLHTMLPublish Events

The events of the TWSDLHTMLPublish class are listed here.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 26035)	Occurs after the publisher generates a WSDL document for the Web Service application.
	OnBeforePublishingTypes (see page 26036)	Occurs before the publisher starts adding type definitions to the WSDL document.
	OnBeforePublishingWSDL (see page 26036)	Occurs before the publisher generates its WSDL document.
	OnPublishingType (see page 26037)	Occurs before the publisher generates the schema for a given type.

193.1.1.6.1 TWSDLHTMLPublish.OnAfterPublishingWSDL Event

Occurs after the publisher generates a WSDL document for the Web Service application.

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

Use OnAfterPublishingWSDL to perform special actions after the publisher has generated a WSDL document. For example, you can use this event to cache the generated WSDL document and then re-use the cached document in an OnBeforePublishingWSDL (see page 26036) event rather than requiring the publisher to generate a new document for every WSDL request it receives.

See Also

OnBeforePublishingWSDL (see page 26036)

193.1.1.6.2 TWSDLHTMLPublish.OnBeforePublishingTypes Event

Occurs before the publisher starts adding type definitions to the WSDL document.

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

Use OnBeforePublishingTypes to add your own type definitions to the WSDL document before the publisher adds definitions for the types that the invokable interfaces use and types that are registered with the remotable type registry. If the OnBeforePublishingTypes event handler adds a schema definition for a type, the publisher uses that definition rather than generating its own version.

See Also

OnBeforePublishingWSDL (see page 26036)

OnPublishingType (see page 26037)

193.1.1.6.3 TWSDLHTMLPublish.OnBeforePublishingWSDL Event

Occurs before the publisher generates its WSDL document.

Pascal

```
property OnBeforePublishingWSDL: TBeforePublishingWSDLEvent;
```

C++

```
__property TBeforePublishingWSDLEvent OnBeforePublishingWSDL;
```

Description

Use OnBeforePublishingWSDL to provide your own WSDL document rather than letting the publisher generate one dynamically. For example, the event handler can supply a cached version of the WSDL document that you saved previously from an OnAfterPublishingWSDL (see page 26035) event handler.

See Also

OnAfterPublishingWSDL (see page 26035)

OnBeforePublishingTypes (see page 26036)

193.1.1.6.4 TWSDLHTMLPublish.OnPublishingType Event

Occurs before the publisher generates the schema for a given type.

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

Use OnPublishingType to perform specific actions immediately before the publisher adds a type definition to the emerging WSDL document.

See Also

OnBeforePublishingTypes (see page 26036)

193.1.2 TWSDLPublish Class

Class Hierarchy

Pascal

```
TWSDLPublish = class(TInvokableClass, IWSDLPublish);
```

C++

```
class TWSDLPublish : public TInvokableClass, public IWSDLPublish;
```

File

WSDLPub

Description

This is class WSDLPub.TWSDLPublish.

193.1.2.1 TWSDLPublish Members

The following tables list the members exposed by TWSDLPublish.

Protected Fields

	Name	Description
	FRefCount (see page 15522)	This is FRefCount, a member of class TInvokableClass.
	FSOAPHeaders (see page 15523)	This is FSOAPHeaders, a member of class TInvokableClass.

Protected Methods

	Name	Description
	_AddRef (see page 15523)	Increments the reference count for this interface.

	_Release (see page 15524)	Decrements the reference count for this interface.
	QueryInterface (see page 15525)	Implements the IInterface QueryInterface method.

Public Events

	Name	Description
	OnAfterPublishingWSDL (see page 26041)	This is OnAfterPublishingWSDL, a member of class TWSDLPublish.
	OnBeforePublishingTypes (see page 26041)	This is OnBeforePublishingTypes, a member of class TWSDLPublish.
	OnBeforePublishingWSDL (see page 26041)	This is OnBeforePublishingWSDL, a member of class TWSDLPublish.
	OnPublishingType (see page 26041)	This is OnPublishingType, a member of class TWSDLPublish.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 15524)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 15524)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 15522)	Creates and initializes a TInvokableClass (see page 15520) object.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetPortTypeEntries (see page 26039)	This is GetPortTypeEntries, a member of class TWSDLPublish.
	GetPortTypeList (see page 26039)	This is GetPortTypeList, a member of class TWSDLPublish.
	GetTypeSystemsList (see page 26039)	This is GetTypeSystemsList, a member of class TWSDLPublish.
	GetWSDLForPortType (see page 26040)	This is GetWSDLForPortType, a member of class TWSDLPublish.
	GetXSDForTypeSystem (see page 26040)	This is GetXSDForTypeSystem, a member of class TWSDLPublish.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 15525)	Allocates memory for each instance of an invokable object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	RefCount (see page 15526)	Indicates the number of interface pointers currently dependent upon the object.
	TargetNamespace (see page 26040)	This is TargetNamespace, a member of class TWSDLPublish.

193.1.2.2 TWSDLPublish Methods

The methods of the TWSDLPublish class are listed here.

Public Methods

	Name	Description
	GetPortTypeEntries (see page 26039)	This is GetPortTypeEntries, a member of class TWSDLPublish.
	GetPortTypeList (see page 26039)	This is GetPortTypeList, a member of class TWSDLPublish.
	GetTypeSystemsList (see page 26039)	This is GetTypeSystemsList, a member of class TWSDLPublish.
	GetWSDLForPortType (see page 26040)	This is GetWSDLForPortType, a member of class TWSDLPublish.
	GetXSDForTypeSystem (see page 26040)	This is GetXSDForTypeSystem, a member of class TWSDLPublish.

193.1.2.2.1 TWSDLPublish.GetPortTypeEntries Method

Pascal

```
procedure GetPortTypeEntries(var Entries: TInvRegIntfEntryArray);
```

C++

```
__fastcall GetPortTypeEntries(TInvRegIntfEntryArray Entries);
```

Description

This is GetPortTypeEntries, a member of class TWSDLPublish.

193.1.2.2.2 TWSDLPublish.GetPortTypeList Method

Pascal

```
function GetPortTypeList: TWideStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall TWideStringDynArray GetPortTypeList();
```

Description

This is GetPortTypeList, a member of class TWSDLPublish.

193.1.2.2.3 TWSDLPublish.GetTypeSystemsList Method

Pascal

```
function GetTypeSystemsList: TWideStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall TWideStringDynArray GetTypeSystemsList();
```

Description

This is GetTypeSystemsList, a member of class TWSDLPublish.

193.1.2.2.4 TWSDLPublish.GetWSDLForPortType Method

Pascal

```
function GetWSDLForPortType(const PortType: WideString): WideString; stdcall;
```

C++

```
__fastcall __stdcall BSTR GetWSDLForPortType(const BSTR PortType);
```

Description

This is GetWSDLForPortType, a member of class TWSDLPublish.

193.1.2.2.5 TWSDLPublish.GetXSDForTypeSystem Method

Pascal

```
function GetXSDForTypeSystem(const TypeSystem: WideString): WideString; stdcall;
```

C++

```
__fastcall __stdcall BSTR GetXSDForTypeSystem(const BSTR TypeSystem);
```

Description

This is GetXSDForTypeSystem, a member of class TWSDLPublish.

193.1.2.3 TWSDLPublish Properties

The properties of the TWSDLPublish class are listed here.

Public Properties

	Name	Description
	TargetNamespace (see page 26040)	This is TargetNamespace, a member of class TWSDLPublish.

193.1.2.3.1 TWSDLPublish.TargetNamespace Property

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

This is TargetNamespace, a member of class TWSDLPublish.

193.1.2.4 TWSDLPublish Events

The events of the TWSDLPublish class are listed here.

Public Events

	Name	Description
	OnAfterPublishingWSDL (see page 26041)	This is OnAfterPublishingWSDL, a member of class TWSDLPublish.
	OnBeforePublishingTypes (see page 26041)	This is OnBeforePublishingTypes, a member of class TWSDLPublish.
	OnBeforePublishingWSDL (see page 26041)	This is OnBeforePublishingWSDL, a member of class TWSDLPublish.

	OnPublishingType (see page 26041)	This is OnPublishingType, a member of class TWSDLPublish.

193.1.2.4.1 TWSDLPublish.OnAfterPublishingWSDL Event

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

This is OnAfterPublishingWSDL, a member of class TWSDLPublish.

193.1.2.4.2 TWSDLPublish.OnBeforePublishingTypes Event

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

This is OnBeforePublishingTypes, a member of class TWSDLPublish.

193.1.2.4.3 TWSDLPublish.OnBeforePublishingWSDL Event

Pascal

```
property OnBeforePublishingWSDL: TBeforePublishingWSDLEvent;
```

C++

```
__property TBeforePublishingWSDLEvent OnBeforePublishingWSDL;
```

Description

This is OnBeforePublishingWSDL, a member of class TWSDLPublish.

193.1.2.4.4 TWSDLPublish.OnPublishingType Event

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

This is OnPublishingType, a member of class TWSDLPublish.

193.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWSDLPublish (see page 26042)	This is class WSDLPub.IWSDLPublish.

193.2.1 IWSDLPublish Interface

Class Hierarchy

Pascal

```
IWSDLPublish = interface(IInvokable);
```

C++

```
__interface IWSDLPublish : public IInvokable;
```

File

WSDLPub

Description

This is class WSDLPub.IWSDLPublish.

193.2.1.1 IWSDLPublish Members

The following tables list the members exposed by IWSDLPublish.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	GetPortTypeList (see page 26043)	This is GetPortTypeList, a member of class IWSDLPublish.
	GetTypeSystemsList (see page 26043)	This is GetTypeSystemsList, a member of class IWSDLPublish.
	GetWSDLForPortType (see page 26043)	This is GetWSDLForPortType, a member of class IWSDLPublish.
	GetXSDForTypeSystem (see page 26043)	This is GetXSDForTypeSystem, a member of class IWSDLPublish.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.

193.2.1.2 IWSDLPublish Methods

The methods of the IWSDLPublish class are listed here.

