EXMLDocError (see page 26381)

IXMLDocument (see page 26382)

LoadXMLDocument (see page 26241)

Using TXMLDocument

Using Code That the XML Data Binding Wizard Generates

195.1.1.1 TXMLDocument Members

The following tables list the members exposed by TXMLDocument.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 26113)	Returns the value of the Active property.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.

	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetModified (see page 26116)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	LoadData (see page 26120)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.

	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.
	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 26107)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 26103)	This is the overview for the Create constructor overload.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26104)	Disposes of a TXMLDocument (see page 26097) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.
	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.

	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

195.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TXMLDocument.Create (DOMString) (see page 26103)	Instantiates a TXMLDocument (see page 26097) object.
	TXMLDocument.Create (TComponent) (see page 26103)	Instantiates a TXMLDocument (see page 26097) object.

195.1.1.2.1 TXMLDocument.Create Constructor (DOMString)

Instantiates a TXMLDocument (see page 26097) object.

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
constructor Create(const AFileName: DOMString); overload; reintroduce;
```

C++

```
virtual __fastcall TXMLDocument(TComponent * AOwner);
__fastcall TXMLDocument(const DOMString AFileName);
```

Description

Call Create to instantiate a TXMLDocument (see page 26097) component at runtime. You do not need to explicitly create TXMLDocument (see page 26097) components that are added to forms or data modules at design time: they are created automatically.

AFileName specifies the file that the new TXMLDocument (see page 26097) instance represents.

AOwner is another component that is responsible for freeing the TXMLDocument (see page 26097) instance. It becomes the value of the Owner property.

TXMLDocument (see page 26097) components that are created at runtime without an owner are freed automatically when all references to their IXMLDocument interface are released. This differs from TXMLDocument (see page 26097) components added to a form or data module at design time or those created with an owner. When added to a form or data module at design time, the object is explicitly freed by its Owner (the form or data module).

See Also

FileName (see page 26138)

IXMLDocument (see page 26382)

Owner (see page 2807)

195.1.1.3 TXMLDocument.Destroy Destructor

Disposes of a TXMLDocument (see page 26097) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDocument();
```

Description

It is not necessary to explicitly free a TXMLDocument (see page 26097) component. If the component is created with an Owner, that Owner handles the task of freeing the document. If the component is created without an Owner, it is freed automatically when the reference count on its IXMLDocument interface drops to zero.

Create (see page 26103)

195.1.1.4 TXMLDocument Methods

The methods of the TXMLDocument class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 26113)	Returns the value of the Active property.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetModified (see page 26116)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.

	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 26120)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.
	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Public Methods

	Name	Description
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 26107)	Responds after the last constructor has executed.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.

195.1.1.4.1 TXMLDocument._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_Release (see page 2769)

ComObject (see page 2793)

_AddRef (see page 22397)

195.1.1.4.2 TXMLDocument._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

See Also

Invoke (see page 2781)

QueryInterface (see page 2784)

_AddRef (see page 2769)

ComObject (see page 2793)

195.1.1.4.3 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	TXMLDocument.AddChild (DOMString) (see page 26107)	Creates and adds a node to the child nodes of this document.
	TXMLDocument.AddChild (DOMString, DOMString) (see page 26107)	Creates and adds a node to the child nodes of this document.

195.1.1.4.3.1 TXMLDocument.AddChild Method (DOMString)

Creates and adds a node to the child nodes of this document.

Pascal

```
function AddChild(const TagName: DOMString): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI);
```

Description

Call AddChild to add a new child element node to the document itself. The new node is added to the end of the list maintained by the ChildNodes (see page 26135) property.

TagName is the tag name for the new element node.

NamespaceURI identifies the namespace, if any, that includes the new node's definition.

AddChild returns the interface for the newly created node.

Note: Do not call AddChild to add a child to the document element of this document. When adding data to the XML (see page 26144) document, use the AddChild method of the document element or of the node in the hierarchy that should be the parent of the new node.

See Also

AddChild (see page 26414)

CreateNode (see page 26109)

CreateElement (see page 26109)

ChildNodes (see page 26135)

DocumentElement (see page 26135)

195.1.1.4.4 TXMLDocument.AfterConstruction Method

Responds after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

The System::TObject::AfterConstruction method implemented in System::TObject::TObject does nothing. Override this method when creating a class that takes some action after the object is created. For example, TCustomForm overrides System::TObject::AfterConstruction to generate an OnCreate event.

See Also

System::TObject::BeforeDestruction (see page 22289)

OnCreate (see page 13951)

System::TObject::Create (see page 22287)

195.1.1.4.5 TXMLDocument.AssignParseOptions Method

Pascal

```
procedure AssignParseOptions;
```

C++

```
__fastcall AssignParseOptions();
```

Description

This is AssignParseOptions, a member of class TXMLDocument.

195.1.1.4.6 TXMLDocument.CheckActive Method

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

This is CheckActive, a member of class TXMLDocument.

195.1.1.4.7 TXMLDocument.CheckAutoSave Method

Pascal

```
procedure CheckAutoSave; dynamic;
```

C++

```
__fastcall CheckAutoSave();
```

Description

This is CheckAutoSave, a member of class TXMLDocument.

195.1.1.4.8 TXMLDocument.CheckDOM Method

Pascal

```
procedure CheckDOM; dynamic;
```

C++

```
__fastcall CheckDOM();
```

Description

This is CheckDOM, a member of class TXMLDocument.

195.1.1.4.9 TXMLDocument.CreateElement Method

Creates a new element node that is associated with this document.

Pascal

```
function CreateElement(const TagOrData: DOMString; const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateElement(const DOMString TagOrData, const DOMString NamespaceURI);
```

Description

Call CreateElement to create a new generic element node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 26135) list of any node in the document (including this document's ChildNodes (see page 26135) property). It can also be assigned to the DocumentElement (see page 26135) property to replace the entire data hierarchy of this document.

TagOrData provides the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

CreateElement returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 26107) method.

See Also

AddChild (see page 26414)

ChildNodes (see page 26135)

DocumentElement (see page 26135)

AddChild (see page 26107)

CreateNode (see page 26109)

195.1.1.4.10 TXMLDocument.CreateNode Method

Creates a new node that is associated with this document.

Pascal

```
function CreateNode(const NameOrData: DOMString; NodeType: TNodeType = ntElement; const
AddlData: DOMString = ''): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNode(const DOMString NameOrData, TNodeType NodeType = ntElement,
const DOMString AddlData = '');
```

Description

Call CreateNode to create a new generic XML (see page 26144) node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 26135) or AttributeNodes list of any node in the document (including this document's ChildNodes (see page 26135) property). It can also be assigned to the DocumentElement (see page 26135) property to replace the entire data hierarchy of this document.

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

CreateNode returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 26107) method.

See Also

AddChild (see page 26414)

ChildNodes (see page 26135)

AttributeNodes (see page 26189)

DocumentElement (see page 26135)

AddChild (see page 26107)

CreateElement (see page 26109)

CreateDOMNode (see page 26238)

195.1.1.4.11 TXMLDocument.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

See Also

Ancestor (see page 2839)

DefineBinaryProperty (see page 2837)

DefineProperties (see page 2931)

DefineProperty (see page 2838)

195.1.1.4.12 TXMLDocument.DoAfterClose Method

Pascal

```
procedure DoAfterClose; dynamic;
```

C++

```
__fastcall DoAfterClose();
```

Description

This is DoAfterClose, a member of class TXMLDocument.

195.1.1.4.13 TXMLDocument.DoAfterOpen Method

Pascal

```
procedure DoAfterOpen; dynamic;
```

C++

```
__fastcall DoAfterOpen();
```

Description

This is DoAfterOpen, a member of class TXMLDocument.

195.1.1.4.14 TXMLDocument.DoBeforeClose Method

Pascal

```
procedure DoBeforeClose; dynamic;
```

C++

```
__fastcall DoBeforeClose();
```

Description

This is DoBeforeClose, a member of class TXMLDocument.

195.1.1.4.15 TXMLDocument.DoBeforeOpen Method

Pascal

```
procedure DoBeforeOpen; dynamic;
```

C++

```
__fastcall DoBeforeOpen();
```

Description

This is DoBeforeOpen, a member of class TXMLDocument.

195.1.1.4.16 TXMLDocument.DoNodeChange Method

Pascal

```
procedure DoNodeChange(const Node: IXMLNode; ChangeType: TNodeChange; BeforeOperation:
Boolean);
```

C++

```
__fastcall DoNodeChange(const IXMLNode Node, TNodeChange ChangeType, Boolean BeforeOperation);
```

Description

This is DoNodeChange, a member of class TXMLDocument.

195.1.1.4.17 TXMLDocument.GeneratePrefix Method

Generates a unique namespace prefix that can be used for a node in the document.

Pascal

```
function GeneratePrefix(const Node: IXMLNode): DOMString;
```

C++

```
__fastcall DOMString GeneratePrefix(const IXMLNode Node);
```

Description

Call GeneratePrefix to generate a new namespace prefix that is not already used in the document to represent a namespace URI. GeneratePrefix uses the NSPrefixBase (see page 26141) property to generate a unique string to act as a namespace prefix. This unique string consists of NSPrefixBase (see page 26141) followed by a number that ensures uniqueness. Thus, for example, if NSPrefixBase (see page 26141) is 'NS', automatically-generated namespace prefixes have the form 'NS1', 'NS2', and so on.

Node (see page 26140) is the interface for the node which will use the newly-generated namespace prefix.

The generated namespace prefixes are only unique within a single document. If two document components have the same value for NSPrefixBase (see page 26141), they will generate the same namespace prefixes.

See Also

NSPrefixBase (see page 26141)

195.1.1.4.18 TXMLDocument.GetActive Method

Returns the value of the Active property.

Pascal

```
function GetActive: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetActive();
```

Description

GetActive is the read implementation of the Active property.

See Also

Active (see page 26403)

195.1.1.4.19 TXMLDocument.GetAsyncLoadState Method

Returns the value of the AsyncLoadState property.

Pascal

```
function GetAsyncLoadState: Integer;
```

C++

```
__fastcall int GetAsyncLoadState();
```

Description

GetAsyncLoadState is the read implementation of the AsyncLoadState property.

See Also

AsyncLoadState (see page 26404)

195.1.1.4.20 TXMLDocument.GetChildNodeClass Method

Pascal

```
function GetChildNodeClass(const Node: IDOMNode): TXMLNodeClass; virtual;
```

C++

```
virtual __fastcall TXMLNodeClass GetChildNodeClass(const IDOMNode Node);
```

Description

This is GetChildNodeClass, a member of class TXMLDocument.

195.1.1.4.21 TXMLDocument.GetChildNodes Method

Returns the value of the ChildNodes property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes property.

See Also

ChildNodes (see page 26405)

195.1.1.4.22 TXMLDocument.GetDocBinding Method

Replaces the document element with an instance of a specified implementation class.

Pascal

```
function GetDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI: DOMString
= ''): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call GetDocBinding to specify the implementation class and tag name for the document element. After replacing the specified node with an instance of the specified class, GetDocBinding returns the interface of the document element.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 26135)

RegisterDocBinding (see page 26124)

ChildNodes (see page 26135)

195.1.1.4.23 TXMLDocument.GetDocumentElement Method

Returns the value of the DocumentElement property.

Pascal

```
function GetDocumentElement: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentElement();
```

Description

GetDocumentElement is the read implementation of the DocumentElement property.

See Also

DocumentElement (see page 26405)

195.1.1.4.24 TXMLDocument.GetDocumentNode Method

Returns the value of the Node property.

Pascal

```
function GetDocumentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentNode();
```

Description

GetDocumentNode is the read implementation of the Node property.

See Also

Node (see page 26407)

195.1.1.4.25 TXMLDocument.GetDocumentObject Method

Pascal

```
function GetDocumentObject: TXMLDocument;
```

C++

```
__fastcall TXMLDocument GetDocumentObject();
```

Description

This is GetDocumentObject, a member of class TXMLDocument.

195.1.1.4.26 TXMLDocument.GetDOMDocument Method

Returns the value of the DOMDocument property.

Pascal

```
function GetDOMDocument: IDOMDocument;
```

C++

```
__fastcall IDOMDocument GetDOMDocument();
```

Description

GetDOMDocument is the read implementation of the DOMDocument property.

See Also

DOMDocument (see page 26405)

195.1.1.4.27 TXMLDocument.GetDOMPersist Method

Pascal

```
function GetDOMPersist: IDOMPersist;
```

C++

```
__fastcall IDOMPersist GetDOMPersist();
```

Description

This is GetDOMPersist, a member of class TXMLDocument.

195.1.1.4.28 TXMLDocument.GetEncoding Method

Returns the value of the Encoding property.

Pascal

```
function GetEncoding: DOMString;
```

C++

```
__fastcall DOMString GetEncoding();
```

Description

GetEncoding is the read implementation of the Encoding property.

See Also

Encoding (see page 26406)

195.1.1.4.29 TXMLDocument.GetFileName Method

Returns the value of the FileName property.

Pascal

```
function GetFileName: DOMString;
```

C++

```
__fastcall DOMString GetFileName();
```

Description

GetFileName is the read implementation of the FileName property.

See Also

FileName (see page 26406)

195.1.1.4.30 TXMLDocument.GetModified Method

Returns the value of the Modified property.

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

GetModified is the read implementation of the Modified property.

See Also

Modified (see page 26407)

195.1.1.4.31 TXMLDocument.GetNodeIndentStr Method

Returns the value of the NodeIndentStr property.

Pascal

```
function GetNodeIndentStr: DOMString;
```

C++

```
__fastcall DOMString GetNodeIndentStr();
```

Description

GetNodeIndentStr is the read implementation of the NodeIndentStr property.

See Also

NodeIndentStr (see page 26408)

195.1.1.4.32 TXMLDocument.GetOptions Method

Returns the value of the Options property.

Pascal

```
function GetOptions: TXMLDocOptions;
```

C++

```
__fastcall TXMLDocOptions GetOptions();
```

Description

GetOptions is the read implementation of the Options property.

See Also

Options (see page 26408)

195.1.1.4.33 TXMLDocument.GetParseOptions Method

Returns the value of the ParseOptions property.

Pascal

```
function GetParseOptions: TParseOptions;
```

C++

```
__fastcall TParseOptions GetParseOptions();
```

Description

GetParseOptions is the read implementation of the ParseOptions property.

See Also

ParseOptions (see page 26409)

195.1.1.4.34 TXMLDocument.GetPrologNode Method

Pascal

```
function GetPrologNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetPrologNode();
```

Description

This is GetPrologNode, a member of class TXMLDocument.

195.1.1.4.35 TXMLDocument.GetPrologValue Method

Pascal

```
function GetPrologValue(PrologItem: TXMLPrologItem; const Default: DOMString = ''): DOMString;
```

C++

```
__fastcall DOMString GetPrologValue(TXMLPrologItem PrologItem, const DOMString Default = '');
```

Description

This is GetPrologValue, a member of class TXMLDocument.

195.1.1.4.36 TXMLDocument.GetSchemaRef Method

Returns the value of the SchemaRef property.

Pascal

```
function GetSchemaRef: DOMString;
```

C++

```
__fastcall DOMString GetSchemaRef();
```

Description

GetSchemaRef is the read implementation of the SchemaRef property.

See Also

SchemaRef (see page 26409)

195.1.1.4.37 TXMLDocument.GetStandAlone Method

Returns the value of the StandAlone property.

Pascal

```
function GetStandAlone: DOMString;
```

C++

```
__fastcall DOMString GetStandAlone();
```

Description

GetStandAlone is the read implementation of the StandAlone property.

See Also

StandAlone (see page 26410)

195.1.1.4.38 TXMLDocument.GetVersion Method

Returns the value of the Version property.

Pascal

```
function GetVersion: DOMString;
```

C++

```
__fastcall DOMString GetVersion();
```

Description

GetVersion is the read implementation of the Version property.

See Also

Version (see page 26410)

195.1.1.4.39 TXMLDocument.GetXML Method

Returns the value of the XML property.

Pascal

```
function GetXML: TSTrings;
```

C++

```
__fastcall TSTrings GetXML();
```

Description

GetXML is the read implementation of the XML property.

See Also

XML (see page 26410)

195.1.1.4.40 TXMLDocument.InternalSetPrologValue Method

Pascal

```
function InternalSetPrologValue(const PrologNode: IXMLNode; const Value: Variant; PrologItem:
TXMLPrologItem): string;
```

C++

```
__fastcall AnsiString InternalSetPrologValue(const IXMLNode PrologNode, const Variant Value,
TXMLPrologItem PrologItem);
```

Description

This is InternalSetPrologValue, a member of class TXMLDocument.

195.1.1.4.41 TXMLDocument.IsEmptyDoc Method

Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.

Pascal

```
function IsEmptyDoc: Boolean;
```

C++

```
__fastcall Boolean IsEmptyDoc();
```

Description

Call IsEmptyDoc to determine whether the TXMLDocument (see page 26097) instance represents an empty document.

IsEmptyDoc returns true if the DOMDocument (see page 26136) property is not set (for example, if there is no DOM implementation) or if this object represents a document with no child nodes.

See Also

XML (see page 26144)

ChildNodes (see page 26135)

DOMDocument (see page 26136)

195.1.1.4.42 TXMLDocument.LoadData Method

Pascal

```
procedure LoadData; dynamic;
```

C++

```
__fastcall LoadData();
```

Description

This is LoadData, a member of class TXMLDocument.

195.1.1.4.43 TXMLDocument.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState (see page 2804)

Create (see page 2766)

TReader (see page 2933)

195.1.1.4.44 TXMLDocument.LoadFromFile Method

Loads an XML (see page 26144) document and activates it.

Pascal

```
procedure LoadFromFile(const AFileName: DOMString = '');
```

C++

```
__fastcall LoadFromFile(const DOMString AFileName = '');
```

Description

Call LoadFromFile to load the XML (see page 26144) document specified by AFileName and set the Active (see page 26133) property to true so that you can examine or modify the document.

AFileName is the name of the XML (see page 26144) document to load from disk. If AFileName is an empty string, TXMLDocument (see page 26097) uses the value of the FileName (see page 26138) property. If AFileName is not an empty string, TXMLDocument (see page 26097) changes the FileName (see page 26138) property to AFileName.

Once you have loaded an XML (see page 26144) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 26125) method.

See Also

SaveToFile (see page 26125)

FileName (see page 26138)

Active (see page 26133)

Refresh (see page 26123)

LoadFromXML (see page 26122)

LoadFromStream (see page 26121)

195.1.1.4.45 TXMLDocument.LoadFromStream Method

Loads an XML (see page 26144) document from a stream and activates it.

Pascal

```
procedure LoadFromStream(const Stream: TStream; EncodingType: TXMLEncodingType = xetUnknown);
```

C++

```
__fastcall LoadFromStream(const TStream Stream, TXMLEncodingType EncodingType = xetUnknown);
```

Description

Call LoadFromStream to load the XML (see page 26144) document from a stream.

Stream is a stream object that can be used to read the string of XML (see page 26144) that makes up the document.

EncodingType indicates the character set that is used for Stream. If EncodingType is xetUnknown (the default), LoadFromStream attempts to infer the encoding type from the XML (see page 26144) encoding declaration at the beginning of the document.

After loading the document from Stream, LoadFromStream sets the Active (see page 26133) property to true.

See Also

SaveToStream (see page 26125)

LoadFromFile (see page 26121)

Active (see page 26133)

LoadFromXML (see page 26122)

195.1.1.4.46 LoadFromXML Method

This is the overview for the LoadFromXML method overload.

Overload List

	Name	Description
	TXMLDocument.LoadFromXML (DOMString) (see page 26122)	Loads a string representation of an XML (see page 26144) document and activates it.
	TXMLDocument.LoadFromXML (string) (see page 26122)	Loads a string representation of an XML (see page 26144) document and activates it.

195.1.1.4.46.1 TXMLDocument.LoadFromXML Method (DOMString)

Loads a string representation of an XML (see page 26144) document and activates it.

Pascal

```
procedure LoadFromXML(const XML: string); overload;
procedure LoadFromXML(const XML: DOMString); overload;
```

C++

```
__fastcall LoadFromXML(const AnsiString XML);
__fastcall LoadFromXML(const DOMString XML);
```

Description

Call LoadFromXML to assign a string as the value of the XML (see page 26144) document. Unlike the XML (see page 26144) property, which lets you assign XML (see page 26144) on a line-by-line basis, LoadFromXML treats the text of the XML (see page 26144) document as a whole.

The XML (see page 26144) parameter is a string containing the text of an XML (see page 26144) document. It should represent the XML (see page 26144) text encoded using UTF-8, Unicode, or UTF-16.

After assigning the XML (see page 26144) property as the contents of the document, LoadFromXML sets the Active (see page 26133) property to true.

See Also

SaveToXML (see page 26126)

LoadFromFile (see page 26121)

Active (see page 26133)

LoadFromStream (see page 26121)

XML (see page 26144)

195.1.1.4.47 TXMLDocument.NewInstance Method

Allocates memory for an instance of an object type and returns a pointer to that new instance.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call System::TObject::NewInstance automatically. System::TObject::NewInstance calls System::TObject::InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call System::TObject::NewInstance directly.

Override System::TObject::NewInstance only for special memory allocation requirements. For example, when allocating a large number of identical objects that all need to be in memory at the same time, you could allocate a single block of memory for the entire group, then override System::TObject::NewInstance to use part of that larger block for each instance.

If you override System::TObject::NewInstance to allocate memory, you may need to override System::TObject::FreeInstance to deallocate the memory.

Note: By default System::TObject::NewInstance calls System::TObject::InitInstance.

See Also

System::TObject::FreeInstance (see page 22303)

System::TObject::InstanceSize (see page 22306)

System::TObject::InitInstance (see page 22305)

195.1.1.4.48 TXMLDocument.ReadDOMVendor Method

Pascal

```
procedure ReadDOMVendor(Reader: TReader);
```

C++

```
__fastcall ReadDOMVendor(TReader Reader);
```

Description

This is ReadDOMVendor, a member of class TXMLDocument.

195.1.1.4.49 TXMLDocument.Refresh Method

Updates the parsed XML (see page 26144) document to reflect external changes.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the XML (see page 26144) document specified by FileName (see page 26138) has changed due to an external cause. Refresh updates the parsed version of the XML (see page 26144) document (which can be traversed starting with DocumentElement (see page 26135)) to reflect the current contents of the file specified by FileName (see page 26138).

The Active (see page 26133) property must be true when you call Refresh. If the XML (see page 26144) document is not active when you call Refresh, TXMLDocument (see page 26097) raises an EXMLDocError exception.

Note: Do not call Refresh after making changes directly to the XML (see page 26144) property, because assigning a value to XML (see page 26144) automatically closes the XML (see page 26144) document. To refresh the XML (see page 26144) document after assigning a new value to XML (see page 26144), set the Active (see page 26133) property to true.

See Also

FileName (see page 26138)

Active (see page 26133)

DOMDocument (see page 26136)

DocumentElement (see page 26135)

Resync (see page 26125)

195.1.1.4.50 TXMLDocument.RegisterDocBinding Method

Registers an implementation class for child nodes with a specified tag name.

Pascal

```
procedure RegisterDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI:
DOMString = '');
```

C++

```
__fastcall RegisterDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call RegisterDocBinding to specify the implementation class for one of the child nodes of the document node. RegisterDocBinding replaces the specified node with an instance of the specified class.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 26135)

GetDocBinding (see page 26114)

ChildNodes (see page 26135)

195.1.1.4.51 TXMLDocument.ReleaseDoc Method

Pascal

```
procedure ReleaseDoc(const CheckSave: Boolean = True); dynamic;
```

C++

```
__fastcall ReleaseDoc(const Boolean CheckSave = True);
```

Description

This is ReleaseDoc, a member of class TXMLDocument.

195.1.1.4.52 TXMLDocument.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the document to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 26135)

Refresh (see page 26123)

195.1.1.4.53 TXMLDocument.SaveToFile Method

Saves the XML (see page 26144) document to disk.

Pascal

```
procedure SaveToFile(const AFileName: DOMString = ''); dynamic;
```

C++

```
__fastcall SaveToFile(const DOMString AFileName = '');
```

Description

Call SaveToFile to save any modifications you have made to the parsed XML (see page 26144) document.

AFileName is the name of the file to save. If AFileName is an empty string, TXMLDocument (see page 26097) uses the value of the FileName (see page 26138) property.

See Also

LoadFromFile (see page 26121)

FileName (see page 26138)

SaveToXML (see page 26126)

SaveToStream (see page 26125)

Using Code That the XML Data Binding Wizard Generates

195.1.1.4.54 TXMLDocument.SaveToStream Method

Saves the XML (see page 26144) document to a stream.

Pascal

```
procedure SaveToStream(const Stream: TStream);
```

C++

```
__fastcall SaveToStream(const TStream Stream);
```

Description

Call SaveToStream to save the contents of the XML (see page 26144) document to the stream specified by Stream. Regardless of the encoding system of the original XML (see page 26144) document, SaveToStream always saves the stream in UTF-16.

See Also

LoadFromStream (see page 26121)

SaveToXML (see page 26126)

SaveToFile (see page 26125)

195.1.1.4.55 TXMLDocument.SaveToUTF8String Method

Pascal

```
procedure SaveToUTF8String(var XML: string);
```

C++

```
__fastcall SaveToUTF8String(AnsiString XML);
```

Description

This is SaveToUTF8String, a member of class TXMLDocument.

195.1.1.4.56 SaveToXML Method

This is the overview for the SaveToXML method overload.

Overload List

	Name	Description
	TXMLDocument.SaveToXML (DOMString) (see page 26126)	Saves the XML (see page 26144) document to a string-type variable.
	TXMLDocument.SaveToXML (string) (see page 26126)	Saves the XML (see page 26144) document to a string-type variable.

195.1.1.4.56.1 TXMLDocument.SaveToXML Method (DOMString)

Saves the XML (see page 26144) document to a string-type variable.

Pascal

```
procedure SaveToXML(var XML: DOMString); overload;
procedure SaveToXML(var XML: string); overload;
```

C++

```
__fastcall SaveToXML(DOMString XML);
__fastcall SaveToXML(AnsiString XML);
```

Description

Call SaveToXML to save the contents of the XML (see page 26144) document to the string-type variable specified by XML (see page 26144). SaveToXML writes the contents of XML (see page 26144) document using UTF-8 or UTF-16 as an encoding system, depending on the type of the XML (see page 26144) parameter.

Unlike the XML (see page 26144) property, which lets you write individual lines from the XML (see page 26144) document,

SaveToXML writes the entire text of the XML (see page 26144) document.

See Also

LoadFromXML (see page 26122)

SaveToStream (see page 26125)

SaveToFile (see page 26125)

XML (see page 26144)

195.1.1.4.57 TXMLDocument.SaveToXMLStrings Method

Pascal

```
procedure SaveToXMLStrings;
```

C++

```
__fastcall SaveToXMLStrings();
```

Description

This is SaveToXMLStrings, a member of class TXMLDocument.

195.1.1.4.58 TXMLDocument.SetActive Method

Sets the value of the Active property.

Pascal

```
procedure SetActive(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetActive(const Boolean Value);
```

Description

SetActive is the write implementation of the Active property.

Value is the new value to set.

See Also

Active (see page 26403)

195.1.1.4.59 TXMLDocument.SetDocumentElement Method

Sets the value of the DocumentElement property.

Pascal

```
procedure SetDocumentElement(const Value: IXMLNode);
```

C++

```
__fastcall SetDocumentElement(const IXMLNode Value);
```

Description

SetDocumentElement is the write implementation of the DocumentElement property.

Value is the interface for the node tree that replaces the current document element.

See Also

DocumentElement (see page 26405)

195.1.1.4.60 TXMLDocument.SetDOMDocument Method

Sets the value of the DOMDocument property.

Pascal

```
procedure SetDOMDocument(const Value: IDOMDocument);
```

C++

```
__fastcall SetDOMDocument(const IDOMDocument Value);
```

Description

SetDOMDocument is the write implementation of the DOMDocument property.

Value is the DOM interface for the document to assign.

See Also

DOMDocument (see page 26405)

195.1.1.4.61 TXMLDocument.SetEncoding Method

Sets the value of the Encoding property.

Pascal

```
procedure SetEncoding(const Value: DOMString);
```

C++

```
__fastcall SetEncoding(const DOMString Value);
```

Description

SetEncoding is the write implementation of the Encoding property.

Value is the value of the encoding attribute of the document type node.

See Also

Encoding (see page 26406)

195.1.1.4.62 TXMLDocument.SetFileName Method

Sets the value of the FileName property.

Pascal

```
procedure SetFileName(const Value: DOMString);
```

C++

```
__fastcall SetFileName(const DOMString Value);
```

Description

SetFileName is the write implementation of the FileName property.

Value is the name of an XML document or, if the vendor supports it, an URL for the XML document.

See Also

FileName (see page 26406)

195.1.1.4.63 TXMLDocument.SetModified Method

Pascal

```
procedure SetModified(const Value: Boolean);
```

C++

```
__fastcall SetModified(const Boolean Value);
```

Description

This is SetModified, a member of class TXMLDocument.

195.1.1.4.64 TXMLDocument.SetNodeIndentStr Method

Sets the value of the NodeIndentStr property.

Pascal

```
procedure SetNodeIndentStr(const Value: DOMString);
```

C++

```
__fastcall SetNodeIndentStr(const DOMString Value);
```

Description

SetNodeIndentStr is the write implementation of the NodeIndentStr property.

Value is the string that is inserted before nested nodes to indicate a level of nesting.

See Also

NodeIndentStr (see page 26408)

195.1.1.4.65 TXMLDocument.SetOnAsyncLoad Method

Supplies an event handler that responds when the AsyncLoadState property changes.

Pascal

```
procedure SetOnAsyncLoad(const Value: TAsyncEventHandler);
```

C++

```
__fastcall SetOnAsyncLoad(const TAsyncEventHandler Value);
```

Description

Use SetOnAsyncLoad to supply a callback that responds when the asynchronous parsing of an XML document progresses to a certain point.

Value is a method that is called when the AsyncLoadState property changes to reflect a new stage in the parsing process.

See Also

AsyncLoadState (see page 26404)

195.1.1.4.66 TXMLDocument.SetOptions Method

Sets the value of the Options property.

Pascal

```
procedure SetOptions(const Value: TXMLDocOptions);
```

C++

```
__fastcall SetOptions(const TXMLDocOptions Value);
```

Description

GetOptions is the write implementation of the Options property.

Value is the set of options to assign.

See Also

Options (see page 26408)

195.1.1.4.67 TXMLDocument.SetParseOptions Method

Sets the value of the ParseOptions property.

Pascal

```
procedure SetParseOptions(const Value: TParseOptions);
```

C++

```
__fastcall SetParseOptions(const TParseOptions Value);
```

Description

GetParseOptions is the write implementation of the ParseOptions property.

Value is the set of parser options to assign.

See Also

ParseOptions (see page 26409)

195.1.1.4.68 TXMLDocument.SetPrologValue Method

Pascal

```
procedure SetPrologValue(const Value: Variant; PrologItem: TXMLPrologItem);
```

C++

```
__fastcall SetPrologValue(const Variant Value, TXMLPrologItem PrologItem);
```

Description

This is SetPrologValue, a member of class TXMLDocument.

195.1.1.4.69 TXMLDocument.SetStandAlone Method

Sets the value of the StandAlone property.

Pascal

```
procedure SetStandAlone(const Value: DOMString);
```

C++

```
__fastcall SetStandAlone(const DOMString Value);
```

Description

SetStandAlone is the write implementation of the StandAlone property.

Value is the value of the stand-alone attribute of the document type node.

See Also

StandAlone (see page 26410)

195.1.1.4.70 TXMLDocument.SetVersion Method

Sets the value of the Version property.

Pascal

```
procedure SetVersion(const Value: DOMString);
```

C++

```
__fastcall SetVersion(const DOMString Value);
```

Description

SetVersion is the write implementation of the Version property.

Value is the value of the version attribute of the document type node.

See Also

Version (see page 26410)

195.1.1.4.71 TXMLDocument.SetXML Method

Sets the value of the XML property.

Pascal

```
procedure SetXML(const Value: TStrings);
```

C++

```
__fastcall SetXML(const TStrings Value);
```

Description

SetXML is the write implementation of the XML property.

Value contains the raw (unparsed) XML to assign.

See Also

XML (see page 26410)

195.1.1.4.72 TXMLDocument.SetXMLStrings Method

Pascal

```
procedure SetXMLStrings(const Value: string);
```

C++

```
__fastcall SetXMLStrings(const AnsiString Value);
```

Description

This is SetXMLStrings, a member of class TXMLDocument.

195.1.1.4.73 TXMLDocument.WriteDOMVendor Method

Pascal

```
procedure WriteDOMVendor(Writer: TWriter);
```

C++

```
__fastcall WriteDOMVendor(TWriter Writer);
```

Description

This is WriteDOMVendor, a member of class TXMLDocument.

195.1.1.4.74 TXMLDocument.XMLStringsChanging Method

Pascal

```
procedure XMLStringsChanging(Sender: TObject);
```

C++

```
__fastcall XMLStringsChanging(TObject * Sender);
```

Description

This is XMLStringsChanging, a member of class TXMLDocument.

195.1.1.5 TXMLDocument Properties

The properties of the TXMLDocument class are listed here.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Properties

	Name	Description
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.

R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.
	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

195.1.1.5.1 TXMLDocument.Active Property

Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before you can use TXMLDocument (see page 26097) to examine or change the contents of an XML (see page 26144) document, it must be active. Setting Active to true causes TXMLDocument (see page 26097) to do the following:

1.Generate a BeforeOpen (see page 26147) event.

2.If necessary, load the DOM parser and assign the DOMImplementation (see page 26137) property.

3.Parse the XML (see page 26144) document specified by FileName (see page 26138) or, if FileName (see page 26138) is an empty string, by the XML (see page 26144) property using the options specified by ParseOptions (see page 26142). If both FileName (see page 26138) and XML (see page 26144) are empty strings, TXMLDocument (see page 26097) creates an empty document. The interface for the parsed document is assigned to the DOMDocument (see page 26136) property.

4. Generate an AfterOpen (see page 26145) event.

Note: Once the DOMDocument (see page 26136) property is assigned, you can also use the DocumentElement (see page 26135) property.

Setting Active to false causes TXMLDocument (see page 26097) to do the following:

1.Generate a BeforeClose (see page 26146) event.

2.Release all of the DOM interfaces, such as DOMDocument (see page 26136) and DocumentElement (see page 26135), that represent the parsed XML (see page 26144) document.

3. Generate an AfterClose (see page 26144) event.

See Also

DOMDocument (see page 26136)

DocumentElement (see page 26135)

FileName (see page 26138)

XML (see page 26144)

ParseOptions (see page 26142)

BeforeOpen (see page 26147)

AfterOpen (see page 26145)

domimplementation (see page 26137)

BeforeClose (see page 26146)

AfterClose (see page 26144)

Using TXMLDocument

195.1.1.5.2 TXMLDocument.AsyncLoadState Property

Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.

Pascal

```
property AsyncLoadState: Integer;
```

C++

```
__property int AsyncLoadState;
```

Description

Use AsyncLoadState to determine that status of the DOM parser when it is parsing an XML (see page 26144) document asynchronously. AsyncLoadState is only meaningful when the value of ParseOptions (see page 26142) is poAsyncLoad.

The value of AsyncLoadState is vendor-specific. That is, each DOM parser that loads and parses an XML (see page 26144) document asynchronously supplies its own flags to indicate state information.

When the DOM vendor is MSXML, AsyncLoadState can have any of the following values:

Value	Meaning
0	Uninitialized: The AsyncLoadState is not assigned. (Usually indicates that the parser has not tried to parse a document or it is not parsing the document asynchronously.)
1	Loading: The parser is currently parsing the structure of the XML (see page 26144) document.
2	Loaded (see page 26120): The parser has finished reading and parsing the structure of the XML (see page 26144) document, but the corresponding DOM interfaces are not yet available.
3	Interactive: The parser has parsed the structure of the XML (see page 26144) document, the corresponding DOM interfaces are available, but the parser has not finished reading all the node values.
4	Complete: The parser has fully read and parsed the XML (see page 26144) document.

See Also

OnAsyncLoad (see page 26147)

ParseOptions (see page 26142)

195.1.1.5.3 TXMLDocument.ChildNodes Property

Lists all of the child nodes of the document.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access all of the nodes that are children of the document object. In addition to DocumentElement (see page 26135), which is the root of the data hierarchy, ChildNodes can include nodes for comments, processing instructions, and so on.

Note: ChildNodes is not available unless the XML (see page 26144) document is Active (see page 26133).

See Also

DocumentElement (see page 26135)

Active (see page 26133)

195.1.1.5.4 TXMLDocument.DocBindingInfo Property

Pascal

```
property DocBindingInfo: TNodeClassArray;
```

C++

```
__property TNodeClassArray DocBindingInfo;
```

Description

This is DocBindingInfo, a member of class TXMLDocument.

195.1.1.5.5 TXMLDocument.DocSource Property

Pascal

```
property DocSource: TXMLDocumentSource;
```

C++

```
__property TXMLDocumentSource DocSource;
```

Description

This is DocSource, a member of class TXMLDocument.

195.1.1.5.6 TXMLDocument.DocumentElement Property

Provides access to the root node of the XML (see page 26144) document.

Pascal

```
property DocumentElement: IXMLNode;
```

C++

```
__property IXMLNode DocumentElement;
```

Description

Use DocumentElement to access the root node of the XML (see page 26144) document. Because XML (see page 26144) documents are hierarchical in structure, DocumentElement is the entry point to all data in the XML (see page 26144) document. Setting DocumentElement replaces the entire data hierarchy with a new hierarchy of nodes.

Note: For some DOM implementations, if you set DocumentElement, all of the new nodes must already be associated with this document. That is, the new value should be a node that came from the existing node hierarchy or that was created using the CreateNode (see page 26109) method.

The IXMLNode interface includes properties and methods for examining and changing the text and attributes of a node, for adding and deleting child nodes, and for traversing the hierarchy of nodes rooted at that node.

Note: DocumentElement is not available unless the XML (see page 26144) document is Active (see page 26133).

Using TXMLDocument

Working with XML Nodes

195.1.1.5.7 TXMLDocument.DOMDocument Property

Provides access to the DOM interface for the parsed XML (see page 26144) document.

Pascal

```
property DOMDocument: IDOMDocument;
```

C++

```
__property IDOMDocument DOMDocument;
```

Description

Use DOMDocument to directly access the IDOMDocument interface for the parsed XML (see page 26144) document. This is the interface supported by the DOM parser for the document that is represented in raw (unparsed) form by the FileName (see page 26138) or XML (see page 26144) property.

DOMDocument provides access to the IDOMImplementation and IDOMElement interfaces that are surfaced as the DOMImplementation (see page 26137) and DocumentElement (see page 26135) properties. It also provides access to an IDOMDocumentType interface that describes the structure of the XML (see page 26144) document, and supports a number of methods for creating elements within the document.

Most applications do not need to use the DOMDocument property directly. Instead, it supplies the underlying support for parsing and manipulating the nodes accessed through DocumentElement (see page 26135). If you do want to make use of DOMDocument's low-level support, you must be familiar with the W3C Document Object Model (DOM) Level 1 Specification.

Note: DOMDocument is not available unless the XML (see page 26144) document is Active (see page 26133).