Public Methods

	Name	Description
	GetPortTypeList (see page 26043)	This is GetPortTypeList, a member of class IWSDLPublish.
	GetTypeSystemsList (see page 26043)	This is GetTypeSystemsList, a member of class IWSDLPublish.
	GetWSDLForPortType (see page 26043)	This is GetWSDLForPortType, a member of class IWSDLPublish.
	GetXSDForTypeSystem (see page 26043)	This is GetXSDForTypeSystem, a member of class IWSDLPublish.

193.2.1.2.1 IWSDLPublish.GetPortTypeList Method

Pascal

```
function GetPortTypeList: TWideStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall TWideStringDynArray GetPortTypeList();
```

Description

This is GetPortTypeList, a member of class IWSDLPublish.

193.2.1.2.2 IWSDLPublish.GetTypeSystemsList Method

Pascal

```
function GetTypeSystemsList: TWideStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall TWideStringDynArray GetTypeSystemsList();
```

Description

This is GetTypeSystemsList, a member of class IWSDLPublish.

193.2.1.2.3 IWSDLPublish.GetWSDLForPortType Method

Pascal

```
function GetWSDLForPortType(const PortType: WideString): WideString; stdcall;
```

C++

```
__fastcall __stdcall BSTR GetWSDLForPortType(const BSTR PortType);
```

Description

This is GetWSDLForPortType, a member of class IWSDLPublish.

193.2.1.2.4 IWSDLPublish.GetXSDForTypeSystem Method

Pascal

```
function GetXSDForTypeSystem(const TypeSystem: WideString): WideString; stdcall;
```

C++

```
__fastcall __stdcall BSTR GetXSDForTypeSystem(const BSTR TypeSystem);
```

Description

This is GetXSDForTypeSystem, a member of class IWSDLPublish.

193.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WSDLPubFactory (see page 26044)	This is function WSDLPub.WSDLPubFactory.

193.3.1 WSDLPub.WSDLPubFactory Function

Pascal

```
procedure WSDLPubFactory(out obj: TObject);
```

C++

```
WSDLPubFactory(TObject * obj);
```

File

WSDLPub

Description

This is function WSDLPub.WSDLPubFactory.

193.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	SOAPPublishOptions (see page 26045)	This is record WSDLPub.SOAPPublishOptions.

193.4.1 WSDLPub.SOAPPublishOptions Enumeration

Pascal

```
SOAPPublishOptions = (
  poDefault,
  poPublishLocationAsSecure
);
```

C++

```
enum SOAPPublishOptions {
  poDefault,
  poPublishLocationAsSecure
};
```

File

WSDLPub

Description

This is record WSDLPub.SOAPPublishOptions.

193.5 Types

The following table lists types in this documentation.

Types

Name	Description
TBeforePublishingWSDLEvent (see page 26046)	This is type WSDLPub.TBeforePublishingWSDLEvent.
TSOAPPublishOptions (see page 26046)	This is type WSDLPub.TSOAPPublishOptions.

193.5.1 WSDLPub.TBeforePublishingWSDLEvent Type

Pascal

```
TBeforePublishingWSDLEvent = procedure (const IntfName: WideString; var WSDL: WideString; var
Handled: Boolean) of object;
```

C++

```
(const IntfName: WideString; var WSDL: WideString; var Handled: Boolean) (
TBeforePublishingWSDLEvent)();
```

File

WSDLPub

Description

This is type WSDLPub.TBeforePublishingWSDLEvent.

193.5.2 WSDLPub.TSOAPPublishOptions Type

Pascal

```
TSOAPPublishOptions = set of SOAPPublishOptions;
```

C++

```
SOAPPublishOptions TSOAPPublishOptions;
```

File

WSDLPub

Description

This is type WSDLPub.TSOAPPublishOptions.

194 XMLBrokr Namespace

This is namespace XMLBrokr.

Topics

Name	Description
Classes (see page 26049)	The following table lists classes in this documentation.
Interfaces (see page 26086)	The following table lists interfaces in this documentation.
Functions (see page 26088)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 26089)	The following table lists structs, records, enums in this documentation.
Types (see page 26090)	The following table lists types in this documentation.
Constants (see page 26092)	The following table lists constants in this documentation.

Classes

	Name	Description
	TXMLBroker (see page 26049)	TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.
	TXMLParams (see page 26081)	TXMLParams manages a list of parameters for an XML broker.

Constants

Name	Description
sPostDelta (see page 26092)	This is constant XMLBrokr.sPostDelta.
sProducer (see page 26092)	This is constant XMLBrokr.sProducer.
sRedirect (see page 26092)	This is constant XMLBrokr.sRedirect.

Functions

	Name	Description
	FormatXML (see page 26088)	This is function XMLBrokr.FormatXML.

Interfaces

	Name	Description
	INotifyConnectionChange (see page 26086)	This is class XMLBrokr.INotifyConnectionChange.

Structs, Records, Enums

	Name	Description
	TXMLOption (see page 26089)	This is record XMLBrokr.TXMLOption.

Types

Name	Description
TGetErrorResponseEvent (see page 26090)	This is type XMLBrokr.TGetErrorResponseEvent.
TGetResponseEvent (see page 26090)	This is type XMLBrokr.TGetResponseEvent.
TRequestRecordsEvent (see page 26091)	This is type XMLBrokr.TRequestRecordsEvent.
TRequestUpdateEvent (see page 26091)	This is type XMLBrokr.TRequestUpdateEvent.
TXMLOptions (see page 26091)	This is type XMLBrokr.TXMLOptions.

194.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TXMLBroker (see page 26049)	TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.
	TXMLParams (see page 26081)	TXMLParams manages a list of parameters for an XML broker.

194.1.1 TXMLBroker Class

TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.

Class Hierarchy

Pascal

```
TXMLBroker = class(TComponent, IWebDispatch, IGetXMLStream);
```

C++

```
class TXMLBroker : public TComponent, public IWebDispatch, public IGetXMLStream;
```

File

XMLBrokr

Description

Use TXMLBroker in an application that is simultaneously the client of a multi-tiered database application and a Web server application. This class serves two major functions:

It fetches XML data packets from a provider using the IAppServer interface.

It receives HTTP messages from Web browsers that contain XML delta packets and applies them to the application server.

Add a TXMLBroker object to a Web module to make database information supplied by a provider on the application server available as XML. An InternetExpress page producer (TInetXPageProducer) in the same Web module uses this XML to build HTML pages that represent that database information.

The XML broker automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the XML broker without requiring the use of Web action items.

These incoming messages are assumed to be update messages created by the browser in response to HTML generated by a TApplyUpdatesButton component. The XML broker automatically applies the delta packet (the content of the HTTP request message) to the application server, and passes any update errors to a separate content producer, which can generate a

response message.

TApplyUpdatesButton (see page 16480)

Building an InternetExpress Application

194.1.1.1 TXMLBroker Members

The following tables list the members exposed by TXMLBroker.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	AS_ApplyUpdates (see page 26056)	This is AS_ApplyUpdates, a member of class TXMLBroker.
	AS_FetchParams (see page 26057)	This is AS_FetchParams, a member of class TXMLBroker.
	AS_GetRecords (see page 26057)	This is AS_GetRecords, a member of class TXMLBroker.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckInactive (see page 26057)	This is CheckInactive, a member of class TXMLBroker.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DispatchEnabled (see page 26057)	
	DispatchMask (see page 26058)	
	DispatchMethodType (see page 26058)	
	DispatchRequest (see page 26058)	
	GetAppServer (see page 26059)	This is GetAppServer, a member of class TXMLBroker.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetConnected (see page 26059)	This is GetConnected, a member of class TXMLBroker.
	GetErrorResponse (see page 26060)	This is GetErrorResponse, a member of class TXMLBroker.
	GetHasAppServer (see page 26060)	This is GetHasAppServer, a member of class TXMLBroker.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetNotify (see page 26060)	This is GetNotify, a member of class TXMLBroker.
	GetNotifyCount (see page 26061)	This is GetNotifyCount, a member of class TXMLBroker.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetProducerName (see page 26061)	This is GetProducerName, a member of class TXMLBroker.
	GetRedirect (see page 26061)	This is GetRedirect, a member of class TXMLBroker.

	GetResponse (see page 26061)	This is GetResponse, a member of class TXMLBroker.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetXMLStream (see page 26062)	This is GetXMLStream, a member of class TXMLBroker.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 26064)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SendConnectEvent (see page 26067)	This is SendConnectEvent, a member of class TXMLBroker.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppServer (see page 26067)	This is SetAppServer, a member of class TXMLBroker.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetConnected (see page 26067)	This is SetConnected, a member of class TXMLBroker.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParams (see page 26067)	This is SetParams, a member of class TXMLBroker.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetProviderName (see page 26068)	This is SetProviderName, a member of class TXMLBroker.
	SetReconcileProducer (see page 26068)	This is SetReconcileProducer, a member of class TXMLBroker.
	SetRemoteServer (see page 26069)	This is SetRemoteServer, a member of class TXMLBroker.
	SetWebDispatch (see page 26069)	This is SetWebDispatch, a member of class TXMLBroker.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddNotify (see page 26055)	Adds an object to the Notify (see page 26073) property list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyXMLUpdates (see page 26056)	Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 26054)	Creates a new TXMLBroker (see page 26049) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26054)	Frees the memory associated with the TXMLBroker (see page 26049) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
V	FetchParams (see page 26058)	Retrieves parameter values from the application server.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDelta (see page 26059)	Extracts an XML delta packet from an HTTP request message.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetErrorCount (see page 26059)	This is GetErrorCount, a member of class TXMLBroker.
	GetErrors (see page 26060)	Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetXMLRecords (see page 26062)	Retrieves an XML data packet from the application server.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HTMLSubmitFormName (see page 26063)	Returns the name of the HTML form that submits updates to the XML broker.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MasterRowSetVarName (see page 26063)	Returns the name of the javascript variable for the XML broker's dataset.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	RemoveNotify (see page 26064)	Removes an object to the Notify (see page 26073) property list.
V	RequestRecords (see page 26064)	Returns an XML data packet from the application server.
V	RequestUpdate (see page 26065)	Responds to an HTTP update request.