XML (see page 26144)

FileName (see page 26138)

195.1.1.5.8 TXMLDocument.DOMImplementation Property

Pascal

```
property DOMImplementation: IDOMImplementation;
```

C++

```
__property IDOMImplementation DOMImplementation;
```

Description

This is DOMImplementation, a member of class TXMLDocument.

195.1.1.5.9 TXMLDocument.DOMParseOptions Property

Pascal

```
property DOMParseOptions: IDOMParseOptions;
```

C++

```
__property IDOMParseOptions DOMParseOptions;
```

Description

This is DOMParseOptions, a member of class TXMLDocument.

195.1.1.5.10 TXMLDocument.DOMPersist Property

Pascal

```
property DOMPersist: IDOMPersist;
```

C++

```
__property IDOMPersist DOMPersist;
```

Description

This is DOMPersist, a member of class TXMLDocument.

195.1.1.5.11 TXMLDocument.DOMVendor Property

Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.

Pascal

```
property DOMVendor: TDOMVendor;
```

C++

```
__property TDOMVendor DOMVendor;
```

Description

DOMVendor is the object that represents a registered DOM implementation. TXMLDocument (see page 26097) uses this object to obtain an IDOMImplementation interface, which it can use to access all the other DOM interfaces needed for parsing and manipulating the XML (see page 26144) document. Once DOMVendor is assigned, TXMLDocument (see page 26097) obtains the IDOMImplementation interface (when needed) and assigns it to the DOMImplementation (see page 26137) property.

DOMVendor must be registered before it can be used to obtain an IDOMImplementation interface. For a list of all the currently registered DOM implementations, use the global DOMVendors variable. To obtain a specific DOM implementation, given its description, use the global GetDOMVendor function. Use the RegisterDOMVendor procedure to register a new DOM implementation.

You must assign a value to either DOMVendor or DOMImplementation (see page 26137) before you can set the Active (see page 26133) property to true.

See Also

domimplementation (see page 26137)

DOMVendors

Active (see page 26133)

RegisterDOMVendor

Active (see page 26133)

GetDOMVendor

Using TXMLDocument

195.1.1.5.12 TXMLDocument.Encoding Property

Indicates the character set that the XML (see page 26144) document uses to encode characters.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Encoding is the encoding name that appears in the document type declaration of the XML (see page 26144) document. It is a string such as 'UTF-8', 'UTF-16', or 'ISO-10646-UCS-2' that indicates the character set used in the document.

See Also

FileName (see page 26138)

DOMDocument (see page 26136)

XML (see page 26144)

195.1.1.5.13 TXMLDocument.FileName Property

Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.

Pascal

```
property FileName: DOMString;
```

C++

```
__property DOMString FileName;
```

Description

Set FileName to specify the XML (see page 26144) document you want to examine or manipulate using the TXMLDocument (see page 26097) object. Once you have set FileName to the name of an XML (see page 26144) document, you can activate the XML (see page 26144) document and examine or manipulate it using the DocumentElement (see page 26135) property.

When you set the value of FileName, the XML (see page 26144) property automatically changes (at runtime) to represent the contents of that file.

Note: Setting the value of FileName automatically sets the Active (see page 26133) property to false.

After activating the XML (see page 26144) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 26125) method.

Tip: If the underlying DOM implementation supports it, you can use FileName to specify an URL rather than a file on disk.

See Also

XML (see page 26144)

LoadFromFile (see page 26121)

SaveToFile (see page 26125)

DocumentElement (see page 26135)

Using TXMLDocument

Using Code That the XML Data Binding Wizard Generates

195.1.1.5.14 TXMLDocument.Modified Property

Indicates whether the XML (see page 26144) document has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Read Modified to determine whether the application has made any changes to the nodes in the XML (see page 26144) document. When Modified is true, the value of the XML (see page 26144) property may differ from the contents of the file specified by FileName (see page 26138). You can call the SaveToFile (see page 26125) method to update the XML (see page 26144) document file to reflect the changes.

Note: Modfied changes to false when you call the Refresh (see page 26123) or SaveToFile (see page 26125) method.

See Also

BeforeNodeChange (see page 26146)

AfterNodeChange (see page 26145)

Refresh (see page 26123)

SaveToFile (see page 26125)

XML (see page 26144)

FileName (see page 26138)

195.1.1.5.15 TXMLDocument.Node Property

Provides access to the document node for the XML (see page 26144) document.

Pascal

```
property Node: IXMLNode;
```

C++

```
__property IXMLNode Node;
```

Description

Read Node to access the document node for the XML (see page 26144) document. The document node represents information about the entire document. It may have several child nodes, which represent comments, processing instructions, and which include the DocumentElement (see page 26135) node that acts as the root of the data hierarchy.

See Also

DocumentElement (see page 26135)

ChildNodes (see page 26135)

195.1.1.5.16 TXMLDocument.NodeIndentStr Property

Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.

Pascal

```
property NodeIndentStr: DOMString;
```

C++

```
__property DOMString NodeIndentStr;
```

Description

Use NodeIndentStr to customize how TXMLDocument (see page 26097) formats nodes that are added. When the Options (see page 26141) property includes doNodeAutoIndent, this string is inserted in the generated XML (see page 26144) before any newly added node, once for each nesting level.

If you do not assign a value to NodeIndentStr, TXMLDocument (see page 26097) inserts two spaces to represent each nesting level.

See Also

Options (see page 26141)

NestingLevel (see page 26180)

FormatXMLData (see page 26240)

XML (see page 26144)

195.1.1.5.17 TXMLDocument.NSPrefixBase Property

Specifies the base string for automatically-generated namespace prefixes.

Pascal

```
property NSPrefixBase: DOMString;
```

C++

```
__property DOMString NSPrefixBase;
```

Description

The AddChild (see page 26107) method for each node allows the caller to specify that the new node should use an automatically-generated namespace prefix. When this option is specified, the node uses NSPrefixBase to generate a unique string to act as a namespace prefix. This unique string consists of NSPrefixBase followed by a number that ensures uniqueness. Thus, for example, if NSPrefixBase is 'NS', automatically-generated namespace prefixes have the form 'NS1', 'NS2', and so on.

The generated namespace prefixes are only unique within a single document. If two document components have the same value for NSPrefixBase, they will generate the same namespace prefixes.

See Also

AddChild (see page 26414)

GeneratePrefix (see page 26112)

195.1.1.5.18 TXMLDocument.Options Property

Influences various aspects of the document's behavior.

Pascal

```
property Options: TXMLDocOptions;
```

C++

```
__property TXMLDocOptions Options;
```

Description

Set Options to configure how you want the document to respond when the application tries to read nodes or attributes that do not exist, when it creates a new namespace when adding a node, when it generates XML (see page 26144) text from the nodes in the document, or whether it saves its value automatically when you close the document. Options can include any of the following values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML (see page 26144) text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.
doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null Variant (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.
doNamespaceDecl	When the AddChild (see page 26107) method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild (see page 26107) creates the new namespace but does not add an attribute to declare it.

doAutoSave	When you close the document (set Active (see page 26133) to false), any changes are automatically saved back to the file specified by FileName (see page 26138) or to the XML (see page 26144) property.

See Also

Nodes (see page 26456)

Attributes (see page 26430)

AddChild (see page 26414)

Active (see page 26133)

FileName (see page 26138)

XML (see page 26144)

195.1.1.5.19 TXMLDocument.ParseOptions Property

Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.

Pascal

```
property ParseOptions: TParseOptions;
```

C++

```
__property TParseOptions ParseOptions;
```

Description

Set ParseOptions to influence the way the DOM implementation parses the XML (see page 26144) document. Different DOM implementations support different options. If you attempt to use an option that is not supported by your DOM implementation, TXMLDocument (see page 26097) raises an EXMLDocError exception.

See Also

domimplementation (see page 26137)

EXMLDocError (see page 26381)

Using TXMLDocument

195.1.1.5.20 TXMLDocument.PrefixID Property

Pascal

```
property PrefixID: Integer;
```

C++

```
__property int PrefixID;
```

Description

This is PrefixID, a member of class TXMLDocument.

195.1.1.5.21 TXMLDocument.SchemaRef Property

Returns the name of the schema associated with this XML (see page 26144) document.

Pascal

```
property SchemaRef: DOMString;
```

C++

```
__property DOMString SchemaRef;
```

Description

Read SchemaRef to determine the schema associated with this XML (see page 26144) document. If the document does not have an attribute that identifies an associated schema, the value of SchemaRef is an empty string.

See Also

DOMDocument (see page 26136)

195.1.1.5.22 TXMLDocument.StandAlone Property

Indicates whether the XML (see page 26144) document includes any external markup declarations.

Pascal

```
property StandAlone: DOMString;
```

C++

```
__property DOMString StandAlone;
```

Description

StandAlone is the value of the stand-alone attribute on the document type declaration of the XML (see page 26144) document. StandAlone has a value of 'yes' or 'no'.

When StandAlone is 'yes', the document contains no external markup declarations. It may, however, still contain references to external entities, as long as they are not declarations.

When StandAlone is 'no', the document may or may not contain external markup declarations.

See Also

DOMDocument (see page 26136)

195.1.1.5.23 TXMLDocument.Version Property

Indicates the XML (see page 26144) version that the document uses.

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

Version indicates the XML (see page 26144) version number that the document uses. An XML (see page 26144) version number is a string of the form 'n.m', where n is the major version number and m is the minor version number.

See Also

XML (see page 26144)

195.1.1.5.24 TXMLDocument.XML Property

Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

Pascal

```
property XML: TStrings;
```

C++

```
__property TStrings XML;
```

Description

Read XML to obtain the contents of the associated XML document. Set XML to specify the XML document you want to examine or manipulate. Once XML is set, you can activate the XML document and examine or manipulate it using the DocumentElement (see page 26135) property.

XML is a TStrings object. This means you can supply a value using the Strings editor at design time, or manipulate the XML line by line at runtime. To read or write the XML in the document as a single string, use the LoadFromXML (see page 26122) or SaveToXML (see page 26126) method.

See Also

FileName (see page 26138)

LoadFromXML (see page 26122)

SaveToXML (see page 26126)

DocumentElement (see page 26135)

Using TXMLDocument

Using Code That the XML Data Binding Wizard Generates

195.1.1.6 TXMLDocument Events

The events of the TXMLDocument class are listed here.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

195.1.1.6.1 TXMLDocument.AfterClose Event

Occurs after the XML (see page 26144) document is closed.

Pascal

```
property AfterClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterClose;
```

Description

Write an AfterClose event handler to take specific action after the XML (see page 26144) document interfaces are released. For example, you can use an AfterClose event to update your user interface to indicate that the XML (see page 26144) document is no longer available.

AfterClose is the last event to occur when the Active (see page 26133) property is set to false.

See Also

BeforeClose (see page 26146)

Active (see page 26133)

195.1.1.6.2 TXMLDocument.AfterNodeChange Event

Occurs after a change is made to one of the nodes in the document.

Pascal

```
property AfterNodeChange: TNodeChangeEvent;
```

C++

```
__property TNodeChangeEvent AfterNodeChange;
```

Description

Write an AfterNodeChange event handler to take specific action after a change is made to a node in the XML (see page 26144) document. When an application makes a change to one of the nodes, the following steps occur:

1. The Modified (see page 26139) property is set to true.
2. A BeforeNodeChange (see page 26146) event occurs.
3. The change is made to the node.
4. An AfterNodeChange event occurs.

See Also

BeforeNodeChange (see page 26146)

Modified (see page 26139)

ChildNodes (see page 26135)

195.1.1.6.3 TXMLDocument.AfterOpen Event

Occurs immediately after the XML (see page 26144) document is opened.

Pascal

```
property AfterOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterOpen;
```

Description

Write an AfterOpen event handler to take specific action once the XML (see page 26144) document interfaces become

available. For example, you can use an AfterOpen event to update your user interface to reflect the structure of the XML (see page 26144) document once it is opened.

AfterOpen is the last event to occur when the Active (see page 26133) property is set to true.

See Also

BeforeOpen (see page 26147)

Active (see page 26133)

195.1.1.6.4 TXMLDocument.BeforeClose Event

Occurs immediately before the XML (see page 26144) document is closed.

Pascal

```
property BeforeClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeClose;
```

Description

Write a BeforeClose event handler to take specific action before the XML (see page 26144) document interfaces are released. For example, you can use an BeforeClose event to cache information about the XML (see page 26144) document before it becomes unavailable.

BeforeClose is the first event to occur when the Active (see page 26133) property is set to false.

See Also

AfterClose (see page 26144)

Active (see page 26133)

195.1.1.6.5 TXMLDocument.BeforeNodeChange Event

Occurs before a change is made to one of the nodes in the document.

Pascal

```
property BeforeNodeChange: TNodeChangeEvent;
```

C++

```
__property TNodeChangeEvent BeforeNodeChange;
```

Description

Write a BeforeNodeChange event handler to take specific action before a change is made to a node in the XML (see page 26144) document. When an application makes a change to one of the nodes, the following steps occur:

1. The Modified (see page 26139) property is set to true.
2. A BeforeNodeChange event occurs.
3. The change is made to the node.
4. An BeforeNodeChange event occurs.

See Also

AfterNodeChange (see page 26145)

Modified (see page 26139)

ChildNodes (see page 26135)

195.1.1.6.6 TXMLDocument.BeforeOpen Event

Occurs immediately before the XML (see page 26144) document is opened.

Pascal

```
property BeforeOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeOpen;
```

Description

Write a BeforeOpen event handler to take specific action before the XML (see page 26144) document interfaces become available. For example, you can use a BeforeOpen event to provide feedback to the user that the XML (see page 26144) document is being parsed (which can be cleared in an AfterOpen (see page 26145) event handler).

BeforeOpen is the first event to occur when the Active (see page 26133) property is set to true.

See Also

AfterOpen (see page 26145)

Active (see page 26133)

195.1.1.6.7 TXMLDocument.OnAsyncLoad Event

Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Pascal

```
property OnAsyncLoad: TAsyncEventHandler;
```

C++

```
__property TAsyncEventHandler OnAsyncLoad;
```

Description

Write a OnAsyncLoad event handler to respond appropriately during the asynchronous parsing of an XML (see page 26144) document. For example, OnAsyncLoad can update a progress indicator, or initiate operations that can't be performed until the document is fully parsed. OnAsyncLoad occurs every time the AsyncLoadState (see page 26134) property changes to reflect a new stage in the parsing process.

See Also

AsyncLoadState (see page 26134)

XML (see page 26144)

195.1.2 TXMLNode Class

TXMLNode represents a node in an XML document.

Class Hierarchy

Pascal

```
TXMLNode = class(TInterfacedObject, IXMLNode, IXMLNodeAccess);
```

C++

```
class TXMLNode : public TInterfacedObject, public IXMLNode, public IXMLNodeAccess;
```

File

XMLDoc

Description

The XML Data Binding Wizard uses TXMLNode as a base class for the classes it generates to represent nodes that have child nodes. For example, if the XML document includes the following:

```
<Address country="US">
  <Name>
    <First> John </First>
    <MI> Q. </MI>
    <Last> Public </Last>
  </Name>
  <Street> 123 Easy Street </Street>
  <City> Anytown </City>
  <State> CA </State>
</Address>
```

then the XML Data Binding Wizard generates TXMLNode descendants for the elements Address and Name. Child nodes and node attributes appear as properties of the TXMLNode descendant.

Note: The XML Data Binding Wizard also generates code that can create TXMLNode objects for attributes as well as element nodes. However, there are no special TXMLNode descendants for attribute nodes. Rather, each attribute is represented directly by TXMLNode.

TXMLNode implements the IXMLNode interface. Each TXMLNode descendant implements a class-specific interface that descends from IXMLNode. Typically, applications do not work directly with TXMLNode. Instead, they use the IXMLNode interface or the IXMLNode descendant that is implemented by a TXMLNode descendant.

See Also

TXMLDocument (see page 26097)

TXMLNodeCollection (see page 26196)

IXMLNode (see page 26411)

TXMLNodeList (see page 26211)

195.1.2.1 TXMLNode Members

The following tables list the members exposed by TXMLNode.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.

	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 26152)	Instantiates a Create object.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
	Attributes (see page 26430)	Represents the values of this node's attributes.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.

	NodeValue (see page 26436)	Specifies the value of this node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

195.1.2.2 TXMLNode.Create Constructor

Instantiates a Create object.

Pascal

```
constructor Create(const ADOMNode: IDOMNode; const AParentNode: TXMLNode; const OwnerDoc:
TXMLDocument);
```

C++

```
__fastcall TXMLNode(const IDOMNode ADOMNode, const TXMLNode AParentNode, const TXMLDocument
OwnerDoc);
```

Description

Create instantiates a new Create object to wrap an existing DOM node implementation. Using the first syntax,

ADOMNode is the interface for the DOM implementation of the node.

AParentNode is the implementation of the parent node of this node.

OwnerDoc represents the XML document in which the new node occurs.

Using the second syntax,

HostNode (see page 26193) is another Create object that represents the host node of this node. In this case, this node is a "hosted" node, which means it shares the same underlying parent and DOM node as the host node, but represents a different view of the host node. For example, a node that contains some child nodes that are all of the same type creates a hosted node to represent only the set of repeating child nodes.

Typically, applications do not directly call the Create constructor. Instead, new nodes are created automatically for an XML document as necessary when the application reads their interfaces, starting with the DocumentElement property of the TXMLDocument (see page 26097) object. To add new nodes to a document, applications call the parent node's AddChild (see page 26156) method.

See Also

OwnerDocument (see page 26193)

ParentNode (see page 26194)

DocumentElement (see page 26135)

AddChild (see page 26156)

195.1.2.3 TXMLNode.CreateHosted Constructor

Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.

Pascal

```
constructor CreateHosted(HostNode: TXMLNode);
```

C++

```
__fastcall TXMLNode(TXMLNode HostNode);
```

Description

CreateHosted instantiates a new TXMLNode (see page 26147) object to represent a specific view on an existing TXMLNode (see page 26147) object.

HostNode (see page 26193) is another TXMLNode (see page 26147) object that represents the host node of this node. The new node becomes a "hosted" node, which means it shares the same underlying parent and DOM node as the host node, but represents a different view of the host node. For example, a node that contains some child nodes that are all of the same type creates a hosted node to represent only the set of repeating child nodes.

Typically, applications do not directly call CreateHosted to create a hosted node. Instead, this method is called in code generated by the XML Data Binding Wizard, or by the CreateCollection (see page 26163) method of the host node.

HostNode (see page 26193) (or, if HostNode (see page 26193) is hosted, the host node of HostNode (see page 26193)) becomes the value of the new node's HostNode (see page 26193) property, and the new node is added to the HostedNodes (see page 26192) property list of the new host node.

See Also

HostedNodes (see page 26192)

HostNode (see page 26193)

OnHostAttrNotify (see page 26194)

OnHostChildNotify (see page 26195)

CreateCollection (see page 26163)

195.1.2.4 TXMLNode.Destroy Destructor

Frees the memory associated with the TXMLNode (see page 26147) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLNode();
```

Description

Do not explicitly destroy TXMLNode (see page 26147) objects. As interfaced objects, XML nodes are destroyed automatically when the reference count of their IXMLNode interface drops to zero.

See Also

RefCount (see page 22281)

195.1.2.5 TXMLNode Methods

The methods of the TXMLNode class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 26155)	Increments the reference count for this node.

	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26159)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.
	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.

	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 26185)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.
	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.

195.1.2.5.1 TXMLNode._AddRef Method

Increments the reference count for this node.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef implements the IInterface or IUnknown method that is called when an application obtains a reference to this node's interface pointer. __AddRef increments the RefCount property. In addition, to ensure that the document object is alive, it also increments the reference count for the owning document.

When the caller is through with the interface, it calls _Release (see page 26155). This allows the node to free itself when it is no longer used (when the reference count goes to zero).

See Also

_Release (see page 26155)

OwnerDocument (see page 26193)

RefCount (see page 22281)

195.1.2.5.2 TXMLNode._Release Method

Decrements the reference count for this node.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release implements the IInterface or IUnknown method that is called when an application releases a reference to this node's interface pointer. __Release decrements the RefCount property. In addition, it also decrements the reference count for the owning document, which it incremented when the _AddRef (see page 26155) method was called.

When __Release causes the node's reference count to drop to zero, __Release causes the node to free itself.

See Also

_AddRef (see page 26155)

OwnerDocument (see page 26193)

RefCount (see page 22281)

195.1.2.5.3 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	TXMLNode.AddChild (DOMString, DOMString, Boolean, Integer) (see page 26156)	Adds a new child node to this node.
	TXMLNode.AddChild (DOMString, DOMString, TXMLNodeClass, Integer) (see page 26156)	Adds a new child node to this node.
	TXMLNode.AddChild (DOMString, Integer) (see page 26156)	Adds a new child node to this node.

195.1.2.5.3.1 TXMLNode.AddChild Method (DOMString, DOMString, Boolean, Integer)

Adds a new child node to this node.

Pascal

```
function AddChild(const TagName: DOMString; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; GenPrefix: Boolean
= False; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; NodeClass:
TXMLNodeClass; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI, Boolean
GenPrefix = False, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI,
TXMLNodeClass NodeClass, int Index = -1);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected AddChild method. Only the first two versions of AddChild are available on the IXMLNode interface. The third syntax is used by TXMLNode (see page 26147)

descendants that the XML data binding wizard creates.

AddChild creates a new element node as the child of this node.

TagName provides the tag name of the newly created node.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

NamespaceURI identifies the namespace that includes the new node's definition. If NamespaceURI is omitted (the first syntax), the namespace of the new node is deduced from the namespace prefix of TagName. If TagName has no namespace prefix and there is no NamespaceURI parameter, the namespace is the same as this node's NamespaceURI property.

GenPrefix controls whether AddChild generates a namespace prefix for the namespace URI when the NamespaceURI parameter identifies a URI that is not already declared in the document. Note that setting GenPrefix to true does not cause AddChild to add a declaration of the new namespace prefix unless the document's Options property includes doNamespaceDecl.

NodeClass identifies the implementation class to use for the new child node. It must be TXMLNode (see page 26147) or one of its descendants.

AddChild returns the interface for the newly created child node.

Tip: AddChild only adds element nodes. To add other types of child nodes, use the XML document's CreateNode method instead, and then add the resulting node to the ChildNodes (see page 26190) property array.

See Also

ChildNodes (see page 26190)

AddChild (see page 26414)

CreateNode (see page 26109)

Options (see page 26141)

CreateElement (see page 26109)

NSPrefixBase (see page 26141)

DeclareNamespace (see page 26164)

195.1.2.5.4 TXMLNode.AddHostedNode Method

Adds a node to the HostedNodes (see page 26192) property list.

Pascal

```
procedure AddHostedNode(Node: TXMLNode);
```

C++

```
__fastcall AddHostedNode(TXMLNode Node);
```

Description

AddHostedNode is used internally to add nodes to the HostedNodes (see page 26192) array.

Node is the node to add to the array.

See Also

HostedNodes (see page 26192)

RemoveHostedNode (see page 26183)

195.1.2.5.5 TXMLNode.AttributeListNotify Method

Responds to notifications of changes in the list of attributes.

Pascal

```
procedure AttributeListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean);
```

C++

```
__fastcall AttributeListNotify(TNodeListOperation Operation, IXMLNode Node, const OleVariant
IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the AttributeNodes (see page 26189) property calls AttributeListNotify when attribute nodes are inserted or removed, or when a new attribute node needs to be created. AttributeListNotify generates a BeforeNodeChange or AfterNodeChange event on the document object, and, if the change has not yet occurred, updates the underlying DOM implementation to reflect the change.

Operation indicates what type of change occurred.

Node is the interface for the attribute node that was added or removed. If a new attribute node needs to be created, Node returns the new node.

IndexOrName is the name of the attribute when Operation is nlCreateNode.

BeforeOperation indicates whether the call occurs before the attribute node is added or removed.

See Also

AttributeNodes (see page 26189)

TNodeListNotification (see page 26248)

BeforeNodeChange (see page 26146)

AfterNodeChange (see page 26145)

195.1.2.5.6 TXMLNode.CheckNotHosted Method

Raises an EXMLDocError exception if this is a hosted node.

Pascal

```
procedure CheckNotHosted;
```

C++

```
__fastcall CheckNotHosted();
```

Description

Applications can't call this protected method. It is used internally in methods that can only be used by the main node that corresponds to an element. If the node represents a hosted node (that is, if the node is used to represent a subset of the main, or host, node), then CheckNotHosted raises an EXMLDocError exception.

For example, the CreateCollection (see page 26163) method calls CheckNotHosted, because only the main node for an element can host collection nodes.

See Also

HostNode (see page 26193)

HostedNodes (see page 26192)

EXMLDocError (see page 26381)

CreateCollection (see page 26163)

195.1.2.5.7 TXMLNode.CheckReadOnly Method

Raises an EXMLDocError exception if this is a read-only node.

Pascal

```
procedure CheckReadOnly;
```

C++

```
__fastcall CheckReadOnly();
```

Description

Applications can't call this protected method. It is used internally in methods that change the value, children, or attributes of the node, to check whether the change is permitted, and if not, raise an exception.

See Also

GetReadOnly (see page 26177)

SetReadOnly (see page 26187)

ReadOnly (see page 26438)

EXMLDocError (see page 26381)

195.1.2.5.8 TXMLNode.CheckTextNode Method

Generates a DOM text node implementation if it does not yet exist.

Pascal

```
procedure CheckTextNode;
```

C++

```
__fastcall CheckTextNode();
```

Description

Applications can't call this protected method. It is used internally to generate a DOM node implementation for text values.

If the XML node is an element that has child nodes (other than a single DOM text node), CheckTextNode raises an exception.

195.1.2.5.9 TXMLNode.ChildListNotify Method

Responds to notifications of changes in the list of child nodes.

Pascal

```
procedure ChildListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean); virtual;
```

C++

```
virtual __fastcall ChildListNotify(TNodeListOperation Operation, IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the ChildNodes (see page 26190) property calls ChildListNotify when child nodes are inserted or removed, or when a node needs to be created. ChildListNotify generates a BeforeNodeChange or AfterNodeChange event on the document object, and, if the change has not yet occurred, updates the underlying DOM implementation to reflect the change.

Operation indicates what type of change is occurring.

Node is the interface for the child node about which this method is called. When nodes are added or removed, this is the node that is added or removed. When a node needs to be created, this parameter returns the newly created node.

IndexOrName is the index of the node that is added or removed when Operation is nlInsert or nlRemove. When Operation is nlCreateNode, IndexOrName is the name of the child node to create.

BeforeOperation indicates whether the call occurs before the child node is added or removed.

See Also

ChildNodes (see page 26190)

AddChild (see page 26156)

TNodeListNotification (see page 26248)

BeforeNodeChange (see page 26146)

AfterNodeChange (see page 26145)

195.1.2.5.10 TXMLNode.ClearDocumentRef Method

Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).

Pascal

```
procedure ClearDocumentRef;
```

C++

```
__fastcall ClearDocumentRef();
```

Description

Applications can't call this protected method. The document that contains this node calls ClearDocumentRef when it is freed so that the node does not maintain a reference to a non-existent document.

In addition to setting the OwnerDocument (see page 26193) property to nil (Delphi) or NULL (C++), ClearDocumentRef propagates this call to all of this nodes child nodes and attribute nodes.

See Also

OwnerDocument (see page 26193)

ChildNodes (see page 26190)

AttributeNodes (see page 26189)

195.1.2.5.11 TXMLNode.CloneNode Method

Creates a copy of this node and returns its interface.

Pascal

```
function CloneNode(Deep: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode CloneNode(Boolean Deep);
```

Description

Applications can't call the protected CloneNode method. To create a copy of this node, use the CloneNode method of this node's IXMLNode interface.

CloneNode returns a copy of this node that has no parent. Any attributes of this node are copied as well, including attribute nodes that represent default values.

Deep indicates whether the child nodes of this node should be cloned as well. For example, if an element node contains any text, CloneNode only copies then text when deep is true, because in the underlying DOM implementation, the text is contained in a child node.

See Also

ChildNodes (see page 26190)

AddChild (see page 26156)

ParentNode (see page 26194)

CloneNode (see page 26415)

CloneNode (see page 26309)

195.1.2.5.12 TXMLNode.CreateAttributeList Method

Creates the object that implements the AttributeNodes (see page 26189) property.

Pascal

```
function CreateAttributeList: IXMLNodeList; dynamic;
```

C++

```
__fastcall IXMLNodeList CreateAttributeList();
```

Description

Applications can't call the protected CreateAttributeList method. This method is used internally the first time an application reads the AttributeNodes (see page 26189) property.

CreateAttributeList creates an implementation class for the AttributeNodes (see page 26189) property, telling it to call the AttributeListNotify (see page 26158) method when it changes the list of attributes for this node, and filling it with nodes based on the current attributes of this node.

See Also

AttributeNodes (see page 26189)

AttributeListNotify (see page 26158)

195.1.2.5.13 TXMLNode.CreateAttributeNode Method

Creates a new TXMLNode (see page 26147) object for an attribute of this node.

Pascal

```
function CreateAttributeNode(const ADOMNode: IDOMNode): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode CreateAttributeNode(const IDOMNode ADOMNode);
```

Description

Applications can't call the protected CreateAttributeNode method. TXMLNode (see page 26147) uses this method internally to generate the nodes that populate the AttributeNodes (see page 26189) property.

CreateAttributeNode creates a new TXMLNode (see page 26147) object for the specified IDOMNode interface and returns its interface.

ADOMNode is the interface for the DOM implementation's version of the attribute node.

See Also

AttributeNodes (see page 26189)

195.1.2.5.14 TXMLNode.CreateChildList Method

Creates the object that implements the ChildNodes (see page 26190) property.

Pascal

```
function CreateChildList: IXMLNodeList; dynamic;
```

C++

```
__fastcall IXMLNodeList CreateChildList();
```

Description

Applications can't call the protected CreateChildList method. This method is used internally the first time an application reads the ChildNodes (see page 26190) property.

CreateChildList creates an implementation class for the ChildNodes (see page 26190) property, telling it to call the ChildListNotify (see page 26159) method when it changes the list of attributes for this node, and filling it with nodes that are based on the current children of this node.

See Also

ChildNodes (see page 26190)

ChildListNotify (see page 26159)

195.1.2.5.15 TXMLNode.CreateChildNode Method

Creates a new TXMLNode (see page 26147) object for a child node of this node.

Pascal

```
function CreateChildNode(const ADOMNode: IDOMNode): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode CreateChildNode(const IDOMNode ADOMNode);
```

Description

Applications can't call the protected CreateChildNode method. This method is used internally to create the implementation object for a new child node.

CreateChildNode creates a new TXMLNode (see page 26147) descendant for the specified IDOMNode interface, with this node as the parent. If the node name of the DOM node matches one of the names listed by the ChildNodeClasses (see page 26190) property, the corresponding descendant of TXMLNode (see page 26147) becomes the implementation class of the

new node. Otherwise, the new node is an instance of TXMLNode (see page 26147).

ADOMNode is the interface for the DOM implementation's version of the node.

CreateChildNode returns the interface for the newly created child node.

See Also

Create (see page 26152)

ChildNodeClasses (see page 26190)

CreateDOMNode (see page 26238)

195.1.2.5.16 TXMLNode.CreateCollection Method

Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.

Pascal

```
function CreateCollection(const CollectionClass: TXMLNodeCollectionClass; const ItemInterface:
TGuid; const ItemTag: DOMString; ItemNS: DOMString = ''): TXMLNodeCollection;
```

C++

```
__fastcall TXMLNodeCollection CreateCollection(const TXMLNodeCollectionClass CollectionClass,
const TGuid ItemInterface, const DOMString ItemTag, DOMString ItemNS = '');
```

Description

Applications can't call the protected CreateCollection method. It is used internally to generate the collections that are listed in the HostedNodes (see page 26192) property.

CollectionClass specifies the class (a TXMLNodeCollection (see page 26196) descendant) that implements the collection of child nodes.

ItemInterface specifies the interface for each child node in the collection.

ItemTag specifies the tag name for each child node in the collection.

ItemNS specifies the namespace in which ItemTag is defined.

CreateCollection returns the new hosted collection node. This new node has the same parent node, DOM interface, attribute nodes, and child nodes as this node, but it also maintains a list of only those child nodes with the specified tag and interface. The new collection node lists this node as the value of its HostNode (see page 26193) property.

Note: CreateCollection raises an exception if this is a hosted node.

See Also

HostedNodes (see page 26192)

ChildNodes (see page 26190)

ParentNode (see page 26194)

DOMNode (see page 26192)

HostNode (see page 26193)

ItemInterface (see page 26209)

itemtag (see page 26210)

itemns (see page 26210)

195.1.2.5.17 TXMLNode.DeclareNamespace Method

Adds an attribute to the node that declares a specified namespace URI.

Pascal

```
procedure DeclareNamespace(const Prefix: DOMString; const URI: DOMString);
```

C++

```
__fastcall DeclareNamespace(const DOMString Prefix, const DOMString URI);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected DeclareNamespace method. DeclareNamespace adds an attribute to this node that declares the specified namespace URI as the value of the specified prefix.

Prefix is the namespace prefix that appears in tag names that reference the namespace.

URI is the corresponding namespace URI.

Note: This method is called automatically for newly created nodes when the document's Options property includes doNamespaceDecl.

See Also

Options (see page 26141)

AttributeNodes (see page 26189)

FindNamespaceDecl (see page 26165)

DeclareNamespace (see page 26416)

195.1.2.5.18 TXMLNode.DOMElement Method

Returns the IDOMElement interface for this node if it exists.

Pascal

```
function DOMElement: IDOMElement;
```

C++

```
__fastcall IDOMElement DOMElement();
```

Description

Application's can't call the protected DOMElement method. TXMLNode (see page 26147) uses this method internally to obtain the DOM element interface, which it uses for working with attributes.

If the TXMLNode (see page 26147) instance does not represent an element node, DOMElement raises an EXMLDocError exception.

See Also

AttributeNodes (see page 26189)

GetAttribute (see page 26166)

SetAttribute (see page 26183)

195.1.2.5.19 TXMLNode.DoNodeChange Method

Generates a BeforeNodeChange or AfterNodeChange event on this node's document.

Pascal

```
procedure DoNodeChange(ChangeType: TNodeChange; BeforeOperation: Boolean); virtual;
```

C++

```
virtual __fastcall DoNodeChange(TNodeChange ChangeType, Boolean BeforeOperation);
```

Description

Applications can't call the protected DoNodeChange method. It is called internally before and after every change that is made to the node. DoNodeChange checks whether the node's OwnerDocument (see page 26193) property is set, and if so, generates a BeforeNodeChange or AfterNodeChange event on that document, as appropriate.

ChangeType indicates the type of change that is occurring to the node.

BeforeOperation is true if the change is about to occur, false if the change has just occurred.

See Also

AfterNodeChange (see page 26145)

BeforeNodeChange (see page 26146)

OwnerDocument (see page 26193)

195.1.2.5.20 TXMLNode.FindHostedNode Method

Returns the IXMLNode interface for a hosted node given its implementation class.

Pascal

```
function FindHostedNode(const NodeClass: TXMLNodeClass): IXMLNode;
```

C++

```
__fastcall IXMLNode FindHostedNode(const TXMLNodeClass NodeClass);
```

Description

Applications can't call the protected FindHostedNode method. Descendant classes call this method to locate a hosted node of a particular class type.

FindHostedNode searches the nodes in the HostedNodes (see page 26192) list and returns the first one it finds that is an instance of descendant of NodeClass. If this node does not have a hosted node of the specified class, FindHostedNode returns nil (Delphi) or NULL (C++).

See Also

HostedNodes (see page 26192)

CreateCollection (see page 26163)

195.1.2.5.21 TXMLNode.FindNamespaceDecl Method

Returns the attribute node that declares a specified Namespace URI.

Pascal

```
function FindNamespaceDecl(const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNamespaceDecl(const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected FindNamespaceDecl method. FindNamespaceDecl searches the node hierarchy that contains this node for an attribute that specifies the mapping between a namespace prefix and the namespace URI specified by NamespaceURI. If it finds such a mapping, FindNamespaceDecl returns the interface for the Attribute node. If it does not find a mapping, FindNamespaceDecl returns nil (Delphi) or NULL (C++).

NamespaceURI is the namespace URI to locate.

See Also

FindNamespaceURI (see page 26166)

DeclareNamespace (see page 26164)

FindNamespaceDecl (see page 26416)

195.1.2.5.22 TXMLNode.FindNamespaceURI Method

Returns the namespace URI for a namespace prefix or qualified tag name.

Pascal

```
function FindNamespaceURI(const TagOrPrefix: DOMString): DOMString;
```

C++

```
__fastcall DOMString FindNamespaceURI(const DOMString TagOrPrefix);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected FindNamespaceURI method. FindNamespaceDecl (see page 26165) searches the node hierarchy that contains this node for an attribute that specifies the mapping between the namespace prefix identified by TagOrPrefix and a namespace URI. If it finds such a mapping, FindNamespaceURI returns the namespace URI. If it does not find a mapping, FindNamespaceURI returns an empty string.

TagOrPrefix is the namespace prefix or a tag name that includes the namespace prefix.

See Also

GetNamespaceURI (see page 26172)

GetPrefix (see page 26176)

FindNamespaceDecl (see page 26165)

FindNamespaceURI (see page 26416)

195.1.2.5.23 TXMLNode.GetAttribute Method

Returns the value of one of this node's attributes.

Pascal

```
function GetAttribute(const AttrName: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttribute(const DOMString AttrName);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetAttribute method. GetAttribute returns the value of an attribute of this node.

AttrName is the name of the attribute.

GetAttribute returns the value of the specified attribute. Typically, this value is a string. If the node does not have an attribute with the name specified by AttrName, the value that GetAttribute returns is determined by the document's Options property. When Options include doAttrNull, GetAttribute returns a Null Variant for missing attributes. When Options does not include doAttrNull, GetAttribute returns an empty string as the value of missing attributes.

If this node is not an element node, GetAttribute raises an EXMLDocError exception.

See Also

SetAttribute (see page 26183)

AttributeNodes (see page 26189)

GetAttributeNS (see page 26167)

195.1.2.5.24 TXMLNode.GetAttributeNodes Method

Returns the value of the AttributeNodes (see page 26189) property.

Pascal

```
function GetAttributeNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetAttributeNodes();
```

Description

GetAttributeNodes is the read implementation of the AttributeNodes (see page 26189) property on the IXMLNode interface for this node.

GetAttributeNodes generates the list that implements the AttributeNodes (see page 26189) property the first time an application reads the AttributeNodes (see page 26189) property.

See Also

GetAttribute (see page 26166)

AttributeNodes (see page 26189)

195.1.2.5.25 TXMLNode.GetAttributeNS Method

Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.

Pascal

```
function GetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetAttributeNS method. GetAttributeNS returns the value of an attribute of this node.

AttrName is the name of the attribute.

NamespaceURI identifies the namespace in which the attribute resides.

GetAttributeNS returns the value of the specified attribute. If AttrName and NamespaceURI do not identify an attribute of this node, GetAttributeNS returns a Null Variant.

If this node is not an element node, GetAttributeNS raises an EXMLDocError exception.

See Also

GetAttribute (see page 26166)

Attributes (see page 26430)

GetNamespaceURI (see page 26172)

SetAttributeNS (see page 26184)

AttributeNodes (see page 26189)

195.1.2.5.26 TXMLNode.GetChildNodeClasses Method

Returns a list of the classes that can implement child nodes of this node.

Pascal

```
function GetChildNodeClasses: TNodeClassArray;
```

C++

```
__fastcall TNodeClassArray GetChildNodeClasses();
```

Description

GetChildNodeClasses is used internally to obtain a list of the classes that can be used to represent child nodes of this node.

If this node is not a hosted node, GetChildNodeClasses returns an array containing every class that has been registered using the RegisterChildNode (see page 26182) method. If this node is a hosted node, GetChildNodeClasses returns the ChildNodeClasses (see page 26190) property of the host node.

See Also

ChildNodeClasses (see page 26190)

RegisterChildNode (see page 26182)

HostNode (see page 26193)

195.1.2.5.27 TXMLNode.GetChildNodes Method

Returns the value of the ChildNodes (see page 26190) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the protected read implementation of the ChildNodes (see page 26190) property.

GetChildNodes generates the list that implements the ChildNodes (see page 26190) property the first time an application reads the ChildNodes (see page 26190) property.

See Also

GetChildValue (see page 26169)

ChildNodes (see page 26190)

195.1.2.5.28 TXMLNode.GetChildValue Method

Returns the value of a specified child node.

Pascal

```
function GetChildValue(const IndexOrName: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetChildValue(const OleVariant IndexOrName);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetChildValue method. GetChildValue returns the value of the node.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

If IndexOrName does not identify a child of this node, GetChildValue nil (Delphi) or NULL (C++). Otherwise, the return value depends on the type of the child node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, GetChildValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

Note: Attributes are not considered child nodes of a node. To get the values of this node's attributes, use the GetAttribute (see page 26166) method instead.

See Also

ChildNodes (see page 26190)

ParentNode (see page 26194)

GetAttribute (see page 26166)

GetNodeValue (see page 26174)

195.1.2.5.29 TXMLNode.GetCollection Method

Returns the value of the Collection (see page 26191) property.

Pascal

```
function GetCollection: IXMLNodeCollection;
```

C++

```
__fastcall IXMLNodeCollection GetCollection();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetCollection method. GetCollection returns the value of the Collection (see page 26191) property. If this node is not a member of a collection (that is, if it does not represent one of a set of child nodes that are all the same type), then GetCollection returns nil (Delphi) or NULL (C++).

See Also

Collection (see page 26191)

195.1.2.5.30 TXMLNode.GetDOMNode Method

Returns the value of the DOMNode (see page 26192) property.

Pascal

```
function GetDOMNode: IDOMNode;
```

C++

```
__fastcall IDOMNode GetDOMNode();
```

Description

GetDOMNode is the protected read implementation of the DOMNode (see page 26192) property.

See Also

DOMNode (see page 26192)

195.1.2.5.31 TXMLNode.GetHasChildNodes Method

Indicates whether this node has any child nodes.

Pascal

```
function GetHasChildNodes: Boolean;
```

C++

```
__fastcall Boolean GetHasChildNodes();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetHasChildNodes method. GetHasChildNodes returns true if the underlying DOM node has any child nodes, false if it doesn't.

Note that even if the underlying DOM node has a child node, there may not be a TXMLNode (see page 26147) object to represent that child. For example, text nodes do not, by default, have corresponding TXMLNode (see page 26147) wrappers. Rather, the text becomes the value of the parent element node.

See Also

ChildNodes (see page 26190)

DOMNode (see page 26192)

GetIsTextElement (see page 26171)

195.1.2.5.32 TXMLNode.GetHostedNodes Method

Returns a list an array of the hosted nodes that share this node's attribute and child node lists.

Pascal

```
function GetHostedNodes: TXMLNodeArray;
```

C++

```
__fastcall TXMLNodeArray GetHostedNodes();
```

Description

GetHostedNodes is the read implementation of the HostedNodes (see page 26192) property. It returns a list an array of all nodes that represent aspects of this node, sharing its attributes and list of child nodes.

See Also

HostedNodes (see page 26192)

195.1.2.5.33 TXMLNode.GetHostNode Method

Returns the value of the HostNode (see page 26193) property.

Pascal

```
function GetHostNode: TXMLNode;
```

C++

```
__fastcall TXMLNode GetHostNode();
```

Description

GetHostNode returns the node that uses this node to represent a particular aspect of it, sharing the same attributes and list of child nodes. If this is not a hosted node, GetHostNode returns nil (Delphi) or NULL (C++).

See Also

HostNode (see page 26193)

195.1.2.5.34 TXMLNode.GetIsTextElement Method

Indicates whether the node has a single text value.

Pascal

```
function GetIsTextElement: Boolean;
```

C++

```
__fastcall Boolean GetIsTextElement();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetIsTextElement method. GetIsTextElement returns true if the node represents an XML fragment such as

```
<Title> Understanding XML </Title>
```

where the node has a tag name (in this case Title) and a single text value (in this case 'Understanding XML').

GetIsTextElement returns false if the node is any other type of node.

Note: In the underlying DOM implementation, nodes for which GetIsTextElement is true are element nodes that have a single

child node that is a text node. TXMLNode (see page 26147) flattens this out so that the child text node does not appear as a child node. Instead, the text can be accessed through the GetText (see page 26177) method.

See Also

GetText (see page 26177)

GetHasChildNodes (see page 26170)

195.1.2.5.35 TXMLNode.GetLocalName Method

Returns the name of the node without any namespace prefix.

Pascal

```
function GetLocalName: DOMString;
```

C++

```
__fastcall DOMString GetLocalName();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetLocalName method. GetLocalName returns the local name of the underlying DOM node.

For element nodes, the local name is derived from the name that appears in the XML tag. For example, the local name for <xsi:Name First="John" Last="Doe"> is 'Name'.

For attribute nodes, the local name is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <Name First=John Last=Doe> results in two attribute nodes, with the local names 'First' and 'Last'.

For any other node types, the local name is nil (Delphi) or NULL (C++).

Note: If both GetPrefix (see page 26176) and GetLocalName return a value for a node, the node name (returned by GetNodeName (see page 26173)) is the combination of these two values.

See Also

GetNodeName (see page 26173)

GetNodeType (see page 26174)

GetPrefix (see page 26176)

GetNamespaceURI (see page 26172)

LocalName (see page 26318)

195.1.2.5.36 TXMLNode.GetNamespaceURI Method

Returns the URI for the namespace used in the qualified node name.

Pascal

```
function GetNamespaceURI: DOMString;
```

C++

```
__fastcall DOMString GetNamespaceURI();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetNamespaceURI method.

GetNamespaceURI returns the URI for the namespace that should be used to interpret the node's name.

Only element and attribute nodes can have a namespace URI value. For any other node type, GetNamespaceURI returns nil (Delphi) or NULL (C++).

The namespace URI is only available if it is explicitly assigned when the node is created. By default, TXMLNode (see page 26147) does not assign namespaces to the new nodes it creates.

See Also

GetNodeName (see page 26173)

GetNodeType (see page 26174)

GetPrefix (see page 26176)

GetLocalName (see page 26172)

CreateDOMNode (see page 26238)

NamespaceURI (see page 26318)

195.1.2.5.37 TXMLNode.GetNodeName Method

Returns the node name.

Pascal

```
function GetNodeName: DOMString;
```

C++

```
__fastcall DOMString GetNodeName();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetNodeName method. GetNodeName returns the name of the underlying DOM node.

The node's name depends on the type of the node, as indicated in the following table:

NodeType	NodeName
ntAttribute	The attribute name
ntElement	The tag name
ntText	'#text'
ntCData	'#cdata-section'
ntEntityRef	The name of the entity reference.
ntEntity	The entity name
ntProcessingInstr	the target of the processing instruction
ntComment	'#comment'
ntDocument	'#document'
ntDocType	The document type name
ntDocFragment	'#document-fragment'
ntNotation	The notation name

Note: If GetPrefix (see page 26176) and GetLocalName (see page 26172) both return values for a node, the node name is the combination of these two values.

See Also

GetNodeType (see page 26174)

GetPrefix (see page 26176)

GetLocalName (see page 26172)

195.1.2.5.38 TXMLNode.GetNodeObject Method

Returns a reference to this TXMLNode (see page 26147) object.

Pascal

```
function GetNodeObject: TXMLNode;
```

C++

```
__fastcall TXMLNode GetNodeObject();
```

Description

GetNodeObject returns Self (Delphi) or this (C++).

195.1.2.5.39 TXMLNode.GetNodeType Method

Returns the type of the node.

Pascal

```
function GetNodeType: TNodeType;
```

C++

```
__fastcall TNodeType GetNodeType();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetNodeType method. GetNodeType returns the type of the underlying DOM node that this TXMLNode (see page 26147) object represents.

See Also

GetIsTextElement (see page 26171)

195.1.2.5.40 TXMLNode.GetNodeValue Method

Returns the value of this node.

Pascal

```
function GetNodeValue: OleVariant;
```

C++

```
__fastcall OleVariant GetNodeValue();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetNodeValue method. GetNodeValue returns the value of the node. This value depends on the type of the node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value

ntElement	If the element contains only text, this is that text value. Otherwise, GetNodeValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

See Also

GetChildValue (see page 26169)

GetText (see page 26177)

195.1.2.5.41 TXMLNode.GetOwnerDocument Method

Returns the interface for the document in which this node appears.

Pascal

```
function GetOwnerDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument GetOwnerDocument();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetOwnerDocument method. GetOwnerDocument returns the value of the OwnerDocument (see page 26193) property.

See Also

OwnerDocument (see page 26193)

195.1.2.5.42 TXMLNode.GetParentNode Method

Returns the interface for the node's parent node.

Pascal

```
function GetParentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetParentNode();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetParentNode method. GetParentNode returns the interface of the node's parent node.

See Also

ParentNode (see page 26194)

195.1.2.5.43 TXMLNode.GetPrefix Method

Returns the namespace prefix of the node's name.

Pascal

```
function GetPrefix: DOMString;
```

C++

```
__fastcall DOMString GetPrefix();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetPrefix method. GetPrefix returns the namespace prefix of an element or attribute node's name. A namespace prefix is a symbolic name for a namespace URI.

For element nodes, the namespace prefix is derived from the name that appears in the XML tag. For example, the namespace prefix for <xsi:Name First="John" Last="Doe"> is 'xsi'.

For attribute nodes, the namespace prefix is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <xsi:Name xsn:First="John" Last="Doe"> results in two attribute nodes, with namespace prefixes of 'xsn' and '', respectively. Note that the attribute never inherits a namespace prefix from the node to which it is attached.

For any other node types, the namespace prefix is nil (Delphi) or NULL (C++).

Note: If both GetPrefix and GetLocalName (see page 26172) return a value for a node, the node name (returned by GetNodeName (see page 26173)) is the combination of these two values.

See Also

GetLocalName (see page 26172)

GetNodeType (see page 26174)

GetNamespaceURI (see page 26172)

GetPrefixedName (see page 26176)

195.1.2.5.44 TXMLNode.GetPrefixedName Method

Returns a node name includes a namespace prefix for a specified namespace URI.

Pascal

```
function GetPrefixedName(const Name: DOMString; const NamespaceURI: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetPrefixedName(const DOMString Name, const DOMString NamespaceURI);
```

Description

GetPrefixedName adds a prefix to a local node name based on the specified namespace URI. If there is no corresponding namespace already declared or if the name is already prefixed, GetPrefixedName returns the original node name.

Name is the node name to which the namespace prefix should be added.

NamespaceURI is the URI for the namespace that should be identified by the namespace prefix.

Note: If the document containing this node does not include doAutoPrefix in its Options property, GetPrefixedName always returns the value of Name, without trying to generate or add a namespace prefix.

See Also

GetLocalName (see page 26172)

GetPrefix (see page 26176)

GetNamespaceURI (see page 26172)

Options (see page 26141)

195.1.2.5.45 TXMLNode.GetReadOnly Method

Indicates whether the node can be modified.

Pascal

```
function GetReadOnly: Boolean;
```

C++

```
__fastcall Boolean GetReadOnly();
```

Description

GetReadOnly returns true if the node can't be modified. Read-only nodes raise an EXMLDocError exception when an attempt is made to change their value, child nodes, or attributes.

GetReadOnly returns false if the node can be modified.

Note: Use the ReadOnly property on the IXMLNode interface to specify whether a node is read-only.

See Also

SetReadOnly (see page 26187)

ReadOnly (see page 26438)

EXMLDocError (see page 26381)

195.1.2.5.46 TXMLNode.GetText Method

Returns the text value of the node.

Pascal

```
function GetText: DOMString;
```

C++

```
__fastcall DOMString GetText();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetText method. GetText returns the text of the node. For example, if the node represents an XML fragment such as

```
<Title> Understanding XML </Title>
```

GetText returns the string 'Understanding XML'.

GetText is intended for use when the GetIsTextElement (see page 26171) method returns true. If GetIsTextElement (see page 26171) returns false, GetText returns an empty string if the node has no children, otherwise it raises an exception.

See Also

GetIsTextElement (see page 26171)

GetNodeValue (see page 26174)

SetText (see page 26188)

195.1.2.5.47 TXMLNode.GetXML Method

Returns the XML that corresponds to the subtree rooted at this node.

Pascal

```
function GetXML: DOMString;
```

C++

```
__fastcall DOMString GetXML();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected GetXML method. GetXML returns the XML that corresponds to this node and any child nodes it contains.

Note: GetXML is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

GetText (see page 26177)

ChildNodes (see page 26190)

DOMVendor (see page 26137)

195.1.2.5.48 HasAttribute Method

This is the overview for the HasAttribute method overload.

Overload List

	Name	Description
	TXMLNode.HasAttribute (DOMString) (see page 26178)	Indicates whether the node has an attribute with a specified name.
	TXMLNode.HasAttribute (DOMString, DOMString) (see page 26178)	Indicates whether the node has an attribute with a specified name.

195.1.2.5.48.1 TXMLNode.HasAttribute Method (DOMString)

Indicates whether the node has an attribute with a specified name.

Pascal

```
function HasAttribute(const Name: DOMString): Boolean; overload;
function HasAttribute(const Name: DOMString; const NamespaceURI: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasAttribute(const DOMString Name);
__fastcall Boolean HasAttribute(const DOMString Name, const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected HasAttribute method.

Name is the name of the attribute about which you want to know.

NamespaceURI is the namespace of the attribute.

HasAttribute returns true if this node has the specified attribute, false otherwise.

See Also

AttributeNodes (see page 26189)

GetAttribute (see page 26166)

GetAttributeNS (see page 26167)

195.1.2.5.49 HasChildNode Method

This is the overview for the HasChildNode method overload.

Overload List

	Name	Description
	TXMLNode.HasChildNode (DOMString) (see page 26179)	Indicates whether the node has a child node with the specified name.
	TXMLNode.HasChildNode (DOMString, DOMString) (see page 26179)	Indicates whether the node has a child node with the specified name.

195.1.2.5.49.1 TXMLNode.HasChildNode Method (DOMString)

Indicates whether the node has a child node with the specified name.

Pascal

```
function HasChildNode(const ChildTag: DOMString): Boolean; overload;
function HasChildNode(const ChildTag: DOMString; const NamespaceURI: DOMString): Boolean;
overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag);
__fastcall Boolean HasChildNode(const DOMString ChildTag, const DOMString NamespaceURI);
```

Description

Applications can't call the protected HasChildNode method. It is used internally to determine when the underlying DOM node has a child with the specified name.

ChildTag is the local tag name of the child to find.

NamespaceURI identifies the namespace in which ChildTag is defined.

HasChildNode returns true if the underlying DOM node includes the specified child node. Otherwise, it returns false.

See Also

ChildNodes (see page 26190)

DOMNode (see page 26192)

195.1.2.5.50 TXMLNode.InternalAddChild Method

Provides the underlying implementation for the AddChild (see page 26156) method.

Pascal

```
function InternalAddChild(NodeClass: TXMLNodeClass; const NodeName: DOMString; const
```

```
NamespaceURI: DOMString; Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode InternalAddChild(TXMLNodeClass NodeClass, const DOMString NodeName, const
DOMString NamespaceURI, int Index);
```

Description

Applications can't call the protected InternalAddChild method. It is used internally to perform all the tasks common to the various overloads of the AddChild (see page 26156) method. InternalAddChild creates a new element node as the child of this node and returns its interface.

NodeClass specifies the implementation class to use for the new child node. It must be TXMLNode (see page 26147) or one of its descendants.

NodeName specifies the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

See Also

AddChild (see page 26156)

195.1.2.5.51 TXMLNode.NestingLevel Method

Returns the number of parents for this node in the node hierarchy.

Pascal

```
function NestingLevel: Integer;
```

C++

```
__fastcall int NestingLevel();
```

Description

Application's can't call the protected NestingLevel property. It is used internally when formatting the XML text that corresponds to this XML document.

NestingLevel returns the number of ancestors for this node in the node hierarchy.

See Also

ParentNode (see page 26194)

ChildNodes (see page 26190)

195.1.2.5.52 TXMLNode.NextSibling Method

Returns the next child of this node's parent.

Pascal

```
function NextSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode NextSibling();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected NextSibling method. NextSibling

returns the node that follows this one in the parent node's ChildNodes (see page 26190) property list.

If this node is the last node in its parent's child list, NextSibling raises an exception.

See Also

ParentNode (see page 26194)

PreviousSibling (see page 26181)

ChildNodes (see page 26190)

195.1.2.5.53 TXMLNode.Normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure Normalize;
```

C++

```
__fastcall Normalize();
```

Description

Use the IXMLNode interface to call the protected Normalize method. Normalize consolidates adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes, only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes.

See Also

ChildNodes (see page 26190)

AttributeNodes (see page 26189)

195.1.2.5.54 TXMLNode.PreviousSibling Method

Returns the previous child of this node's parent.

Pascal

```
function PreviousSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode PreviousSibling();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected PreviousSibling method. PreviousSibling returns the node that precedes this one in the parent node's ChildNodes (see page 26190) property list.

If this node is the first node in its parent's child list, PreviousSibling raises an exception.

See Also

ParentNode (see page 26194)

NextSibling (see page 26180)

ChildNodes (see page 26190)

195.1.2.5.55 TXMLNode.RegisterChildNode Method

Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.

Pascal

```
procedure RegisterChildNode(const TagName: DOMString; ChildNodeClass: TXMLNodeClass;
NamespaceURI: DOMString = '');
```

C++

```
__fastcall RegisterChildNode(const DOMString TagName, TXMLNodeClass ChildNodeClass, DOMString
NamespaceURI = '');
```

Description

Applications can't call the protected RegisterChildNode method. It is called by the RegisterChildNodes (see page 26182) method to register a TXMLNode (see page 26147) descendant so that it can be used as a child of this node. Each TXMLNode (see page 26147) descendant is specific to the structure of the XML document, with properties that correspond to the child nodes and attributes of a node.

RegisterChildNode adds an entry to the ChildNodeClasses (see page 26190) property for the specified node class and tag name.

TagName is the tag name of the child node that the class represents.

NodeClass is the TXMLNode (see page 26147) descendant that implements child nodes that have the specified tag name.

NamespaceURI identifies the namespace in which TagName is defined.

Note: RegisterChildNode raises an exception if this is a hosted node.

See Also

RegisterChildNodes (see page 26182)

ChildNodeClasses (see page 26190)

195.1.2.5.56 TXMLNode.RegisterChildNodes Method

Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.

Pascal

```
procedure RegisterChildNodes(const TagNames: array of DOMString; const NodeClasses: array of
TXMLNodeClass);
```

C++

```
__fastcall RegisterChildNodes(const array of DOMString TagNames, const array of TXMLNodeClass
NodeClasses);
```

Description

Applications can't call the protected RegisterChildNodes method. It is used in code that the XML Data Binding wizard generates to register the special TXMLNode (see page 26147) descendants the are created for nodes in the XML document. Each of these descendant classes is specific to the structure of the XML document, with properties that correspond to the child nodes and attributes of the node.

RegisterChildNodes adds an entry to the ChildNodeClasses (see page 26190) property for each specified node class and tag name.

TagNames is an array containing the names of the child nodes that the classes represent.

TagNames_Size is the index of the last name in TagNames (one less than the number of elements).

NodeClasses is an array containing the TXMLNode (see page 26147) descendants that implement child nodes that have the tag names in the corresponding entries in TagNames.

NodeClasses_Size is the index of the last class in NodeClasses (one less than the number of elements).

See Also

RegisterChildNode (see page 26182)

ChildNodeClasses (see page 26190)

195.1.2.5.57 TXMLNode.RemoveHostedNode Method

Removes a node from the HostedNodes (see page 26192) property list.

Pascal

```
procedure RemoveHostedNode(Node: TXMLNode);
```

C++

```
__fastcall RemoveHostedNode(TXMLNode Node);
```

Description

RemoveHostedNode is used internally to remove nodes from the HostedNodes (see page 26192) array.

Node is the node to remove from the array.

See Also

HostedNodes (see page 26192)

AddHostedNode (see page 26157)

195.1.2.5.58 TXMLNode.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected Resync method. Resync forces the node to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 26190)

AttributeNodes (see page 26189)

Refresh (see page 26123)

195.1.2.5.59 TXMLNode.SetAttribute Method

Sets the value of one of this node's attributes.

Pascal

```
procedure SetAttribute(const AttrName: DOMString; const Value: OleVariant);
```

C++

```
__fastcall SetAttribute(const DOMString AttrName, const OleVariant Value);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected SetAttribute method. SetAttribute sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

GetAttribute (see page 26166)

AttributeNodes (see page 26189)

SetAttributeNS (see page 26184)

195.1.2.5.60 TXMLNode.SetAttributeNodes Method

Sets the value of the AttributeNodes (see page 26189) property.

Pascal

```
procedure SetAttributeNodes(const Value: IXMLNodeList); virtual;
```

C++

```
virtual __fastcall SetAttributeNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the AttributeNodes (see page 26189) property to supply the interface that implements that property.

See Also

AttributeNodes (see page 26189)

195.1.2.5.61 TXMLNode.SetAttributeNS Method

Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

Pascal

```
procedure SetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString; const
Value: OleVariant);
```

C++

```
__fastcall SetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI, const
OleVariant Value);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected SetAttributeNS method.

SetAttributeNS sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

NamespaceURI is the namespace for the attribute.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

SetAttribute (see page 26183)

GetAttributeNS (see page 26167)

AttributeNodes (see page 26189)

195.1.2.5.62 TXMLNode.SetChildNodes Method

Sets the value of the ChildNodes (see page 26190) property.

Pascal

```
procedure SetChildNodes(const Value: IXMLNodeList); virtual;
```

C++

```
virtual __fastcall SetChildNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the ChildNodes (see page 26190) property to supply the interface that implements that property.

See Also

ChildNodes (see page 26190)

195.1.2.5.63 TXMLNode.SetChildValue Method

Sets the value of a specified child node.

Pascal

```
procedure SetChildValue(const IndexOrName: OleVariant; const Value: OleVariant);
```

C++

```
__fastcall SetChildValue(const OleVariant IndexOrName, const OleVariant Value);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected SetChildValue method. SetChildValue sets the value of a specified child node to a specified value.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node. If IndexOrName does not identify a child of this node, SetChildValue raises an exception.

Value is the value to assign. It's interpretation depends on the type of the child node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value

ntElement	If the element contains only text, this is that text value. Otherwise, SetChildValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the child node is any other node type, SetChildValue raises an exception.	

Note: Attributes are not considered child nodes of a node. To set the values of this node's attributes, use the SetAttribute (see page 26183) method instead.

See Also

ChildNodes (see page 26190)

ParentNode (see page 26194)

SetAttribute (see page 26183)

SetNodeValue (see page 26186)

195.1.2.5.64 TXMLNode.SetCollection Method

Sets the value of the Collection (see page 26191) property.

Pascal

```
procedure SetCollection(const Value: TXMLNodeCollection);
```

C++

```
__fastcall SetCollection(const TXMLNodeCollection Value);
```

Description

SetCollection assigns Value as the value of the Collection (see page 26191) property. This protected method is called when this node is added to the collection specified by the Value property.

Value is a TXMLNodeCollection (see page 26196) descendant that represents a repeating set of child nodes, of which this node is a member.

See Also

Collection (see page 26191)

195.1.2.5.65 TXMLNode.SetNodeValue Method

Sets the value of this node.

Pascal

```
procedure SetNodeValue(const Value: OleVariant);
```

C++

```
__fastcall SetNodeValue(const OleVariant Value);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected SetNodeValue method. SetNodeValue

sets the value of this node.

Value is the value to assign. It's meaning depends on the type of the node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, SetNodeValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the node is any other node type, SetNodeValue raises an exception.	

See Also

SetChildValue (see page 26185)

SetText (see page 26188)

195.1.2.5.66 TXMLNode.SetParentNode Method

Sets the value of the ParentNode (see page 26194) property.

Pascal

```
procedure SetParentNode(const Value: TXMLNode); virtual;
```

C++

```
virtual __fastcall SetParentNode(const TXMLNode Value);
```

Description

Applications can't use this protected property. It is used internally when nodes are added to the ChildNodes (see page 26190) or AttributeNodes (see page 26189) property.

See Also

ParentNode (see page 26194)

ChildNodes (see page 26190)

AttributeNodes (see page 26189)

195.1.2.5.67 TXMLNode.SetReadOnly Method

Specifies whether the node can be modified.

Pascal

```
procedure SetReadOnly(const Value: Boolean);
```

C++

```
__fastcall SetReadOnly(const Boolean Value);
```

Description

SetReadOnly assigns the read-only status of the node.

Value is the new read-only status of the node. When Value is true, the node raises an EXMLDocError exception when an attempt is made to change its value, child nodes, or attributes. When Value is false, the node can be modified.

See Also

GetReadOnly (see page 26177)

ReadOnly (see page 26438)

EXMLDocError (see page 26381)

195.1.2.5.68 TXMLNode.SetText Method

Sets the text value of the node.

Pascal

```
procedure SetText(const Value: DOMString);
```

C++

```
__fastcall SetText(const DOMString Value);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected SetText method. SetText replaces the text of the node.

SetText is intended for use when the GetIsTextElement (see page 26171) method returns true. If GetIsTextElement (see page 26171) returns false, SetText adds a new text value to a node that has no children, otherwise, it raises an exception.

See Also

GetIsTextElement (see page 26171)

SetNodeValue (see page 26186)

GetText (see page 26177)

195.1.2.5.69 TransformNode Method

This is the overview for the TransformNode method overload.

Overload List

	Name	Description
	TXMLNode.TransformNode (IXMLNode, IXMLDocument) (see page 26188)	Transforms the subtree rooted at this node, using a specified XSL interface.
	TXMLNode.TransformNode (IXMLNode, WideString) (see page 26188)	Transforms the subtree rooted at this node, using a specified XSL interface.

195.1.2.5.69.1 TXMLNode.TransformNode Method (IXMLNode, IXMLDocument)

Transforms the subtree rooted at this node, using a specified XSL interface.

Pascal

```
procedure TransformNode(const stylesheet: IXMLNode; var output: WideString); overload;
procedure TransformNode(const stylesheet: IXMLNode; const output: IXMLDocument); overload;
```

C++

```
__fastcall TransformNode(const IXMLNode stylesheet, BSTR output);
__fastcall TransformNode(const IXMLNode stylesheet, const IXMLDocument output);
```

Description

Use the TXMLNode (see page 26147) object's IXMLNode interface to call the protected TransformNode method.

stylesheet is a node in an XML document that represents an XSL transformation. Typically, it is the document element of that document.

output represents the result of the transformation. If output is a WideString, TransformNode returns a string of XML. If output is the interface to an XML document, TransformNode replaces the content of that document with the results of the transformation.

Note: TransformNode is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

GetXML (see page 26178)

195.1.2.6 TXMLNode Properties

The properties of the TXMLNode class are listed here.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

195.1.2.6.1 TXMLNode.AttributeNodes Property

Lists the interfaces for nodes that represent attributes of this node.

Pascal

```
property AttributeNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList AttributeNodes;
```

Description

TXMLNode (see page 26147) uses AttributeNodes to keep track of its attributes. AttributeNodes is an IXMLNodeList interface, which can be used to access individual attribute nodes or to add attributes to or delete them from this node.

Applications can't use this protected property to access the attributes of a node. Instead, they use the AttributeNodes property of the IXMLNode interface for this node.

Attributes modify a node in an XML document. For example, given the node

```
<Movie genre=scifi title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

Only element nodes have attributes, and not every element node has them. If the node does not have any attributes, AttributeNodes is the interface for an empty list.

Note: Attributes are not considered child nodes of a node and can't be accessed using the ChildNodes (see page 26190) property.

See Also

IXMLNode (see page 26411)

ChildNodes (see page 26190)

AttributeNodes (see page 26430)

195.1.2.6.2 TXMLNode.ChildNodeClasses Property

Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.

Pascal

```
property ChildNodeClasses: TNodeClassArray;
```

C++

```
__property TNodeClassArray ChildNodeClasses;
```

Description

ChildNodeClasses is used internally when creating child nodes for this node. The XML Data Binding wizard defines TXMLNode (see page 26147) descendants for each node in the XML document that represents a node that has (or can have) children. ChildNodeClasses lists only those TXMLNode (see page 26147) descendants that can represent child nodes of this node. These classes become the types of the corresponding properties on the TXMLNode (see page 26147) descendant that represents this node.

Classes (see page 2685) are added to ChildNodeClasses by the RegisterChildNode (see page 26182) method.

See Also

RegisterChildNode (see page 26182)

RegisterChildNodes (see page 26182)

ChildNodes (see page 26190)

CreateChildNode (see page 26162)

195.1.2.6.3 TXMLNode.ChildNodes Property

Lists the child nodes of this node.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

TXMLNode (see page 26147) uses ChildNodes to keep track of the subnodes of a node. ChildNodes is an IXMLNodeList interface, which can be used to access individual child nodes or to add child nodes to or delete them from this node. Each child node specifies this node as its parent node.

Applications can't use this protected property to access the child nodes of a node. Instead, they use the ChildNodes property of the IXMLNode interface for this node.

Note: Attributes are not considered child nodes of a node. To get the values of this node's attributes, use the Attributes property instead.

See Also

IXMLNode (see page 26411)

ChildNodes (see page 26431)

ParentNode (see page 26194)

195.1.2.6.4 TXMLNode.Collection Property

Indicates the collection in which this node appears.

Pascal

```
property Collection: TXMLNodeCollection;
```

C++

```
__property TXMLNodeCollection Collection;
```

Description

Collection indicates the collection that contains this node if it represents one of a repeating set of child nodes. The node specified by Collection represents the same node in the XML document as this node's ParentNode (see page 26194) property, but it is specialized to work with this node and any other child nodes of the same type.

The node identified by Collection is one of the collections listed by the parent node's HostedNodes (see page 26192) property, and it lists ParentNode (see page 26194) as the value of its HostNode (see page 26193) property.

For example, consider the following XML fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

If this node represents one of the <student> nodes, then ParentNode (see page 26194) represents the <students> node, and Collection represents a copy of the <students> node that is used for only those children that are <student> nodes, and not the <auditor> nodes.

Applications can't use this protected property to access the Collection that contains this node. Instead, they use the Collection property of the IXMLNode interface for this node.

See Also

ParentNode (see page 26194)

HostedNodes (see page 26192)

HostNode (see page 26193)

Collection (see page 26432)

195.1.2.6.5 TXMLNode.DOMNode Property

Provides access to the IDOMNode interface for this node.

Pascal

```
property DOMNode: IDOMNode;
```

C++

```
__property IDOMNode DOMNode;
```

Description

IDOMNode is the interface for this node provided by the DOM implementation that parsed the XML document. It can be accessed through the DOMNode property of the node's IXMLNode interface.

Typically, applications that contain TXMLNode (see page 26147) descendants use the IXMLNode interface to work with a node rather than the IDOMNode interface. IDOMNode is used more typically in applications that work directly with the DOM interfaces.

The value of DOMNode is set to the IDOMNode interface that is provided to the TXMLNode (see page 26147) constructor.

See Also

DOMNode (see page 26433)

Create (see page 26152)

195.1.2.6.6 TXMLNode.HostedNodes Property

Lists the nodes that share this node's lists of child and attribute nodes.

Pascal

```
property HostedNodes: TXMLNodeArray;
```

C++

```
__property TXMLNodeArray HostedNodes;
```

Description

TXMLNode (see page 26147) uses HostedNodes to keep track of the nodes it uses to represent this same node, restricted to a specialized purpose. For example, any node that represents a subset of this node's child nodes that are all of the same type is a hosted node.

Each object in the HostedNodes list is a representation of a particular aspect of this node. Each hosted node acts as a sibling to this TXMLNode (see page 26147) object but does not represent a separate element in the XML document. Rather, it represents a different view of this element.

For example, consider the following XML fragment:

```
<students>
  <fulltime student>Joe Smith</fulltime student>
  <fulltime student>Jane Doe</fulltime student>
  <auditor>Bill Jones</auditor>
</students>
```

The TXMLNode (see page 26147) that represents students would define two hosted nodes for collections of repeating child elements, one for the fulltime students, and one for the auditors. The two collections share the same underlying DOM node as students, but each represents only those child elements of a particular type.

See Also

CreateCollection (see page 26163)

ChildNodes (see page 26190)

TXMLNodeCollection (see page 26196)

Collection (see page 26191)

HostNode (see page 26193)

195.1.2.6.7 TXMLNode.HostNode Property

Indicates the main object for the node to which this node corresponds when it represents a specialized view.

Pascal

```
property HostNode: TXMLNode;
```

C++

```
__property TXMLNode HostNode;
```

Description

If this node represents a hosted node, HostNode is the main node for which this node represents a subset or specialized view. For example, if this node represents a set of repeating child elements, HostNode is the node that uses this node to represent its repeating child elements.

For example, consider the following XML fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
  <auditor name="Susan Brown"></auditor>
</students>
```

The <students> node spawns two hosted nodes to represent the collections of repeating child nodes: one for all of the child nodes of type <student>, and one for all of the child nodes of type <auditor>. If this node represents one of those hosted nodes, then HostNode is the <students> node to which this node belongs. The host node lists this node in its HostedNodes (see page 26192) property.

Applications can't use this protected property to access the host node that created this node. Instead, they use the HostNode property of the IXMLNode interface for this node.

See Also

Collection (see page 26191)

HostedNodes (see page 26192)

TXMLNodeCollection (see page 26196)

195.1.2.6.8 TXMLNode.OwnerDocument Property

Provides access to the document that contains this node.

Pascal

```
property OwnerDocument: TXMLDocument;
```

C++

```
__property TXMLDocument OwnerDocument;
```

Description

Applications can't use this protected property to access the document that contains this. Instead, they use the OwnerDocument property of the IXMLNode interface for this node.

The value of OwnerDocument is set to the TXMLDocument (see page 26097) that is provided to the TXMLNode (see page 26147) constructor.

See Also

Create (see page 26152)

OwnerDocument (see page 26437)

195.1.2.6.9 TXMLNode.ParentNode Property

Identifies the object that represents this node's parent node.

Pascal

```
property ParentNode: TXMLNode;
```

C++

```
__property TXMLNode ParentNode;
```

Description

TXMLNode (see page 26147) uses ParentNode to access the implementation of the node's parent, if it exists. Some nodes (for example attribute nodes) do not have parents.

Applications can't use this protected property to access the parent node of a node. Instead, they use the ParentNode property of the IXMLNode interface for this node.

See Also

ChildNodes (see page 26190)

ParentNode (see page 26437)

195.1.2.7 TXMLNode Events

The events of the TXMLNode class are listed here.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

195.1.2.7.1 TXMLNode.OnHostAttrNotify Event

Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).

Pascal

```
property OnHostAttrNotify: TNodeListNotification;
```

C++

```
__property TNodeListNotification OnHostAttrNotify;
```

Description

Use the OnHostAttrNotify event to update a TXMLNode (see page 26147) descendant that represents a hosted node (such as a collection of repeating child elements) when the host node changes its attribute list.

The AttributeListNotify (see page 26158) method of a host node generates an OnHostAttrNotify event on all of its hosted nodes. This allows the hosted nodes (for example, the nodes that represent a subset of the child nodes that are all the same type) to update their own representation of node attributes so that they reflect the attributes of the host node.

See Also

OnHostChildNotify (see page 26195)

AttributeListNotify (see page 26158)

HostNode (see page 26193)

HostedNodes (see page 26192)

AttributeNodes (see page 26189)

195.1.2.7.2 TXMLNode.OnHostChildNotify Event

Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Pascal

```
property OnHostChildNotify: TNodeListNotification;
```

C++

```
__property TNodeListNotification OnHostChildNotify;
```

Description

Use the OnHostChildNotify event to update a TXMLNode (see page 26147) descendant that represents a hosted node (such as a collection of repeating child elements) when the host node changes its list of child nodes. For example, TXMLNodeCollection (see page 26196) assigns its UpdateCollectionList method as an OnHostChildNotify event handler so that its list of repeating child elements reflects any changes to the host node's list of child nodes.

The ChildListNotify (see page 26159) method of a host node generates an OnHostChildNotify event on all of its hosted nodes.

See Also

OnHostAttrNotify (see page 26194)

ChildListNotify (see page 26159)

HostNode (see page 26193)

HostedNodes (see page 26192)

ChildNodes (see page 26190)

UpdateCollectionList (see page 26208)

195.1.3 TXMLNodeCollection Class

TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.

Class Hierarchy

Pascal

```
TXMLNodeCollection = class(TXMLNode, IXMLNodeCollection);
```

C++

```
class TXMLNodeCollection : public TXMLNode, public IXMLNodeCollection;
```

File

XMLDoc

Description

The XML Data Binding Wizard uses TXMLNodeCollection as a base class for the classes it generates to represent nodes that have repeating elements for child nodes. For example, if the XML document includes the following:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

then the XML Data Binding Wizard generates 3 nodes to represent the <students> node: a TXMLNode (see page 26147) descendant to represent the entire <students> node, and two TXMLNodeCollection descendants to represent the repeating elements: one for the child nodes with the tag <student>, and one for the child nodes with the tag <auditor>.

As with any of the classes the Data Binding Wizard generates to represent nodes in an XML document, child nodes and node attributes appear as properties of the TXMLNodeCollection descendant.

TXMLNodeCollection implements the IXMLNodeCollection interface. Each TXMLNodeCollection descendant implements a class-specific interface that descends from IXMLNodeCollection. Typically, applications do not work directly with TXMLNodeCollection. Instead, they use the IXMLNodeCollection interface or the IXMLNodeCollection descendant that is implemented by a TXMLNodeCollection descendant.

See Also

TXMLDocument (see page 26097)

TXMLNode (see page 26147)

IXMLNodeCollection (see page 26440)

195.1.3.1 TXMLNodeCollection Members

The following tables list the members exposed by TXMLNodeCollection.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 26194)	Occurs when changes occur to the attribute list of this node's HostNode (see page 26193).
	OnHostChildNotify (see page 26195)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 26193).