	RowSetVarName (see page 26066)	Returns the name of the javascript variable for the XML broker's dataset.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetProvider (see page 26068)	Associates the XML broker with a provider in the same process space.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SubmitFormVarName (see page 26069)	Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 26063).
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	AppServer (see page 26070)	Provides access to the interface the XML broker uses to communicate with the application server.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Enabled (see page 15232)	
R	HasAppServer (see page 26071)	Indicates whether the XML broker has an IAppServer interface for communicating with its provider.
R	Mask (see page 15233)	
R	MethodType (see page 15233)	This is MethodType, a member of class IWebDispatch.
R	Notify (see page 26073)	Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.
R	NotifyCount (see page 26073)	Indicates the number of objects in the Notify (see page 26073) property list.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterDispatch (see page 26077)	Occurs after the XML broker generates the content of a response message.
	BeforeDispatch (see page 26078)	Occurs when the XML broker receives an HTTP request message.
	OnGetErrorResponse (see page 26078)	Occurs when there are errors applying updates to the application server.
	OnGetResponse (see page 26079)	Occurs when there are no errors applying updates to the application server.
	OnRequestRecords (see page 26080)	Occurs when the XML broker needs to fetch a data packet from its associated provider.
	OnRequestUpdate (see page 26080)	Occurs immediately before the XML broker applies updates to the application server.

Published Properties

	Name	Description
	Connected (see page 26070)	Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.
	MaxErrors (see page 26071)	Specifies the maximum number of update errors allowed before aborting an update operations.
	MaxRecords (see page 26072)	Specifies the maximum number of records that can appear in XML data packets.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Params (see page 26073)	Contains parameter values that are sent to or retrieved from the application server.
	ProviderName (see page 26074)	Specifies the name of a registered provider from the application server.
	ReconcileProducer (see page 26075)	Specifies the producer that generates response message content when an update generates errors.

	RemoteServer (see page 26076)	Specifies the connection component that this XML broker uses to connect to an application server.
	Tag (see page 2808)	Stores an integer value as part of a component.
	WebDispatch (see page 26076)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

194.1.1.2 TXMLBroker.Create Constructor

Creates a new TXMLBroker (see page 26049) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLBroker(TComponent * AOwner);
```

Description

Most applications do not need to call the XML broker constructor. Typically the XML broker is added to a Web module at design time, so that the constructor is called automatically.

The Owner parameter specifies the component (usually the Web module) that is responsible for freeing the XML broker.

See Also

Owner (see page 2807)

194.1.1.3 TXMLBroker.Destroy Destructor

Frees the memory associated with the TXMLBroker (see page 26049) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLBroker();
```

Description

Do not call Destroy directly. Instead,call Free, which verifies that the XML broker is not nil before calling Destroy.

See Also

Free (see page 22300)

194.1.1.4 TXMLBroker Methods

The methods of the TXMLBroker class are listed here.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 26056)	This is AS_ApplyUpdates, a member of class TXMLBroker.
	AS_FetchParams (see page 26057)	This is AS_FetchParams, a member of class TXMLBroker.
	AS_GetRecords (see page 26057)	This is AS_GetRecords, a member of class TXMLBroker.
	CheckInactive (see page 26057)	This is CheckInactive, a member of class TXMLBroker.
	DispatchEnabled (see page 26057)	

	DispatchMask (see page 26058)	
	DispatchMethodType (see page 26058)	
	DispatchRequest (see page 26058)	
	GetAppServer (see page 26059)	This is GetAppServer, a member of class TXMLBroker.
	GetConnected (see page 26059)	This is GetConnected, a member of class TXMLBroker.
	GetErrorResponse (see page 26060)	This is GetErrorResponse, a member of class TXMLBroker.
	GetHasAppServer (see page 26060)	This is GetHasAppServer, a member of class TXMLBroker.
	GetNotify (see page 26060)	This is GetNotify, a member of class TXMLBroker.
	GetNotifyCount (see page 26061)	This is GetNotifyCount, a member of class TXMLBroker.
	GetProducerName (see page 26061)	This is GetProducerName, a member of class TXMLBroker.
	GetRedirect (see page 26061)	This is GetRedirect, a member of class TXMLBroker.
	GetResponse (see page 26061)	This is GetResponse, a member of class TXMLBroker.
	GetXMLStream (see page 26062)	This is GetXMLStream, a member of class TXMLBroker.
V	Notification (see page 26064)	Forwards notification messages to all owned components.
	SendConnectEvent (see page 26067)	This is SendConnectEvent, a member of class TXMLBroker.
	SetAppServer (see page 26067)	This is SetAppServer, a member of class TXMLBroker.
	SetConnected (see page 26067)	This is SetConnected, a member of class TXMLBroker.
	SetParams (see page 26067)	This is SetParams, a member of class TXMLBroker.
	SetProviderName (see page 26068)	This is SetProviderName, a member of class TXMLBroker.
	SetReconcileProducer (see page 26068)	This is SetReconcileProducer, a member of class TXMLBroker.
	SetRemoteServer (see page 26069)	This is SetRemoteServer, a member of class TXMLBroker.
	SetWebDispatch (see page 26069)	This is SetWebDispatch, a member of class TXMLBroker.

Public Methods

	Name	Description
	AddNotify (see page 26055)	Adds an object to the Notify (see page 26073) property list.
	ApplyXMLUpdates (see page 26056)	Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.
V	FetchParams (see page 26058)	Retrieves parameter values from the application server.
	GetDelta (see page 26059)	Extracts an XML delta packet from an HTTP request message.
	GetErrorCount (see page 26059)	This is GetErrorCount, a member of class TXMLBroker.
	GetErrors (see page 26060)	Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.
	GetXMLRecords (see page 26062)	Retrieves an XML data packet from the application server.
	HTMLSubmitFormName (see page 26063)	Returns the name of the HTML form that submits updates to the XML broker.
	MasterRowSetVarName (see page 26063)	Returns the name of the javascript variable for the XML broker's dataset.
	RemoveNotify (see page 26064)	Removes an object to the Notify (see page 26073) property list.
V	RequestRecords (see page 26064)	Returns an XML data packet from the application server.
V	RequestUpdate (see page 26065)	Responds to an HTTP update request.
	RowSetVarName (see page 26066)	Returns the name of the javascript variable for the XML broker's dataset.
	SetProvider (see page 26068)	Associates the XML broker with a provider in the same process space.
	SubmitFormVarName (see page 26069)	Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 26063).

194.1.1.4.1 TXMLBroker.AddNotify Method

Adds an object to the Notify (see page 26073) property list.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to add an object to the list maintained by the Notify (see page 26073) property. Each object in this list is notified

every time a property that affects the metadata of the XML broker's data packets changes. These include changes to the RemoteServer (see page 26076), AppServer (see page 26070), and ProviderName (see page 26074) properties.

ANotify specifies the object that wants to be notified of property changes. This object must support the INotifyConnectionChange (see page 26086) interface, which the XML broker uses to notify it of changes.

See Also

NotifyCount (see page 26073)

Notify (see page 26073)

RemoveNotify (see page 26064)

RemoteServer (see page 26076)

AppServer (see page 26070)

ProviderName (see page 26074)

194.1.1.4.2 TXMLBroker.ApplyXMLUpdates Method

Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.

Pascal

```
function ApplyXMLUpdates(const Delta: string; out ErrorCount: Integer): string;
```

C++

```
__fastcall AnsiString ApplyXMLUpdates(const AnsiString Delta, int ErrorCount);
```

Description

Call ApplyXMLUpdates to send the updates in the XML delta packet specified by Delta to the application server. ApplyXMLUpdates is used internally (by the RequestUpdate (see page 26065) method) to apply updates in an XML delta packet and retrieve a delta packet containing any failed updates.

Delta is the XML delta packet that contains the insertions, deletions and modifications from a Web browser. Typically, it is retrieved from an HTTP request message using the GetDelta (see page 26059) method.

ErrorCount returns the number of errors encountered on the application server before it terminated the update operation. If ErrorCount is 0, all updates were applied successfully. ErrorCount can not exceed the value of MaxErrors (see page 26071).

ApplyXMLUpdates returns an XML delta packet containing all updates that were not successfully applied. If ErrorCount is 0, this is an empty string.

See Also

RequestUpdate (see page 26065)

AS_ApplyUpdates (see page 16451)

MaxErrors (see page 26071)

GetDelta (see page 26059)

194.1.1.4.3 TXMLBroker.AS_ApplyUpdates Method

Pascal

```
function AS_ApplyUpdates(Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(OleVariant Delta, int MaxErrors, int ErrorCount);
```

Description

This is AS_ApplyUpdates, a member of class TXMLBroker.

194.1.1.4.4 TXMLBroker.AS_FetchParams Method

Pascal

```
procedure AS_FetchParams;
```

C++

```
__fastcall AS_FetchParams();
```

Description

This is AS_FetchParams, a member of class TXMLBroker.