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 26155)	Increments the reference count for this node.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	_Release (see page 26155)	Decrements the reference count for this node.
	AddChild (see page 26156)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 26157)	Adds a node to the HostedNodes (see page 26192) property list.
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 26158)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 26158)	Raises an EXMLDocError exception if this is a hosted node.
	CheckReadOnly (see page 26159)	Raises an EXMLDocError exception if this is a read-only node.
	CheckTextNode (see page 26159)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.
	ClearDocumentRef (see page 26160)	Sets the value of OwnerDocument (see page 26193) to nil (Delphi) or NULL (C++).
	CloneNode (see page 26160)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 26161)	Creates the object that implements the AttributeNodes (see page 26189) property.
V	CreateAttributeNode (see page 26161)	Creates a new TXMLNode (see page 26147) object for an attribute of this node.
	CreateChildList (see page 26162)	Creates the object that implements the ChildNodes (see page 26190) property.
V	CreateChildNode (see page 26162)	Creates a new TXMLNode (see page 26147) object for a child node of this node.
	CreateCollection (see page 26163)	Creates an instance of a TXMLNodeCollection (see page 26196) descendant and returns it.
	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	DeclareNamespace (see page 26164)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 26164)	Returns the IDOMElement interface for this node if it exists.
V	DoNodeChange (see page 26165)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 26165)	Returns the IXMLNode interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 26165)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26166)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26166)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26167)	Returns the value of the AttributeNodes (see page 26189) property.

	GetAttributeNS (see page 26167)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 26168)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 26168)	Returns the value of the ChildNodes (see page 26190) property.
	GetChildValue (see page 26169)	Returns the value of a specified child node.
	GetCollection (see page 26169)	Returns the value of the Collection (see page 26191) property.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
	GetDOMNode (see page 26170)	Returns the value of the DOMNode (see page 26192) property.
	GetHasChildNodes (see page 26170)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 26171)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 26171)	Returns the value of the HostNode (see page 26193) property.
	GetIsTextElement (see page 26171)	Indicates whether the node has a single text value.
	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetLocalName (see page 26172)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26172)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26173)	Returns the node name.
	GetNodeObject (see page 26174)	Returns a reference to this TXMLNode (see page 26147) object.
	GetNodeType (see page 26174)	Returns the type of the node.
	GetNodeValue (see page 26174)	Returns the value of this node.
	GetOwnerDocument (see page 26175)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26175)	Returns the interface for the node's parent node.
	GetPrefix (see page 26176)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 26176)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 26177)	Indicates whether the node can be modified.
	GetText (see page 26177)	Returns the text value of the node.
	GetXML (see page 26178)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 26178)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26179)	This is the overview for the HasChildNode method overload.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	InternalAddChild (see page 26179)	Provides the underlying implementation for the AddChild (see page 26156) method.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 26180)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 26180)	Returns the next child of this node's parent.
	Normalize (see page 26181)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26181)	Returns the previous child of this node's parent.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 26182)	Registers a descendant of TXMLNode (see page 26147) that can represent the children of this node.
	RegisterChildNodes (see page 26182)	Registers a set of TXMLNode (see page 26147) descendants that can represent the children of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 26183)	Removes a node from the HostedNodes (see page 26192) property list.
	Resync (see page 26183)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26183)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 26184)	Sets the value of the AttributeNodes (see page 26189) property.
	SetAttributeNS (see page 26184)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	SetChildValue (see page 26185)	Sets the value of a specified child node.

	SetCollection (see page 26186)	Sets the value of the Collection (see page 26191) property.
	SetNodeValue (see page 26186)	Sets the value of this node.
V	SetParentNode (see page 26187)	Sets the value of the ParentNode (see page 26194) property.
	SetReadOnly (see page 26187)	Specifies whether the node can be modified.
	SetText (see page 26188)	Sets the text value of the node.
	TransformNode (see page 26188)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 26189)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 26190)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 26190)	Lists the child nodes of this node.
	Collection (see page 26191)	Indicates the collection in which this node appears.
R	Count (see page 26209)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26192)	Provides access to the IDOMNode interface for this node.
R	HostedNodes (see page 26192)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 26193)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 26193)	Provides access to the document that contains this node.
R	ParentNode (see page 26194)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26152)	Instantiates a Create object.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 26152)	Creates a TXMLNode (see page 26147) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.

	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Destroy (see page 26153)	Frees the memory associated with the TXMLNode (see page 26147) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

195.1.3.2 TXMLNodeCollection Methods

The methods of the TXMLNodeCollection class are listed here.

Protected Methods

	Name	Description
V	AddItem (see page 26202)	Adds a new repetition of the repeating child element to this node.
V	ChildListNotify (see page 26203)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 26204)	Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.

	CreateItemList (see page 26204)	Creates the object that implements the List (see page 26210) property.
	Delete (see page 26205)	Removes one of the repeating child nodes from this node.
	GetCount (see page 26205)	Returns the value of the Count (see page 26209) property.
V	GetList (see page 26205)	Returns the value of the List (see page 26210) property.
	GetNode (see page 26206)	Returns the interface for one of the repeating child nodes.
	InsertInCollection (see page 26206)	Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.
	IsCollectionItem (see page 26207)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	Remove (see page 26207)	Removes one of the repeating child nodes from this node.
V	SetChildNodes (see page 26208)	Sets the value of the ChildNodes (see page 26190) property.
	UpdateCollectionList (see page 26208)	Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Public Methods

	Name	Description
V	AfterConstruction (see page 26202)	Initializes the node collection object once it is fully created.

195.1.3.2.1 TXMLNodeCollection.AddItem Method

Adds a new repetition of the repeating child element to this node.

Pascal

```
function AddItem(Index: Integer): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode AddItem(int Index);
```

Description

Applications can't call the protected AddItem method. It is used internally to create a new child node for this node that is an instance of the repeating element. The new child node is given the first tag name listed by the ItemTag (see page 26210) property.

Index indicates the position of the new child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

Note: Index refers to the list of repeating elements (the List (see page 26210) property), not the list of all children (the ChildNodes (see page 26190) property).

AddItem returns the interface for the newly created child node.

See Also

AddChild (see page 26156)

InsertInCollection (see page 26206)

itemtag (see page 26210)

List (see page 26210)

ChildNodes (see page 26190)

195.1.3.2.2 TXMLNodeCollection.AfterConstruction Method

Initializes the node collection object once it is fully created.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

AfterConstruction sets the UpdateCollectionList (see page 26208) method as the event handler for the collection's OnHostChildNotify (see page 26195) event. This allows the collection to update itself when the list of child nodes (for which this collection manages a subset) changes.

See Also

OnHostChildNotify (see page 26195)

UpdateCollectionList (see page 26208)

195.1.3.2.3 TXMLNodeCollection.ChildListNotify Method

Responds to notifications of changes in the list of child nodes.

Pascal

```
procedure ChildListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean); override;
```

C++

```
virtual __fastcall ChildListNotify(TNodeListOperation Operation, IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the ChildNodes (see page 26190) property calls ChildListNotify when child nodes are inserted, removed, or need to be created. ChildListNotify calls the inherited method to generate a BeforeNodeChange or AfterNodeChange event and to ensure that the DOM implementation for this node reflects the change. After calling the inherited method, ChildListNotify updates the List (see page 26210) property so that it stays in sync with the ChildNodes (see page 26190) property.

Operation indicates what type of change is about to occur.

Node is the interface for the child node that is added or removed. If Operation is nlCreateNode, Node returns a newly created child node.

IndexOrName is the index of the node that is added or removed when Operation is nlInsert or nlRemove. When Operation is nlCreateNode, IndexOrName is the name or value of the new node to create.

BeforeOperation indicates whether the call occurs before or after the change.

See Also

ChildNodes (see page 26190)

AddChild (see page 26156)

List (see page 26210)

BeforeNodeChange (see page 26146)

AfterNodeChange (see page 26145)

195.1.3.2.4 TXMLNodeCollection.Clear Method

Removes all child nodes in the List (see page 26210) property from the ChildNodes (see page 26190) and List (see page 26210) properties.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use the IXMLNodeCollection interface for this node to call the protected Clear method. Clear deletes every child node from the collection (all the nodes in the List (see page 26210) property), along with the corresponding nodes in the ChildNodes (see page 26190) property.

See Also

List (see page 26210)

Delete (see page 26205)

Remove (see page 26207)

ChildNodes (see page 26190)

Clear (see page 26442)

195.1.3.2.5 TXMLNodeCollection.CreateItemList Method

Creates the object that implements the List (see page 26210) property.

Pascal

```
procedure CreateItemList(CheckFirst: Boolean = False);
```

C++

```
__fastcall CreateItemList(Boolean CheckFirst = False);
```

Description

Applications can't call the protected CreateItemList method. It is used internally when TXMLNodeCollection (see page 26196) needs to create a separate object to implement the List (see page 26210) property. A separate implementation object is only needed if this node contains child nodes that are not in the collection. Otherwise, TXMLNodeCollection (see page 26196) can simply use the ChildNodes (see page 26190) property.

CheckFirst specifies whether CreateItemList should check whether the ChildNodes (see page 26190) property currently includes any nodes that are not in the collection. When CheckFirst is true, CreateItemList first checks the ChildNodes (see page 26190) property, and if all nodes are in the collection, it does not create a separate list to store the nodes of the collection. When CheckFirst is false (or when the ChildNodes (see page 26190) property includes nodes that are not in the collection), CreateItemList instantiates a list to hold the nodes in the collection, and adds to it any nodes listed in ChildNodes (see page 26190) that belong in the collection.

See Also

List (see page 26210)

ChildNodes (see page 26190)

195.1.3.2.6 TXMLNodeCollection.Delete Method

Removes one of the repeating child nodes from this node.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Use the TXMLNodeCollection (see page 26196) object's IXMLNodeCollection interface to call the protected Delete method. Delete removes a specified child node from this node.

Index identifies the child to remove. It is the index of the child in the list of repeating child nodes (The List (see page 26210) property, not the ChildNodes (see page 26190) property). The index 0 represents the first repetition, 1 represents the second repetition, and so on.

See Also

Remove (see page 26207)

Delete (see page 26442)

List (see page 26210)

ChildNodes (see page 26190)

195.1.3.2.7 TXMLNodeCollection.GetCount Method

Returns the value of the Count (see page 26209) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count (see page 26209) property. It returns the number of nodes in the List (see page 26210) property.

See Also

Count (see page 26209)

List (see page 26210)

195.1.3.2.8 TXMLNodeCollection.GetList Method

Returns the value of the List (see page 26210) property.

Pascal

```
function GetList: IXMLNodeList; virtual;
```

C++

```
virtual __fastcall IXMLNodeList GetList();
```

Description

GetList is the protected read implementation of the List (see page 26210) property.

See Also

List (see page 26210)

195.1.3.2.9 TXMLNodeCollection.GetNode Method

Returns the interface for one of the repeating child nodes.

Pascal

```
function GetNode(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(int Index);
```

Description

Use the TXMLNodeCollection (see page 26196) object's IXMLNodeCollection interface to call the protected GetNode method. GetNode returns an interface for working with one of the repeating child nodes.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on. Note that Index is the index of the node in the List (see page 26210) property, not in the index in the ChildNodes (see page 26190) property.

See Also

Nodes (see page 26445)

GetCount (see page 26205)

GetNode (see page 26443)

ChildNodes (see page 26190)

195.1.3.2.10 TXMLNodeCollection.InsertInCollection Method

Copies a child node from the ChildNodes (see page 26190) property to the List (see page 26210) property.

Pascal

```
procedure InsertInCollection(Node: IXMLNode; Index: Integer);
```

C++

```
__fastcall InsertInCollection(IXMLNode Node, int Index);
```

Description

Applications can't call this protected method. It is called automatically when nodes are added to the ChildNodes (see page 26190) property list.

Node is the node that was just added to the ChildNodes (see page 26190) property.

Index is the index of Node in the ChildNodes (see page 26190) property.

InsertInCollection first checks whether Node belongs in the collection. If so, it adds it to the List (see page 26210) property in the position that corresponds to Index (that is, in the index of Node when you ignore all the nodes in ChildNodes (see page 26190) that do not belong in the collection.)

See Also

ChildNodes (see page 26190)

List (see page 26210)

195.1.3.2.11 TXMLNodeCollection.IsCollectionItem Method

Indicates whether a specified node represents the type of node that appears as a repeating child of this node.

Pascal

```
function IsCollectionItem(const Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean IsCollectionItem(const IXMLNode Node);
```

Description

Applications can't call the protected IsCollectionItem method. TXMLNodeCollection (see page 26196) uses this method internally to distinguish nodes that represent instances of the repeating child node type.

IsCollectionItem checks whether Node implements the interface specified by the ItemInterface (see page 26209) property . If so, it returns true. Otherwise, it returns false.

See Also

List (see page 26210)

ItemInterface (see page 26209)

195.1.3.2.12 TXMLNodeCollection.Remove Method

Removes one of the repeating child nodes from this node.

Pascal

```
function Remove(const AItem: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode AItem);
```

Description

Use the TXMLNodeCollection (see page 26196) object's IXMLNodeCollection interface to call the protected Remove method. Remove removes a specified child node from this node.

AItem is the interface of the child to remove. It must represent on of the repeating child nodes.

Remove deletes the child node from both the List (see page 26210) property and from the ChildNodes (see page 26190) property. It returns the index that the child node held in the List (see page 26210) property.

To remove a child that is not one of the repeating child nodes, use the ChildNodes (see page 26190) property instead.

See Also

Delete (see page 26205)

List (see page 26210)

ChildNodes (see page 26190)

195.1.3.2.13 TXMLNodeCollection.SetChildNodes Method

Sets the value of the ChildNodes (see page 26190) property.

Pascal

```
procedure SetChildNodes(const Value: IXMLNodeList); override;
```

C++

```
virtual __fastcall SetChildNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the ChildNodes (see page 26190) property to supply the interface that implements that property.

TXMLNodeCollection (see page 26196) overrides the inherited method to update the List (see page 26210) property as well.

See Also

ChildNodes (see page 26190)

List (see page 26210)

195.1.3.2.14 TXMLNodeCollection.UpdateCollectionList Method

Updates the List (see page 26210) property to reflect changes to the set of child nodes.

Pascal

```
procedure UpdateCollectionList(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean);
```

C++

```
__fastcall UpdateCollectionList(TNodeListOperation Operation, IXMLNode Node, const OleVariant
IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. This method is called automatically when the ChildNodes (see page 26190) property changes so that the collection can update the List (see page 26210) property to reflect the repeating elements in the current set of child nodes.

Operation indicates whether the change to ChildNodes (see page 26190) is the addition of a new node (nlInsert) or the deletion of a child node (nlRemove).

Node is the interface for a child node that is added or removed.

IndexOrName is the index or tag name of the node that is added or removed.

BeforeOperation indicates whether this method is called before ChildNodes (see page 26190) has changed or after the change has occurred.

See Also

List (see page 26210)

ChildListNotify (see page 26203)

ChildNodes (see page 26190)

OnHostChildNotify (see page 26195)

195.1.3.3 TXMLNodeCollection Properties

The properties of the TXMLNodeCollection class are listed here.

Protected Properties

	Name	Description
R	Count (see page 26209)	Indicates the number of repeating child nodes.
	ItemInterface (see page 26209)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 26210)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 26210)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 26210)	Lists the interfaces for the children that are repeated elements.

195.1.3.3.1 TXMLNodeCollection.Count Property

Indicates the number of repeating child nodes.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use the IXMLNodeCollection interface to read this protected property. Count is the number of child nodes for this node that are repetitions of the repeating child node type. That is, Count is the number of nodes in the List (see page 26210) property.

Use Count to obtain an upper limit when addressing child nodes by index (for example, when iterating over all nodes in using the GetNode (see page 26206) method).

Count is changed when you add child nodes using the AddChild (see page 26156) method or delete them using the Delete (see page 26205) or Remove (see page 26207) method. You can access the individual repeating child nodes using the GetNode (see page 26206) method.

See Also

GetNode (see page 26206)

AddChild (see page 26414)

Remove (see page 26207)

Delete (see page 26205)

List (see page 26210)

195.1.3.3.2 TXMLNodeCollection.ItemInterface Property

Indicates the interface type for the repeating child nodes.

Pascal

```
property ItemInterface: TGuid;
```

C++

```
__property TGuid ItemInterface;
```

Description

Applications can't use this protected property. It is used internally to identify the interface for all child nodes that represent the repeating child element.

ItemInterface is the GUID for the default interface of the class that implements the nodes in the collection.

IXMLNode (see page 26411)

IsCollectionItem (see page 26207)

List (see page 26210)

itemtag (see page 26210)

itemns (see page 26210)

195.1.3.3.3 TXMLNodeCollection.ItemNS Property

Pascal

```
property ItemNS: DOMString;
```

C++

```
__property DOMString ItemNS;
```

Description

This is ItemNS, a member of class TXMLNodeCollection.

195.1.3.3.4 TXMLNodeCollection.ItemTag Property

Pascal

```
property ItemTag: DOMString;
```

C++

```
__property DOMString ItemTag;
```

Description

This is ItemTag, a member of class TXMLNodeCollection.

195.1.3.3.5 TXMLNodeCollection.List Property

Lists the interfaces for the children that are repeated elements.

Pascal

```
property List: IXMLNodeList;
```

C++

```
__property IXMLNodeList List;
```

Description

Applications can't use the protected List property. TXMLNodeCollection (see page 26196) uses this property internally to identify those child nodes that are repeated elements. Because TXMLNodeCollection (see page 26196) can correspond to a node in the XML document that has additional children that are not instances of the repeating node type, List is kept separate from the ChildNodes (see page 26190) property, which lists all child nodes.

Applications that need to access the child nodes in this list should use the Nodes property of the IXMLNodeCollection interface for this node or the Items property of an IXMLNodeCollection descendant that is generated by the XML Data Binding wizard.

Nodes (see page 26445)

ChildNodes (see page 26190)

195.1.4 TXMLNodeList Class

TXMLNodeList represents a set of nodes in an XML document.

Class Hierarchy

Pascal

```
TXMLNodeList = class(TInterfacedObject, IXMLNodeList);
```

C++

```
class TXMLNodeList : public TInterfacedObject, public IXMLNodeList;
```

File

XMLDoc

Description

TXMLNodeList is used to represent a set of related nodes (IXMLNode interfaces) in an XML document. For example, TXMLNodeList is used to represent all of the children of a node, or all of the attributes of a node, or all of the nodes in a collection of repeating nodes.

TXMLNodeList can be used to add or delete nodes from the collection, or to access specific nodes.

Typically, applications do not use TXMLNodeList directly. Instead, they access it through the IXMLNodeList interface.

See Also

ChildNodes

AttributeNodes

TXMLNodeCollection (see page 26196)

IXMLNodeList (see page 26445)

IXMLNode (see page 26411)

TObjectList (see page 5677)

TInterfaceList (see page 2855)

195.1.4.1 TXMLNodeList Members

The following tables list the members exposed by TXMLNodeList.

Protected Data Members

	Name	Description
	FRefCount (see page 22278)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
R	NotificationProc (see page 26227)	Specifies a callback that TXMLNodeList (see page 26211) calls when nodes are added to or removed from the list, or when new nodes need to be created

Protected Methods

	Name	Description
	_AddRef (see page 22278)	Implements the IInterface (see page 22396) System::TInterfacedObject::_AddRef method.
	_Release (see page 22279)	Implements the IInterface (see page 22396) System::TInterfacedObject::_Release method.
	Add (see page 26215)	Adds a new node to the end of the list.
	BeginUpdate (see page 26215)	Increments the value of UpdateCount (see page 26226).
	Clear (see page 26216)	Removes all nodes from the list.
	Delete (see page 26216)	This is the overview for the Delete method overload.
	DoNotify (see page 26217)	Executes the callback specified by NotificationProc (see page 26227).
	EndUpdate (see page 26218)	Decrements the value of UpdateCount (see page 26226).
	FindNode (see page 26218)	This is the overview for the FindNode method overload.
	FindSibling (see page 26219)	Returns a node that appears a specified amount before or after another node.
	First (see page 26220)	Returns the first node in the list.
	Get (see page 26220)	Returns a specified node in the list.
	GetCount (see page 26220)	Returns the number of nodes in the list.
	GetNode (see page 26221)	Returns a specified node from the list.
	GetUpdateCount (see page 26221)	Returns the value of the UpdateCount (see page 26226) property.
	IndexOf (see page 26222)	This is the overview for the IndexOf method overload.
	Insert (see page 26223)	Inserts a new node into a specified position in the list.
	InternalInsert (see page 26223)	Provides the underlying implementation of the Insert (see page 26223) method
	Last (see page 26223)	Returns the last node in the list.
	QueryInterface (see page 22280)	Implements the IInterface (see page 22396) System::TInterfacedObject::QueryInterface method.
	Remove (see page 26224)	Removes a specified node from the list.
	ReplaceNode (see page 26224)	Replaces a node in the list with another node.

Protected Properties

	Name	Description
R	Count (see page 26225)	Indicates the number of nodes in the collection.
R	DefaultNamespaceURI (see page 26225)	Identifies the default Namespace for the nodes in this collection.
R	List (see page 26226)	Stores the interfaces for every node in the list.
R	Owner (see page 26226)	Specifies the node that uses this TXMLNodeList (see page 26211) object to manage a set of its child or attribute nodes.
R	UpdateCount (see page 26226)	Indicates the number of times an application has called BeginUpdate (see page 26215) without a matching call to EndUpdate (see page 26218).

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22279)	Responds after the last constructor executes.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22279)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.

	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 26213)	Instantiates a TXMLNodeList (see page 26211) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Delete (see page 26448)	This is the overview for the Delete method overload.
V	Destroy (see page 26214)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindNode (see page 26450)	This is the overview for the FindNode method overload.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 26453)	This is the overview for the IndexOf method overload.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22280)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	Nodes (see page 26456)	Provides access to the nodes in the list.
R	RefCount (see page 22281)	Indicates the number of interface pointers currently dependent upon the object.

195.1.4.2 TXMLNodeList.Create Constructor

Instantiates a TXMLNodeList (see page 26211) object.

Pascal

```
constructor Create(Owner: TXMLNode; const DefaultNamespaceURI: DOMString; NotificationProc:
TNodeListNotification);
```

C++

```
__fastcall TXMLNodeList(TXMLNode Owner, const DOMString DefaultNamespaceURI,
TNodeListNotification NotificationProc);
```

Description

Createinstantiates a new TXMLNodeList (see page 26211) object. Typically, TXMLNodeList (see page 26211) is created by another object that represents a node. The TXMLNodeList (see page 26211) represents a set of nodes that are of interest to

the other object that creates it.

AOwner is the node that creates TXMLNodeList (see page 26211) to represent a set of its child nodes or attributes.

DefaultNamespaceURI (see page 26225) identifies the namespace that is used by default for nodes added to this list when no namespace is explicitly specified.

NotificationProc (see page 26227) is a callback that TXMLNodeList (see page 26211) calls when nodes are added to or removed from the list, or when new nodes need to be created.

See Also

DefaultNamespaceURI (see page 26225)

Owner (see page 26226)

NotificationProc (see page 26227)

195.1.4.3 TXMLNodeList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLNodeList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 22300)

195.1.4.4 TXMLNodeList Methods

The methods of the TXMLNodeList class are listed here.

Protected Methods

	Name	Description
	Add (see page 26215)	Adds a new node to the end of the list.
	BeginUpdate (see page 26215)	Increments the value of UpdateCount (see page 26226).
	Clear (see page 26216)	Removes all nodes from the list.
	Delete (see page 26216)	This is the overview for the Delete method overload.
	DoNotify (see page 26217)	Executes the callback specified by NotificationProc (see page 26227).
	EndUpdate (see page 26218)	Decrements the value of UpdateCount (see page 26226).
	FindNode (see page 26218)	This is the overview for the FindNode method overload.
	FindSibling (see page 26219)	Returns a node that appears a specified amount before or after another node.
	First (see page 26220)	Returns the first node in the list.
	Get (see page 26220)	Returns a specified node in the list.
	GetCount (see page 26220)	Returns the number of nodes in the list.
	GetNode (see page 26221)	Returns a specified node from the list.
	GetUpdateCount (see page 26221)	Returns the value of the UpdateCount (see page 26226) property.
	IndexOf (see page 26222)	This is the overview for the IndexOf method overload.
	Insert (see page 26223)	Inserts a new node into a specified position in the list.
	InternalInsert (see page 26223)	Provides the underlying implementation of the Insert (see page 26223) method
	Last (see page 26223)	Returns the last node in the list.
	Remove (see page 26224)	Removes a specified node from the list.
	ReplaceNode (see page 26224)	Replaces a node in the list with another node.

195.1.4.4.1 TXMLNodeList.Add Method

Adds a new node to the end of the list.

Pascal

```
function Add(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Add(const IXMLNode Node);
```

Description

Call Add to add a node to the end of the list. Add returns the index of the node once it is added, where 0 is the index of the first node in the list, 1 is the index of the second node, and so on.

Node is the node to add to the list.

See Also

Delete (see page 26217)

Remove (see page 26224)

IndexOf (see page 26222)

Insert (see page 26223)

List (see page 26226)

195.1.4.4.2 TXMLNodeList.BeginUpdate Method

Increments the value of UpdateCount (see page 26226).

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before making several changes to the nodes in the list (such as adding or removing several nodes). BeginUpdate increments the UpdateCount (see page 26226) property, to keep track of the fact that the list is in the middle of an update. When the update is complete, call EndUpdate (see page 26218) to decrement the UpdateCount (see page 26226) property.

Every call to BeginUpdate should be matched by a call to EndUpdate (see page 26218), so that the UpdateCount (see page 26226) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 26226)

EndUpdate (see page 26218)

195.1.4.4.3 TXMLNodeList.Clear Method

Removes all nodes from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the list.

Note: Clear does not call the BeginUpdate (see page 26215) and EndUpdate (see page 26218) methods. NotificationProc (see page 26227) is called for every node in the list as it is removed.

See Also

Delete (see page 26217)

Remove (see page 26224)

List (see page 26226)

NotificationProc

195.1.4.4.4 Delete Method

This is the overview for the Delete method overload.

Overload List

	Name	Description
	TXMLNodeList.Delete (DOMString) (see page 26217)	Removes a specified node from the list.
	TXMLNodeList.Delete (DOMString, DOMString) (see page 26217)	Removes a specified node from the list.
	TXMLNodeList.Delete (Integer) (see page 26217)	Removes a specified node from the list.

195.1.4.4.4.1 TXMLNodeList.Delete Method (DOMString)

Removes a specified node from the list.

Pascal

```
function Delete(const Index: Integer): Integer; overload;
function Delete(const Name: DOMString): Integer; overload;
function Delete(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int Delete(const int Index);
__fastcall int Delete(const DOMString Name);
__fastcall int Delete(const DOMString Name, const DOMString NamespaceURI);
```

Description

Delete removes the node specified by the Index or Name parameter.

Name identifies the node to remove from the list. This is the local name of the node to remove.

NamespaceURI identifies the namespace to use when interpreting Name. If the node is identified by Name, but no NamespaceURI parameter is provided, Delete uses DefaultNamespaceURI (see page 26225).

Index identifies the node to remove by index rather than name. Index ranges from 0 to one less than the value of the Count (see page 26225) property.

Delete returns the index of the node that was removed. If there was no node that matched the value of Index or Name, Delete returns –1.

See Also

Remove (see page 26224)

Clear (see page 26216)

IndexOf (see page 26222)

LocalName (see page 26434)

DefaultNamespaceURI (see page 26225)

NamespaceURI (see page 26435)

195.1.4.4.5 TXMLNodeList.DoNotify Method

Executes the callback specified by NotificationProc (see page 26227).

Pascal

```
function DoNotify(Operation: TNodeListOperation; const Node: IXMLNode; const IndexOrName:
OleVariant; BeforeOperation: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode DoNotify(TNodeListOperation Operation, const IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

DoNotify executes the callback that is assigned to NotificationProc (see page 26227) when the list adds, deletes, or needs to create nodes in the list. The parameters are supplied as parameters to the callback, and DoNotify returns the node that was added, deleted, or created.

Operation indicates what change is about to occur or has just occurred.

Node is the node that is being added or removed from the list, or that acts as a parent if the callback must create a node (when Operation is nlCreateNode).

IndexOrName is the name of the node to be created when Operation is nlCreateNode. Otherwise, it is the name or index of the node being deleted or added.

BeforeOperation indicates whether the call occurs before the indicated operation or after. When nodes are inserted and removed, a call is made first with BeforeOperation set to true, then the operation occurs, and then a second callback is made with BeforeOperation set to false. When nodes must be created, only one call is made, with BeforeOperation set to true.

See Also

NotificationProc (see page 26227)

195.1.4.4.6 TXMLNodeList.EndUpdate Method

Decrements the value of UpdateCount (see page 26226).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after making several changes to the nodes in the list (such as adding or removing several nodes). EndUpdate decrements the UpdateCount (see page 26226) property, which was incremented by a previous call to BeginUpdate (see page 26215).

Every call to BeginUpdate (see page 26215) should be matched by a call to EndUpdate, so that the UpdateCount (see page 26226) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 26226)

BeginUpdate (see page 26215)

195.1.4.4.7 FindNode Method

This is the overview for the FindNode method overload.

Overload List

	Name	Description
	TXMLNodeList.FindNode (DOMString) (see page 26218)	Returns a specified node from the list.
	TXMLNodeList.FindNode (DOMString, DOMString) (see page 26218)	Returns a specified node from the list.
	TXMLNodeList.FindNode (TGuid) (see page 26218)	Returns a specified node from the list.

195.1.4.4.7.1 TXMLNodeList.FindNode Method (DOMString)

Returns a specified node from the list.

Pascal

```
function FindNode(NodeName: DOMString): IXMLNode; overload;
function FindNode(NodeName: DOMString; NamespaceURI: DOMString): IXMLNode; overload;
function FindNode(ChildNodeType: TGuid): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode FindNode(DOMString NodeName);
__fastcall IXMLNode FindNode(DOMString NodeName, DOMString NamespaceURI);
__fastcall IXMLNode FindNode(TGuid ChildNodeType);
```

Description

Call FindNode to access a particular node in the list.

NodeName is the node to access. It specifies the LocalName property of the desired node.

NamespaceURI identifies the namespace that qualifies NodeName. It is the same as the NamespaceURI property of the desired node. If the first syntax is used (omitting NamespaceURI), FindNode uses the value of the DefaultNamespaceURI (see page 26225) property.

ChildNodeType identifies the node to access by its interface type (GUID), rather than by name. When using ChildNodeType, FindNode returns the first child node it finds that implements the specified interface.

FindNode returns the interface for the node if it is in the list. If NodeName or ChildNodeType does not specify a node in the list, FindNode returns nil (Delphi) or NULL (C++).

See Also

FindSibling (see page 26219)

First (see page 26220)

Last (see page 26223)

IndexOf (see page 26222)

LocalName (see page 26434)

NamespaceURI (see page 26435)

DefaultNamespaceURI (see page 26225)

195.1.4.4.8 TXMLNodeList.FindSibling Method

Returns a node that appears a specified amount before or after another node.

Pascal

```
function FindSibling(const Node: IXMLNode; Delta: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode FindSibling(const IXMLNode Node, int Delta);
```

Description

Call FindSibling to access the node whose position has a specified relationship to another node.

Node is a node in the list to use as a reference point.

Delta indicates where the desired node appears, relative to Node. If Delta is positive, FindSibling returns the node that appears Delta positions after Node. If Delta is negative, FindSibling returns a node that appears before Node.

FindSibling returns the node that appears at the position offset by Delta, relative to the position of Node. If Delta specifies a position before the first node or after the last node in the list, FindSibling returns nil (Delphi) or NULL (C++).

See Also

FindNode (see page 26218)

First (see page 26220)

Last (see page 26223)

IndexOf (see page 26222)

195.1.4.4.9 TXMLNodeList.First Method

Returns the first node in the list.

Pascal

```
function First: IXMLNode;
```

C++

```
__fastcall IXMLNode First();
```

Description

Call First to access the first node in the list. If the list is empty, First raises an exception.

See Also

FindNode (see page 26218)

FindSibling (see page 26219)

Last (see page 26223)

195.1.4.4.10 TXMLNodeList.Get Method

Returns a specified node in the list.

Pascal

```
function Get(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode Get(int Index);
```

Description

Call Get to retrieve a node from the list, given its index.

Index specifies the node to fetch, where 0 identifies the first node, 1 identifies the second node, and so on. Index should be less than the value of the Count (see page 26225) property.

See Also

List (see page 26226)

GetNode (see page 26221)

Count (see page 26225)

195.1.4.4.11 TXMLNodeList.GetCount Method

Returns the number of nodes in the list.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 26225) property.

See Also

Count (see page 26225)

195.1.4.4.12 TXMLNodeList.GetNode Method

Returns a specified node from the list.

Pascal

```
function GetNode(const IndexOrName: OleVariant): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(const OleVariant IndexOrName);
```

Description

GetNode returns the interface to a node that is identified by name or by position.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, GetNode tries to create a new node with the name specified by IndexOrName. If it can't create the new node, GetNode raises an exception.

See Also

FindNode (see page 26218)

List (see page 26226)

LocalName (see page 26434)

Get (see page 26220)

195.1.4.4.13 TXMLNodeList.GetUpdateCount Method

Returns the value of the UpdateCount (see page 26226) property.

Pascal

```
function GetUpdateCount: Integer;
```

C++

```
__fastcall int GetUpdateCount();
```

Description

GetUpdateCount is the read implementation of the UpdateCount (see page 26226) property.

See Also

UpdateCount (see page 26226)

195.1.4.4.14 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	TXMLNodeList.IndexOf (DOMString) (see page 26222)	Returns the index of a specified node.
	TXMLNodeList.IndexOf (DOMString, DOMString) (see page 26222)	Returns the index of a specified node.
	TXMLNodeList.IndexOf (IXMLNode) (see page 26222)	Returns the index of a specified node.

195.1.4.4.14.1 TXMLNodeList.IndexOf Method (DOMString)

Returns the index of a specified node.