194.1.1.4.5 TXMLBroker.AS_GetRecords Method

Pascal

```
function AS_GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const
CommandText: WideString; Params: OleVariant; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetRecords(int Count, int RecsOut, int Options, const BSTR
CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is AS_GetRecords, a member of class TXMLBroker.

194.1.1.4.6 TXMLBroker.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TXMLBroker.

194.1.1.4.7 TXMLBroker.DispatchEnabled Method

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

See Also

Enabled (see page 15232)

194.1.1.4.8 TXMLBroker.DispatchMask Method

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

See Also

Mask (see page 15233)

194.1.1.4.9 TXMLBroker.DispatchMethodType Method

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

See Also

MethodType (see page 15233)

194.1.1.4.10 TXMLBroker.DispatchRequest Method

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

194.1.1.4.11 TXMLBroker.FetchParams Method

Retrieves parameter values from the application server.

Pascal

```
procedure FetchParams; virtual;
```

C++

```
virtual __fastcall FetchParams();
```

Description

Call FetchParams to initialize the Params (see page 26073) property with the current parameter values on the application server. FetchParams does nothing unless the provider component on the application server can supply parameter values.

Warning: if the XML broker uses a stateless application server, other clients can change the values returned by FetchParams at any time.

See Also

RowRequest (see page 18472)

Params (see page 26073)

194.1.1.4.12 TXMLBroker.GetAppServer Method

Pascal

```
function GetAppServer: IAppServer;
```

C++

```
__fastcall IAppServer GetAppServer();
```

Description

This is GetAppServer, a member of class TXMLBroker.

194.1.1.4.13 TXMLBroker.GetConnected Method

Pascal

```
function GetConnected: Boolean;
```

C++

```
__fastcall Boolean GetConnected();
```

Description

This is GetConnected, a member of class TXMLBroker.

194.1.1.4.14 TXMLBroker.GetDelta Method

Extracts an XML delta packet from an HTTP request message.

Pascal

```
function GetDelta(Request: TWebRequest): string;
```

C++

```
__fastcall AnsiString GetDelta(TWebRequest Request);
```

Description

Call GetDelta to obtain the XML delta packet contained in the content of the request message specified by Request. This value can be used to apply the updates from the request message by calling ApplyXMLUpdates (see page 26056).

See Also

ApplyXMLUpdates (see page 26056)

194.1.1.4.15 TXMLBroker.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

This is GetErrorCount, a member of class TXMLBroker.

194.1.1.4.16 TXMLBroker.GetErrorResponse Method

Pascal

```
function GetErrorResponse(ErrorCount: Integer; XMLErrors: string; Request: TWebRequest;
Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean GetErrorResponse(int ErrorCount, AnsiString XMLErrors, TWebRequest Request,
TWebResponse Response);
```

Description

This is GetErrorResponse, a member of class TXMLBroker.

194.1.1.4.17 TXMLBroker.GetErrors Method

Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.

Pascal

```
function GetErrors: string;
```

C++

```
__fastcall AnsiString GetErrors();
```

Description

Call GetErrors to obtain the XML delta packet returned by the application server when an update operation included some errors.

Note: See the template err.html (included in the WebMidas directory) for one possible use for the XML delta packet of errors. In err.html, the string returned by GetErrors should replace the <#XMLEMBED_VAR_ERR> tag.

See Also

OnGetErrorResponse (see page 26078)

ApplyXMLUpdates (see page 26056)

GetErrorcount (see page 26059)

194.1.1.4.18 TXMLBroker.GetHasAppServer Method

Pascal

```
function GetHasAppServer: Boolean;
```

C++

```
__fastcall Boolean GetHasAppServer();
```

Description

This is GetHasAppServer, a member of class TXMLBroker.

194.1.1.4.19 TXMLBroker.GetNotify Method

Pascal

```
function GetNotify(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetNotify(int Index);
```

Description

This is GetNotify, a member of class TXMLBroker.

194.1.1.4.20 TXMLBroker.GetNotifyCount Method

Pascal

```
function GetNotifyCount: Integer;
```

C++

```
__fastcall int GetNotifyCount();
```

Description

This is GetNotifyCount, a member of class TXMLBroker.

194.1.1.4.21 TXMLBroker.GetProducerName Method

Pascal

```
function GetProducerName(Request: TWebRequest): string;
```

C++

```
__fastcall AnsiString GetProducerName(TWebRequest Request);
```

Description

This is GetProducerName, a member of class TXMLBroker.

194.1.1.4.22 TXMLBroker.GetRedirect Method

Pascal

```
function GetRedirect(Request: TWebRequest): string;
```

C++

```
__fastcall AnsiString GetRedirect(TWebRequest Request);
```

Description

This is GetRedirect, a member of class TXMLBroker.

194.1.1.4.23 TXMLBroker.GetResponse Method

Pascal

```
function GetResponse(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean GetResponse(TWebRequest Request, TWebResponse Response);
```

Description

This is GetResponse, a member of class TXMLBroker.

194.1.1.4.24 TXMLBroker.GetXMLRecords Method

Retrieves an XML data packet from the application server.

Pascal

```
function GetXMLRecords(var RecsOut: Integer; var OwnerData: OleVariant; XMLOptions:
TXMLOptions): string;
```

C++

```
__fastcall AnsiString GetXMLRecords(int RecsOut, OleVariant OwnerData, TXMLOptions XMLOptions);
```

Description

Call GetXMLRecords to obtain the XML data packet from the application server. GetXMLRecords calls the interface specified by AppServer (see page 26070), requesting an XML data packet with at most MaxRecords (see page 26072) records. It returns the resulting XML data packet in a form that is ready for insertion into an HTML document.

RecsOut returns the number of records in the XML data packet.

On entry, OwnerData contains an application-defined value that is passed to the provider's BeforeGetRecords event handler. OwnerData returns an application-defined value that is set by the provider's AfterGetRecords event handler. Typically, this parameter is used to transmit persistent state information to and from a stateless application server.

XMLOptions is a set of flags that indicate how the broker should format the XML data packet after it is retrieved from the application server.

GetXMLRecords returns the formatted XML data packet.

Note: Unlike the RequestRecords (see page 26064) method, GetXMLRecords bypasses the OnRequestRecords (see page 26080) event.

See Also

RequestRecords (see page 26064)

AS_GetRecords (see page 16455)

MaxRecords (see page 26072)

AppServer (see page 26070)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

Using an XML Broker

194.1.1.4.25 TXMLBroker.GetXMLStream Method

Pascal

```
function GetXMLStream(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLStream(Boolean Owned);
```

Description

This is GetXMLStream, a member of class TXMLBroker.

194.1.1.4.26 TXMLBroker.HTMLSubmitFormName Method

Returns the name of the HTML form that submits updates to the XML broker.

Pascal

```
function HTMLSubmitFormName: string;
```

C++

```
__fastcall AnsiString HTMLSubmitFormName();
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares an HTML form that submits the updates to the XML broker. HTMLSubmitFormName is the name of that HTML form.

The HTML form named by this return value sends the HTTP request messages containing an XML delta packet of updates to be applied.

See Also

SubmitFormVarName (see page 26069)

Content (see page 17138)

194.1.1.4.27 TXMLBroker.MasterRowSetVarName Method

Returns the name of the javascript variable for the XML broker's dataset.

Pascal

```
function MasterRowSetVarName(Path: TStrings): string;
```

C++

```
__fastcall AnsiString MasterRowSetVarName(TStrings Path);
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares a javascript variable of type RowSet for the javascript object that represents the XML broker's dataset. When the variable is first declared, the InternetExpress page producer calls MasterRowSetVarName.

Path is a set of variable names for all the master datasets for which the XML broker's dataset is a detail set. These names come from previous calls to the MasterRowSetVarName method of their XML brokers. The last string in Path refers to the XML broker's dataset itself.

MasterRowSetVarName returns the name of the XML broker, qualified by all strings in Path except for the last one, which is assumed to refer to the XML broker's dataset. Thus, to change the name of the generated variable for an XML broker's dataset, change the Name property of the XML broker.

Note: To retrieve the name of the XML broker preceded by all the datasets in Path, use the RowSetVarName (see page 26066) method instead.

See Also

Name (see page 2805)

Content (see page 17138)

RowSetVarName (see page 26066)

194.1.1.4.28 TXMLBroker.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

194.1.1.4.29 TXMLBroker.RemoveNotify Method

Removes an object to the Notify (see page 26073) property list.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Call RemoveNotify to remove an object from the list maintained by the Notify (see page 26073) property. Each object in this list is notified every time a property that affects the metadata of the XML broker's data packets changes.

See Also

NotifyCount (see page 26073)

Notify (see page 26073)

AddNotify (see page 26055)

194.1.1.4.30 TXMLBroker.RequestRecords Method

Returns an XML data packet from the application server.

Pascal

```
function RequestRecords(Sender: TObject; Request: TWebRequest; out RecCount: Integer; var
OwnerData: OleVariant; XMLOptions: TXMLOptions): string; virtual;
```

C++

```
virtual __fastcall AnsiString RequestRecords(TObject * Sender, TWebRequest Request, int
RecCount, OleVariant OwnerData, TXMLOptions XMLOptions);
```

Description

Call RequestRecords to obtain a current XML data packet, while first allowing the OnRequestRecords (see page 26080) event handler to customize it. After generating the OnRequestRecords (see page 26080) event, RequestRecords fetches the XML data packet by calling GetXMLRecords (see page 26062), unless the event handler supplies the XML data packet first.

Sender is the object that is requesting the XML data packet (usually an InternetExpress page producer).

Request describes an HTTP request message that originated the need for an XML data packet. Typically, this is a request message for which the InternetExpress page producer is creating a response.

RecCount returns the number of records in the XML data packet.

On entry, OwnerData contains an application-defined value that is passed to the OnRequestRecords (see page 26080) event handler, and then forwarded (with any changes provided by the event handler) to the provider's BeforeGetRecords event handler. OwnerData returns an application-defined value that is set by the provider's AfterGetRecords event handler. Typically, this parameter is used to transmit persistent state information to and from a stateless application server.

XMLOptions is a set of flags indicating how the XML broker should format the XML data packet that the application server or OnRequestRecords (see page 26080) event handler supplies.

RequestRecords returns the XML data packet.

GetXMLRecords (see page 26062)

AS_GetRecords (see page 16455)

OnRequestRecords (see page 26080)

AppServer (see page 26070)

BeforeGetRecords (see page 18480)

AfterGetRecords (see page 18477)

Using an XML Broker

194.1.1.4.31 TXMLBroker.RequestUpdate Method

Responds to an HTTP update request.

Pascal

```
function RequestUpdate(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean RequestUpdate(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

Call RequestUpdate when using a Web action item to respond to update requests from a Web browser. When using a Web

action item to respond to update requests, instead of letting the XML broker receive the update requests directly, you should set the Enabled property of the WebDispatch (see page 26076) to false.

RequestUpdate generates an OnRequestUpdate (see page 26080) event, to allow the event handler to apply the updates in the HTTP request message and generate a response. If the OnRequestUpdate (see page 26080) event handler does not handle the message, RequestUpdate applies the updates using the ApplyXMLUpdates (see page 26056) method. Finally, if there are no update errors, RequestUpdate generates an OnGetResponse (see page 26079) event. If there were update errors, RequestResponse generates an OnGetErrorResponse (see page 26078) event and (if the event handler does not generate a response) assigns the content of ReconcileProducer (see page 26075) to the response message. If there are update errors and the response is not completed by an event handler or the ReconcileProducer (see page 26075), the XML broker raises an exception.

Sender is the object that received the request message.

Request describes an HTTP request message that contains the updates that need to be applied.

Response is the emerging response object that should be completed by RequestUpdate so that the XML broker can send it back to the Web browser.

RequestUpdate returns true if the response message is ready to send back to the Web browser, false if it still needs more processing.

OnGetErrorResponse (see page 26078)

ReconcileProducer (see page 26075)

WebDispatch (see page 26076)

Enabled (see page 1482)

194.1.1.4.32 TXMLBroker.RowSetVarName Method

Returns the name of the javascript variable for the XML broker's dataset.

Pascal

```
function RowSetVarName(Path: TStrings): string;
```

C++

```
__fastcall AnsiString RowSetVarName(TStrings Path);
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares a javascript variable of type RowSet for the javascript object that represents the XML broker's dataset. When the InternetExpress page producer needs to determine whether a RowSet variable was already declared, it looks up the variable name by calling RowSetVarName.

Path is a set of variable names for all the master datasets for which the XML broker's dataset is a detail set.

RowSetVarName returns the name of the XML broker, qualified by all strings in Path.

Note: Variable names are assigned for an XML broker's dataset using the MasterRowSetVarName (see page 26063) method.

See Also

Name (see page 2805)

Content (see page 17138)

MasterRowSetVarName (see page 26063)

194.1.1.4.33 TXMLBroker.SendConnectEvent Method

Pascal

```
procedure SendConnectEvent(Connecting: Boolean);
```

C++

```
__fastcall SendConnectEvent(Boolean Connecting);
```

Description

This is SendConnectEvent, a member of class TXMLBroker.

194.1.1.4.34 TXMLBroker.SetAppServer Method

Pascal

```
procedure SetAppServer(Value: IAppServer);
```

C++

```
__fastcall SetAppServer(IAppServer Value);
```

Description

This is SetAppServer, a member of class TXMLBroker.

194.1.1.4.35 TXMLBroker.SetConnected Method

Pascal

```
procedure SetConnected(Value: Boolean);
```

C++

```
__fastcall SetConnected(Boolean Value);
```

Description

This is SetConnected, a member of class TXMLBroker.

194.1.1.4.36 TXMLBroker.SetParams Method

Pascal

```
procedure SetParams(const Value: TXMLParams);
```

C++

```
__fastcall SetParams(const TXMLParams Value);
```

Description

This is SetParams, a member of class TXMLBroker.

194.1.1.4.37 TXMLBroker.SetProvider Method

Associates the XML broker with a provider in the same process space.

Pascal

```
procedure SetProvider(Provider: TComponent);
```

C++

```
__fastcall SetProvider(TComponent * Provider);
```

Description

Use SetProvider to specify a local provider component that provides data to and applies updates from the XML broker. The XML broker communicates with this provider using the IAppServer interface specified by the AppServer (see page 26070) property.

Do not use SetProvider for remote providers on an application server. If the provider is not in the same process space as the XML broker, use the ProviderName (see page 26074) property.

The Provider (see page 18419) parameter must be a descendant of TCustomProvider. Otherwise, SetProvider raises an exception.

See Also

AppServer (see page 26070)

ProviderName (see page 26074)

TDataSetProvider (see page 18508)

TCustomProvider (see page 18449)

194.1.1.4.38 TXMLBroker.SetProviderName Method

Pascal

```
procedure SetProviderName(const Value: string);
```

C++

```
__fastcall SetProviderName(const AnsiString Value);
```

Description

This is SetProviderName, a member of class TXMLBroker.

194.1.1.4.39 TXMLBroker.SetReconcileProducer Method

Pascal

```
procedure SetReconcileProducer(const Value: TCustomContentProducer);
```

C++

```
__fastcall SetReconcileProducer(const TCustomContentProducer Value);
```

Description

This is SetReconcileProducer, a member of class TXMLBroker.

194.1.1.4.40 TXMLBroker.SetRemoteServer Method

Pascal

```
procedure SetRemoteServer(Value: TCustomRemoteServer);
```

C++

```
__fastcall SetRemoteServer(TCustomRemoteServer Value);
```

Description

This is SetRemoteServer, a member of class TXMLBroker.

194.1.1.4.41 TXMLBroker.SetWebDispatch Method

Pascal

```
procedure SetWebDispatch(const Value: TWebDispatch);
```

C++

```
__fastcall SetWebDispatch(const TWebDispatch Value);
```

Description

This is SetWebDispatch, a member of class TXMLBroker.

194.1.1.4.42 TXMLBroker.SubmitFormVarName Method

Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 26063).

Pascal

```
function SubmitFormVarName: string;
```

C++

```
__fastcall AnsiString SubmitFormVarName();
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares an HTML form that submits the updates to the XML broker. In addition, it declares a variable that refers to that form. SubmitFormVarName is the name of that variable.

See Also

HTMLSubmitFormName (see page 26063)

Content (see page 17138)

194.1.1.5 TXMLBroker Properties

The properties of the TXMLBroker class are listed here.

Public Properties

	Name	Description
	AppServer (see page 26070)	Provides access to the interface the XML broker uses to communicate with the application server.
R	HasAppServer (see page 26071)	Indicates whether the XML broker has an IAppServer interface for communicating with its provider.

R	Notify (see page 26073)	Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.
R	NotifyCount (see page 26073)	Indicates the number of objects in the Notify (see page 26073) property list.

Published Properties

	Name	Description
	Connected (see page 26070)	Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.
	MaxErrors (see page 26071)	Specifies the maximum number of update errors allowed before aborting an update operations.
	MaxRecords (see page 26072)	Specifies the maximum number of records that can appear in XML data packets.
	Params (see page 26073)	Contains parameter values that are sent to or retrieved from the application server.
	ProviderName (see page 26074)	Specifies the name of a registered provider from the application server.
	ReconcileProducer (see page 26075)	Specifies the producer that generates response message content when an update generates errors.
	RemoteServer (see page 26076)	Specifies the connection component that this XML broker uses to connect to an application server.
	WebDispatch (see page 26076)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

194.1.1.5.1 TXMLBroker.AppServer Property

Provides access to the interface the XML broker uses to communicate with the application server.

Pascal

```
property AppServer: IAppServer;
```

C++

```
__property IAppServer AppServer;
```

Description

Use AppServer to communicate with the providers that supply data to and resolve updates for the XML broker. If the providers are on a remote application server, AppServer has the same value as the AppServer property of the connection component. If the XML broker uses a provider in the same process space, AppServer is the interface to an internally created object that dispatches IAppServer calls to the local provider.

Applications don't need to work directly with the IAppServer interface. The properties and methods of the XML broker are automatically translated into IAppServer calls as needed.

See Also

HasAppServer (see page 26071)

AppServer (see page 8532)

SetProvider (see page 26068)

194.1.1.5.2 TXMLBroker.Connected Property

Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Use Connected to determine whether the XML broker can supply XML data packets and apply updates. If the XML broker uses a provider on an application server, setting Connected to true sets the Connected property of the connection component to true. If the XML broker uses a local provider component, setting Connected to true causes the XML broker to generate an internal object that communicates with the provider using the IAppServer interface. Thus, the value of Connected indicates whether an IAppServer interface is available for communicating with a provider, and so the value of Connected is the same as the value of HasAppServer (see page 26071).

You can't set Connected to true unless the XML broker has a provider to which it can connect. Trying to set Connected to true before the ProviderName (see page 26074) property is set or a local provider is assigned using the SetProvider (see page 26068) method causes the XML broker to raise an exception.

Note: In the Web Page editor, default fields or parameter values may not appear if the associated XML broker is not connected.

See Also

HasAppServer (see page 26071)

AppServer (see page 26070)

Connected (see page 6868)

TDataSetProvider (see page 18508)

ProviderName (see page 26074)

SetProvider (see page 26068)

194.1.1.5.3 TXMLBroker.HasAppServer Property

Indicates whether the XML broker has an IAppServer interface for communicating with its provider.

Pascal

```
property HasAppServer: Boolean;
```

C++

```
__property Boolean HasAppServer;
```

Description

Read HasAppServer to determine whether the XML broker can get its data from an IAppServer interface. When HasAppServer is true, the XML broker can interact with its provider through the IAppServer interface.

Use HasAppServer to check whether the XML broker is connected rather than reading the AppServer (see page 26070) property. Reading AppServer (see page 26070) causes the XML broker to obtain an IAppServer interface if it does not already have one.

See Also

IAppServer (see page 16450)

AppServer (see page 26070)

Connected (see page 26070)

194.1.1.5.4 TXMLBroker.MaxErrors Property

Specifies the maximum number of update errors allowed before aborting an update operations.

Pascal

```
property MaxErrors: Integer;
```

C++

```
__property int MaxErrors;
```

Description

Set MaxErrors to indicate the maximum number of errors that the associated provider should allow before prematurely stopping an update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

See Also

AS_ApplyUpdates (see page 16451)

ReconcileProducer (see page 26075)

ApplyXMLUpdates (see page 26056)

194.1.1.5.5 TXMLBroker.MaxRecords Property

Specifies the maximum number of records that can appear in XML data packets.

Pascal

```
property MaxRecords: Integer;
```

C++

```
__property int MaxRecords;
```

Description

Set MaxRecords to limit the size of XML data packets retrieved from the associated provider.

When MaxRecords is –1, XML data packets contain all the records in the provider's dataset.

When MaxRecords is 0, XML data packets contain only metadata.

When MaxRecords is greater than 0, XML data packets contain up to MaxRecords records, depending on the number of records in the provider's dataset.

Tip: Because an InternetExpress application sends the entire data packet to client applications, it is important to limit the size of data packets. Otherwise, the time to download web pages containing data packets can be prohibitively long.

Note: When limiting the number of records that appear in data packets, you may need to fetch several data packets before all data is returned. Because InternetExpress applications are always stateless, you will need to supply information about what record should start the next data packet as the OwnerData parameter of GetXMLRecords (see page 26062) or RequestRecords (see page 26064). You can use a query form to obtain information about the last record seen by a particular Web client.