Pascal

```
function IndexOf(const Node: IXMLNode): Integer; overload;
function IndexOf(const Name: DOMString): Integer; overload;
function IndexOf(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int IndexOf(const IXMLNode Node);
__fastcall int IndexOf(const DOMString Name);
__fastcall int IndexOf(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call IndexOf to locate a node in the list. You can specify which node to locate using its name or its interface.

Name is the LocalName property of the node to locate.

NamespaceURI identifies the namespace to use when interpreting LocalName. If Name is used without a NamespaceURI parameter (the first syntax), IndexOf uses the value of the DefaultNamespaceURI (see page 26225) property.

Node is the interface of the node to locate.

IndexOf returns the index of the specified node, where 0 is the index of the first node, 1 is the index of the second node, and so on. If the specified node is not in the list, IndexOf returns -1.

See Also

FindNode (see page 26218)

LocalName (see page 26434)

NamespaceURI (see page 26435)

DefaultNamespaceURI (see page 26225)

195.1.4.4.15 TXMLNodeList.Insert Method

Inserts a new node into a specified position in the list.

Pascal

```
procedure Insert(Index: Integer; const Node: IXMLNode);
```

C++

```
__fastcall Insert(int Index, const IXMLNode Node);
```

Description

Call Insert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index does not specify a valid index, Insert raises an exception.

Node is the node to add to the list.

See Also

Delete (see page 26217)

Remove (see page 26224)

IndexOf (see page 26222)

Add (see page 26215)

195.1.4.4.16 TXMLNodeList.InternalInsert Method

Provides the underlying implementation of the Insert (see page 26223) method

Pascal

```
function InternalInsert(Index: Integer; const Node: IXMLNode): Integer;
```

C++

```
__fastcall int InternalInsert(int Index, const IXMLNode Node);
```

Description

The Insert (see page 26223) method calls InternalInsert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index is –1, the node is added to the end of the list.

Node is the node to add to the list.

InternalInsert returns the index of the node after it is inserted. This is the same as the Index parameter when Index is not –1.

See Also

Insert (see page 26223)

195.1.4.4.17 TXMLNodeList.Last Method

Returns the last node in the list.

Pascal

```
function Last: IXMLNode;
```

C++

```
__fastcall IXMLNode Last();
```

Description

Call Last to access the last node in the list. If the list is empty, Last raises an exception.

See Also

FindNode (see page 26218)

FindSibling (see page 26219)

First (see page 26220)

195.1.4.4.18 TXMLNodeList.Remove Method

Removes a specified node from the list.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes the specified node from the list.

Node is the node to remove from the list.

Remove returns the index of Node before it was removed. If node is not a node in the list, Remove returns -1.

See Also

Delete (see page 26217)

Clear (see page 26216)

195.1.4.4.19 TXMLNodeList.ReplaceNode Method

Replaces a node in the list with another node.

Pascal

```
function ReplaceNode(const OldNode: IXMLNode; const NewNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode ReplaceNode(const IXMLNode OldNode, const IXMLNode NewNode);
```

Description

Call ReplaceNode to replace the node specified by OldNode with the node specified by NewNode.

OldNode is the node to replace. If OldNode does not appear in the list, then ReplaceNode adds the new node to the end of the list.

NewNode is the node to add to the list in place of OldNode.

ReplaceNode returns OldNode (even if OldNode did not appear in the list).

See Also

List (see page 26226)

195.1.4.5 TXMLNodeList Properties

The properties of the TXMLNodeList class are listed here.

Protected Properties

	Name	Description
R	Count (see page 26225)	Indicates the number of nodes in the collection.
R	DefaultNamespaceURI (see page 26225)	Identifies the default Namespace for the nodes in this collection.
R	List (see page 26226)	Stores the interfaces for every node in the list.
R	Owner (see page 26226)	Specifies the node that uses this TXMLNodeList (see page 26211) object to manage a set of its child or attribute nodes.
R	UpdateCount (see page 26226)	Indicates the number of times an application has called BeginUpdate (see page 26215) without a matching call to EndUpdate (see page 26218).

195.1.4.5.1 TXMLNodeList.Count Property

Indicates the number of nodes in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of nodes in the list. To change the value of Count, use the IXMLNodeList interface. Add (see page 26215) nodes using the Add (see page 26215) or Insert (see page 26223) method, or remove them using the Delete (see page 26217) or Remove (see page 26224) method.

See Also

Nodes (see page 26456)

Add (see page 26447)

Delete (see page 26449)

Remove (see page 26455)

Insert (see page 26454)

195.1.4.5.2 TXMLNodeList.DefaultNamespaceURI Property

Identifies the default Namespace for the nodes in this collection.

Pascal

```
property DefaultNamespaceURI: DOMString;
```

C++

```
__property DOMString DefaultNamespaceURI;
```

Description

Read DefaultNamespaceURI to determine the namespace that is used by default when locating nodes in the list. The IndexOf (see page 26222), FindNode (see page 26218), and Delete (see page 26217) methods all use this namespace when trying to match the name of a node if a namespace is not explicitly supplied.

The value of DefaultNamespaceURI is set by the TXMLNodeList (see page 26211) constructor.

See Also

NamespaceURI (see page 26435)

Create (see page 26213)

IndexOf (see page 26222)

FindNode (see page 26218)

Delete (see page 26217)

195.1.4.5.3 TXMLNodeList.List Property

Stores the interfaces for every node in the list.

Pascal

```
property List: IInterfaceList;
```

C++

```
__property IInterfaceList List;
```

Description

TXMLNodeList (see page 26211) uses List internally to store and manage the interfaces to the nodes it represents.

See Also

Count (see page 26225)

Nodes (see page 26456)

195.1.4.5.4 TXMLNodeList.Owner Property

Specifies the node that uses this TXMLNodeList (see page 26211) object to manage a set of its child or attribute nodes.

Pascal

```
property Owner: TXMLNode;
```

C++

```
__property TXMLNode Owner;
```

Description

Owner designates the node that instantiates TXMLNodeList (see page 26211) to manage a set of its child or attribute nodes. This value is supplied to the TXMLNodeList (see page 26211) constructor.

See Also

ChildNodes (see page 26190)

Create (see page 26213)

AttributeNodes (see page 26189)

195.1.4.5.5 TXMLNodeList.UpdateCount Property

Indicates the number of times an application has called BeginUpdate (see page 26215) without a matching call to EndUpdate (see page 26218).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether all update operations have been completed. When an application starts making changes to the list, it calls BeginUpdate (see page 26215), which increments UpdateCount. When those changes are complete, it calls EndUpdate (see page 26218), which decrements UpdateCount. Thus, UpdateCount allows calls to BeginUpdate (see page 26215) and EndUpdate (see page 26218) to be nested.

Applications can avoid responding to updates in a piecemeal fashion by checking UpdateCount and only responding when it is 0. For example, the callback that is supplied to the TXMLNodeList (see page 26211) constructor typically checks UpdateCount before responding to change notifications.

See Also

BeginUpdate (see page 26215)

EndUpdate (see page 26218)

Create (see page 26213)

195.1.4.6 TXMLNodeList Events

The events of the TXMLNodeList class are listed here.

Protected Events

	Name	Description
R	NotificationProc (see page 26227)	Specifies a callback that TXMLNodeList (see page 26211) calls when nodes are added to or removed from the list, or when new nodes need to be created

195.1.4.6.1 TXMLNodeList.NotificationProc Event

Specifies a callback that TXMLNodeList (see page 26211) calls when nodes are added to or removed from the list, or when new nodes need to be created

Pascal

```
property NotificationProc: TNodeListNotification;
```

C++

```
__property TNodeListNotification NotificationProc;
```

Description

The node that instantiates TXMLNodeList (see page 26211) to manage a set of its child or attribute nodes supplies the value of this callback to the TXMLNodeList (see page 26211) constructor. TXMLNodeList (see page 26211) then calls this callback when its methods are used to add, create, or remove nodes.

See Also

ChildListNotify (see page 26159)

Create (see page 26213)

AttributeListNotify (see page 26158)

195.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IXMLDocumentAccess (see page 26228)	This is class XMLDoc.IXMLDocumentAccess.
	IXMLNodeAccess (see page 26230)	This is class XMLDoc.IXMLNodeAccess.

195.2.1 IXMLDocumentAccess Interface

Class Hierarchy

XMLDoc.IXMLDocumentAccess

Pascal

```
IXMLDocumentAccess = interface;
```

C++

```
__interface IXMLDocumentAccess;
```

File

XMLDoc

Description

This is class XMLDoc.IXMLDocumentAccess.

195.2.1.1 IXMLDocumentAccess Members

The following tables list the members exposed by IXMLDocumentAccess.

Public Methods

	Name	Description
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.

Public Properties

	Name	Description
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.

195.2.1.2 IXMLDocumentAccess Methods

The methods of the IXMLDocumentAccess class are listed here.

Public Methods

	Name	Description
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.

195.2.1.2.1 IXMLDocumentAccess.GetDocumentObject Method

Pascal

```
function GetDocumentObject: TXMLDocument;
```

C++

```
__fastcall TXMLDocument GetDocumentObject();
```

Description

This is GetDocumentObject, a member of class IXMLDocumentAccess.

195.2.1.2.2 IXMLDocumentAccess.GetDOMPersist Method

Pascal

```
function GetDOMPersist: IDOMPersist;
```

C++

```
__fastcall IDOMPersist GetDOMPersist();
```

Description

This is GetDOMPersist, a member of class IXMLDocumentAccess.

195.2.1.3 IXMLDocumentAccess Properties

The properties of the IXMLDocumentAccess class are listed here.

Public Properties

	Name	Description
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.

195.2.1.3.1 IXMLDocumentAccess.DocumentObject Property

Pascal

```
property DocumentObject: TXMLDocument;
```

C++

```
__property TXMLDocument DocumentObject;
```

Description

This is DocumentObject, a member of class IXMLDocumentAccess.

195.2.1.3.2 IXMLDocumentAccess.DOMPersist Property

Pascal

```
property DOMPersist: IDOMPersist;
```

C++

```
__property IDOMPersist DOMPersist;
```

Description

This is DOMPersist, a member of class IXMLDocumentAccess.

195.2.2 IXMLNodeAccess Interface

Class Hierarchy

Pascal

```
IXMLNodeAccess = interface(IXMLNode);
```

C++

```
__interface IXMLNodeAccess : public IXMLNode;
```

File

XMLDoc

Description

This is class XMLDoc.IXMLNodeAccess.

195.2.2.1 IXMLNodeAccess Members

The following tables list the members exposed by IXMLNodeAccess.

Public Methods

	Name	Description
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.

	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.

R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

195.2.2.2 IXMLNodeAccess Methods

The methods of the IXMLNodeAccess class are listed here.

Public Methods

	Name	Description
	AddChild (see page 26232)	This is AddChild, a member of class IXMLNodeAccess.
	CheckTextNode (see page 26233)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClearDocumentRef (see page 26233)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CreateAttributeNode (see page 26233)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 26233)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 26233)	This is CreateCollection, a member of class IXMLNodeAccess.
	DOMElement (see page 26234)	This is DOMElement, a member of class IXMLNodeAccess.
	FindHostedNode (see page 26234)	This is FindHostedNode, a member of class IXMLNodeAccess.
	GetChildNodeClasses (see page 26234)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetHostNode (see page 26234)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetNodeObject (see page 26235)	This is GetNodeObject, a member of class IXMLNodeAccess.
	HasChildNode (see page 26235)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 26235)	This is InternalAddChild, a member of class IXMLNodeAccess.
	NestingLevel (see page 26236)	This is NestingLevel, a member of class IXMLNodeAccess.
	RegisterChildNode (see page 26236)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 26236)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	SetCollection (see page 26236)	This is SetCollection, a member of class IXMLNodeAccess.
	SetParentNode (see page 26237)	This is SetParentNode, a member of class IXMLNodeAccess.

195.2.2.2.1 IXMLNodeAccess.AddChild Method

Pascal

```
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; NodeClass:
TXMLNodeClass; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI,
TXMLNodeClass NodeClass, int Index = -1);
```

Description

This is AddChild, a member of class IXMLNodeAccess.

195.2.2.2.2 IXMLNodeAccess.CheckTextNode Method

Pascal

```
procedure CheckTextNode;
```

C++

```
__fastcall CheckTextNode();
```

Description

This is CheckTextNode, a member of class IXMLNodeAccess.

195.2.2.2.3 IXMLNodeAccess.ClearDocumentRef Method

Pascal

```
procedure ClearDocumentRef;
```

C++

```
__fastcall ClearDocumentRef();
```

Description

This is ClearDocumentRef, a member of class IXMLNodeAccess.

195.2.2.2.4 IXMLNodeAccess.CreateAttributeNode Method

Pascal

```
function CreateAttributeNode(const ADOMNode: IDOMNode): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateAttributeNode(const IDOMNode ADOMNode);
```

Description

This is CreateAttributeNode, a member of class IXMLNodeAccess.

195.2.2.2.5 IXMLNodeAccess.CreateChildNode Method

Pascal

```
function CreateChildNode(const ADOMNode: IDOMNode): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateChildNode(const IDOMNode ADOMNode);
```

Description

This is CreateChildNode, a member of class IXMLNodeAccess.

195.2.2.2.6 IXMLNodeAccess.CreateCollection Method

Pascal

```
function CreateCollection(const CollectionClass: TXMLNodeCollectionClass; const ItemIterface:
TGuid; const ItemTag: DOMString; ItemNS: DOMString = ''): TXMLNodeCollection;
```

C++

```
__fastcall TXMLNodeCollection CreateCollection(const TXMLNodeCollectionClass CollectionClass,
const TGuid ItemIterface, const DOMString ItemTag, DOMString ItemNS = '');
```

Description

This is CreateCollection, a member of class IXMLNodeAccess.

195.2.2.2.7 IXMLNodeAccess.DOMElement Method

Pascal

```
function DOMElement: IDOMElement;
```

C++

```
__fastcall IDOMElement DOMElement();
```

Description

This is DOMElement, a member of class IXMLNodeAccess.

195.2.2.2.8 IXMLNodeAccess.FindHostedNode Method

Pascal

```
function FindHostedNode(const NodeClass: TXMLNodeClass): IXMLNode;
```

C++

```
__fastcall IXMLNode FindHostedNode(const TXMLNodeClass NodeClass);
```

Description

This is FindHostedNode, a member of class IXMLNodeAccess.

195.2.2.2.9 IXMLNodeAccess.GetChildNodeClasses Method

Pascal

```
function GetChildNodeClasses: TNodeClassArray;
```

C++

```
__fastcall TNodeClassArray GetChildNodeClasses();
```

Description

This is GetChildNodeClasses, a member of class IXMLNodeAccess.

195.2.2.2.10 IXMLNodeAccess.GetHostNode Method

Pascal

```
function GetHostNode: TXMLNode;
```

C++

```
__fastcall TXMLNode GetHostNode();
```

Description

This is GetHostNode, a member of class IXMLNodeAccess.

195.2.2.2.11 IXMLNodeAccess.GetNodeObject Method

Pascal

```
function GetNodeObject: TXMLNode;
```

C++

```
__fastcall TXMLNode GetNodeObject();
```

Description

This is GetNodeObject, a member of class IXMLNodeAccess.

195.2.2.2.12 HasChildNode Method

This is the overview for the HasChildNode method overload.

Overload List

	Name	Description
	IXMLNodeAccess.HasChildNode (DOMString) (see page 26235)	This is HasChildNode, a member of class IXMLNodeAccess.
	IXMLNodeAccess.HasChildNode (DOMString, DOMString) (see page 26235)	This is HasChildNode, a member of class IXMLNodeAccess.

195.2.2.2.12.1 IXMLNodeAccess.HasChildNode Method (DOMString)

Pascal

```
function HasChildNode(const ChildTag: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag);
```

Description

This is HasChildNode, a member of class IXMLNodeAccess.

195.2.2.2.12.2 IXMLNodeAccess.HasChildNode Method (DOMString, DOMString)

Pascal

```
function HasChildNode(const ChildTag: DOMString; const NamespaceURI: DOMString): Boolean;
overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag, const DOMString NamespaceURI);
```

Description

This is HasChildNode, a member of class IXMLNodeAccess.

195.2.2.2.13 IXMLNodeAccess.InternalAddChild Method

Pascal

```
function InternalAddChild(NodeClass: TXMLNodeClass; const NodeName: DOMString; const
NamespaceURI: DOMString; Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode InternalAddChild(TXMLNodeClass NodeClass, const DOMString NodeName, const
DOMString NamespaceURI, int Index);
```

Description

This is InternalAddChild, a member of class IXMLNodeAccess.

195.2.2.2.14 IXMLNodeAccess.NestingLevel Method

Pascal

```
function NestingLevel: Integer;
```

C++

```
__fastcall int NestingLevel();
```

Description

This is NestingLevel, a member of class IXMLNodeAccess.

195.2.2.2.15 IXMLNodeAccess.RegisterChildNode Method

Pascal

```
procedure RegisterChildNode(const TagName: DOMString; ChildNodeClass: TXMLNodeClass;
NamespaceURI: DOMString = '');
```

C++

```
__fastcall RegisterChildNode(const DOMString TagName, TXMLNodeClass ChildNodeClass, DOMString
NamespaceURI = '');
```

Description

This is RegisterChildNode, a member of class IXMLNodeAccess.

195.2.2.2.16 IXMLNodeAccess.RegisterChildNodes Method

Pascal

```
procedure RegisterChildNodes(const TagNames: array of DOMString; const NodeClasses: array of
TXMLNodeClass);
```

C++

```
__fastcall RegisterChildNodes(const array of DOMString TagNames, const array of TXMLNodeClass
NodeClasses);
```

Description

This is RegisterChildNodes, a member of class IXMLNodeAccess.

195.2.2.2.17 IXMLNodeAccess.SetCollection Method

Pascal

```
procedure SetCollection(const Value: TXMLNodeCollection);
```

C++

```
__fastcall SetCollection(const TXMLNodeCollection Value);
```

Description

This is SetCollection, a member of class IXMLNodeAccess.

195.2.2.2.18 IXMLNodeAccess.SetParentNode Method

Pascal

```
procedure SetParentNode(const Value: TXMLNode);
```

C++

```
__fastcall SetParentNode(const TXMLNode Value);
```

Description

This is SetParentNode, a member of class IXMLNodeAccess.

195.2.2.3 IXMLNodeAccess Properties

The properties of the IXMLNodeAccess class are listed here.

Public Properties

	Name	Description
R	ChildNodeClasses (see page 26237)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	HostNode (see page 26237)	This is HostNode, a member of class IXMLNodeAccess.

195.2.2.3.1 IXMLNodeAccess.ChildNodeClasses Property

Pascal

```
property ChildNodeClasses: TNodeClassArray;
```

C++

```
__property TNodeClassArray ChildNodeClasses;
```

Description

This is ChildNodeClasses, a member of class IXMLNodeAccess.

195.2.2.3.2 IXMLNodeAccess.HostNode Property

Pascal

```
property HostNode: TXMLNode;
```

C++

```
__property TXMLNode HostNode;
```

Description

This is HostNode, a member of class IXMLNodeAccess.

195.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckEncoding (see page 26238)	This is function XMLDoc.CheckEncoding.
	CreateDOMNode (see page 26238)	Creates a new DOM node and returns its interface.
	DetectCharEncoding (see page 26239)	This is function XMLDoc.DetectCharEncoding.
	FormatXMLData (see page 26240)	Formats a string of XML so that it is more readable.
	LoadXMLData (see page 26240)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLData (see page 26240)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLDocument (see page 26241)	Returns the interface for an XML document given the name of an XML file.
	NewXMLDocument (see page 26241)	Returns the interface for a new, empty XML document.
	XMLDocError (see page 26242)	Raises an EXMLDocError exception.
	XMLDocError (see page 26242)	Raises an EXMLDocError exception.
	XMLStringToWideString (see page 26242)	This is function XMLDoc.XMLStringToWideString.

195.3.1 XMLDoc.CheckEncoding Function

Pascal

```
procedure CheckEncoding(var XMLData: DOMString; const ValidEncodings: array of string);
```

C++

```
CheckEncoding(DOMString XMLData, const array of string ValidEncodings);
```

File

XMLDoc

Description

This is function XMLDoc.CheckEncoding.

195.3.2 XMLDoc.CreateDOMNode Function

Creates a new DOM node and returns its interface.

Pascal

```
function CreateDOMNode(Doc: IDOMDocument; const NameOrData: DOMString; NodeType: TNodeType =
ntElement; const AddlData: DOMString = ''): IDOMNode;
```

C++

```
IDOMNode CreateDOMNode(IDOMDocument Doc, const DOMString NameOrData, TNodeType NodeType =
ntElement, const DOMString AddlData = '');
```

File

XMLDoc

Description

CreateDOMNode generates a new DOM node.

Doc is the DOM interface for the document to which the new node will belong.

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

CreateDOMNode returns the interface for the newly created DOM node.

195.3.3 XMLDoc.DetectCharEncoding Function

Pascal

```
function DetectCharEncoding(S: TStream): TXmlEncodingType;
```

C++

```
TXmlEncodingType DetectCharEncoding(TStream S);
```

File

XMLDoc

Description

This is function XMLDoc.DetectCharEncoding.

195.3.4 XMLDoc.FormatXMLData Function

Formats a string of XML so that it is more readable.

Pascal

```
function FormatXMLData(const XMLData: DOMString): DOMString;
```

C++

```
DOMString FormatXMLData(const DOMString XMLData);
```

File

XMLDoc

Description

Use FormatXMLData to convert a string of XML into a format that represents its structure. FormatXMLData changes the input string (XMLData) so that each element node appears on its own line, indented appropriately to reflect its nesting in the node hierarchy.

195.3.5 XMLDoc.LoadXMLData Function

Creates and returns the interface of an XML document object, given a string of XML.

Pascal

```
function LoadXMLData(const XMLData: DOMString): IXMLDocument; overload;
function LoadXMLData(const XMLData: string): IXMLDocument; overload;
```

C++

```
IXMLDocument LoadXMLData(const DOMString XMLData);
IXMLDocument LoadXMLData(const AnsiString XMLData);
```

File

XMLDoc

Description

Call LoadXMLData to create an XML document that represents a specified XML string and obtain its interface.

XMLData is the XML for which you want an IXMLDocument interface.

LoadXMLData returns an interface for the parsed value of XMLData.

LoadXMLData creates a new TXMLDocument (see page 26097) object to parse the XML and returns its IXMLDocument. The TXMLDocument (see page 26097) component is not given an owner, which means that it behaves like an interfaced object. When the application releases the interface that LoadXMLData returns, the TXMLDocument (see page 26097) instance is automatically freed.

See Also

TXMLDocument (see page 26097)

NewXMLDocument (see page 26241)

LoadXMLDocument (see page 26241)

TXMLDocument (see page 26097)

195.3.6 XMLDoc.LoadXMLDocument Function

Returns the interface for an XML document given the name of an XML file.

Pascal

```
function LoadXMLDocument(const FileName: DOMString): IXMLDocument;
```

C++

```
IXMLDocument LoadXMLDocument(const DOMString FileName);
```

File

XMLDoc

Description

Call LoadXMLDocument to load an XML document from a file on disk and obtain its interface. LoadXMLDocument creates a new TXMLDocument (see page 26097) object and uses it to parse the file specified by the FileName parameter. The TXMLDocument (see page 26097) component is not given an owner, which means that it behaves like an interfaced object. When the application releases the interface that LoadXMLDocument returns, the TXMLDocument (see page 26097) instance is automatically freed.

See Also

TXMLDocument (see page 26097)

NewXMLDocument (see page 26241)

LoadXMLData (see page 26240)

195.3.7 XMLDoc.NewXMLDocument Function

Returns the interface for a new, empty XML document.

Pascal

```
function NewXMLDocument(Version: DOMString = '1.0'): IXMLDocument;
```

C++

```
IXMLDocument NewXMLDocument(DOMString Version = '1.0');
```

File

XMLDoc

Description

Call NewXMLDocument to create a TXMLDocument (see page 26097) object for a new, empty XML document.

Version specifies the XML version that the document should use. It becomes the value of the new document's Version property.

See Also

TXMLDocument (see page 26097)

LoadXMLDocument (see page 26241)

IXMLDocument

195.3.8 XMLDoc.XMLDocError Function

Raises an EXMLDocError exception.

Pascal

```
procedure XMLDocError(const Msg: string); overload;
procedure XMLDocError(const Msg: string; const Args: array of const); overload;
```

C++

```
XMLDocError(const AnsiString Msg);
XMLDocError(const AnsiString Msg, const array of const Args);
```

File

XMLDoc

Description

Call XMLDocError to raise an EXMLDocError exception. Using XMLDocError rather than explicitly creating the EXMLDocError instance can result in more space-efficient code.

Msg is the error message associated with the EXMLDocError instance.

Args supplies arguments for any format specifiers embedded in Msg.

Note: Args_Size is the index of the last entry in the Args array. That is one less than the total number of arguments.

See Also

EXMLDocError

195.3.9 XMLDoc.XMLStringToWideString Function

Pascal

```
function XMLStringToWideString(const XMLString: string): WideString;
```

C++

```
BSTR XMLStringToWideString(const AnsiString XMLString);
```

File

XMLDoc

Description

This is function XMLDoc.XMLStringToWideString.

195.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TNodeChange (see page 26243)	TNodeChange indicates the type of change made to a node in an XML document.
	TNodeListOperation (see page 26244)	TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList interface.
	TXMLDocumentSource (see page 26245)	This is record XMLDoc.TXMLDocumentSource.
	TXMLPrologItem (see page 26246)	This is record XMLDoc.TXMLPrologItem.

Records

	Name	Description
	TNodeClassInfo (see page 26244)	TNodeClassInfo and TNodeClassArray (see page 26247) represent information about the classes that implement XML node interfaces.

195.4.1 XMLDoc.TNodeChange Enumeration

TNodeChange indicates the type of change made to a node in an XML document.

Pascal

```
TNodeChange = (
  ncUpdateValue,
  ncInsertChild,
  ncRemoveChild,
  ncAddAttribute,
  ncRemoveAttribute
);
```

C++

```
enum TNodeChange {
  ncUpdateValue,
  ncInsertChild,
  ncRemoveChild,
  ncAddAttribute,
  ncRemoveAttribute
};
```

File

XMLDoc

Description

The following table lists the possible values:

Value	Meaning
ncUpdateValue	The value of the node is changed.
ncInsertChild	A new child node is added to the node.
ncRemoveChild	A child node is removed from the node.

ncAddAttribute	A new attribute is added to the node.
ncRemoveAttribute	An attribute is removed from the node.

See Also

TNodeChangeEvent

195.4.2 XMLDoc.TNodeClassInfo Record

TNodeClassInfo and TNodeClassArray (see page 26247) represent information about the classes that implement XML node interfaces.

Pascal

```
TNodeClassInfo = record
  NodeName: DOMString;
  NamespaceURI: DOMString;
  NodeClass: TXMLNodeClass;
end;
```

C++

```
struct TNodeClassInfo {
  DOMString NodeName;
  DOMString NamespaceURI;
  TXMLNodeClass NodeClass;
};
```

File

XMLDoc

Description

TNodeClassArray (see page 26247) is a dynamic array of TNodeClassInfo values. Each element of the array describes the implementation of a node.

TNodeClassInfo describes the name and implementation class for a node in an XML document. It contains the following fields:

Field	Meaning
NodeName	The name of the node. This string describes the identifier or use of the node. For example, on element nodes, this is the tag name. On attribute nodes, this is the name of the attribute. On comment nodes, this is the string "#comment". This is the value returned by a node's NodeName property, and is used as a property name in classes generated by the XML Data Binding Wizard.
NamespaceURI	The namespace of the node's name. This string is a Uniform Resource Identifier that identifies the namespace that contains NodeName. It is used to interpret the value of NodeName.
NodeClass	The class of a TXMLNode (see page 26147) descendant that represents the node.

195.4.3 XMLDoc.TNodeListOperation Enumeration

TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList interface.

Pascal

```
TNodeListOperation = (
  nlInsert,
  nlRemove,
  nlCreateNode
);
```

C++

```
enum TNodeListOperation {
  nlInsert,
  nlRemove,
  nlCreateNode
};
```

File

XMLDoc

Description

When an application makes a change using the IXMLNodeList interface, the implementing object sends its owner a notification of that change. TNodeListOperation identifies the type of change that is about to occur. The following table lists the possible values:

Value	Meaning
nlInsert	An existing node is about to be added to the list.
nlRemove	A node is about to be removed from the list.
nlCreateNode	A new node needs to be created so that it can be added to the list.

195.4.4 XMLDoc.TXMLDocumentSource Enumeration

Pascal

```
TXMLDocumentSource = (
  xdsNone,
  xdsXMLProperty,
  xdsXMLData,
  xdsFile,
  xdsStream
);
```

C++

```
enum TXMLDocumentSource {
  xdsNone,
  xdsXMLProperty,
  xdsXMLData,
  xdsFile,
  xdsStream
};
```

File

XMLDoc

Description

This is record XMLDoc.TXMLDocumentSource.

195.4.5 XMLDoc.TXMLPrologItem Enumeration

Pascal

```
TXMLPrologItem = (
  xpVersion,
  xpEncoding,
  xpStandalone
);
```

C++

```
enum TXMLPrologItem {
  xpVersion,
  xpEncoding,
  xpStandalone
};
```

File

XMLDoc

Description

This is record XMLDoc.TXMLPrologItem.

195.5 Types

The following table lists types in this documentation.

Types

Name	Description
TNodeChangeEvent (see page 26247)	TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.
TNodeClassArray (see page 26247)	This is type XMLDoc.TNodeClassArray.
TNodeListNotification (see page 26248)	TNodeListNotification is the type of the callback the TXMLNodeList (see page 26211) calls when it adds, deletes, or creates XML nodes.
TXMLNodeArray (see page 26249)	TXMLNodeArray is a dynamic array of TXMLNode (see page 26147) objects.
TXMLNodeClass (see page 26249)	TXMLNodeClass is a class reference to a TXMLNode (see page 26147) descendant.
TXMLNodeCollectionClass (see page 26250)	TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 26196) descendant.

195.5.1 XMLDoc.TNodeChangeEvent Type

TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.

Pascal

```
TNodeChangeEvent = procedure (const Node: IXMLNode; ChangeType: TNodeChange) of object;
```

C++

```
(const Node: IXMLNode; ChangeType: TNodeChange) ( TNodeChangeEvent)();
```

File

XMLDoc

Description

TNodeChangeEvent is the type for the BeforeNodeChange and AfterNodeChange event handlers. These events occur before and after changes are made to the nodes in an XML document.

Node identifies the node to which the change occurs.

ChangeType indicates the type of change made to Node.

See Also

BeforeNodeChange

AfterNodeChange

195.5.2 XMLDoc.TNodeClassArray Type

Pascal

```
TNodeClassArray = array of TNodeClassInfo;
```

C++

```
array of TNodeClassInfo TNodeClassArray;
```

File

XMLDoc

Description

This is type XMLDoc.TNodeClassArray.

195.5.3 XMLDoc.TNodeListNotification Type

TNodeListNotification is the type of the callback the TXMLNodeList (see page 26211) calls when it adds, deletes, or creates XML nodes.

Pascal

```
TNodeListNotification = procedure (Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean) of object;
```

C++

```
(Operation: TNodeListOperation; var Node: IXMLNode; const IndexOrName: OleVariant;
BeforeOperation: Boolean) ( TNodeListNotification)();
```

File

XMLDoc

Description

TNodeListNotification is the type for the callback supplied to TXMLNodeList (see page 26211) in its constructor. TXMLNodeList (see page 26211) calls this procedure before and after it adds or deletes nodes in the list and when it needs to create a new node.

Operation indicates what change is about to occur or has just occurred.

Node specifies the node that is the focus of that change. It's use depends on the operation, as indicated in the following table:

Operation	Node
nlInsert	The node that is about to be added to the list or that has just been added.
nlRemove	The node that is about to be removed from the list or that has just been removed.
nlCreateNode	The newly-created node. This should be created by the callback and returned as the Node parameter.
ntElement	The tag name.
ntAttribute	The name of the attribute.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

IndexOrName is used only when Operation is nlCreateNode. It is the value assigned to the Nodes property using the index of a node that does not yet exist. The interpretation of IndexOrName depends on the type of node that the callback creates, as indicated in the following table:

NodeType	IndexOrName
ntElement	The tag name.
ntAttribute	The name of the attribute.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

BeforeOperation indicates whether the callback occurs before the indicated operation or after. When nodes are inserted and removed, the callback is called first with BeforeOperation set to true, then the operation occurs, and then a second callback is made with BeforeOperation set to false. When nodes must be created, only one call is made, with BeforeOperation set to true.

TXMLNodeList

TXMLNode

TXMLNode

IXMLNodeList

195.5.4 XMLDoc.TXMLNodeArray Type

TXMLNodeArray is a dynamic array of TXMLNode (see page 26147) objects.

Pascal

```
TXMLNodeArray = array of TXMLNode;
```

C++

```
array of TXMLNode TXMLNodeArray;
```

File

XMLDoc

Description

TXMLNodeArray is a dynamic array of TXMLNode (see page 26147) objects, each of which represents a node in an XML document.

195.5.5 XMLDoc.TXMLNodeClass Type

TXMLNodeClass is a class reference to a TXMLNode (see page 26147) descendant.

Pascal

```
TXMLNodeClass = class of TXMLNode;
```

C++

```
TXMLNode TXMLNodeClass;
```

File

XMLDoc

Description

TXMLNodeClass describes a class that descends from TXMLNode (see page 26147).

195.5.6 XMLDoc.TXMLNodeCollectionClass Type

TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 26196) descendant.

Pascal

```
TXMLNodeCollectionClass = class of TXMLNodeCollection;
```

C++

```
TXMLNodeCollection TXMLNodeCollectionClass;
```

File

XMLDoc

Description

TXMLNodeCollectionClass describes a class that descends from TXMLNodeCollection (see page 26196).

195.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
UseXSDBooleanStrings (see page 26251)	This is variable XMLDoc.UseXSDBooleanStrings.

195.6.1 XMLDoc.UseXSDBooleanStrings Variable

Pascal

```
UseXSDBooleanStrings: Boolean = True;
```

C++

```
Boolean UseXSDBooleanStrings = True;
```

File

XMLDoc

Description

This is variable XMLDoc.UseXSDBooleanStrings.

196 xmldom Namespace

This is namespace xmldom.

Topics

Name	Description
Classes (see page 26256)	The following table lists classes in this documentation.
Interfaces (see page 26270)	The following table lists interfaces in this documentation.
Functions (see page 26354)	The following table lists functions in this documentation.
Types (see page 26362)	The following table lists types in this documentation.
Variables (see page 26365)	The following table lists variables in this documentation.
Constants (see page 26366)	The following table lists constants in this documentation.

Classes

	Name	Description
	DOMException (see page 26256)	This is class xmldom.DOMException.
	EDOMParseError (see page 26258)	EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.
	TDOMVendor (see page 26263)	TDOMVendor is the base class for components that provide access to a DOM implementation.
	TDOMVendorList (see page 26265)	TDOMVendorList represents a collection of available DOM implementations.

Constants

Name	Description
ATTRIBUTE_NODE (see page 26366)	This is constant xmldom.ATTRIBUTE_NODE.
CDATA_SECTION_NODE (see page 26367)	This is constant xmldom.CDATA_SECTION_NODE.
COMMENT_NODE (see page 26367)	This is constant xmldom.COMMENT_NODE.
DOCUMENT_FRAGMENT_NODE (see page 26367)	This is constant xmldom.DOCUMENT_FRAGMENT_NODE.
DOCUMENT_NODE (see page 26368)	This is constant xmldom.DOCUMENT_NODE.
DOCUMENT_TYPE_NODE (see page 26368)	This is constant xmldom.DOCUMENT_TYPE_NODE.
DOMSTRING_SIZE_ERR (see page 26368)	This is constant xmldom.DOMSTRING_SIZE_ERR.
DOMWrapperVersion (see page 26369)	This is constant xmldom.DOMWrapperVersion.
ELEMENT_NODE (see page 26369)	This is constant xmldom.ELEMENT_NODE.
ENTITY_NODE (see page 26369)	This is constant xmldom.ENTITY_NODE.
ENTITY_REFERENCE_NODE (see page 26370)	This is constant xmldom.ENTITY_REFERENCE_NODE.
HIERARCHY_REQUEST_ERR (see page 26370)	This is constant xmldom.HIERARCHY_REQUEST_ERR.
INDEX_SIZE_ERR (see page 26370)	This is constant xmldom.INDEX_SIZE_ERR.

INUSE_ATTRIBUTE_ERR (see page 26371)	This is constant xmldom.INUSE_ATTRIBUTE_ERR.
INVALID_ACCESS_ERR (see page 26371)	This is constant xmldom.INVALID_ACCESS_ERR.
INVALID_CHARACTER_ERR (see page 26371)	This is constant xmldom.INVALID_CHARACTER_ERR.
INVALID_MODIFICATION_ERR (see page 26372)	This is constant xmldom.INVALID_MODIFICATION_ERR.
INVALID_STATE_ERR (see page 26372)	This is constant xmldom.INVALID_STATE_ERR.
NAMESPACE_ERR (see page 26372)	This is constant xmldom.NAMESPACE_ERR.
NO_DATA_ALLOWED_ERR (see page 26373)	This is constant xmldom.NO_DATA_ALLOWED_ERR.
NO_MODIFICATION_ALLOWED_ERR (see page 26373)	This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.
NOT_FOUND_ERR (see page 26373)	This is constant xmldom.NOT_FOUND_ERR.
NOT_SUPPORTED_ERR (see page 26374)	This is constant xmldom.NOT_SUPPORTED_ERR.
NOTATION_NODE (see page 26374)	This is constant xmldom.NOTATION_NODE.
NSDelim (see page 26374)	This is constant xmldom.NSDelim.
PROCESSING_INSTRUCTION_NODE (see page 26375)	This is constant xmldom.PROCESSING_INSTRUCTION_NODE.
SEncoding (see page 26375)	This is constant xmldom.SEncoding.
SHttp (see page 26375)	This is constant xmldom.SHttp.
SStandalone (see page 26376)	This is constant xmldom.SStandalone.
SVersion (see page 26376)	This is constant xmldom.SVersion.
SXML (see page 26376)	This is constant xmldom.SXML.
SXMLNamespaceURI (see page 26377)	This is constant xmldom.SXMLNamespaceURI.
SXMLNS (see page 26377)	This is constant xmldom.SXMLNS.
SXMLPrefixNamespaceURI (see page 26377)	This is constant xmldom.SXMLPrefixNamespaceURI.
SYNTAX_ERR (see page 26378)	This is constant xmldom.SYNTAX_ERR.
TEXT_NODE (see page 26378)	This is constant xmldom.TEXT_NODE.
WRONG_DOCUMENT_ERR (see page 26378)	This is constant xmldom.WRONG_DOCUMENT_ERR.

Functions

	Name	Description
	DOMVendorNotSupported (see page 26354)	This is function xmldom.DOMVendorNotSupported.
	ExtractLocalName (see page 26354)	Strips the namespace prefix, if present, from the tag name of an XML node.
	ExtractPrefix (see page 26355)	Returns the namespace prefix of an XML node's tag name.
	GetDOM (see page 26356)	Returns the top-level DOM interface for a registered DOM implementation.
	GetDOMNodeEx (see page 26356)	This is function xmldom.GetDOMNodeEx.
	GetDOMVendor (see page 26357)	Returns the TDOMVendor (see page 26263) object for a specified DOM vendor.
	IsPrefixed (see page 26357)	Indicates whether an XML tag name includes a namespace prefix.
	MakeNodeName (see page 26358)	Assembles a full tag name from a local name and namespace prefix.
	NodeMatches (see page 26358)	Indicates whether a specified node matches a given namespace and tag name.
	RegisterDOMVendor (see page 26359)	Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.
	SameNamespace (see page 26359)	Indicates whether a specified node is defined within a specified namespace.
	SameNamespace (see page 26359)	Indicates whether a specified node is defined within a specified namespace.
	UnRegisterDOMVendor (see page 26360)	Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 26359) .

Interfaces

	Name	Description
	IDOMAttr (see page 26270)	This is class xmldom.IDOMAttr.
	IDOMCDATASection (see page 26274)	This is class xmldom.IDOMCDATASection.
	IDOMCharacterData (see page 26275)	This is class xmldom.IDOMCharacterData.
	IDOMComment (see page 26279)	This is class xmldom.IDOMComment.
	IDOMDocument (see page 26279)	This is class xmldom.IDOMDocument.
	IDOMDocumentFragment (see page 26286)	This is class xmldom.IDOMDocumentFragment.
	IDOMDocumentType (see page 26287)	This is class xmldom.IDOMDocumentType.
	IDOMElement (see page 26291)	This is class xmldom.IDOMElement.
	IDOMEntity (see page 26298)	This is class xmldom.IDOMEntity.

	IDOMEntityReference (see page 26301)	This is class xmldom.IDOMEntityReference.
	IDOMImplementation (see page 26301)	This is class xmldom.IDOMImplementation.
	IDOMNamedNodeMap (see page 26303)	This is class xmldom.IDOMNamedNodeMap.
	IDOMNode (see page 26306)	IDOMNode is the DOM interface for a node in an XML document.
	IDOMNodeEx (see page 26320)	This is class xmldom.IDOMNodeEx.
	IDOMNodeList (see page 26323)	This is class xmldom.IDOMNodeList.
	IDOMNodeSelect (see page 26325)	This is class xmldom.IDOMNodeSelect.
	IDOMNotation (see page 26327)	This is class xmldom.IDOMNotation.
	IDOMParseError (see page 26329)	This is class xmldom.IDOMParseError.
	IDOMParseOptions (see page 26334)	This is class xmldom.IDOMParseOptions.
	IDOMPersist (see page 26338)	This is class xmldom.IDOMPersist.
	IDOMProcessingInstruction (see page 26342)	This is class xmldom.IDOMProcessingInstruction.
	IDOMText (see page 26345)	This is class xmldom.IDOMText.
	IDOMXMLProlog (see page 26347)	This is class xmldom.IDOMXMLProlog.
	IDOMXSLProcessor (see page 26350)	This is class xmldom.IDOMXSLProcessor.

Types

Name	Description
DOMNodeType (see page 26362)	DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.
DOMString (see page 26362)	DOMString is the type for strings that are used by a DOM parser.
DOMTimeStamp (see page 26363)	This is type xmldom.DOMTimeStamp.
TAsyncEventHandler (see page 26363)	TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.
TDOMVendorArray (see page 26364)	This is type xmldom.TDOMVendorArray.

Variables

Name	Description
DefaultDOMVendor (see page 26365)	This is variable xmldom.DefaultDOMVendor.
DOMVendors (see page 26365)	This is variable xmldom.DOMVendors.

196.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	DOMException (see page 26256)	This is class xmldom.DOMException.
	EDOMParseError (see page 26258)	EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.
	TDOMVendor (see page 26263)	TDOMVendor is the base class for components that provide access to a DOM implementation.
	TDOMVendorList (see page 26265)	TDOMVendorList represents a collection of available DOM implementations.

196.1.1 DOMException Class

Class Hierarchy

Pascal

```
DOMException = class(Exception);
```

C++

```
class DOMException : public Exception;
```

File

xmldom

Description

This is class xmldom.DOMException.

196.1.1.1 DOMException Members

The following tables list the members exposed by DOMException.

Public Fields

	Name	Description
	code (see page 26257)	This is code, a member of class DOMException.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.

	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 22752)	Instantiates an instance of an exception with a simple message string.
	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.

196.1.1.2 DOMException Fields

The fields of the DOMException class are listed here.

Public Fields

	Name	Description
	code (see page 26257)	This is code, a member of class DOMException.

196.1.1.2.1 DOMException.code Field

Pascal

```
code: Word;
```

C++

```
Word code;
```

Description

This is code, a member of class DOMException.

196.1.2 EDOMParseError Class

EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.

Class Hierarchy

System::TObject → SysUtils.Exception → xmldom.EDOMParseError

Pascal

```
EDOMParseError = class(Exception);
```

C++

```
class EDOMParseError : public Exception;
```

File

xmldom

Description

EDOMParseError is raised when TXMLDocument encounters an error while parsing an XML document. It wraps the information that is available from the DOM implementation's IDOMParseError (see page 26329) interface.

See Also

TXMLDocument (see page 26097)

196.1.2.1 EDOMParseError Members

The following tables list the members exposed by EDOMParseError.

Protected Properties

	Name	Description
R	ParseError (see page 26261)	This is ParseError, a member of class EDOMParseError.

Public Methods

	Name	Description
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 26259)	This is Create, a member of class EDOMParseError.

	CreateFmt (see page 22754)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 22755)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 22755)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 22756)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 22756)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 22757)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 22759)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	ErrorCode (see page 26260)	Indicates the error code that the DOM parser returned.
R	FilePos (see page 26260)	Indicates the offset in the XML document where the parser encountered an error.
	HelpContext (see page 22760)	Indicates the context ID number for context-sensitive online help associated with the exception.
R	Line (see page 26261)	Indicates the line of the XML document where the parser encountered an error.
R	LinePos (see page 26261)	Indicates the position within the problem line where the parser encountered an error.
	Message (see page 22760)	Message contains the text string to display in the exception dialog box when the exception is raised.
R	Reason (see page 26262)	Indicates the error code that the DOM parser returned.
R	SrcText (see page 26262)	Indicates the text of the line where the parser encountered an error.
R	URL (see page 26262)	Identifies the source that could not be parsed by its URL.

196.1.2.2 EDOMParseError.Create Constructor

Pascal