See Also

AS_GetRecords (see page 16455)

GetXMLRecords (see page 26062)

RequestRecords (see page 26064)

TQueryForm (see page 16745)

Using an XML Broker

194.1.1.5.6 TXMLBroker.Notify Property

Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.

Pascal

```
property Notify [Index: Integer]: TObject;
```

C++

```
__property TObject * Notify[int Index];
```

Description

Read Notify to access the objects that respond when the XML broker's connection to its provider changes. These objects are sent a notification when the ProviderName (see page 26074), AppServer (see page 26070), or RemoteServer (see page 26076) property changes.

Most applications do not need to use the Notify property. It allows the Web page editor to remain synchronized with property changes made at design time.

See Also

NotifyCount (see page 26073)

AddNotify (see page 26055)

RemoveNotify (see page 26064)

RemoteServer (see page 26076)

AppServer (see page 26070)

ProviderName (see page 26074)

194.1.1.5.7 TXMLBroker.NotifyCount Property

Indicates the number of objects in the Notify (see page 26073) property list.

Pascal

```
property NotifyCount: Integer;
```

C++

```
__property int NotifyCount;
```

Description

NotifyCount specifies the number of objects listed in the Notify (see page 26073) property.

See Also

Notify (see page 26073)

AddNotify (see page 26055)

RemoveNotify (see page 26064)

194.1.1.5.8 TXMLBroker.Params Property

Contains parameter values that are sent to or retrieved from the application server.

Pascal

```
property Params: TXMLParams;
```

C++

```
__property TXMLParams Params;
```

Description

Use Params to specify parameter values that should be passed to a source dataset on the application server. These parameter values are used in one of two ways:

If the associated provider represents a query or stored procedure, they supply parameter values that the application server uses when executing the query or stored procedure.

If the associated provider represents a table, they limit the records that are sent in data packets so that they only include records where each field with the same name as a parameter has the same value as the parameter.

After the application specifies parameters (at design time or runtime), they are sent to the application server automatically when the XML broker fetches data.

To send parameter values to a query or stored procedure, add a parameter object (TParam) to Params for every parameter on the query or stored procedure for which you want to supply a value. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the application server when the XML broker fetches data.

To send parameter values to a table, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the application server only contain records that match the assigned value on the corresponding fields.

Tip: You can assign parameter values from the content fields supplied to a request message by TSubmitQueryButton using the AssignStrings method of Params.

Note: To initialize Params so that it reflects the parameters of a query or stored procedure on an application server, call the FetchParams (see page 26058) method.

See Also

Params (see page 10087)

Params (see page 10165)

FetchParams (see page 26058)

TSubmitQueryButton (see page 16833)

AssignStrings (see page 26084)

Using an XML Broker

194.1.1.5.9 TXMLBroker.ProviderName Property

Specifies the name of a registered provider from the application server.

Pascal

```
property ProviderName: string;
```

C++

```
__property AnsiString ProviderName;
```

Description

Use ProviderName to specify the provider with which to communicate on the server (or in the same Web module). This property is passed as a parameter to IAppServer interface calls when the XML broker fetches data or applies updates. If an application server contains multiple provider objects, an XML broker can set ProviderName to any of them once the connection component establishes a connection to the application server.

ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer (see page 26076) property is set.

Note: ProviderName can also be used to link the XML broker to a provider in the same process space, as long as the provider component has the same Owner as the XML broker. If the local provider component has a different Owner, use the SetProvider (see page 26068) method instead.

See Also

RemoteServer (see page 26076)

TDataSetProvider (see page 18508)

IAppServer (see page 16450)

SetProvider (see page 26068)

Using an XML Broker

194.1.1.5.10 TXMLBroker.ReconcileProducer Property

Specifies the producer that generates response message content when an update generates errors.

Pascal

```
property ReconcileProducer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer ReconcileProducer;
```

Description

Use ReconcileProducer to specify the component that generates the content of response messages to update requests when the update operation generated errors.

When the XML broker applies updates, the application server returns a delta packet containing all records that could not be updated because of errors. The XML broker can attempt to respond to those errors or generate its own response message using the OnGetErrorResponse (see page 26078) event. However, unless the OnGetErrorResponse (see page 26078) event handler generates an HTML document to be sent in the response message and indicates that the update is completely handled, the XML broker must still generate a response to the update operation. To do so, it calls the Content method of the ReconcileProducer to generate the content of the response message.

Tip: The Reconcile producer will probably need information about the update errors that the application server returned. You can provide it with this information either by initializing the Reconcile producer in an OnGetErrorResponse (see page 26078) event handler or by having the Reconcile producer call the GetErrors (see page 26060) method.

Note: If there is no ReconcileProducer assigned and an update generates errors, the XML broker raises an exception unless the OnGetErrorResponse (see page 26078) event handler generates a response message.

Tip: The InetXCustom demo contains a TReconcilePageProducer component that you can use as the value of the ReconcileProducer property or as the basis of your own reconcile producer.

See Also

MaxErrors (see page 26071)

OnGetErrorResponse (see page 26078)

ApplyXMLUpdates (see page 26056)

GetErrors (see page 26060)

Using an XML Broker

194.1.1.5.11 TXMLBroker.RemoteServer Property

Specifies the connection component that this XML broker uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

Use RemoteServer to specify the connection component that establishes a connection to the remote application server. The connection component obtains an IAppServer interface for data exchange and maintains the interface of the remote data module on the application server.

If a Web application uses more than connection component, the application can change which connection an XML broker uses by changing the value for this property.

See Also

ProviderName (see page 26074)

TSocketConnection (see page 18928)

TDCOMConnection (see page 16008)

TWebConnection (see page 18968)

AppServer (see page 8532)

IAppServer (see page 16450)

Using an XML Broker

194.1.1.5.12 TXMLBroker.WebDispatch Property

Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

Use WebDispatch to specify the HTTP messages to which the XML broker responds. Typically, these originate from a button added to HTML forms by TApplyUpdatesButton.

The TWebDispatch object that implements WebDispatch includes properties that let you specify the path portion of URLs to which the XML broker responds, as well as the types of messages it accepts (typically post messages). You can also use this property to disable the XML broker so that the Web dispatcher does not send it any HTTP messages. When the XML broker is disabled in this way, it can still provide XML data packets to an InternetExpress page producer, but any update messages must be handled by a Web action item.

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

TApplyUpdatesButton (see page 16480)

Using an XML Broker

194.1.1.6 TXMLBroker Events

The events of the TXMLBroker class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 26077)	Occurs after the XML broker generates the content of a response message.
	BeforeDispatch (see page 26078)	Occurs when the XML broker receives an HTTP request message.
	OnGetErrorResponse (see page 26078)	Occurs when there are errors applying updates to the application server.
	OnGetResponse (see page 26079)	Occurs when there are no errors applying updates to the application server.
	OnRequestRecords (see page 26080)	Occurs when the XML broker needs to fetch a data packet from its associated provider.
	OnRequestUpdate (see page 26080)	Occurs immediately before the XML broker applies updates to the application server.

194.1.1.6.1 TXMLBroker.AfterDispatch Event

Occurs after the XML broker generates the content of a response message.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the XML broker an update message. Usually by the time AfterDispatch occurs, the XML broker has already applied the updates and generated the response message (using the ReconcileProducer (see page 26075) or one of the events that occurs when the XML broker receives an update request).

See Also

WebDispatch (see page 26076)

BeforeDispatch (see page 26078)

OnRequestUpdate (see page 26080)

OnGetResponse (see page 26079)

OnGetErrorResponse (see page 26078)

ReconcileProducer (see page 26075)

Using an XML Broker

194.1.1.6.2 TXMLBroker.BeforeDispatch Event

Occurs when the XML broker receives an HTTP request message.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write a BeforeDispatch event handler to initialize the response to an update request or to handle any messages sent to the XML broker that are not update requests. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing the XML broker from applying the updates.

Unless the BeforeDispatch event handler sets the Handled parameter to true, the XML broker receives an OnRequestUpdate (see page 26080) event after the BeforeDispatch event handler exits. After the OnRequestUpdate (see page 26080) event, the XML broker applies the updates to the application server and generates the contents of the response based on whether there were any update errors. Finally, the XML broker receives an AfterDispatch (see page 26077) event where it can perform any final changes to the response message before it is sent back to the Web browser.

If the BeforeDispatch event handler sets the Handled parameter to true, the XML broker receives an AfterDispatch (see page 26077) event, but does not attempt to apply updates from the request message or receive any of the events that accompany that process.

See Also

WebDispatch (see page 26076)

AfterDispatch (see page 26077)

OnRequestUpdate (see page 26080)

Using an XML Broker

194.1.1.6.3 TXMLBroker.OnGetErrorResponse Event

Occurs when there are errors applying updates to the application server.

Pascal

```
property OnGetErrorResponse: TGetErrorResponseEvent;
```

C++

```
__property TGetErrorResponseEvent OnGetErrorResponse;
```

Description

Write an OnGetErrorResponse event handler to generate the response message after an update request encountered errors or to initialize a ReconcileProducer (see page 26075) before it generates the response.

The Sender parameter is the XML broker that applied updates to the application server and received back a delta packet of update errors.

ErrorCount is the number of update errors found by the application server before it halted the update operation.

XMLErrors is a string of XML returned by the application server. It is a delta packet containing all the updates that could not be applied.

Request is the original request message that contains the delta packet of updates from the Web browser.

Response is the emerging response message that will be sent to the Web browser in response to the update request. Fill in the properties of this object to generate a response (such as an error message or a reconcile form) that indicates the errors in XMLErrors.

Handled indicates whether the event handler completed filling out Response. Set Handled to true if the event handler completes the response for the Web browser. Leave Handled as false if ReconcileProducer (see page 26075) should generate the content of Response.

Note: If the OnGetErrorResponse event handler does not set Handled to true and there is no ReconcileProducer (see page 26075), the XML broker raises an exception.

See Also

MaxErrors (see page 26071)

ReconcileProducer (see page 26075)

OnGetResponse (see page 26079)

ApplyXMLUpdates (see page 26056)

Using an XML Broker

194.1.1.6.4 TXMLBroker.OnGetResponse Event

Occurs when there are no errors applying updates to the application server.

Pascal

```
property OnGetResponse: TGetResponseEvent;
```

C++

```
__property TGetResponseEvent OnGetResponse;
```

Description

Write an OnGetResponse event handler to edit the response message after an update request is successfully applied.

The Sender parameter is the XML broker that applied updates to the application server with no errors.

Request is the original request message that contains the delta packet of updates from the Web browser.

Response is the emerging response message that will be sent to the Web browser in response to the update request. Fill in the properties of this object to generate a response (such as refreshing the data).

Handled indicates whether the event handler completed filling out Response. Set Handled to true if the event handler completes the response for the Web browser. Leave Handled as false if the XML broker should send a redirect response that sends the browser back to the page that generated the update request.

See Also

OnGetErrorResponse (see page 26078)

ApplyXMLUpdates (see page 26056)

Using an XML Broker

194.1.1.6.5 TXMLBroker.OnRequestRecords Event

Occurs when the XML broker needs to fetch a data packet from its associated provider.

Pascal

```
property OnRequestRecords: TRequestRecordsEvent;
```

C++

```
__property TRequestRecordsEvent OnRequestRecords;
```

Description

Write an OnRequestRecords event handler to provide an alternate mechanism for providing XML data packets or to perform other actions whenever the XML broker needs to fetch an XML data packet. For example, the OnRequestRecords event handler might call GetXMLRecords (see page 26062) to fetch an XML data packet from the application server and then edit its contents.

OnRequestRecords occurs when the InternetExpress page producer requests an XML data packet (usually in response to a request message) or when the application calls the XML broker's RequestRecords (see page 26064) method.

The Sender parameter is the object that originates the request (usually an InternetExpress page producer).

Request is the request message that prompted the request for an XML data packet. This value may be nil (Delphi) or NULL (C++) if the request did not arise from a page producer or if the page producer is not processing a request message.

OwnerData contains an application-defined variant that is sent to the provider's BeforeGetRecords event handler. The InternetExpress page producer that is requesting records or the caller of RequestRecords (see page 26064) may initialize this value. OwnerData can be used to pass persistent state information to a stateless application server (for example, the first record that should appear in the data packet when MaxRecords (see page 26072) is greater than 0).

Records optionally returns an XML data packet as a string. If Records is an empty string on exit from the event handler, the XML broker automatically fetches the XML data packet from its associated provider. Otherwise, the XML broker uses the value of Records as the new XML data packet.

GetXMLData (see page 17124)

BeforeGetRecords (see page 18480)

MaxRecords (see page 26072)

Using an XML Broker

194.1.1.6.6 TXMLBroker.OnRequestUpdate Event

Occurs immediately before the XML broker applies updates to the application server.

Pascal

```
property OnRequestUpdate: TRequestUpdateEvent;
```

C++

```
__property TRequestUpdateEvent OnRequestUpdate;
```

Description

Write an OnRequestUpdate event handler to provide an alternate mechanism for applying updates to the application server. For example, the OnRequestUpdate event handler might call GetDelta (see page 26059) to extract the delta packet from the request message and then preprocess the XML string before applying the updates with a call to ApplyXMLUpdates (see page 26056).

OnRequestUpdate occurs immediately after the BeforeDispatch (see page 26078) event or when the application calls the XML broker's RequestUpdate (see page 26065) method.

The Sender parameter is the object that received the update request (the XML broker or a Web action item).

Request is the request message that contains the updates to be applied. The XML delta packet can be extracted from this request object using the GetDelta (see page 26059) method.

Response is the emerging response message that will be sent back to the Web browser that generated the update request. The event handler can set properties on this response object to partially or completely specify the message will be returned to the Web browser.

Handled indicates whether the event handler applied the updates. If Handled is true on exit from the event handler, the XML broker does not apply the updates, does not receive an OnGetResponse (see page 26079) or OnGetErrorResponse (see page 26078) event, and does not call on the ReconcileProducer (see page 26075) to generate a response message. (It does still receive an AfterDispatch (see page 26077) event). If Handled is false on exit from the event handler, the XML broker proceeds to apply the updates contained in the request message and receives all the associated events.

Note: If the event handler applies the updates, it must also generate the response message.

Using an XML Broker

194.1.2 TXMLParams Class

TXMLParams manages a list of parameters for an XML broker.

Class Hierarchy

Pascal

```
TXMLParams = class(TParams);
```

C++

```
class TXMLParams : public TParams;
```

File

XMLBrokr

Description

XML brokers use TXMLParams to manage a list of parameters that it passes to a provider on the application server. These parameters supply values to a query or stored procedure on the application server, or limit the records provided from a table on the application server.

Use the properties and methods of TXMLParams to:

Access a specific parameter.

Add or delete parameters from the list.

Get or set the values of individual parameters.

Assign parameter values from a list such as the one supplied in a request message from a Web browser.

Compare parameters.

Iterate through all parameters.

Copy a set of parameters to another parameter list.

See Also

TParam (see page 7386)

TXMLBroker (see page 26049)

194.1.2.1 TXMLParams Members

The following tables list the members exposed by TXMLParams.

Protected Methods

	Name	Description
V	Added (see page 2736)	Responds when items are added to the collection.
V	AssignTo (see page 26085)	Copies the properties of an object to a destination object.
	Changed (see page 2740)	Responds when the collection or any of its items changes.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 7444)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	Deleting (see page 2741)	Responds when items are deleted from the collection.
	GetAttr (see page 2743)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr (see page 2745) method.
	GetAttrCount (see page 2744)	Returns the number of custom attributes associated with items in the collection.
	GetDataSet (see page 7445)	This is GetDataSet, a member of class TParams.
	GetItem (see page 2744)	Returns a specified item in the collection.
	GetItemAttr (see page 2745)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 2932)	Returns the owner of an object.
V	GetOwner (see page 7445)	Returns the owner of an object.
V	Notify (see page 2746)	Responds when items are added to or removed from the collection.
	SetItem (see page 2747)	Copies the properties of another item to a specified item in the collection.
V	SetItemName (see page 2747)	Initializes the name of a newly inserted collection item.

V	Update (see page 2747)	Updates the collection to reflect changes to its items.
V	Update (see page 7448)	Updates the collection to reflect changes to its items.

Protected Properties

	Name	Description
R	NextID (see page 2752)	Specifies a unique ID that can be assigned to the next added collection item.
	PropName (see page 2752)	Specifies the name of the property that the collection implements.
R	UpdateCount (see page 2753)	Counts the number of times BeginUpdate (see page 2739) was called without a corresponding call to EndUpdate (see page 2742).

Public Methods

	Name	Description
	Add (see page 2736)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	AddParam (see page 7438)	Inserts a new field parameter into the Items (see page 7449) list.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2736)	Copies the contents of another collection to the object where the method is executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
	AssignStrings (see page 26084)	Assigns values to the parameters from a list of name/value pairs.
	AssignValues (see page 7439)	Assigns new values to the parameters of the Items (see page 7449) property.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
V	BeginUpdate (see page 2739)	Suspends screen repainting.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 2741)	Deletes all items from the collection.
	Create (see page 2734)	Creates and initializes a collection.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7437)	This is the overview for the Create constructor overload.
	CreateParam (see page 7441)	Creates a new field parameter object and inserts it into the Items (see page 7449) list.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 2741)	Deletes a single item from the collection.
V	Destroy (see page 2735)	Destroys the collection and each item in it.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	EndUpdate (see page 2742)	Re-enables screen repainting.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindItemID (see page 2743)	Returns the item with the specified ID.
	FindParam (see page 7445)	Locates the parameter with a given name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetEnumerator (see page 2744)	Returns a TCollection (see page 2731) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2745)	Returns a string used by the Object Inspector.

	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParamList (see page 7446)	Fills a TList object with the TParam (see page 7386) objects specified by name.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	Insert (see page 2746)	Creates a new TCollectionItem (see page 2755) instance and adds it to the Items (see page 2751) array.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEqual (see page 7446)	Indicates whether two TParams (see page 7434) objects have identical Items (see page 7449).
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Owner (see page 2746)	Returns the Owner of the collection.
	ParamByName (see page 7447)	Locates the parameter with a given name.
	ParseSQL (see page 7447)	Locates the parameters in an SQL statement and replaces them with question marks.
	RemoveParam (see page 7448)	Removes the specified parameter from the Items (see page 7449) property of a TParams (see page 7434) object.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	Capacity (see page 2748)	Provides access to the internal TList (see page 2868) Capacity property.
R	Count (see page 2749)	Returns the number of items in the collection.
R	ItemClass (see page 2751)	Indicates the class to which the collection's items belong.
	Items (see page 2751)	Lists the items in the collection.
	Items (see page 7449)	Lists the individual field parameters of a TParams (see page 7434) object.
	ParamValues (see page 7451)	Lists the values of individual field parameters that are specified by name.

194.1.2.2 TXMLParams Methods

The methods of the TXMLParams class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 26085)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	AssignStrings (see page 26084)	Assigns values to the parameters from a list of name/value pairs.

194.1.2.2.1 TXMLParams.AssignStrings Method

Assigns values to the parameters from a list of name/value pairs.

Pascal

```
procedure AssignStrings(Value: TStrings);
```

C++

```
__fastcall AssignStrings(TStrings Value);
```

Description

Use AssignStrings to update the values of the parameters in the Items list to match the values in the list specified by Value. For

each string in Value of the form Name=Value, AssignStrings locates the parameter (if any) that has the same name as the name portion of the string. It then assigns the Value portion of the string as the parameter's value.

AssignStrings makes it very convenient to assign parameter values that are received as the content of a request message. In particular, TSubmitQueryButton generates an HTML control that sends the values in an HTML query form to the Web application. If the query form displays parameter values that should be sent to a provider on the application server, you can call AssignStrings with the ContentFields property of that Web request message.

See Also

Items (see page 7449)

ParamValues (see page 7451)

ContentFields (see page 15177)

TQueryForm (see page 16745)

TSubmitQueryButton (see page 16833)

194.1.2.2.2 TXMLParams.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign (see page 2930)

EConvertError (see page 22724)

194.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	INotifyConnectionChange (see page 26086)	This is class XMLBrokr.INotifyConnectionChange.