```
constructor Create(const ParseError: IDOMParseError; const Msg: string);
```

C++

```
__fastcall EDOMParseError(const IDOMParseError ParseError, const AnsiString Msg);
```

Description

This is Create, a member of class EDOMParseError.

196.1.2.3 EDOMParseError Properties

The properties of the EDOMParseError class are listed here.

Protected Properties

	Name	Description
R	ParseError (see page 26261)	This is ParseError, a member of class EDOMParseError.

Public Properties

	Name	Description
R	ErrorCode (see page 26260)	Indicates the error code that the DOM parser returned.
R	FilePos (see page 26260)	Indicates the offset in the XML document where the parser encountered an error.
R	Line (see page 26261)	Indicates the line of the XML document where the parser encountered an error.
R	LinePos (see page 26261)	Indicates the position within the problem line where the parser encountered an error.
R	Reason (see page 26262)	Indicates the error code that the DOM parser returned.
R	SrcText (see page 26262)	Indicates the text of the line where the parser encountered an error.
R	URL (see page 26262)	Identifies the source that could not be parsed by its URL.

196.1.2.3.1 EDOMParseError.ErrorCode Property

Indicates the error code that the DOM parser returned.

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

ErrorCode is the error code supplied by the DOM parser when it encountered a problem parsing the XML document.

See Also

Reason (see page 26262)

196.1.2.3.2 EDOMParseError.FilePos Property

Indicates the offset in the XML document where the parser encountered an error.

Pascal

```
property FilePos: Integer;
```

C++

```
__property int FilePos;
```

Description

FilePos is the offset in the XML document where the parser detected the error.

See Also

Line (see page 26261)

LinePos (see page 26261)

SrcText (see page 26262)

URL (see page 26262)

196.1.2.3.3 EDOMParseError.Line Property

Indicates the line of the XML document where the parser encountered an error.

Pascal

```
property Line: Integer;
```

C++

```
__property int Line;
```

Description

Line is the line of the XML document where the parser detected the error.

See Also

FilePos (see page 26260)

LinePos (see page 26261)

SrcText (see page 26262)

URL (see page 26262)

196.1.2.3.4 EDOMParseError.LinePos Property

Indicates the position within the problem line where the parser encountered an error.

Pascal

```
property LinePos: Integer;
```

C++

```
__property int LinePos;
```

Description

LinePos is the offset in the line specified by the Line (see page 26261) property where the DOM parser detected an error.

See Also

Line (see page 26261)

FilePos (see page 26260)

SrcText (see page 26262)

URL (see page 26262)

196.1.2.3.5 EDOMParseError.ParseError Property

Pascal

```
property ParseError: IDOMParseError;
```

C++

```
__property IDOMParseError ParseError;
```

Description

This is ParseError, a member of class EDOMParseError.

196.1.2.3.6 EDOMParseError.Reason Property

Indicates the error code that the DOM parser returned.

Pascal

```
property Reason: DOMString;
```

C++

```
__property DOMString Reason;
```

Description

Reason is a short text string that describes the error that was encountered. It corresponds to the error code specified by ErrorCode (see page 26260).

See Also

ErrorCode (see page 26260)

Message (see page 22760)

196.1.2.3.7 EDOMParseError.SrcText Property

Indicates the text of the line where the parser encountered an error.

Pascal

```
property SrcText: DOMString;
```

C++

```
__property DOMString SrcText;
```

Description

SrcText is the text from the XML document that the DOM parser could not interpret.

See Also

Line (see page 26261)

196.1.2.3.8 EDOMParseError.URL Property

Identifies the source that could not be parsed by its URL.

Pascal

```
property URL: DOMString;
```

C++

```
__property DOMString URL;
```

Description

URL identifies the problem the DOM parser encountered by its URL.

See Also

SrcText (see page 26262)

196.1.3 TDOMVendor Class

TDOMVendor is the base class for components that provide access to a DOM implementation.

Class Hierarchy

xmldom.TDOMVendor

Pascal

```
TDOMVendor = class;
```

C++

```
class TDOMVendor;
```

File

xmldom

Description

Note: Use TDOMVendor as a base class for a class that can be used to represent a DOM implementation. TDOMVendor introduces two abstract (pure virtual) methods, which provide information about a specific DOM implementation. One returns the IDOMImplementation (see page 26301) interface that acts as the top-level interface for a DOM vendor's implementation. The other returns a unique string that identifies the DOM implementation.

Once a TDOMVendor object has been registered, TXMLDocument objects can assign the DOM implementation as the value of their DOMVendor property by choosing the identifying string in the Object Inspector.

See Also

RegisterDOMVendor

UnregisterDOMVendor

TXMLDocument (see page 26097)

GetDOMVendor

Using the Document Object Model

196.1.3.1 TDOMVendor Members

The following tables list the members exposed by TDOMVendor.

Public Methods

	Name	Description
	Description (see page 26264)	Returns a string that uniquely identifies the associated DOM implementation.
	DOMImplementation (see page 26264)	Returns the IDOMImplementation (see page 26301) interface for the associated DOM implementation.

196.1.3.2 TDOMVendor Methods

The methods of the TDOMVendor class are listed here.

Public Methods

	Name	Description
	Description (see page 26264)	Returns a string that uniquely identifies the associated DOM implementation.
	DOMImplementation (see page 26264)	Returns the IDOMImplementation (see page 26301) interface for the associated DOM implementation.

196.1.3.2.1 TDOMVendor.Description Method

Returns a string that uniquely identifies the associated DOM implementation.

Pascal

```
function Description: string; virtual; abstract;
```

C++

```
virtual __fastcall AnsiString Description() = 0;
```

Description

Description returns the name, or description, of the associated DOM implementation. This is the string that appears in the Object Inspector for a TXMLDocument object's DOMVendor property.

Description is an abstract (pure virtual) method in TDOMVendor (see page 26263). Descendant classes override this method to provide a unique identifier for the DOM implementation.

See Also

DOMVendor (see page 26137)

GetDOMVendor

196.1.3.2.2 TDOMVendor.DOMImplementation Method

Returns the IDOMImplementation (see page 26301) interface for the associated DOM implementation.

Pascal

```
function DOMImplementation: IDOMImplementation; virtual; abstract;
```

C++

```
virtual __fastcall IDOMImplementation DOMImplementation() = 0;
```

Description

DOMImplementation returns the top-level interface for a DOM implementation. This interface is the starting point for any application that uses the DOM implementation to parse and edit an XML document.

DOMImplementation is an abstract (pure virtual) method in TDOMVendor (see page 26263). Descendant classes override this method to return the IDOMImplementation (see page 26301) interface for the associated DOM implementation.

Note: For more information about the IDOMImplementation (see page 26301), see the W3C Document Object Model (DOM) Level 2 Specification or the documentation provided by your DOM vendor.

See Also

domimplementation (see page 26137)

Description (see page 26264)

196.1.4 TDOMVendorList Class

TDOMVendorList represents a collection of available DOM implementations.

Class Hierarchy

xmldom.TDOMVendorList

Pascal

```
TDOMVendorList = class;
```

C++

```
class TDOMVendorList;
```

File

xmldom

Description

TDOMVendorList is the type of the global DOMVendors (see page 26365) variable. It represents a collection of DOM implementations (TDOMVendor (see page 26263) objects).

TDOMVendorList introduces a single property, Vendors (see page 26268), that can be used to iterate through all the DOM vendors in the collection. It also introduces methods that can be used to add, delete, or locate vendors.

Note: Do not explicitly use TDOMVendorList methods to add or delete vendors from the global DOMVendors (see page 26365) variable. Instead, add or remove vendors from this global list by calling the global RegisterDOMVendor (see page 26359) and UnRegisterDOMVendor (see page 26360) procedures.

See Also

DOMVendors

TXMLDocument (see page 26097)

RegisterDOMVendor

TDOMVendor (see page 26263)

UnregisterDOMVendor

196.1.4.1 TDOMVendorList Members

The following tables list the members exposed by TDOMVendorList.

Protected Methods

	Name	Description
	GetVendors (see page 26267)	This is GetVendors, a member of class TDOMVendorList.

Public Methods

	Name	Description
	Add (see page 26266)	Adds a new DOM implementation to the end of the list.
	Count (see page 26266)	Returns the number of DOM vendors in the collection.
	Find (see page 26267)	Returns a vendor from the list, given its description.
	Remove (see page 26268)	Removes a specified vendor from the list.

Public Properties

	Name	Description
	Vendors (see page 26268)	Lists the DOM vendors maintained by this TDOMVendorList (see page 26265) object.

196.1.4.2 TDOMVendorList Methods

The methods of the TDOMVendorList class are listed here.

Protected Methods

	Name	Description
	GetVendors (see page 26267)	This is GetVendors, a member of class TDOMVendorList.

Public Methods

	Name	Description
	Add (see page 26266)	Adds a new DOM implementation to the end of the list.
	Count (see page 26266)	Returns the number of DOM vendors in the collection.
	Find (see page 26267)	Returns a vendor from the list, given its description.
	Remove (see page 26268)	Removes a specified vendor from the list.

196.1.4.2.1 TDOMVendorList.Add Method

Adds a new DOM implementation to the end of the list.

Pascal

```
procedure Add(const Vendor: TDOMVendor);
```

C++

```
__fastcall Add(const TDOMVendor Vendor);
```

Description

Call Add to add a DOM vendor to the end of the list.

Vendor is an object that provides access to the IDOMImplementation (see page 26301) interface for the new DOM vendor.

If the list already includes a DOM vendor with the same description as that supplied by Vendor, Add raises an exception.

See Also

Count

Vendors

Find

Remove

Description (see page 26264)

196.1.4.2.2 TDOMVendorList.Count Method

Returns the number of DOM vendors in the collection.

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

Call Count to determine the number of DOM implementations stored in the list. Count returns a value that can be used as an upper bound when iterating over the vendors using the Vendors (see page 26268) property.

Count increases when the Add (see page 26266) method adds a vendor to the list and decreases when the Remove (see page 26268) method removes a vendor from the list.

See Also

Vendors

Add

Remove

196.1.4.2.3 TDOMVendorList.Find Method

Returns a vendor from the list, given its description.

Pascal

```
function Find(const VendorDesc: string): TDOMVendor;
```

C++

```
__fastcall TDOMVendor Find(const AnsiString VendorDesc);
```

Description

Call Find to access a vendor in the list, given its description. If there is no vendor in the list with the specified description, Find returns nil (Delphi) or NULL (C++).

VendorDesc is the string that is returned by the TDOMVendor (see page 26263) object's Description method.

Find returns a TDOMVendor (see page 26263) object, which can be used as a value for the DOMVendor property of a TXMLDocument component.

See Also

Vendors

Description (see page 26264)

DOMVendor (see page 26137)

196.1.4.2.4 TDOMVendorList.GetVendors Method

Pascal

```
function GetVendors(Index: Integer): TDOMVendor;
```

C++

```
__fastcall TDOMVendor GetVendors(int Index);
```

Description

This is GetVendors, a member of class TDOMVendorList.

196.1.4.2.5 TDOMVendorList.Remove Method

Removes a specified vendor from the list.

Pascal

```
procedure Remove(const Vendor: TDOMVendor);
```

C++

```
__fastcall Remove(const TDOMVendor Vendor);
```

Description

Remove removes the specified vendor from the list.

Vendor is the DOM vendor to remove from the list. If the list does not include a vendor with the same description as this parameter, Remove does nothing.

Description (see page 26264)

196.1.4.3 TDOMVendorList Properties

The properties of the TDOMVendorList class are listed here.

Public Properties

	Name	Description
R	Vendors (see page 26268)	Lists the DOM vendors maintained by this TDOMVendorList (see page 26265) object.

196.1.4.3.1 TDOMVendorList.Vendors Property

Lists the DOM vendors maintained by this TDOMVendorList (see page 26265) object.

Pascal

```
property Vendors [Index: Integer]: TDOMVendor;
```

C++

```
__property TDOMVendor Vendors[int Index];
```

Description

Use Vendors to access the DOM vendors in this collection. Index is the index of the vendor. Its value ranges from 0 to one less than the value returned by the Count (see page 26266) method.

Note: In Delphi, Vendors is the default property for TDOMVendorList (see page 26265). This means that the property name can be omitted in code. That is, the statement

for i := 0 to DOMVendors. Count (see page 26266) do

StringList1.Add (see page 26266)(DOMVendors.Vendors[i].Description);

Can be written

for i := 0 to DOMVendors.Count (see page 26266) do

StringList1.Add (see page 26266)(DOMVendors (see page 26365)[i].Description);

Note: In C++, Vendors can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

196.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDOMAttr (see page 26270)	This is class xmldom.IDOMAttr.
	IDOMCDATASection (see page 26274)	This is class xmldom.IDOMCDATASection.
	IDOMCharacterData (see page 26275)	This is class xmldom.IDOMCharacterData.
	IDOMComment (see page 26279)	This is class xmldom.IDOMComment.
	IDOMDocument (see page 26279)	This is class xmldom.IDOMDocument.
	IDOMDocumentFragment (see page 26286)	This is class xmldom.IDOMDocumentFragment.
	IDOMDocumentType (see page 26287)	This is class xmldom.IDOMDocumentType.
	IDOMElement (see page 26291)	This is class xmldom.IDOMElement.
	IDOMEntity (see page 26298)	This is class xmldom.IDOMEntity.
	IDOMEntityReference (see page 26301)	This is class xmldom.IDOMEntityReference.
	IDOMImplementation (see page 26301)	This is class xmldom.IDOMImplementation.
	IDOMNamedNodeMap (see page 26303)	This is class xmldom.IDOMNamedNodeMap.
	IDOMNode (see page 26306)	IDOMNode is the DOM interface for a node in an XML document.
	IDOMNodeEx (see page 26320)	This is class xmldom.IDOMNodeEx.
	IDOMNodeList (see page 26323)	This is class xmldom.IDOMNodeList.
	IDOMNodeSelect (see page 26325)	This is class xmldom.IDOMNodeSelect.
	IDOMNotation (see page 26327)	This is class xmldom.IDOMNotation.
	IDOMParseError (see page 26329)	This is class xmldom.IDOMParseError.
	IDOMParseOptions (see page 26334)	This is class xmldom.IDOMParseOptions.
	IDOMPersist (see page 26338)	This is class xmldom.IDOMPersist.
	IDOMProcessingInstruction (see page 26342)	This is class xmldom.IDOMProcessingInstruction.
	IDOMText (see page 26345)	This is class xmldom.IDOMText.
	IDOMXMLProlog (see page 26347)	This is class xmldom.IDOMXMLProlog.
	IDOMXSLProcessor (see page 26350)	This is class xmldom.IDOMXSLProcessor.

196.2.1 IDOMAttr Interface

Class Hierarchy

Pascal

```
IDOMAttr = interface(IDOMNode);
```

C++

```
__interface IDOMAttr : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMAttr.

196.2.1.1 IDOMAttr Members

The following tables list the members exposed by IDOMAttr.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_name (see page 26272)	This is get_name, a member of class IDOMAttr.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_ownerElement (see page 26272)	This is get_ownerElement, a member of class IDOMAttr.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_specified (see page 26272)	This is get_specified, a member of class IDOMAttr.
	get_value (see page 26273)	This is get_value, a member of class IDOMAttr.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	set_value (see page 26273)	This is set_value, a member of class IDOMAttr.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	name (see page 26273)	This is name, a member of class IDOMAttr.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.

R	ownerElement (see page 26273)	This is ownerElement, a member of class IDOMAttr.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	specified (see page 26274)	This is specified, a member of class IDOMAttr.
	value (see page 26274)	This is value, a member of class IDOMAttr.

196.2.1.2 IDOMAttr Methods

The methods of the IDOMAttr class are listed here.

Public Methods

	Name	Description
	get_name (see page 26272)	This is get_name, a member of class IDOMAttr.
	get_ownerElement (see page 26272)	This is get_ownerElement, a member of class IDOMAttr.
	get_specified (see page 26272)	This is get_specified, a member of class IDOMAttr.
	get_value (see page 26273)	This is get_value, a member of class IDOMAttr.
	set_value (see page 26273)	This is set_value, a member of class IDOMAttr.

196.2.1.2.1 IDOMAttr.get_name Method

Pascal

```
function get_name: DOMString; safecall;
```

C++

```
__fastcall DOMString get_name();
```

Description

This is get_name, a member of class IDOMAttr.

196.2.1.2.2 IDOMAttr.get_ownerElement Method

Pascal

```
function get_ownerElement: IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement get_ownerElement();
```

Description

This is get_ownerElement, a member of class IDOMAttr.

196.2.1.2.3 IDOMAttr.get_specified Method

Pascal

```
function get_specified: WordBool; safecall;
```

C++

```
__fastcall WordBool get_specified();
```

Description

This is get_specified, a member of class IDOMAttr.

196.2.1.2.4 IDOMAttr.get_value Method

Pascal

```
function get_value: DOMString; safecall;
```

C++

```
__fastcall DOMString get_value();
```

Description

This is get_value, a member of class IDOMAttr.

196.2.1.2.5 IDOMAttr.set_value Method

Pascal

```
procedure set_value(const attributeValue: DOMString); safecall;
```

C++

```
__fastcall set_value(const DOMString attributeValue);
```

Description

This is set_value, a member of class IDOMAttr.

196.2.1.3 IDOMAttr Properties

The properties of the IDOMAttr class are listed here.

Public Properties

	Name	Description
R	name (see page 26273)	This is name, a member of class IDOMAttr.
R	ownerElement (see page 26273)	This is ownerElement, a member of class IDOMAttr.
R	specified (see page 26274)	This is specified, a member of class IDOMAttr.
	value (see page 26274)	This is value, a member of class IDOMAttr.

196.2.1.3.1 IDOMAttr.name Property

Pascal

```
property name: DOMString;
```

C++

```
__property DOMString name;
```

Description

This is name, a member of class IDOMAttr.

196.2.1.3.2 IDOMAttr.ownerElement Property

Pascal

```
property ownerElement: IDOMElement;
```

C++

```
__property IDOMElement ownerElement;
```

Description

This is ownerElement, a member of class IDOMAttr.

196.2.1.3.3 IDOMAttr.specified Property

Pascal

```
property specified: WordBool;
```

C++

```
__property WordBool specified;
```

Description

This is specified, a member of class IDOMAttr.

196.2.1.3.4 IDOMAttr.value Property

Pascal

```
property value: DOMString;
```

C++

```
__property DOMString value;
```

Description

This is value, a member of class IDOMAttr.

196.2.2 IDOMCDATASection Interface

Class Hierarchy

Pascal

```
IDOMCDATASection = interface(IDOMText);
```

C++

```
__interface IDOMCDATASection : public IDOMText;
```

File

xmldom

Description

This is class xmldom.IDOMCDATASection.

196.2.3 IDOMCharacterData Interface

Class Hierarchy

Pascal

```
IDOMCharacterData = interface(IDOMNode);
```

C++

```
__interface IDOMCharacterData : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMCharacterData.

196.2.3.1 IDOMCharacterData Members

The following tables list the members exposed by IDOMCharacterData.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	appendData (see page 26276)	This is appendData, a member of class IDOMCharacterData.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	deleteData (see page 26277)	This is deleteData, a member of class IDOMCharacterData.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_data (see page 26277)	This is get_data, a member of class IDOMCharacterData.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_length (see page 26277)	This is get_length, a member of class IDOMCharacterData.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	insertData (see page 26277)	This is insertData, a member of class IDOMCharacterData.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	replaceData (see page 26277)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 26278)	This is set_data, a member of class IDOMCharacterData.
	set_nodeValue (see page 26316)	Sets the value of the node.
	substringData (see page 26278)	This is substringData, a member of class IDOMCharacterData.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
	data (see page 26278)	This is data, a member of class IDOMCharacterData.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	length (see page 26278)	This is length, a member of class IDOMCharacterData.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.

196.2.3.2 IDOMCharacterData Methods

The methods of the IDOMCharacterData class are listed here.

Public Methods

	Name	Description
	appendData (see page 26276)	This is appendData, a member of class IDOMCharacterData.
	deleteData (see page 26277)	This is deleteData, a member of class IDOMCharacterData.
	get_data (see page 26277)	This is get_data, a member of class IDOMCharacterData.
	get_length (see page 26277)	This is get_length, a member of class IDOMCharacterData.
	insertData (see page 26277)	This is insertData, a member of class IDOMCharacterData.
	replaceData (see page 26277)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 26278)	This is set_data, a member of class IDOMCharacterData.
	substringData (see page 26278)	This is substringData, a member of class IDOMCharacterData.

196.2.3.2.1 IDOMCharacterData.appendData Method

Pascal

```
procedure appendData(const data: DOMString); safecall;
```

C++

```
__fastcall appendData(const DOMString data);
```

Description

This is appendData, a member of class IDOMCharacterData.

196.2.3.2.2 IDOMCharacterData.deleteData Method

Pascal

```
procedure deleteData(offset: Integer; count: Integer); safecall;
```

C++

```
__fastcall deleteData(int offset, int count);
```

Description

This is deleteData, a member of class IDOMCharacterData.

196.2.3.2.3 IDOMCharacterData.get_data Method

Pascal

```
function get_data: DOMString; safecall;
```

C++

```
__fastcall DOMString get_data();
```

Description

This is get_data, a member of class IDOMCharacterData.

196.2.3.2.4 IDOMCharacterData.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMCharacterData.

196.2.3.2.5 IDOMCharacterData.insertData Method

Pascal

```
procedure insertData(offset: Integer; const data: DOMString); safecall;
```

C++

```
__fastcall insertData(int offset, const DOMString data);
```

Description

This is insertData, a member of class IDOMCharacterData.

196.2.3.2.6 IDOMCharacterData.replaceData Method

Pascal

```
procedure replaceData(offset: Integer; count: Integer; const data: DOMString); safecall;
```

C++

```
__fastcall replaceData(int offset, int count, const DOMString data);
```

Description

This is replaceData, a member of class IDOMCharacterData.

196.2.3.2.7 IDOMCharacterData.set_data Method

Pascal

```
procedure set_data(const data: DOMString); safecall;
```

C++

```
__fastcall set_data(const DOMString data);
```

Description

This is set_data, a member of class IDOMCharacterData.

196.2.3.2.8 IDOMCharacterData.substringData Method

Pascal

```
function substringData(offset: Integer; count: Integer): DOMString; safecall;
```

C++

```
__fastcall DOMString substringData(int offset, int count);
```

Description

This is substringData, a member of class IDOMCharacterData.

196.2.3.3 IDOMCharacterData Properties

The properties of the IDOMCharacterData class are listed here.

Public Properties

	Name	Description
	data (see page 26278)	This is data, a member of class IDOMCharacterData.
R	length (see page 26278)	This is length, a member of class IDOMCharacterData.

196.2.3.3.1 IDOMCharacterData.data Property

Pascal

```
property data: DOMString;
```

C++

```
__property DOMString data;
```

Description

This is data, a member of class IDOMCharacterData.

196.2.3.3.2 IDOMCharacterData.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMCharacterData.

196.2.4 IDOMComment Interface

Class Hierarchy

Pascal

```
IDOMComment = interface(IDOMCharacterData);
```

C++

```
__interface IDOMComment : public IDOMCharacterData;
```

File

xmldom

Description

This is class xmldom.IDOMComment.

196.2.5 IDOMDocument Interface

Class Hierarchy

Pascal

```
IDOMDocument = interface(IDOMNode);
```

C++

```
__interface IDOMDocument : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocument.

196.2.5.1 IDOMDocument Members

The following tables list the members exposed by IDOMDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	createAttribute (see page 26281)	This is createAttribute, a member of class IDOMDocument.
	createAttributeNS (see page 26282)	This is createAttributeNS, a member of class IDOMDocument.
	createCDATASection (see page 26282)	This is createCDATASection, a member of class IDOMDocument.
	createComment (see page 26282)	This is createComment, a member of class IDOMDocument.
	createDocumentFragment (see page 26282)	This is createDocumentFragment, a member of class IDOMDocument.
	createElement (see page 26282)	This is createElement, a member of class IDOMDocument.
	createElementNS (see page 26283)	This is createElementNS, a member of class IDOMDocument.
	createEntityReference (see page 26283)	This is createEntityReference, a member of class IDOMDocument.
	createProcessingInstruction (see page 26283)	This is createProcessingInstruction, a member of class IDOMDocument.
	createTextNode (see page 26283)	This is createTextNode, a member of class IDOMDocument.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_doctype (see page 26284)	This is get_doctype, a member of class IDOMDocument.
	get_documentElement (see page 26284)	This is get_documentElement, a member of class IDOMDocument.
	get_domImplementation (see page 26284)	This is get_domImplementation, a member of class IDOMDocument.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	getElementById (see page 26284)	This is getElementById, a member of class IDOMDocument.
	getElementsByTagName (see page 26285)	This is getElementsByTagName, a member of class IDOMDocument.
	getElementsByTagNameNS (see page 26285)	This is getElementsByTagNameNS, a member of class IDOMDocument.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	importNode (see page 26285)	This is importNode, a member of class IDOMDocument.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_documentElement (see page 26285)	This is set_documentElement, a member of class IDOMDocument.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	doctype (see page 26286)	This is doctype, a member of class IDOMDocument.
	documentElement (see page 26286)	This is documentElement, a member of class IDOMDocument.

R	domImplementation (see page 26286)	This is domImplementation, a member of class IDOMDocument.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.

196.2.5.2 IDOMDocument Methods

The methods of the IDOMDocument class are listed here.

Public Methods

	Name	Description
	createAttribute (see page 26281)	This is createAttribute, a member of class IDOMDocument.
	createAttributeNS (see page 26282)	This is createAttributeNS, a member of class IDOMDocument.
	createCDATASection (see page 26282)	This is createCDATASection, a member of class IDOMDocument.
	createComment (see page 26282)	This is createComment, a member of class IDOMDocument.
	createDocumentFragment (see page 26282)	This is createDocumentFragment, a member of class IDOMDocument.
	createElement (see page 26282)	This is createElement, a member of class IDOMDocument.
	createElementNS (see page 26283)	This is createElementNS, a member of class IDOMDocument.
	createEntityReference (see page 26283)	This is createEntityReference, a member of class IDOMDocument.
	createProcessingInstruction (see page 26283)	This is createProcessingInstruction, a member of class IDOMDocument.
	createTextNode (see page 26283)	This is createTextNode, a member of class IDOMDocument.
	get_doctype (see page 26284)	This is get_doctype, a member of class IDOMDocument.
	get_documentElement (see page 26284)	This is get_documentElement, a member of class IDOMDocument.
	get_domImplementation (see page 26284)	This is get_domImplementation, a member of class IDOMDocument.
	getElementById (see page 26284)	This is getElementById, a member of class IDOMDocument.
	getElementsByTagName (see page 26285)	This is getElementsByTagName, a member of class IDOMDocument.
	getElementsByTagNameNS (see page 26285)	This is getElementsByTagNameNS, a member of class IDOMDocument.
	importNode (see page 26285)	This is importNode, a member of class IDOMDocument.
	set_documentElement (see page 26285)	This is set_documentElement, a member of class IDOMDocument.

196.2.5.2.1 IDOMDocument.createAttribute Method

Pascal

```
function createAttribute(const name: DOMString): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr createAttribute(const DOMString name);
```

Description

This is createAttribute, a member of class IDOMDocument.

196.2.5.2.2 IDOMDocument.createAttributeNS Method

Pascal

```
function createAttributeNS(const namespaceURI: DOMString; const qualifiedName: DOMString):
IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr createAttributeNS(const DOMString namespaceURI, const DOMString
qualifiedName);
```

Description

This is createAttributeNS, a member of class IDOMDocument.

196.2.5.2.3 IDOMDocument.createCDATASection Method

Pascal

```
function createCDATASection(const data: DOMString): IDOMCDATASection; safecall;
```

C++

```
__fastcall IDOMCDATASection createCDATASection(const DOMString data);
```

Description

This is createCDATASection, a member of class IDOMDocument.

196.2.5.2.4 IDOMDocument.createComment Method

Pascal

```
function createComment(const data: DOMString): IDOMComment; safecall;
```

C++

```
__fastcall IDOMComment createComment(const DOMString data);
```

Description

This is createComment, a member of class IDOMDocument.

196.2.5.2.5 IDOMDocument.createDocumentFragment Method

Pascal

```
function createDocumentFragment: IDOMDocumentFragment; safecall;
```

C++

```
__fastcall IDOMDocumentFragment createDocumentFragment();
```

Description

This is createDocumentFragment, a member of class IDOMDocument.

196.2.5.2.6 IDOMDocument.createElement Method

Pascal

```
function createElement(const tagName: DOMString): IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement createElement(const DOMString tagName);
```

Description

This is createElement, a member of class IDOMDocument.

196.2.5.2.7 IDOMDocument.createElementNS Method

Pascal

```
function createElementNS(const namespaceURI: DOMString; const qualifiedName: DOMString):
IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement createElementNS(const DOMString namespaceURI, const DOMString
qualifiedName);
```

Description

This is createElementNS, a member of class IDOMDocument.

196.2.5.2.8 IDOMDocument.createEntityReference Method

Pascal

```
function createEntityReference(const name: DOMString): IDOMEntityReference; safecall;
```

C++

```
__fastcall IDOMEntityReference createEntityReference(const DOMString name);
```

Description

This is createEntityReference, a member of class IDOMDocument.

196.2.5.2.9 IDOMDocument.createProcessingInstruction Method

Pascal

```
function createProcessingInstruction(const target: DOMString; const data: DOMString):
IDOMProcessingInstruction; safecall;
```

C++

```
__fastcall IDOMProcessingInstruction createProcessingInstruction(const DOMString target, const
DOMString data);
```

Description

This is createProcessingInstruction, a member of class IDOMDocument.

196.2.5.2.10 IDOMDocument.createTextNode Method

Pascal

```
function createTextNode(const data: DOMString): IDOMText; safecall;
```

C++

```
__fastcall IDOMText createTextNode(const DOMString data);
```

Description

This is createTextNode, a member of class IDOMDocument.

196.2.5.2.11 IDOMDocument.get_doctype Method

Pascal

```
function get_doctype: IDOMDocumentType; safecall;
```

C++

```
__fastcall IDOMDocumentType get_doctype();
```

Description

This is get_doctype, a member of class IDOMDocument.

196.2.5.2.12 IDOMDocument.get_documentElement Method

Pascal

```
function get_documentElement: IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement get_documentElement();
```

Description

This is get_documentElement, a member of class IDOMDocument.

196.2.5.2.13 IDOMDocument.get_domImplementation Method

Pascal

```
function get_domImplementation: IDOMImplementation; safecall;
```

C++

```
__fastcall IDOMImplementation get_domImplementation();
```

Description

This is get_domImplementation, a member of class IDOMDocument.

196.2.5.2.14 IDOMDocument.getElementById Method

Pascal

```
function getElementById(const elementId: DOMString): IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement getElementById(const DOMString elementId);
```

Description

This is getElementById, a member of class IDOMDocument.

196.2.5.2.15 IDOMDocument.getElementsByTagName Method

Pascal

```
function getElementsByTagName(const tagName: DOMString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagName(const DOMString tagName);
```

Description

This is getElementsByTagName, a member of class IDOMDocument.

196.2.5.2.16 IDOMDocument.getElementsByTagNameNS Method

Pascal

```
function getElementsByTagNameNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagNameNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getElementsByTagNameNS, a member of class IDOMDocument.

196.2.5.2.17 IDOMDocument.importNode Method

Pascal

```
function importNode(importedNode: IDOMNode; deep: WordBool): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode importNode(IDOMNode importedNode, WordBool deep);
```

Description

This is importNode, a member of class IDOMDocument.

196.2.5.2.18 IDOMDocument.set_documentElement Method

Pascal

```
procedure set_documentElement(const Element: IDOMElement); safecall;
```

C++

```
__fastcall set_documentElement(const IDOMElement Element);
```

Description

This is set_documentElement, a member of class IDOMDocument.

196.2.5.3 IDOMDocument Properties

The properties of the IDOMDocument class are listed here.

Public Properties

	Name	Description
R	doctype (see page 26286)	This is doctype, a member of class IDOMDocument.
	documentElement (see page 26286)	This is documentElement, a member of class IDOMDocument.
R	domImplementation (see page 26286)	This is domImplementation, a member of class IDOMDocument.

196.2.5.3.1 IDOMDocument.doctype Property

Pascal

```
property doctype: IDOMDocumentType;
```

C++

```
__property IDOMDocumentType doctype;
```

Description

This is doctype, a member of class IDOMDocument.

196.2.5.3.2 IDOMDocument.documentElement Property

Pascal

```
property documentElement: IDOMElement;
```

C++

```
__property IDOMElement documentElement;
```

Description

This is documentElement, a member of class IDOMDocument.

196.2.5.3.3 IDOMDocument.domImplementation Property

Pascal

```
property domImplementation: IDOMImplementation;
```

C++

```
__property IDOMImplementation domImplementation;
```

Description

This is domImplementation, a member of class IDOMDocument.

196.2.6 IDOMDocumentFragment Interface

Class Hierarchy

Pascal

```
IDOMDocumentFragment = interface(IDOMNode);
```

C++

```
__interface IDOMDocumentFragment : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocumentFragment.

196.2.7 IDOMDocumentType Interface

Class Hierarchy

Pascal

```
IDOMDocumentType = interface(IDOMNode);
```

C++

```
__interface IDOMDocumentType : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocumentType.

196.2.7.1 IDOMDocumentType Members

The following tables list the members exposed by IDOMDocumentType.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_entities (see page 26289)	This is get_entities, a member of class IDOMDocumentType.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_internalSubset (see page 26289)	This is get_internalSubset, a member of class IDOMDocumentType.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_name (see page 26289)	This is get_name, a member of class IDOMDocumentType.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_notations (see page 26289)	This is get_notations, a member of class IDOMDocumentType.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.

	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_publicId (see page 26289)	This is get_publicId, a member of class IDOMDocumentType.
	get_systemId (see page 26290)	This is get_systemId, a member of class IDOMDocumentType.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	entities (see page 26290)	This is entities, a member of class IDOMDocumentType.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	internalSubset (see page 26290)	This is internalSubset, a member of class IDOMDocumentType.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	name (see page 26291)	This is name, a member of class IDOMDocumentType.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	notations (see page 26291)	This is notations, a member of class IDOMDocumentType.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 26291)	This is publicId, a member of class IDOMDocumentType.
R	systemId (see page 26291)	This is systemId, a member of class IDOMDocumentType.

196.2.7.2 IDOMDocumentType Methods

The methods of the IDOMDocumentType class are listed here.

Public Methods

	Name	Description
	get_entities (see page 26289)	This is get_entities, a member of class IDOMDocumentType.
	get_internalSubset (see page 26289)	This is get_internalSubset, a member of class IDOMDocumentType.
	get_name (see page 26289)	This is get_name, a member of class IDOMDocumentType.
	get_notations (see page 26289)	This is get_notations, a member of class IDOMDocumentType.
	get_publicId (see page 26289)	This is get_publicId, a member of class IDOMDocumentType.
	get_systemId (see page 26290)	This is get_systemId, a member of class IDOMDocumentType.

196.2.7.2.1 IDOMDocumentType.get_entities Method

Pascal

```
function get_entities: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_entities();
```

Description

This is get_entities, a member of class IDOMDocumentType.

196.2.7.2.2 IDOMDocumentType.get_internalSubset Method

Pascal

```
function get_internalSubset: DOMString; safecall;
```

C++

```
__fastcall DOMString get_internalSubset();
```

Description

This is get_internalSubset, a member of class IDOMDocumentType.

196.2.7.2.3 IDOMDocumentType.get_name Method

Pascal

```
function get_name: DOMString; safecall;
```

C++

```
__fastcall DOMString get_name();
```

Description

This is get_name, a member of class IDOMDocumentType.

196.2.7.2.4 IDOMDocumentType.get_notations Method

Pascal

```
function get_notations: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_notations();
```

Description

This is get_notations, a member of class IDOMDocumentType.

196.2.7.2.5 IDOMDocumentType.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMDocumentType.

196.2.7.2.6 IDOMDocumentType.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMDocumentType.

196.2.7.3 IDOMDocumentType Properties

The properties of the IDOMDocumentType class are listed here.

Public Properties

	Name	Description
R	entities (see page 26290)	This is entities, a member of class IDOMDocumentType.
R	internalSubset (see page 26290)	This is internalSubset, a member of class IDOMDocumentType.
R	name (see page 26291)	This is name, a member of class IDOMDocumentType.
R	notations (see page 26291)	This is notations, a member of class IDOMDocumentType.
R	publicId (see page 26291)	This is publicId, a member of class IDOMDocumentType.
R	systemId (see page 26291)	This is systemId, a member of class IDOMDocumentType.

196.2.7.3.1 IDOMDocumentType.entities Property

Pascal

```
property entities: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap entities;
```

Description

This is entities, a member of class IDOMDocumentType.

196.2.7.3.2 IDOMDocumentType.internalSubset Property

Pascal

```
property internalSubset: DOMString;
```

C++

```
__property DOMString internalSubset;
```

Description

This is internalSubset, a member of class IDOMDocumentType.

196.2.7.3.3 IDOMDocumentType.name Property

Pascal

```
property name: DOMString;
```

C++

```
__property DOMString name;
```

Description

This is name, a member of class IDOMDocumentType.

196.2.7.3.4 IDOMDocumentType.notations Property

Pascal

```
property notations: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap notations;
```

Description

This is notations, a member of class IDOMDocumentType.

196.2.7.3.5 IDOMDocumentType.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMDocumentType.

196.2.7.3.6 IDOMDocumentType.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMDocumentType.

196.2.8 IDOMElement Interface

Class Hierarchy

Pascal

```
IDOMElement = interface(IDOMNode);
```

C++

```
__interface IDOMElement : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMElement.

196.2.8.1 IDOMElement Members

The following tables list the members exposed by IDOMElement.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_tagName (see page 26294)	This is get_tagName, a member of class IDOMElement.
	getAttribute (see page 26294)	This is getAttribute, a member of class IDOMElement.
	getAttributeNode (see page 26294)	This is getAttributeNode, a member of class IDOMElement.
	getAttributeNodeNS (see page 26294)	This is getAttributeNodeNS, a member of class IDOMElement.
	getAttributeNS (see page 26294)	This is getAttributeNS, a member of class IDOMElement.
	getElementsByTagName (see page 26295)	This is getElementsByTagName, a member of class IDOMElement.
	getElementsByTagNameNS (see page 26295)	This is getElementsByTagNameNS, a member of class IDOMElement.
	hasAttribute (see page 26295)	This is hasAttribute, a member of class IDOMElement.
	hasAttributeNS (see page 26295)	This is hasAttributeNS, a member of class IDOMElement.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeAttribute (see page 26296)	This is removeAttribute, a member of class IDOMElement.
	removeAttributeNode (see page 26296)	This is removeAttributeNode, a member of class IDOMElement.
	removeAttributeNS (see page 26296)	This is removeAttributeNS, a member of class IDOMElement.