194.2.1 INotifyConnectionChange Interface

Class Hierarchy

XMLBrokr.INotifyConnectionChange

Pascal

```
INotifyConnectionChange = interface;
```

C++

```
__interface INotifyConnectionChange;
```

File

XMLBrokr

Description

This is class XMLBrokr.INotifyConnectionChange.

194.2.1.1 INotifyConnectionChange Members

The following tables list the members exposed by INotifyConnectionChange.

Public Methods

	Name	Description
	ConnectionChange (see page 26087)	This is ConnectionChange, a member of class INotifyConnectionChange.

194.2.1.2 INotifyConnectionChange Methods

The methods of the INotifyConnectionChange class are listed here.

Public Methods

	Name	Description
	ConnectionChange (see page 26087)	This is ConnectionChange, a member of class INotifyConnectionChange.

194.2.1.2.1 INotifyConnectionChange.ConnectionChange Method

Pascal

```
procedure ConnectionChange(Sender: TComponent; Connected: Boolean);
```

C++

```
__fastcall ConnectionChange(TComponent * Sender, Boolean Connected);
```

Description

This is ConnectionChange, a member of class INotifyConnectionChange.

194.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FormatXML (see page 26088)	This is function XMLBrokr.FormatXML.

194.3.1 XMLBrokr.FormatXML Function

Pascal

```
function FormatXML(const Value: string; XMLOptions: TXMLOptions): string;
```

C++

```
AnsiString FormatXML(const AnsiString Value, TXMLOptions XMLOptions);
```

File

XMLBrokr

Description

This is function XMLBrokr.FormatXML.

194.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TXMLOption (see page 26089)	This is record XMLBrokr.TXMLOption.

194.4.1 XMLBrokr.TXMLOption Enumeration

Pascal

```
TXMLOption = (
  xoQuote
);
```

C++

```
enum TXMLOption {
  xoQuote
};
```

File

XMLBrokr

Description

This is record XMLBrokr.TXMLOption.

194.5 Types

The following table lists types in this documentation.

Types

Name	Description
TGetErrorResponseEvent (see page 26090)	This is type XMLBrokr.TGetErrorResponseEvent.
TGetResponseEvent (see page 26090)	This is type XMLBrokr.TGetResponseEvent.
TRequestRecordsEvent (see page 26091)	This is type XMLBrokr.TRequestRecordsEvent.
TRequestUpdateEvent (see page 26091)	This is type XMLBrokr.TRequestUpdateEvent.
TXMLOptions (see page 26091)	This is type XMLBrokr.TXMLOptions.

194.5.1 XMLBrokr.TGetErrorResponseEvent Type

Pascal

```
TGetErrorResponseEvent = procedure (Sender: TObject; ErrorCount: Integer; XMLErrors: string;
Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; ErrorCount: Integer; XMLErrors: string; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean) ( TGetErrorResponseEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TGetErrorResponseEvent.

194.5.2 XMLBrokr.TGetResponseEvent Type

Pascal

```
TGetResponseEvent = procedure (Sender: TObject;Request: TWebRequest; Response: TWebResponse;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject;Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
TGetResponseEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TGetResponseEvent.

194.5.3 XMLBrokr.TRequestRecordsEvent Type

Pascal

```
TRequestRecordsEvent = procedure (Sender: TObject; Request: TWebRequest; out RecCount:
Integer; var OwnerData: OleVariant; var Records: string) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; out RecCount: Integer; var OwnerData: OleVariant; var
Records: string) ( TRequestRecordsEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TRequestRecordsEvent.

194.5.4 XMLBrokr.TRequestUpdateEvent Type

Pascal

```
TRequestUpdateEvent = procedure (Sender: TObject; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
TRequestUpdateEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TRequestUpdateEvent.

194.5.5 XMLBrokr.TXMLOptions Type

Pascal

```
TXMLOptions = set of TXMLOption;
```

C++

```
TXMLOption TXMLOptions;
```

File

XMLBrokr

Description

This is type XMLBrokr.TXMLOptions.

194.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sPostDelta (see page 26092)	This is constant XMLBrokr.sPostDelta.
sProducer (see page 26092)	This is constant XMLBrokr.sProducer.
sRedirect (see page 26092)	This is constant XMLBrokr.sRedirect.

194.6.1 XMLBrokr.sPostDelta Constant

Pascal

```
sPostDelta = 'postdelta';
```

C++

```
sPostDelta = 'postdelta';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sPostDelta.

194.6.2 XMLBrokr.sProducer Constant

Pascal

```
sProducer = 'PRODUCER';
```

C++

```
sProducer = 'PRODUCER';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sProducer.

194.6.3 XMLBrokr.sRedirect Constant

Pascal

```
sRedirect = 'REDIRECT';
```

C++

```
sRedirect = 'REDIRECT';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sRedirect.

195 XMLDoc Namespace

This is namespace XMLDoc.

Topics

Name	Description
Classes (see page 26097)	The following table lists classes in this documentation.
Interfaces (see page 26228)	The following table lists interfaces in this documentation.
Functions (see page 26238)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 26243)	The following table lists structs, records, enums in this documentation.
Types (see page 26247)	The following table lists types in this documentation.
Variables (see page 26251)	The following table lists variables in this documentation.

Classes

	Name	Description
	TXMLDocument (see page 26097)	TXMLDocument represents an XML (see page 26144) document.
	TXMLNode (see page 26147)	TXMLNode represents a node in an XML document.
	TXMLNodeCollection (see page 26196)	TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.
	TXMLNodeList (see page 26211)	TXMLNodeList represents a set of nodes in an XML document.

Functions

	Name	Description
	CheckEncoding (see page 26238)	This is function XMLDoc.CheckEncoding.
	CreateDOMNode (see page 26238)	Creates a new DOM node and returns its interface.
	DetectCharEncoding (see page 26239)	This is function XMLDoc.DetectCharEncoding.
	FormatXMLData (see page 26240)	Formats a string of XML so that it is more readable.
	LoadXMLData (see page 26240)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLData (see page 26240)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLDocument (see page 26241)	Returns the interface for an XML document given the name of an XML file.
	NewXMLDocument (see page 26241)	Returns the interface for a new, empty XML document.
	XMLDocError (see page 26242)	Raises an EXMLDocError exception.
	XMLDocError (see page 26242)	Raises an EXMLDocError exception.
	XMLStringToWideString (see page 26242)	This is function XMLDoc.XMLStringToWideString.

Interfaces

	Name	Description
	IXMLDocumentAccess (see page 26228)	This is class XMLDoc.IXMLDocumentAccess.
	IXMLNodeAccess (see page 26230)	This is class XMLDoc.IXMLNodeAccess.

Structs, Records, Enums

	Name	Description
	TNodeChange (see page 26243)	TNodeChange indicates the type of change made to a node in an XML document.
	TNodeClassInfo (see page 26244)	TNodeClassInfo and TNodeClassArray (see page 26247) represent information about the classes that implement XML node interfaces.
	TNodeListOperation (see page 26244)	TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList interface.
	TXMLDocumentSource (see page 26245)	This is record XMLDoc.TXMLDocumentSource.
	TXMLPrologItem (see page 26246)	This is record XMLDoc.TXMLPrologItem.

Types

Name	Description
TNodeChangeEvent (see page 26247)	TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.
TNodeClassArray (see page 26247)	This is type XMLDoc.TNodeClassArray.
TNodeListNotification (see page 26248)	TNodeListNotification is the type of the callback the TXMLNodeList (see page 26211) calls when it adds, deletes, or creates XML nodes.
TXMLNodeArray (see page 26249)	TXMLNodeArray is a dynamic array of TXMLNode (see page 26147) objects.
TXMLNodeClass (see page 26249)	TXMLNodeClass is a class reference to a TXMLNode (see page 26147) descendant.
TXMLNodeCollectionClass (see page 26250)	TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 26196) descendant.

Variables

Name	Description
UseXSDBooleanStrings (see page 26251)	This is variable XMLDoc.UseXSDBooleanStrings.

195.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TXMLDocument (see page 26097)	TXMLDocument represents an XML (see page 26144) document.
	TXMLNode (see page 26147)	TXMLNode represents a node in an XML document.
	TXMLNodeCollection (see page 26196)	TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.
	TXMLNodeList (see page 26211)	TXMLNodeList represents a set of nodes in an XML document.

195.1.1 TXMLDocument Class

TXMLDocument represents an XML (see page 26144) document.

Class Hierarchy

Pascal

```
TXMLDocument = class(TComponent, IInterface, IXMLDocument, IXMLDocumentAccess);
```

C++

```
class TXMLDocument : public TComponent, public IInterface, public IXMLDocument, public
IXMLDocumentAccess;
```

File

XMLDoc

Description

Use TXMLDocument to represent an XML (see page 26144) document. TXMLDocument can read an existing XML (see page 26144) document from a file, it can be associated with an in-memory string that is the contents of an XML (see page 26144) document, or it can create a new, empty XML (see page 26144) document.

You can use TXMLDocument directly to load an XML (see page 26144) document, read and edit it, and save any changes. You can also use TXMLDocument to access the objects generated by the XML (see page 26144) Data Binding wizard.

TXMLDocument uses an external DOM (Document Object Model) parser to analyze the XML (see page 26144) document. This parser is usually assigned by specifying the DOMVendor (see page 26137) property.

When you set the Active (see page 26133) property to true, TXMLDocument uses the DOM parser to parse the XML (see page 26144) document so that you can examine or modify it. In particular, the DocumentElement (see page 26135) property provides an interface to the root node of the document. You can use that interface to access its child nodes and to add or delete child nodes.

TXMLDocument implements the IXMLDocument interface. Applications obtain this interface from TXMLDocument or from the nodes in the document.

When TXMLDocument is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TXMLDocument instance is automatically freed. When TXMLDocument is created with an Owner, however, it behaves like any other component, and is freed by its Owner. When you add a TXMLDocument component from the component palette to a form or data module, it is automatically created with an Owner. When the TXMLDocument component is created using the global LoadXMLDocument (see page 26241) function (or by a function that the XML (see page 26144) Data Binding wizard generates to return the root node of the document), the function creates a TXMLDocument instance without an Owner.