	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	setAttribute (see page 26296)	This is setAttribute, a member of class IDOMElement.
	setAttributeNode (see page 26296)	This is setAttributeNode, a member of class IDOMElement.
	setAttributeNodeNS (see page 26297)	This is setAttributeNodeNS, a member of class IDOMElement.
	setAttributeNS (see page 26297)	This is setAttributeNS, a member of class IDOMElement.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	tagName (see page 26297)	This is tagName, a member of class IDOMElement.

196.2.8.2 IDOMElement Methods

The methods of the IDOMElement class are listed here.

Public Methods

	Name	Description
	get_tagName (see page 26294)	This is get_tagName, a member of class IDOMElement.
	getAttribute (see page 26294)	This is getAttribute, a member of class IDOMElement.
	getAttributeNode (see page 26294)	This is getAttributeNode, a member of class IDOMElement.
	getAttributeNodeNS (see page 26294)	This is getAttributeNodeNS, a member of class IDOMElement.
	getAttributeNS (see page 26294)	This is getAttributeNS, a member of class IDOMElement.
	getElementsByTagName (see page 26295)	This is getElementsByTagName, a member of class IDOMElement.
	getElementsByTagNameNS (see page 26295)	This is getElementsByTagNameNS, a member of class IDOMElement.
	hasAttribute (see page 26295)	This is hasAttribute, a member of class IDOMElement.
	hasAttributeNS (see page 26295)	This is hasAttributeNS, a member of class IDOMElement.
	removeAttribute (see page 26296)	This is removeAttribute, a member of class IDOMElement.
	removeAttributeNode (see page 26296)	This is removeAttributeNode, a member of class IDOMElement.
	removeAttributeNS (see page 26296)	This is removeAttributeNS, a member of class IDOMElement.
	setAttribute (see page 26296)	This is setAttribute, a member of class IDOMElement.
	setAttributeNode (see page 26296)	This is setAttributeNode, a member of class IDOMElement.
	setAttributeNodeNS (see page 26297)	This is setAttributeNodeNS, a member of class IDOMElement.
	setAttributeNS (see page 26297)	This is setAttributeNS, a member of class IDOMElement.

196.2.8.2.1 IDOMElement.get_tagName Method

Pascal

```
function get_tagName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_tagName();
```

Description

This is get_tagName, a member of class IDOMElement.

196.2.8.2.2 IDOMElement.getAttribute Method

Pascal

```
function getAttribute(const name: DOMString): DOMString; safecall;
```

C++

```
__fastcall DOMString getAttribute(const DOMString name);
```

Description

This is getAttribute, a member of class IDOMElement.

196.2.8.2.3 IDOMElement.getAttributeNode Method

Pascal

```
function getAttributeNode(const name: DOMString): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr getAttributeNode(const DOMString name);
```

Description

This is getAttributeNode, a member of class IDOMElement.

196.2.8.2.4 IDOMElement.getAttributeNodeNS Method

Pascal

```
function getAttributeNodeNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr getAttributeNodeNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getAttributeNodeNS, a member of class IDOMElement.

196.2.8.2.5 IDOMElement.getAttributeNS Method

Pascal

```
function getAttributeNS(const namespaceURI: DOMString; const localName: DOMString): DOMString;
safecall;
```

C++

```
__fastcall DOMString getAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is getAttributeNS, a member of class IDOMElement.

196.2.8.2.6 IDOMElement.getElementsByTagName Method

Pascal

```
function getElementsByTagName(const name: DOMString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagName(const DOMString name);
```

Description

This is getElementsByTagName, a member of class IDOMElement.

196.2.8.2.7 IDOMElement.getElementsByTagNameNS Method

Pascal

```
function getElementsByTagNameNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagNameNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getElementsByTagNameNS, a member of class IDOMElement.

196.2.8.2.8 IDOMElement.hasAttribute Method

Pascal

```
function hasAttribute(const name: DOMString): WordBool; safecall;
```

C++

```
__fastcall WordBool hasAttribute(const DOMString name);
```

Description

This is hasAttribute, a member of class IDOMElement.

196.2.8.2.9 IDOMElement.hasAttributeNS Method

Pascal

```
function hasAttributeNS(const namespaceURI: DOMString; const localName: DOMString): WordBool;
safecall;
```

C++

```
__fastcall WordBool hasAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is hasAttributeNS, a member of class IDOMElement.

196.2.8.2.10 IDOMElement.removeAttribute Method

Pascal

```
procedure removeAttribute(const name: DOMString); safecall;
```

C++

```
__fastcall removeAttribute(const DOMString name);
```

Description

This is removeAttribute, a member of class IDOMElement.

196.2.8.2.11 IDOMElement.removeAttributeNode Method

Pascal

```
function removeAttributeNode(const oldAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr removeAttributeNode(const IDOMAttr oldAttr);
```

Description

This is removeAttributeNode, a member of class IDOMElement.

196.2.8.2.12 IDOMElement.removeAttributeNS Method

Pascal

```
procedure removeAttributeNS(const namespaceURI: DOMString; const localName: DOMString);
safecall;
```

C++

```
__fastcall removeAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is removeAttributeNS, a member of class IDOMElement.

196.2.8.2.13 IDOMElement.setAttribute Method

Pascal

```
procedure setAttribute(const name: DOMString; const value: DOMString); safecall;
```

C++

```
__fastcall setAttribute(const DOMString name, const DOMString value);
```

Description

This is setAttribute, a member of class IDOMElement.

196.2.8.2.14 IDOMElement.setAttributeNode Method

Pascal

```
function setAttributeNode(const newAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr setAttributeNode(const IDOMAttr newAttr);
```

Description

This is setAttributeNode, a member of class IDOMElement.

196.2.8.2.15 IDOMElement.setAttributeNodeNS Method

Pascal

```
function setAttributeNodeNS(const newAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr setAttributeNodeNS(const IDOMAttr newAttr);
```

Description

This is setAttributeNodeNS, a member of class IDOMElement.

196.2.8.2.16 IDOMElement.setAttributeNS Method

Pascal

```
procedure setAttributeNS(const namespaceURI: DOMString; const qulifiedName: DOMString; const
value: DOMString); safecall;
```

C++

```
__fastcall setAttributeNS(const DOMString namespaceURI, const DOMString qulifiedName, const
DOMString value);
```

Description

This is setAttributeNS, a member of class IDOMElement.

196.2.8.3 IDOMElement Properties

The properties of the IDOMElement class are listed here.

Public Properties

	Name	Description
R	tagName (see page 26297)	This is tagName, a member of class IDOMElement.

196.2.8.3.1 IDOMElement.tagName Property

Pascal

```
property tagName: DOMString;
```

C++

```
__property DOMString tagName;
```

Description

This is tagName, a member of class IDOMElement.

196.2.9 IDOMEntity Interface

Class Hierarchy

Pascal

```
IDOMEntity = interface(IDOMNode);
```

C++

```
__interface IDOMEntity : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMEntity.

196.2.9.1 IDOMEntity Members

The following tables list the members exposed by IDOMEntity.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_notationName (see page 26299)	This is get_notationName, a member of class IDOMEntity.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_publicId (see page 26299)	This is get_publicId, a member of class IDOMEntity.
	get_systemId (see page 26300)	This is get_systemId, a member of class IDOMEntity.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.

	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	notationName (see page 26300)	This is notationName, a member of class IDOMEntity.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 26300)	This is publicId, a member of class IDOMEntity.
R	systemId (see page 26300)	This is systemId, a member of class IDOMEntity.

196.2.9.2 IDOMEntity Methods

The methods of the IDOMEntity class are listed here.

Public Methods

	Name	Description
	get_notationName (see page 26299)	This is get_notationName, a member of class IDOMEntity.
	get_publicId (see page 26299)	This is get_publicId, a member of class IDOMEntity.
	get_systemId (see page 26300)	This is get_systemId, a member of class IDOMEntity.

196.2.9.2.1 IDOMEntity.get_notationName Method

Pascal

```
function get_notationName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_notationName();
```

Description

This is get_notationName, a member of class IDOMEntity.

196.2.9.2.2 IDOMEntity.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMEntity.

196.2.9.2.3 IDOMEntity.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMEntity.

196.2.9.3 IDOMEntity Properties

The properties of the IDOMEntity class are listed here.

Public Properties

	Name	Description
R	notationName (see page 26300)	This is notationName, a member of class IDOMEntity.
R	publicId (see page 26300)	This is publicId, a member of class IDOMEntity.
R	systemId (see page 26300)	This is systemId, a member of class IDOMEntity.

196.2.9.3.1 IDOMEntity.notationName Property

Pascal

```
property notationName: DOMString;
```

C++

```
__property DOMString notationName;
```

Description

This is notationName, a member of class IDOMEntity.

196.2.9.3.2 IDOMEntity.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMEntity.

196.2.9.3.3 IDOMEntity.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMEntity.

196.2.10 IDOMEntityReference Interface

Class Hierarchy

Pascal

```
IDOMEntityReference = interface(IDOMNode);
```

C++

```
__interface IDOMEntityReference : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMEntityReference.

196.2.11 IDOMImplementation Interface

Class Hierarchy

Pascal

```
IDOMImplementation = interface;
```

C++

```
__interface IDOMImplementation;
```

File

xmldom

Description

This is class xmldom.IDOMImplementation.

196.2.11.1 IDOMImplementation Members

The following tables list the members exposed by IDOMImplementation.

Public Methods

	Name	Description
	createDocument (see page 26302)	This is createDocument, a member of class IDOMImplementation.
	createDocumentType (see page 26302)	This is createDocumentType, a member of class IDOMImplementation.
	hasFeature (see page 26302)	This is hasFeature, a member of class IDOMImplementation.

196.2.11.2 IDOMImplementation Methods

The methods of the IDOMImplementation class are listed here.

Public Methods

	Name	Description
	createDocument (see page 26302)	This is createDocument, a member of class IDOMImplementation.
	createDocumentType (see page 26302)	This is createDocumentType, a member of class IDOMImplementation.
	hasFeature (see page 26302)	This is hasFeature, a member of class IDOMImplementation.

196.2.11.2.1 IDOMImplementation.createDocument Method

Pascal

```
function createDocument(const namespaceURI: DOMString; const qualifiedName: DOMString;
doctype: IDOMDocumentType): IDOMDocument; safecall;
```

C++

```
__fastcall IDOMDocument createDocument(const DOMString namespaceURI, const DOMString
qualifiedName, IDOMDocumentType doctype);
```

Description

This is createDocument, a member of class IDOMImplementation.

196.2.11.2.2 IDOMImplementation.createDocumentType Method

Pascal

```
function createDocumentType(const qualifiedName: DOMString; const publicId: DOMString; const
systemId: DOMString): IDOMDocumentType; safecall;
```

C++

```
__fastcall IDOMDocumentType createDocumentType(const DOMString qualifiedName, const DOMString
publicId, const DOMString systemId);
```

Description

This is createDocumentType, a member of class IDOMImplementation.

196.2.11.2.3 IDOMImplementation.hasFeature Method

Pascal

```
function hasFeature(const feature: DOMString; const version: DOMString): WordBool;
```

C++

```
__fastcall WordBool hasFeature(const DOMString feature, const DOMString version);
```

Description

This is hasFeature, a member of class IDOMImplementation.

196.2.12 IDOMNamedNodeMap Interface

Class Hierarchy

xmldom.IDOMNamedNodeMap

Pascal

```
IDOMNamedNodeMap = interface;
```

C++

```
__interface IDOMNamedNodeMap;
```

File

xmldom

Description

This is class xmldom.IDOMNamedNodeMap.

196.2.12.1 IDOMNamedNodeMap Members

The following tables list the members exposed by IDOMNamedNodeMap.

Public Methods

	Name	Description
	get_item (see page 26304)	This is get_item, a member of class IDOMNamedNodeMap.
	get_length (see page 26304)	This is get_length, a member of class IDOMNamedNodeMap.
	getNamedItem (see page 26304)	This is getNamedItem, a member of class IDOMNamedNodeMap.
	getNamedItemNS (see page 26304)	This is getNamedItemNS, a member of class IDOMNamedNodeMap.
	removeNamedItem (see page 26305)	This is removeNamedItem, a member of class IDOMNamedNodeMap.
	removeNamedItemNS (see page 26305)	This is removeNamedItemNS, a member of class IDOMNamedNodeMap.
	setNamedItem (see page 26305)	This is setNamedItem, a member of class IDOMNamedNodeMap.
	setNamedItemNS (see page 26305)	This is setNamedItemNS, a member of class IDOMNamedNodeMap.

Public Properties

	Name	Description
R	item (see page 26306)	This is item, a member of class IDOMNamedNodeMap.
R	length (see page 26306)	This is length, a member of class IDOMNamedNodeMap.

196.2.12.2 IDOMNamedNodeMap Methods

The methods of the IDOMNamedNodeMap class are listed here.

Public Methods

	Name	Description
	get_item (see page 26304)	This is get_item, a member of class IDOMNamedNodeMap.
	get_length (see page 26304)	This is get_length, a member of class IDOMNamedNodeMap.
	getNamedItem (see page 26304)	This is getNamedItem, a member of class IDOMNamedNodeMap.
	getNamedItemNS (see page 26304)	This is getNamedItemNS, a member of class IDOMNamedNodeMap.
	removeNamedItem (see page 26305)	This is removeNamedItem, a member of class IDOMNamedNodeMap.
	removeNamedItemNS (see page 26305)	This is removeNamedItemNS, a member of class IDOMNamedNodeMap.

	setNamedItem (see page 26305)	This is setNamedItem, a member of class IDOMNamedNodeMap.
	setNamedItemNS (see page 26305)	This is setNamedItemNS, a member of class IDOMNamedNodeMap.

196.2.12.2.1 IDOMNamedNodeMap.get_item Method

Pascal

```
function get_item(index: Integer): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_item(int index);
```

Description

This is get_item, a member of class IDOMNamedNodeMap.

196.2.12.2.2 IDOMNamedNodeMap.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMNamedNodeMap.

196.2.12.2.3 IDOMNamedNodeMap.getNamedItem Method

Pascal

```
function getNamedItem(const name: DOMString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode getNamedItem(const DOMString name);
```

Description

This is getNamedItem, a member of class IDOMNamedNodeMap.

196.2.12.2.4 IDOMNamedNodeMap.getNamedItemNS Method

Pascal

```
function getNamedItemNS(const namespaceURI: DOMString; const localName: DOMString): IDOMNode;
safecall;
```

C++

```
__fastcall IDOMNode getNamedItemNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is getNamedItemNS, a member of class IDOMNamedNodeMap.

196.2.12.2.5 IDOMNamedNodeMap.removeNamedItem Method

Pascal

```
function removeNamedItem(const name: DOMString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeNamedItem(const DOMString name);
```

Description

This is removeNamedItem, a member of class IDOMNamedNodeMap.

196.2.12.2.6 IDOMNamedNodeMap.removeNamedItemNS Method

Pascal

```
function removeNamedItemNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeNamedItemNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is removeNamedItemNS, a member of class IDOMNamedNodeMap.

196.2.12.2.7 IDOMNamedNodeMap.setNamedItem Method

Pascal

```
function setNamedItem(const arg: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode setNamedItem(const IDOMNode arg);
```

Description

This is setNamedItem, a member of class IDOMNamedNodeMap.

196.2.12.2.8 IDOMNamedNodeMap.setNamedItemNS Method

Pascal

```
function setNamedItemNS(const arg: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode setNamedItemNS(const IDOMNode arg);
```

Description

This is setNamedItemNS, a member of class IDOMNamedNodeMap.

196.2.12.3 IDOMNamedNodeMap Properties

The properties of the IDOMNamedNodeMap class are listed here.

Public Properties

	Name	Description
R	item (see page 26306)	This is item, a member of class IDOMNamedNodeMap.
R	length (see page 26306)	This is length, a member of class IDOMNamedNodeMap.

196.2.12.3.1 IDOMNamedNodeMap.item Property

Pascal

```
property item [index: Integer]: IDOMNode;
```

C++

```
__property IDOMNode item[int index];
```

Description

This is item, a member of class IDOMNamedNodeMap.

196.2.12.3.2 IDOMNamedNodeMap.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMNamedNodeMap.

196.2.13 IDOMNode Interface

IDOMNode is the DOM interface for a node in an XML document.

Class Hierarchy

Pascal

```
IDOMNode = interface(IInterface);
```

C++

```
__interface IDOMNode : public IInterface;
```

File

xmldom

Description

IDOMNode is a vendor-neutral version of the DOM interface for a node in an XML document. It conforms to the W3CXML DOM level 2 specification. Use IDOMNode to work with a node in an XML document when you are using standard DOM interfaces rather than the IXMLNode interface. (IXMLNode is the node interface used by TXMLDocument document.)

IDOMNode represents an element in an XML document that has been parsed by a DOM parser. It includes properties and methods for navigating the node hierarchy of an XML document, for accessing the attributes (see page 26317) of a node, and

for drilling down to obtain the node's value.

For more information about IDOMNode and the other standard DOM interfaces, see the DOM specification on the W3 website or the documentation provided by your DOM vendor.

Note: C++ method declarations that use IDOMNode use the _di_IDOMNode type instead. This type is a DelphiInterface wrapper around the IDOMNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDOMNode >  _di_IDOMNode;
```

CreateDOMNode

196.2.13.1 IDOMNode Members

The following tables list the members exposed by IDOMNode.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.

R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.

196.2.13.2 IDOMNode Methods

The methods of the IDOMNode class are listed here.

Public Methods

	Name	Description
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

196.2.13.2.1 IDOMNode.appendChild Method

Pascal

```
function appendChild(const newChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode appendChild(const IDOMNode newChild);
```

Description

This is appendChild, a member of class IDOMNode.

196.2.13.2.2 IDOMNode.cloneNode Method

Pascal

```
function cloneNode(deep: WordBool): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode cloneNode(WordBool deep);
```

Description

This is cloneNode, a member of class IDOMNode.

196.2.13.2.3 IDOMNode.get_attributes Method

Returns the value of the get_attributes property.

Pascal

```
function get_attributes: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_attributes();
```

Description

get_get_attributes is the read implementation of the get_attributes property.

See Also

get_attributes

196.2.13.2.4 IDOMNode.get_childNodes Method

Returns the value of the get_childNodes property.

Pascal

```
function get_childNodes: IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList get_childNodes();
```

Description

get_get_childNodes is the read implementation of the get_childNodes property.

See Also

get_childNodes

196.2.13.2.5 IDOMNode.get_firstChild Method

Returns the value of the get_firstChild property.

Pascal

```
function get_firstChild: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_firstChild();
```

Description

get_get_firstChild is the read implementation of the get_firstChild property.

See Also

get_firstChild

196.2.13.2.6 IDOMNode.get_lastChild Method

Returns the value of the get_lastChild property.

Pascal

```
function get_lastChild: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_lastChild();
```

Description

get_get_lastChild is the read implementation of the get_lastChild property.

See Also

get_lastChild

196.2.13.2.7 IDOMNode.get_localName Method

Returns the value of the get_localName property.

Pascal

```
function get_localName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_localName();
```

Description

get_get_localName is the read implementation of the get_localName property.

See Also

get_localName

196.2.13.2.8 IDOMNode.get_namespaceURI Method

Returns the value of the get_namespaceURI property.

Pascal

```
function get_namespaceURI: DOMString; safecall;
```

C++

```
__fastcall DOMString get_namespaceURI();
```

Description

get_get_namespaceURI is the read implementation of the get_namespaceURI property.

See Also

get_namespaceURI

196.2.13.2.9 IDOMNode.get_nextSibling Method

Returns the value of the get_nextSibling property.

Pascal

```
function get_nextSibling: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_nextSibling();
```

Description

get_get_nextSibling is the read implementation of the get_nextSibling property.

See Also

get_nextSibling

196.2.13.2.10 IDOMNode.get_nodeName Method

Returns the value of the get_nodeName property.

Pascal

```
function get_nodeName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_nodeName();
```

Description

get_get_nodeName is the read implementation of the get_nodeName property.

See Also

get_nodeName

196.2.13.2.11 IDOMNode.get_nodeType Method

Returns the value of the get_nodeType property.

Pascal

```
function get_nodeType: DOMNodeType; safecall;
```

C++

```
__fastcall DOMNodeType get_nodeType();
```

Description

get_get_nodeType is the read implementation of the get_nodeType property.

See Also

get_nodeType

196.2.13.2.12 IDOMNode.get_nodeValue Method

Returns the value of the get_nodeValue property.

Pascal

```
function get_nodeValue: DOMString; safecall;
```

C++

```
__fastcall DOMString get_nodeValue();
```

Description

get_get_nodeValue is the read implementation of the get_nodeValue property.

See Also

get_nodeValue

196.2.13.2.13 IDOMNode.get_ownerDocument Method

Returns the value of the get_ownerDocument property.

Pascal

```
function get_ownerDocument: IDOMDocument; safecall;
```

C++

```
__fastcall IDOMDocument get_ownerDocument();
```

Description

get_get_ownerDocument is the read implementation of the get_ownerDocument property.

See Also

get_ownerDocument

196.2.13.2.14 IDOMNode.get_parentNode Method

Returns the value of the get_parentNode property.

Pascal

```
function get_parentNode: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_parentNode();
```

Description

get_get_parentNode is the read implementation of the get_parentNode property.

See Also

get_parentNode

196.2.13.2.15 IDOMNode.get_prefix Method

Returns the value of the get_prefix property.

Pascal

```
function get_prefix: DOMString; safecall;
```

C++

```
__fastcall DOMString get_prefix();
```

Description

get_get_prefix is the read implementation of the get_prefix property.

See Also

get_prefix

196.2.13.2.16 IDOMNode.get_previousSibling Method

Returns the value of the get_previousSibling property.

Pascal

```
function get_previousSibling: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_previousSibling();
```

Description

get_get_previousSibling is the read implementation of the get_previousSibling property.

See Also

get_previousSibling

196.2.13.2.17 IDOMNode.hasChildNodes Method

Indicates whether the node has any child nodes.

Pascal

```
function hasChildNodes: WordBool; safecall;
```

C++

```
__fastcall WordBool hasChildNodes();
```

Description

hasChildNodes returns true if this node has any child nodes, false if it has no children.

See Also

ChildNodes (see page 26317)

FirstChild (see page 26317)

LastChild (see page 26317)

196.2.13.2.18 IDOMNode.insertBefore Method

Inserts a new child node before a specified child of the node.

Pascal

```
function insertBefore(const newChild: IDOMNode; const refChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode insertBefore(const IDOMNode newChild, const IDOMNode refChild);
```

Description

Use insertBefore to add a child node at a specified position in this node's list of children. If the new node is already in the document's node hierarchy, it is first removed from its parent node. If this node is read-only, refChild is a node that is not in this node's child list, newChild was created using a different document, or if newChild is of a nodeType (see page 26318) that is not permitted as a child of this node, insertBefore raises an exception.

newChild is the child node to add. It can be a node that currently has another parent node, or a new node created using the methods of the document interface. If it is of nodeType (see page 26318) DOCUMENT_FRAGMENT_NODE (see page 26367), the entire contents of the document fragment are moved into this node's childNodes (see page 26317) property list.

refChild is a child of this node before which to insert the new node. If refChild is nil (Delphi) or NULL (C++), the new node is added to the end of this node's child list.

insertBefore returns the interface for the newly added child node.

See Also

AppendChild (see page 26308)

ChildNodes (see page 26317)

replaceChild (see page 26315)

removeChild (see page 26315)

NodeType (see page 26318)

OwnerDocument (see page 26319)

196.2.13.2.19 IDOMNode.normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure normalize; safecall;
```

C++

```
__fastcall normalize();
```

Description

Call normalize to consolidate adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes (see page 26317), only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes. This is useful for operations (such as XPointer lookups) that depend on a particular structure in the node hierarchy.

See Also

ChildNodes (see page 26317)

NodeType (see page 26318)

Attributes (see page 26317)

196.2.13.2.20 IDOMNode.removeChild Method

Removes a child node from this node.

Pascal

```
function removeChild(const childNode: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeChild(const IDOMNode childNode);
```

Description

removeChild removes a specified child node from this node, and returns its interface. If this node is read-only, or if the specified child node is not a child of this node, removeChild raises an exception.

childNode the node to remove.

See Also

AppendChild (see page 26308)

ChildNodes (see page 26317)

replaceChild (see page 26315)

196.2.13.2.21 IDOMNode.replaceChild Method

Replaces one of this node's children with a specified node.

Pascal

```
function replaceChild(const newChild: IDOMNode; const oldChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode replaceChild(const IDOMNode newChild, const IDOMNode oldChild);
```

Description

Use replaceChild to remove a child of this node and replace it with the node specified by newChild. If the new node is already in the document's node hierarchy, it is first removed from its parent node.

If this node is read-only, refChild is a node that is not in this node's child list, newChild was created using a different document, or if newChild is of a nodeType (see page 26318) that is not permitted as a child of this node, replaceChild raises an exception.

newChild is the child node that replaces oldChild. It can be a node that currently has another parent node, or a new node created using the methods of the document interface. If it is of nodeType (see page 26318) DOCUMENT_FRAGMENT_NODE (see page 26367), the entire contents of the document fragment are moved into this node's childNodes (see page 26317) property list.

refChild is a child that newChild replaces. If refChild is nil (Delphi) or NULL (C++), the new node is added to the end of this node's child list.

replaceChild returns the interface for refChild (the replaced node).

See Also

AppendChild (see page 26308)

ChildNodes (see page 26317)

replaceChild

insertBefore (see page 26313)

196.2.13.2.22 IDOMNode.set_nodeValue Method

Sets the value of the node.

Pascal

```
procedure set_nodeValue(value: DOMString); safecall;
```

C++

```
__fastcall set_nodeValue(DOMString value);
```

Description

set_set_nodeValue is the write implementation of the set_nodeValue property.

value is the new value for the node.

See Also

set_nodeValue

196.2.13.2.23 IDOMNode.supports Method

Indicates whether the node supports a specified feature.

Pascal

```
function supports(const feature: DOMString; const version: DOMString): WordBool;
```

C++

```
__fastcall WordBool supports(const DOMString feature, const DOMString version);
```

Description

supports returns true if the DOM implementation implements the specified feature and this node supports that feature. Otherwise, supports returns false.

feature is the name of the feature in question.

version is the version of the feature. If no version is specified, supports returns true if any version of the feature is supported.

196.2.13.3 IDOMNode Properties

The properties of the IDOMNode class are listed here.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.

R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.

196.2.13.3.1 IDOMNode.attributes Property

Pascal

```
property attributes: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap attributes;
```

Description

This is attributes, a member of class IDOMNode.

196.2.13.3.2 IDOMNode.childNodes Property

Pascal

```
property childNodes: IDOMNodeList;
```

C++

```
__property IDOMNodeList childNodes;
```

Description

This is childNodes, a member of class IDOMNode.

196.2.13.3.3 IDOMNode.firstChild Property

Pascal

```
property firstChild: IDOMNode;
```

C++

```
__property IDOMNode firstChild;
```

Description

This is firstChild, a member of class IDOMNode.

196.2.13.3.4 IDOMNode.lastChild Property

Pascal

```
property lastChild: IDOMNode;
```

C++

```
__property IDOMNode lastChild;
```

Description

This is lastChild, a member of class IDOMNode.

196.2.13.3.5 IDOMNode.localName Property

Pascal

```
property localName: DOMString;
```

C++

```
__property DOMString localName;
```

Description

This is localName, a member of class IDOMNode.

196.2.13.3.6 IDOMNode.namespaceURI Property

Pascal

```
property namespaceURI: DOMString;
```

C++

```
__property DOMString namespaceURI;
```

Description

This is namespaceURI, a member of class IDOMNode.

196.2.13.3.7 IDOMNode.nextSibling Property

Pascal

```
property nextSibling: IDOMNode;
```

C++

```
__property IDOMNode nextSibling;
```

Description

This is nextSibling, a member of class IDOMNode.

196.2.13.3.8 IDOMNode.nodeName Property

Pascal

```
property nodeName: DOMString;
```

C++

```
__property DOMString nodeName;
```

Description

This is nodeName, a member of class IDOMNode.

196.2.13.3.9 IDOMNode.nodeType Property

Pascal

```
property nodeType: DOMNodeType;
```

C++

```
__property DOMNodeType nodeType;
```

Description

This is nodeType, a member of class IDOMNode.

196.2.13.3.10 IDOMNode.nodeValue Property

Pascal

```
property nodeValue: DOMString;
```

C++

```
__property DOMString nodeValue;
```

Description

This is nodeValue, a member of class IDOMNode.

196.2.13.3.11 IDOMNode.ownerDocument Property

Pascal

```
property ownerDocument: IDOMDocument;
```

C++

```
__property IDOMDocument ownerDocument;
```

Description

This is ownerDocument, a member of class IDOMNode.

196.2.13.3.12 IDOMNode.parentNode Property

Pascal

```
property parentNode: IDOMNode;
```

C++

```
__property IDOMNode parentNode;
```

Description

This is parentNode, a member of class IDOMNode.

196.2.13.3.13 IDOMNode.prefix Property

Pascal

```
property prefix: DOMString;
```

C++

```
__property DOMString prefix;
```

Description

This is prefix, a member of class IDOMNode.

196.2.13.3.14 IDOMNode.previousSibling Property

Pascal

```
property previousSibling: IDOMNode;
```

C++

```
__property IDOMNode previousSibling;
```

Description

This is previousSibling, a member of class IDOMNode.

196.2.14 IDOMNodeEx Interface

Class Hierarchy

Pascal

```
IDOMNodeEx = interface(IDOMNode);
```

C++

```
__interface IDOMNodeEx : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMNodeEx.

196.2.14.1 IDOMNodeEx Members

The following tables list the members exposed by IDOMNodeEx.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.

	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_text (see page 26321)	This is get_text, a member of class IDOMNodeEx.
	get_xml (see page 26322)	This is get_xml, a member of class IDOMNodeEx.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 26316)	Sets the value of the node.
	set_text (see page 26322)	This is set_text, a member of class IDOMNodeEx.
	supports (see page 26316)	Indicates whether the node supports a specified feature.
	transformNode (see page 26322)	This is the overview for the transformNode method overload.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
	text (see page 26323)	This is text, a member of class IDOMNodeEx.
R	xml (see page 26323)	This is xml, a member of class IDOMNodeEx.

196.2.14.2 IDOMNodeEx Methods

The methods of the IDOMNodeEx class are listed here.

Public Methods

	Name	Description
	get_text (see page 26321)	This is get_text, a member of class IDOMNodeEx.
	get_xml (see page 26322)	This is get_xml, a member of class IDOMNodeEx.
	set_text (see page 26322)	This is set_text, a member of class IDOMNodeEx.
	transformNode (see page 26322)	This is the overview for the transformNode method overload.

196.2.14.2.1 IDOMNodeEx.get_text Method

Pascal

```
function get_text: DOMString; safecall;
```

C++

```
__fastcall DOMString get_text();
```

Description

This is get_text, a member of class IDOMNodeEx.

196.2.14.2.2 IDOMNodeEx.get_xml Method

Pascal

```
function get_xml: DOMString; safecall;
```

C++

```
__fastcall DOMString get_xml();
```

Description

This is get_xml, a member of class IDOMNodeEx.

196.2.14.2.3 IDOMNodeEx.set_text Method

Pascal

```
procedure set_text(const Value: DOMString); safecall;
```

C++

```
__fastcall set_text(const DOMString Value);
```

Description

This is set_text, a member of class IDOMNodeEx.

196.2.14.2.4 transformNode Method

This is the overview for the transformNode method overload.

Overload List

	Name	Description
	IDOMNodeEx.transformNode (IDOMNode, IDOMDocument) (see page 26322)	This is transformNode, a member of class IDOMNodeEx.
	IDOMNodeEx.transformNode (IDOMNode, WideString) (see page 26323)	This is transformNode, a member of class IDOMNodeEx.

196.2.14.2.4.1 IDOMNodeEx.transformNode Method (IDOMNode, IDOMDocument)

Pascal

```
procedure transformNode(const stylesheet: IDOMNode; const output: IDOMDocument); safecall;
overload;
```

C++

```
__fastcall transformNode(const IDOMNode stylesheet, const IDOMDocument output);
```

Description

This is transformNode, a member of class IDOMNodeEx.

196.2.14.2.4.2 IDOMNodeEx.transformNode Method (IDOMNode, WideString)

Pascal

```
procedure transformNode(const stylesheet: IDOMNode; var output: WideString); safecall;
overload;
```

C++

```
__fastcall transformNode(const IDOMNode stylesheet, BSTR output);
```

Description

This is transformNode, a member of class IDOMNodeEx.

196.2.14.3 IDOMNodeEx Properties

The properties of the IDOMNodeEx class are listed here.

Public Properties

	Name	Description
	text (see page 26323)	This is text, a member of class IDOMNodeEx.
R	xml (see page 26323)	This is xml, a member of class IDOMNodeEx.

196.2.14.3.1 IDOMNodeEx.text Property

Pascal

```
property text: DOMString;
```

C++

```
__property DOMString text;
```

Description

This is text, a member of class IDOMNodeEx.

196.2.14.3.2 IDOMNodeEx.xml Property

Pascal

```
property xml: DOMString;
```

C++

```
__property DOMString xml;
```

Description

This is xml, a member of class IDOMNodeEx.

196.2.15 IDOMNodeList Interface

Class Hierarchy

Pascal

```
IDOMNodeList = interface;
```

C++

```
__interface IDOMNodeList;
```

File

xmldom

Description

This is class xmldom.IDOMNodeList.

196.2.15.1 IDOMNodeList Members

The following tables list the members exposed by IDOMNodeList.

Public Methods

	Name	Description
	get_item (see page 26324)	This is get_item, a member of class IDOMNodeList.
	get_length (see page 26324)	This is get_length, a member of class IDOMNodeList.

Public Properties

	Name	Description
R	item (see page 26325)	This is item, a member of class IDOMNodeList.
R	length (see page 26325)	This is length, a member of class IDOMNodeList.

196.2.15.2 IDOMNodeList Methods

The methods of the IDOMNodeList class are listed here.

Public Methods

	Name	Description
	get_item (see page 26324)	This is get_item, a member of class IDOMNodeList.
	get_length (see page 26324)	This is get_length, a member of class IDOMNodeList.

196.2.15.2.1 IDOMNodeList.get_item Method

Pascal

```
function get_item(index: Integer): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_item(int index);
```

Description

This is get_item, a member of class IDOMNodeList.

196.2.15.2.2 IDOMNodeList.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMNodeList.

196.2.15.3 IDOMNodeList Properties

The properties of the IDOMNodeList class are listed here.

Public Properties

	Name	Description
R	item (see page 26325)	This is item, a member of class IDOMNodeList.
R	length (see page 26325)	This is length, a member of class IDOMNodeList.

196.2.15.3.1 IDOMNodeList.item Property

Pascal

```
property item [index: Integer]: IDOMNode;
```

C++

```
__property IDOMNode item[int index];
```

Description

This is item, a member of class IDOMNodeList.

196.2.15.3.2 IDOMNodeList.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMNodeList.

196.2.16 IDOMNodeSelect Interface

Class Hierarchy

Pascal

```
IDOMNodeSelect = interface(IInterface);
```

C++

```
__interface IDOMNodeSelect : public IInterface;
```

File

xmldom

Description

This is class xmldom.IDOMNodeSelect.

196.2.16.1 IDOMNodeSelect Members

The following tables list the members exposed by IDOMNodeSelect.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	selectNode (see page 26326)	This is selectNode, a member of class IDOMNodeSelect.
	selectNodes (see page 26326)	This is selectNodes, a member of class IDOMNodeSelect.

196.2.16.2 IDOMNodeSelect Methods

The methods of the IDOMNodeSelect class are listed here.

Public Methods

	Name	Description
	selectNode (see page 26326)	This is selectNode, a member of class IDOMNodeSelect.
	selectNodes (see page 26326)	This is selectNodes, a member of class IDOMNodeSelect.

196.2.16.2.1 IDOMNodeSelect.selectNode Method

Pascal

```
function selectNode(const nodePath: WideString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode selectNode(const BSTR nodePath);
```

Description

This is selectNode, a member of class IDOMNodeSelect.

196.2.16.2.2 IDOMNodeSelect.selectNodes Method

Pascal

```
function selectNodes(const nodePath: WideString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList selectNodes(const BSTR nodePath);
```

Description

This is selectNodes, a member of class IDOMNodeSelect.

196.2.17 IDOMNotation Interface

Class Hierarchy

Pascal

```
IDOMNotation = interface(IDOMNode);
```

C++

```
__interface IDOMNotation : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMNotation.

196.2.17.1 IDOMNotation Members

The following tables list the members exposed by IDOMNotation.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_publicId (see page 26328)	This is get_publicId, a member of class IDOMNotation.
	get_systemId (see page 26328)	This is get_systemId, a member of class IDOMNotation.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.

	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 26329)	This is publicId, a member of class IDOMNotation.
R	systemId (see page 26329)	This is systemId, a member of class IDOMNotation.

196.2.17.2 IDOMNotation Methods

The methods of the IDOMNotation class are listed here.

Public Methods

	Name	Description
	get_publicId (see page 26328)	This is get_publicId, a member of class IDOMNotation.
	get_systemId (see page 26328)	This is get_systemId, a member of class IDOMNotation.

196.2.17.2.1 IDOMNotation.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMNotation.

196.2.17.2.2 IDOMNotation.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMNotation.

196.2.17.3 IDOMNotation Properties

The properties of the IDOMNotation class are listed here.

Public Properties

	Name	Description
R	publicId (see page 26329)	This is publicId, a member of class IDOMNotation.
R	systemId (see page 26329)	This is systemId, a member of class IDOMNotation.

196.2.17.3.1 IDOMNotation.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMNotation.

196.2.17.3.2 IDOMNotation.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMNotation.

196.2.18 IDOMParseError Interface

Class Hierarchy

xmldom.IDOMParseError

Pascal

```
IDOMParseError = interface;
```

C++

```
__interface IDOMParseError;
```

File

xmldom

Description

This is class xmldom.IDOMParseError.

196.2.18.1 IDOMParseError Members

The following tables list the members exposed by IDOMParseError.

Public Methods

	Name	Description
	get_errorCode (see page 26330)	This is get_errorCode, a member of class IDOMParseError.
	get_filepos (see page 26331)	This is get_filepos, a member of class IDOMParseError.
	get_line (see page 26331)	This is get_line, a member of class IDOMParseError.
	get_linepos (see page 26331)	This is get_linepos, a member of class IDOMParseError.
	get_reason (see page 26331)	This is get_reason, a member of class IDOMParseError.
	get_srcText (see page 26331)	This is get_srcText, a member of class IDOMParseError.
	get_url (see page 26332)	This is get_url, a member of class IDOMParseError.

Public Properties

	Name	Description
R	errorCode (see page 26332)	This is errorCode, a member of class IDOMParseError.
R	filePos (see page 26332)	This is filePos, a member of class IDOMParseError.
R	line (see page 26333)	This is line, a member of class IDOMParseError.
R	linePos (see page 26333)	This is linePos, a member of class IDOMParseError.
R	reason (see page 26333)	This is reason, a member of class IDOMParseError.
R	srcText (see page 26333)	This is srcText, a member of class IDOMParseError.
R	url (see page 26333)	This is url, a member of class IDOMParseError.

196.2.18.2 IDOMParseError Methods

The methods of the IDOMParseError class are listed here.

Public Methods

	Name	Description
	get_errorCode (see page 26330)	This is get_errorCode, a member of class IDOMParseError.
	get_filepos (see page 26331)	This is get_filepos, a member of class IDOMParseError.
	get_line (see page 26331)	This is get_line, a member of class IDOMParseError.
	get_linepos (see page 26331)	This is get_linepos, a member of class IDOMParseError.
	get_reason (see page 26331)	This is get_reason, a member of class IDOMParseError.
	get_srcText (see page 26331)	This is get_srcText, a member of class IDOMParseError.
	get_url (see page 26332)	This is get_url, a member of class IDOMParseError.

196.2.18.2.1 IDOMParseError.get_errorCode Method

Pascal

```
function get_errorCode: Integer; safecall;
```

C++

```
__fastcall int get_errorCode();
```

Description

This is get_errorCode, a member of class IDOMParseError.

196.2.18.2.2 IDOMParseError.get_filepos Method

Pascal

```
function get_filepos: Integer; safecall;
```

C++

```
__fastcall int get_filepos();
```

Description

This is get_filepos, a member of class IDOMParseError.

196.2.18.2.3 IDOMParseError.get_line Method

Pascal

```
function get_line: Integer; safecall;
```

C++

```
__fastcall int get_line();
```

Description

This is get_line, a member of class IDOMParseError.

196.2.18.2.4 IDOMParseError.get_linepos Method

Pascal

```
function get_linepos: Integer; safecall;
```

C++

```
__fastcall int get_linepos();
```

Description

This is get_linepos, a member of class IDOMParseError.

196.2.18.2.5 IDOMParseError.get_reason Method

Pascal

```
function get_reason: DOMString; safecall;
```

C++

```
__fastcall DOMString get_reason();
```

Description

This is get_reason, a member of class IDOMParseError.

196.2.18.2.6 IDOMParseError.get_srcText Method

Pascal

```
function get_srcText: DOMString; safecall;
```

C++

```
__fastcall DOMString get_srcText();
```

Description

This is get_srcText, a member of class IDOMParseError.

196.2.18.2.7 IDOMParseError.get_url Method

Pascal

```
function get_url: DOMString; safecall;
```

C++

```
__fastcall DOMString get_url();
```

Description

This is get_url, a member of class IDOMParseError.

196.2.18.3 IDOMParseError Properties

The properties of the IDOMParseError class are listed here.

Public Properties

	Name	Description
R	errorCode (see page 26332)	This is errorCode, a member of class IDOMParseError.
R	filePos (see page 26332)	This is filePos, a member of class IDOMParseError.
R	line (see page 26333)	This is line, a member of class IDOMParseError.
R	linePos (see page 26333)	This is linePos, a member of class IDOMParseError.
R	reason (see page 26333)	This is reason, a member of class IDOMParseError.
R	srcText (see page 26333)	This is srcText, a member of class IDOMParseError.
R	url (see page 26333)	This is url, a member of class IDOMParseError.

196.2.18.3.1 IDOMParseError.errorCode Property

Pascal

```
property errorCode: Integer;
```

C++

```
__property int errorCode;
```

Description

This is errorCode, a member of class IDOMParseError.

196.2.18.3.2 IDOMParseError.filePos Property

Pascal

```
property filePos: Integer;
```

C++

```
__property int filePos;
```

Description

This is filePos, a member of class IDOMParseError.

196.2.18.3.3 IDOMParseError.line Property

Pascal

```
property line: Integer;
```

C++

```
__property int line;
```

Description

This is line, a member of class IDOMParseError.

196.2.18.3.4 IDOMParseError.linePos Property

Pascal

```
property linePos: Integer;
```

C++

```
__property int linePos;
```

Description

This is linePos, a member of class IDOMParseError.

196.2.18.3.5 IDOMParseError.reason Property

Pascal

```
property reason: DOMString;
```

C++

```
__property DOMString reason;
```

Description

This is reason, a member of class IDOMParseError.

196.2.18.3.6 IDOMParseError.srcText Property

Pascal

```
property srcText: DOMString;
```

C++

```
__property DOMString srcText;
```

Description

This is srcText, a member of class IDOMParseError.

196.2.18.3.7 IDOMParseError.url Property

Pascal

```
property url: DOMString;
```

C++

```
__property DOMString url;
```

Description

This is url, a member of class IDOMParseError.

196.2.19 IDOMParseOptions Interface

Class Hierarchy

xmldom.IDOMParseOptions

Pascal

```
IDOMParseOptions = interface;
```

C++

```
__interface IDOMParseOptions;
```

File

xmldom

Description

This is class xmldom.IDOMParseOptions.

196.2.19.1 IDOMParseOptions Members

The following tables list the members exposed by IDOMParseOptions.

Public Methods

	Name	Description
	get_async (see page 26335)	This is get_async, a member of class IDOMParseOptions.
	get_preserveWhiteSpace (see page 26335)	This is get_preserveWhiteSpace, a member of class IDOMParseOptions.
	get_resolveExternals (see page 26335)	This is get_resolveExternals, a member of class IDOMParseOptions.
	get_validate (see page 26335)	This is get_validate, a member of class IDOMParseOptions.
	set_async (see page 26336)	This is set_async, a member of class IDOMParseOptions.
	set_preserveWhiteSpace (see page 26336)	This is set_preserveWhiteSpace, a member of class IDOMParseOptions.
	set_resolveExternals (see page 26336)	This is set_resolveExternals, a member of class IDOMParseOptions.
	set_validate (see page 26336)	This is set_validate, a member of class IDOMParseOptions.

Public Properties

	Name	Description
	async (see page 26337)	This is async, a member of class IDOMParseOptions.
	preserveWhiteSpace (see page 26337)	This is preserveWhiteSpace, a member of class IDOMParseOptions.
	resolveExternals (see page 26337)	This is resolveExternals, a member of class IDOMParseOptions.
	validate (see page 26337)	This is validate, a member of class IDOMParseOptions.

196.2.19.2 IDOMParseOptions Methods

The methods of the IDOMParseOptions class are listed here.

Public Methods

	Name	Description
	get_async (see page 26335)	This is get_async, a member of class IDOMParseOptions.
	get_preserveWhiteSpace (see page 26335)	This is get_preserveWhiteSpace, a member of class IDOMParseOptions.
	get_resolveExternals (see page 26335)	This is get_resolveExternals, a member of class IDOMParseOptions.
	get_validate (see page 26335)	This is get_validate, a member of class IDOMParseOptions.
	set_async (see page 26336)	This is set_async, a member of class IDOMParseOptions.
	set_preserveWhiteSpace (see page 26336)	This is set_preserveWhiteSpace, a member of class IDOMParseOptions.
	set_resolveExternals (see page 26336)	This is set_resolveExternals, a member of class IDOMParseOptions.
	set_validate (see page 26336)	This is set_validate, a member of class IDOMParseOptions.

196.2.19.2.1 IDOMParseOptions.get_async Method

Pascal

```
function get_async: Boolean; safecall;
```

C++

```
__fastcall Boolean get_async();
```

Description

This is get_async, a member of class IDOMParseOptions.

196.2.19.2.2 IDOMParseOptions.get_preserveWhiteSpace Method

Pascal

```
function get_preserveWhiteSpace: Boolean; safecall;
```

C++

```
__fastcall Boolean get_preserveWhiteSpace();
```

Description

This is get_preserveWhiteSpace, a member of class IDOMParseOptions.

196.2.19.2.3 IDOMParseOptions.get_resolveExternals Method

Pascal

```
function get_resolveExternals: Boolean; safecall;
```

C++

```
__fastcall Boolean get_resolveExternals();
```

Description

This is get_resolveExternals, a member of class IDOMParseOptions.

196.2.19.2.4 IDOMParseOptions.get_validate Method

Pascal

```
function get_validate: Boolean; safecall;
```

C++

```
__fastcall Boolean get_validate();
```

Description

This is get_validate, a member of class IDOMParseOptions.

196.2.19.2.5 IDOMParseOptions.set_async Method

Pascal

```
procedure set_async(Value: Boolean); safecall;
```

C++

```
__fastcall set_async(Boolean Value);
```

Description

This is set_async, a member of class IDOMParseOptions.

196.2.19.2.6 IDOMParseOptions.set_preserveWhiteSpace Method

Pascal

```
procedure set_preserveWhiteSpace(Value: Boolean); safecall;
```

C++

```
__fastcall set_preserveWhiteSpace(Boolean Value);
```

Description

This is set_preserveWhiteSpace, a member of class IDOMParseOptions.

196.2.19.2.7 IDOMParseOptions.set_resolveExternals Method

Pascal

```
procedure set_resolveExternals(Value: Boolean); safecall;
```

C++

```
__fastcall set_resolveExternals(Boolean Value);
```

Description

This is set_resolveExternals, a member of class IDOMParseOptions.

196.2.19.2.8 IDOMParseOptions.set_validate Method

Pascal

```
procedure set_validate(Value: Boolean); safecall;
```

C++

```
__fastcall set_validate(Boolean Value);
```

Description

This is set_validate, a member of class IDOMParseOptions.

196.2.19.3 IDOMParseOptions Properties

The properties of the IDOMParseOptions class are listed here.

Public Properties

	Name	Description
	async (see page 26337)	This is async, a member of class IDOMParseOptions.
	preserveWhiteSpace (see page 26337)	This is preserveWhiteSpace, a member of class IDOMParseOptions.
	resolveExternals (see page 26337)	This is resolveExternals, a member of class IDOMParseOptions.
	validate (see page 26337)	This is validate, a member of class IDOMParseOptions.

196.2.19.3.1 IDOMParseOptions.async Property

Pascal

```
property async: Boolean;
```

C++

```
__property Boolean async;
```

Description

This is async, a member of class IDOMParseOptions.

196.2.19.3.2 IDOMParseOptions.preserveWhiteSpace Property

Pascal

```
property preserveWhiteSpace: Boolean;
```

C++

```
__property Boolean preserveWhiteSpace;
```

Description

This is preserveWhiteSpace, a member of class IDOMParseOptions.

196.2.19.3.3 IDOMParseOptions.resolveExternals Property

Pascal

```
property resolveExternals: Boolean;
```

C++

```
__property Boolean resolveExternals;
```

Description

This is resolveExternals, a member of class IDOMParseOptions.

196.2.19.3.4 IDOMParseOptions.validate Property

Pascal

```
property validate: Boolean;
```

C++

```
__property Boolean validate;
```

Description

This is validate, a member of class IDOMParseOptions.

196.2.20 IDOMPersist Interface

Class Hierarchy

xmldom.IDOMPersist

Pascal

```
IDOMPersist = interface;
```

C++

```
__interface IDOMPersist;
```

File

xmldom

Description

This is class xmldom.IDOMPersist.

196.2.20.1 IDOMPersist Members

The following tables list the members exposed by IDOMPersist.

Public Methods

	Name	Description
	asyncLoadState (see page 26339)	This is asyncLoadState, a member of class IDOMPersist.
	get_xml (see page 26339)	This is get_xml, a member of class IDOMPersist.
	load (see page 26339)	This is load, a member of class IDOMPersist.
	loadFromStream (see page 26339)	This is the overview for the loadFromStream method overload.
	loadxml (see page 26340)	This is loadxml, a member of class IDOMPersist.
	save (see page 26340)	This is save, a member of class IDOMPersist.
	saveToStream (see page 26340)	This is the overview for the saveToStream method overload.
	set_OnAsyncLoad (see page 26341)	This is set_OnAsyncLoad, a member of class IDOMPersist.

Public Properties

	Name	Description
R	xml (see page 26341)	This is xml, a member of class IDOMPersist.

196.2.20.2 IDOMPersist Methods

The methods of the IDOMPersist class are listed here.

Public Methods

	Name	Description
	asyncLoadState (see page 26339)	This is asyncLoadState, a member of class IDOMPersist.
	get_xml (see page 26339)	This is get_xml, a member of class IDOMPersist.
	load (see page 26339)	This is load, a member of class IDOMPersist.
	loadFromStream (see page 26339)	This is the overview for the loadFromStream method overload.
	loadxml (see page 26340)	This is loadxml, a member of class IDOMPersist.
	save (see page 26340)	This is save, a member of class IDOMPersist.
	saveToStream (see page 26340)	This is the overview for the saveToStream method overload.

	set_OnAsyncLoad (see page 26341)	This is set_OnAsyncLoad, a member of class IDOMPersist.

196.2.20.2.1 IDOMPersist.asyncLoadState Method

Pascal

```
function asyncLoadState: Integer; safecall;
```

C++

```
__fastcall int asyncLoadState();
```

Description

This is asyncLoadState, a member of class IDOMPersist.

196.2.20.2.2 IDOMPersist.get_xml Method

Pascal

```
function get_xml: DOMString; safecall;
```

C++

```
__fastcall DOMString get_xml();
```

Description

This is get_xml, a member of class IDOMPersist.

196.2.20.2.3 IDOMPersist.load Method

Pascal

```
function load(source: OleVariant): WordBool; safecall;
```

C++

```
__fastcall WordBool load(OleVariant source);
```

Description

This is load, a member of class IDOMPersist.

196.2.20.2.4 loadFromStream Method

This is the overview for the loadFromStream method overload.

Overload List

	Name	Description
	IDOMPersist.loadFromStream (IStream) (see page 26339)	This is loadFromStream, a member of class IDOMPersist.
	IDOMPersist.loadFromStream (TStream) (see page 26340)	This is loadFromStream, a member of class IDOMPersist.

196.2.20.2.4.1 IDOMPersist.loadFromStream Method (IStream)

Pascal

```
function loadFromStream(const stream: IStream): WordBool; safecall; overload;
```

C++

```
__fastcall WordBool loadFromStream(const IStream stream);
```

Description

This is loadFromStream, a member of class IDOMPersist.

196.2.20.2.4.2 IDOMPersist.loadFromStream Method (TStream)

Pascal

```
function loadFromStream(const stream: TStream): WordBool; safecall; overload;
```

C++

```
__fastcall WordBool loadFromStream(const TStream stream);
```

Description

This is loadFromStream, a member of class IDOMPersist.

196.2.20.2.5 IDOMPersist.loadxml Method

Pascal

```
function loadxml(const Value: DOMString): WordBool; safecall;
```

C++

```
__fastcall WordBool loadxml(const DOMString Value);
```

Description

This is loadxml, a member of class IDOMPersist.

196.2.20.2.6 IDOMPersist.save Method

Pascal

```
procedure save(destination: OleVariant); safecall;
```

C++

```
__fastcall save(OleVariant destination);
```

Description

This is save, a member of class IDOMPersist.

196.2.20.2.7 saveToStream Method

This is the overview for the saveToStream method overload.

Overload List

	Name	Description
	IDOMPersist.saveToStream (IStream) (see page 26341)	This is saveToStream, a member of class IDOMPersist.
	IDOMPersist.saveToStream (TStream) (see page 26341)	This is saveToStream, a member of class IDOMPersist.

196.2.20.2.7.1 IDOMPersist.saveToStream Method (IStream)

Pascal

```
procedure saveToStream(const stream: IStream); safecall; overload;
```

C++

```
__fastcall saveToStream(const IStream stream);
```

Description

This is saveToStream, a member of class IDOMPersist.

196.2.20.2.7.2 IDOMPersist.saveToStream Method (TStream)

Pascal

```
procedure saveToStream(const stream: TStream); safecall; overload;
```

C++

```
__fastcall saveToStream(const TStream stream);
```

Description

This is saveToStream, a member of class IDOMPersist.

196.2.20.2.8 IDOMPersist.set_OnAsyncLoad Method

Pascal

```
procedure set_OnAsyncLoad(const Sender: TObject; EventHandler: TAsyncEventHandler); safecall;
```

C++

```
__fastcall set_OnAsyncLoad(const TObject * Sender, TAsyncEventHandler EventHandler);
```

Description

This is set_OnAsyncLoad, a member of class IDOMPersist.

196.2.20.3 IDOMPersist Properties

The properties of the IDOMPersist class are listed here.

Public Properties

	Name	Description
R	xml (see page 26341)	This is xml, a member of class IDOMPersist.

196.2.20.3.1 IDOMPersist.xml Property

Pascal

```
property xml: DOMString;
```

C++

```
__property DOMString xml;
```

Description

This is xml, a member of class IDOMPersist.

196.2.21 IDOMProcessingInstruction Interface

Class Hierarchy

Pascal

```
IDOMProcessingInstruction = interface(IDOMNode);
```

C++

```
__interface IDOMProcessingInstruction : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMProcessingInstruction.

196.2.21.1 IDOMProcessingInstruction Members

The following tables list the members exposed by IDOMProcessingInstruction.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_data (see page 26343)	This is get_data, a member of class IDOMProcessingInstruction.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	get_target (see page 26343)	This is get_target, a member of class IDOMProcessingInstruction.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.

	set_data (see page 26344)	This is set_data, a member of class IDOMProcessingInstruction.
	set_nodeValue (see page 26316)	Sets the value of the node.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
	data (see page 26344)	This is data, a member of class IDOMProcessingInstruction.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.
R	target (see page 26344)	This is target, a member of class IDOMProcessingInstruction.

196.2.21.2 IDOMProcessingInstruction Methods

The methods of the IDOMProcessingInstruction class are listed here.

Public Methods

	Name	Description
	get_data (see page 26343)	This is get_data, a member of class IDOMProcessingInstruction.
	get_target (see page 26343)	This is get_target, a member of class IDOMProcessingInstruction.
	set_data (see page 26344)	This is set_data, a member of class IDOMProcessingInstruction.

196.2.21.2.1 IDOMProcessingInstruction.get_data Method

Pascal

```
function get_data: DOMString; safecall;
```

C++

```
__fastcall DOMString get_data();
```

Description

This is get_data, a member of class IDOMProcessingInstruction.

196.2.21.2.2 IDOMProcessingInstruction.get_target Method

Pascal

```
function get_target: DOMString; safecall;
```

C++

```
__fastcall DOMString get_target();
```

Description

This is get_target, a member of class IDOMProcessingInstruction.

196.2.21.2.3 IDOMProcessingInstruction.set_data Method

Pascal

```
procedure set_data(const value: DOMString); safecall;
```

C++

```
__fastcall set_data(const DOMString value);
```

Description

This is set_data, a member of class IDOMProcessingInstruction.

196.2.21.3 IDOMProcessingInstruction Properties

The properties of the IDOMProcessingInstruction class are listed here.

Public Properties

	Name	Description
	data (see page 26344)	This is data, a member of class IDOMProcessingInstruction.
R	target (see page 26344)	This is target, a member of class IDOMProcessingInstruction.

196.2.21.3.1 IDOMProcessingInstruction.data Property

Pascal

```
property data: DOMString;
```

C++

```
__property DOMString data;
```

Description

This is data, a member of class IDOMProcessingInstruction.

196.2.21.3.2 IDOMProcessingInstruction.target Property

Pascal

```
property target: DOMString;
```

C++

```
__property DOMString target;
```

Description

This is target, a member of class IDOMProcessingInstruction.

196.2.22 IDOMText Interface

Class Hierarchy

Pascal

```
IDOMText = interface(IDOMCharacterData);
```

C++

```
__interface IDOMText : public IDOMCharacterData;
```

File

xmldom

Description

This is class xmldom.IDOMText.

196.2.22.1 IDOMText Members

The following tables list the members exposed by IDOMText.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	appendChild (see page 26308)	This is appendChild, a member of class IDOMNode.
	appendData (see page 26276)	This is appendData, a member of class IDOMCharacterData.
	cloneNode (see page 26309)	This is cloneNode, a member of class IDOMNode.
	deleteData (see page 26277)	This is deleteData, a member of class IDOMCharacterData.
	get_attributes (see page 26309)	Returns the value of the get_attributes property.
	get_childNodes (see page 26309)	Returns the value of the get_childNodes property.
	get_data (see page 26277)	This is get_data, a member of class IDOMCharacterData.
	get_firstChild (see page 26309)	Returns the value of the get_firstChild property.
	get_lastChild (see page 26310)	Returns the value of the get_lastChild property.
	get_length (see page 26277)	This is get_length, a member of class IDOMCharacterData.
	get_localName (see page 26310)	Returns the value of the get_localName property.
	get_namespaceURI (see page 26310)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 26311)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 26311)	Returns the value of the get_nodeName property.
	get_nodeType (see page 26311)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 26312)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 26312)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 26312)	Returns the value of the get_parentNode property.
	get_prefix (see page 26312)	Returns the value of the get_prefix property.
	get_previousSibling (see page 26313)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 26313)	Indicates whether the node has any child nodes.
	insertBefore (see page 26313)	Inserts a new child node before a specified child of the node.
	insertData (see page 26277)	This is insertData, a member of class IDOMCharacterData.
	normalize (see page 26314)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 26315)	Removes a child node from this node.
	replaceChild (see page 26315)	Replaces one of this node's children with a specified node.
	replaceData (see page 26277)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 26278)	This is set_data, a member of class IDOMCharacterData.
	set_nodeValue (see page 26316)	Sets the value of the node.
	splitText (see page 26346)	This is splitText, a member of class IDOMText.
	substringData (see page 26278)	This is substringData, a member of class IDOMCharacterData.
	supports (see page 26316)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 26317)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 26317)	This is childNodes, a member of class IDOMNode.
	data (see page 26278)	This is data, a member of class IDOMCharacterData.
R	firstChild (see page 26317)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 26317)	This is lastChild, a member of class IDOMNode.
R	length (see page 26278)	This is length, a member of class IDOMCharacterData.
R	localName (see page 26318)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 26318)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 26318)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 26318)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 26318)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 26319)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 26319)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 26319)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 26319)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 26320)	This is previousSibling, a member of class IDOMNode.

196.2.22.2 IDOMText Methods

The methods of the IDOMText class are listed here.

Public Methods

	Name	Description
	splitText (see page 26346)	This is splitText, a member of class IDOMText.

196.2.22.2.1 IDOMText.splitText Method

Pascal

```
function splitText(offset: Integer): IDOMText; safecall;
```

C++

```
__fastcall IDOMText splitText(int offset);
```

Description

This is splitText, a member of class IDOMText.

196.2.23 IDOMXMLProlog Interface

Class Hierarchy

xmldom.IDOMXMLProlog

Pascal

```
IDOMXMLProlog = interface;
```

C++

```
__interface IDOMXMLProlog;
```

File

xmldom

Description

This is class xmldom.IDOMXMLProlog.

196.2.23.1 IDOMXMLProlog Members

The following tables list the members exposed by IDOMXMLProlog.

Public Methods

	Name	Description
	get_Encoding (see page 26348)	This is get_Encoding, a member of class IDOMXMLProlog.
	get_Standalone (see page 26348)	This is get_Standalone, a member of class IDOMXMLProlog.
	get_Version (see page 26348)	This is get_Version, a member of class IDOMXMLProlog.
	set_Encoding (see page 26348)	This is set_Encoding, a member of class IDOMXMLProlog.
	set_Standalone (see page 26348)	This is set_Standalone, a member of class IDOMXMLProlog.
	set_Version (see page 26349)	This is set_Version, a member of class IDOMXMLProlog.

Public Properties

	Name	Description
	Encoding (see page 26349)	This is Encoding, a member of class IDOMXMLProlog.
	Standalone (see page 26349)	This is Standalone, a member of class IDOMXMLProlog.
	Version (see page 26349)	This is Version, a member of class IDOMXMLProlog.

196.2.23.2 IDOMXMLProlog Methods

The methods of the IDOMXMLProlog class are listed here.

Public Methods

	Name	Description
	get_Encoding (see page 26348)	This is get_Encoding, a member of class IDOMXMLProlog.
	get_Standalone (see page 26348)	This is get_Standalone, a member of class IDOMXMLProlog.
	get_Version (see page 26348)	This is get_Version, a member of class IDOMXMLProlog.
	set_Encoding (see page 26348)	This is set_Encoding, a member of class IDOMXMLProlog.
	set_Standalone (see page 26348)	This is set_Standalone, a member of class IDOMXMLProlog.
	set_Version (see page 26349)	This is set_Version, a member of class IDOMXMLProlog.

196.2.23.2.1 IDOMXMLProlog.get_Encoding Method

Pascal

```
function get_Encoding: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Encoding();
```

Description

This is get_Encoding, a member of class IDOMXMLProlog.

196.2.23.2.2 IDOMXMLProlog.get_Standalone Method

Pascal

```
function get_Standalone: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Standalone();
```

Description

This is get_Standalone, a member of class IDOMXMLProlog.

196.2.23.2.3 IDOMXMLProlog.get_Version Method

Pascal

```
function get_Version: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Version();
```

Description

This is get_Version, a member of class IDOMXMLProlog.

196.2.23.2.4 IDOMXMLProlog.set_Encoding Method

Pascal

```
procedure set_Encoding(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Encoding(const DOMString Value);
```

Description

This is set_Encoding, a member of class IDOMXMLProlog.

196.2.23.2.5 IDOMXMLProlog.set_Standalone Method

Pascal

```
procedure set_Standalone(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Standalone(const DOMString Value);
```

Description

This is set_Standalone, a member of class IDOMXMLProlog.

196.2.23.2.6 IDOMXMLProlog.set_Version Method

Pascal

```
procedure set_Version(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Version(const DOMString Value);
```

Description

This is set_Version, a member of class IDOMXMLProlog.

196.2.23.3 IDOMXMLProlog Properties

The properties of the IDOMXMLProlog class are listed here.

Public Properties

	Name	Description
	Encoding (see page 26349)	This is Encoding, a member of class IDOMXMLProlog.
	Standalone (see page 26349)	This is Standalone, a member of class IDOMXMLProlog.
	Version (see page 26349)	This is Version, a member of class IDOMXMLProlog.

196.2.23.3.1 IDOMXMLProlog.Encoding Property

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

This is Encoding, a member of class IDOMXMLProlog.

196.2.23.3.2 IDOMXMLProlog.Standalone Property

Pascal

```
property Standalone: DOMString;
```

C++

```
__property DOMString Standalone;
```

Description

This is Standalone, a member of class IDOMXMLProlog.

196.2.23.3.3 IDOMXMLProlog.Version Property

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

This is Version, a member of class IDOMXMLProlog.

196.2.24 IDOMXSLProcessor Interface

Class Hierarchy

Pascal

```
IDOMXSLProcessor = interface(IInterface);
```

C++

```
__interface IDOMXSLProcessor : public IInterface;
```

File

xmldom

Description

This is class xmldom.IDOMXSLProcessor.

196.2.24.1 IDOMXSLProcessor Members

The following tables list the members exposed by IDOMXSLProcessor.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	Get_input (see page 26351)	This is Get_input, a member of class IDOMXSLProcessor.
	Get_output (see page 26351)	This is Get_output, a member of class IDOMXSLProcessor.
	Get_stylesheet (see page 26351)	This is Get_stylesheet, a member of class IDOMXSLProcessor.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	reset (see page 26352)	This is reset, a member of class IDOMXSLProcessor.
	Set_input (see page 26352)	This is Set_input, a member of class IDOMXSLProcessor.
	Set_output (see page 26352)	This is Set_output, a member of class IDOMXSLProcessor.
	setParameter (see page 26352)	This is setParameter, a member of class IDOMXSLProcessor.
	transform (see page 26352)	This is transform, a member of class IDOMXSLProcessor.

Public Properties

	Name	Description
	input (see page 26353)	This is input, a member of class IDOMXSLProcessor.
	output (see page 26353)	This is output, a member of class IDOMXSLProcessor.
R	stylesheet (see page 26353)	This is stylesheet, a member of class IDOMXSLProcessor.

196.2.24.2 IDOMXSLProcessor Methods

The methods of the IDOMXSLProcessor class are listed here.

Public Methods

	Name	Description
	Get_input (see page 26351)	This is Get_input, a member of class IDOMXSLProcessor.
	Get_output (see page 26351)	This is Get_output, a member of class IDOMXSLProcessor.
	Get_stylesheet (see page 26351)	This is Get_stylesheet, a member of class IDOMXSLProcessor.
	reset (see page 26352)	This is reset, a member of class IDOMXSLProcessor.
	Set_input (see page 26352)	This is Set_input, a member of class IDOMXSLProcessor.
	Set_output (see page 26352)	This is Set_output, a member of class IDOMXSLProcessor.
	setParameter (see page 26352)	This is setParameter, a member of class IDOMXSLProcessor.
	transform (see page 26352)	This is transform, a member of class IDOMXSLProcessor.

196.2.24.2.1 IDOMXSLProcessor.Get_input Method

Pascal

```
function Get_input: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_input();
```

Description

This is Get_input, a member of class IDOMXSLProcessor.

196.2.24.2.2 IDOMXSLProcessor.Get_output Method

Pascal

```
function Get_output: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_output();
```

Description

This is Get_output, a member of class IDOMXSLProcessor.

196.2.24.2.3 IDOMXSLProcessor.Get_stylesheet Method

Pascal

```
function Get_stylesheet: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode Get_stylesheet();
```

Description

This is Get_stylesheet, a member of class IDOMXSLProcessor.

196.2.24.2.4 IDOMXSLProcessor.reset Method

Pascal

```
procedure reset; safecall;
```

C++

```
__fastcall reset();
```

Description

This is reset, a member of class IDOMXSLProcessor.

196.2.24.2.5 IDOMXSLProcessor.Set_input Method

Pascal

```
procedure Set_input(const value: OleVariant); safecall;
```

C++

```
__fastcall Set_input(const OleVariant value);
```

Description

This is Set_input, a member of class IDOMXSLProcessor.

196.2.24.2.6 IDOMXSLProcessor.Set_output Method

Pascal

```
procedure Set_output(const value: OleVariant); safecall;
```

C++

```
__fastcall Set_output(const OleVariant value);
```

Description

This is Set_output, a member of class IDOMXSLProcessor.

196.2.24.2.7 IDOMXSLProcessor.setParameter Method

Pascal

```
procedure setParameter(const Name: DOMString; Value: OleVariant; const namespaceURI:
DOMString); safecall;
```

C++

```
__fastcall setParameter(const DOMString Name, OleVariant Value, const DOMString namespaceURI);
```

Description

This is setParameter, a member of class IDOMXSLProcessor.

196.2.24.2.8 IDOMXSLProcessor.transform Method

Pascal

```
function transform: WordBool; safecall;
```

C++

```
__fastcall WordBool transform();
```

Description

This is transform, a member of class IDOMXSLProcessor.

196.2.24.3 IDOMXSLProcessor Properties

The properties of the IDOMXSLProcessor class are listed here.

Public Properties

	Name	Description
	input (see page 26353)	This is input, a member of class IDOMXSLProcessor.
	output (see page 26353)	This is output, a member of class IDOMXSLProcessor.
R	stylesheet (see page 26353)	This is stylesheet, a member of class IDOMXSLProcessor.

196.2.24.3.1 IDOMXSLProcessor.input Property

Pascal

```
property input: OleVariant;
```

C++

```
__property OleVariant input;
```

Description

This is input, a member of class IDOMXSLProcessor.

196.2.24.3.2 IDOMXSLProcessor.output Property

Pascal

```
property output: OleVariant;
```

C++

```
__property OleVariant output;
```

Description

This is output, a member of class IDOMXSLProcessor.

196.2.24.3.3 IDOMXSLProcessor.stylesheet Property

Pascal

```
property stylesheet: IDOMNode;
```

C++

```
__property IDOMNode stylesheet;
```

Description

This is stylesheet, a member of class IDOMXSLProcessor.

196.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DOMVendorNotSupported (see page 26354)	This is function xmldom.DOMVendorNotSupported.
	ExtractLocalName (see page 26354)	Strips the namespace prefix, if present, from the tag name of an XML node.
	ExtractPrefix (see page 26355)	Returns the namespace prefix of an XML node's tag name.
	GetDOM (see page 26356)	Returns the top-level DOM interface for a registered DOM implementation.
	GetDOMNodeEx (see page 26356)	This is function xmldom.GetDOMNodeEx.
	GetDOMVendor (see page 26357)	Returns the TDOMVendor (see page 26263) object for a specified DOM vendor.
	IsPrefixed (see page 26357)	Indicates whether an XML tag name includes a namespace prefix.
	MakeNodeName (see page 26358)	Assembles a full tag name from a local name and namespace prefix.
	NodeMatches (see page 26358)	Indicates whether a specified node matches a given namespace and tag name.
	RegisterDOMVendor (see page 26359)	Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.
	SameNamespace (see page 26359)	Indicates whether a specified node is defined within a specified namespace.
	SameNamespace (see page 26359)	Indicates whether a specified node is defined within a specified namespace.
	UnRegisterDOMVendor (see page 26360)	Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 26359) .

196.3.1 xmldom.DOMVendorNotSupported Function

Pascal

```
procedure DOMVendorNotSupported(const PropOrMethod: string; const VendorName: string);
```

C++

```
DOMVendorNotSupported(const AnsiString PropOrMethod, const AnsiString VendorName);
```

File

xmldom

Description

This is function xmldom.DOMVendorNotSupported.

196.3.2 xmldom.ExtractLocalName Function

Strips the namespace prefix, if present, from the tag name of an XML node.

Pascal

```
function ExtractLocalName(const AName: DOMString): DOMString;
```

C++

```
DOMString ExtractLocalName(const DOMString AName);
```

File

xmldom

Description

Call ExtractLocalName to convert a full tag name for an XML node into the corresponding local name.

AName is the tag name to be converted.

ExtractLocalName returns the value of AName with any namespace prefix stripped away.

See Also

ExtractPrefix (see page 26355)

IsPrefixed (see page 26357)

NodeMatches (see page 26358)

IXMLNode

SameNamespace (see page 26359)

196.3.3 xmldom.ExtractPrefix Function

Returns the namespace prefix of an XML node's tag name.

Pascal

```
function ExtractPrefix(const AName: DOMString): DOMString;
```

C++

```
DOMString ExtractPrefix(const DOMString AName);
```

File

xmldom

Description

Call ExtractPrefix to determine the namespace prefix, if any, of a full tag name for an XML node.

AName is the tag name of the XML node.

ExtractPrefix returns the namespace prefix, not including the colon (:) that separates the namespace from the local name of the XML node. If the tag name does not include a namespace prefix, ExtractPrefix returns an empty string.

See Also

ExtractLocalName (see page 26354)

IsPrefixed (see page 26357)

SameNamespace (see page 26359)

NodeMatches (see page 26358)

196.3.4 xmldom.GetDOM Function

Returns the top-level DOM interface for a registered DOM implementation.

Pascal

```
function GetDOM(const VendorDesc: string = ''): IDOMImplementation;
```

C++

```
IDOMImplementation GetDOM(const AnsiString VendorDesc = '');
```

File

xmldom

Description

Call GetDOM to obtain an IDOMImplementation (see page 26301) interface that you can use for parsing and editing XML documents. The IDOMImplementation (see page 26301) interface is the top-level DOM interface, which you can use to check for the presence of a specific feature or to obtain an interface for working with a DOM document.

VendorDesc is a short descriptive name that identifies the DOM implementation. This name is returned by the Description method of the DOM implementation factory that is used to register the implementation.

Note: The DOM implementation must be registered before you can access it using GetDOM. To register a DOM implementation, use the RegisterDOMVendor (see page 26359) procedure.

See Also

RegisterDOMVendor (see page 26359)

DOMVendors (see page 26365)

GetDOMVendor (see page 26357)

TXMLDocument

Using the Document Object Model

196.3.5 xmldom.GetDOMNodeEx Function

Pascal

```
function GetDOMNodeEx(const Node: IDOMNode): IDOMNodeEx;
```

C++

```
IDOMNodeEx GetDOMNodeEx(const IDOMNode Node);
```

File

xmldom

Description

This is function xmldom.GetDOMNodeEx.

196.3.6 xmldom.GetDOMVendor Function

Returns the TDOMVendor (see page 26263) object for a specified DOM vendor.

Pascal

```
function GetDOMVendor(VendorDesc: string): TDOMVendor;
```

C++

```
TDOMVendor GetDOMVendor(AnsiString VendorDesc);
```

File

xmldom

Description

Call GetDOMVendor to obtain the TDOMVendor (see page 26263) object that represents a registered DOM implementation. You can then assign this return value as the DOMVendor property of TXMLDocument, or call this object's DOMImplementation method to access the IDOMImplementation (see page 26301) interface for the DOM implementation.

VendorDesc is the descriptive string that identifies the particular DOM implementation that is desired. This is the value returned by the TDOMVendor (see page 26263) object's Description method.

See Also

RegisterDOMVendor (see page 26359)

DOMVendors (see page 26365)

TXMLDocument

196.3.7 xmldom.IsPrefixed Function

Indicates whether an XML tag name includes a namespace prefix.

Pascal

```
function IsPrefixed(const AName: DOMString): Boolean;
```

C++

```
Boolean IsPrefixed(const DOMString AName);
```

File

xmldom

Description

Call IsPrefixed to determine whether a tag name includes a namespace prefix.

AName is the tag name of the XML node.

IsPrefixed returns true if AName includes a namespace prefix followed by the colon (:) separator character, false otherwise.

See Also

ExtractLocalName (see page 26354)

ExtractPrefix (see page 26355)

IXMLNode

196.3.8 xmldom.MakeNodeName Function

Assembles a full tag name from a local name and namespace prefix.

Pascal

```
function MakeNodeName(const Prefix: DOMString; const LocalName: DOMString): DOMString;
```

C++

```
DOMString MakeNodeName(const DOMString Prefix, const DOMString LocalName);
```

File

xmldom

Description

Call MakeNodeName to create a tag name from a namespace prefix and a local tag name.

Prefix is the namespace prefix.

LocalName is the local name for the node.

MakeNodeName returns the full tag name that consists of the namespace prefix, followed by a colon and then the local name.

See Also

ExtractPrefix (see page 26355)

ExtractLocalName (see page 26354)

196.3.9 xmldom.NodeMatches Function

Indicates whether a specified node matches a given namespace and tag name.

Pascal

```
function NodeMatches(const Node: IDOMNode; const TagName: DOMString; const NamespaceURI:
DOMString): Boolean; overload;
```

C++

```
Boolean NodeMatches(const IDOMNode Node, const DOMString TagName, const DOMString
NamespaceURI);
```

File

xmldom

Description

Call NodeMatches to determine whether the node with the interface specified by Node refers to the same node as is described by the TagName and NamespaceURI parameters.

NodeMatches returns true if

The value of Node's NamespaceURI property is the same as the NamespaceURI parameter.

The local name or tag name of Node is the same as the TagName parameter.

Tip: Given an IXMLNode interface, you can obtain the IDOMNode (see page 26306) interface required for the Node parameter by reading its DOMNode property.

See Also

ExtractLocalName (see page 26354)

ExtractPrefix (see page 26355)

IXMLNode

SameNamespace (see page 26359)

IXMLNode

196.3.10 xmldom.RegisterDOMVendor Function

Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.

Pascal

```
procedure RegisterDOMVendor(const Vendor: TDOMVendor);
```

C++

```
RegisterDOMVendor(const TDOMVendor Vendor);
```

File

xmldom

Description

Call RegisterDOMVendor to register a DOM implementation that you want to use for parsing XML documents. A DOM (Document Object Model) implementation is a set of objects that implement the standard DOM interfaces.

If you are using another DOM implementation, you must create a TDOMVendor (see page 26263) descendant that can supply the IDOMImplementation (see page 26301) interface and description string for the DOM implementation. Pass an instance of this object as the Vendor parameter to RegisterDOMVendor.

See Also

UnRegisterDOMVendor (see page 26360)

TXMLDocument

TXMLDocument

DOMVendors (see page 26365)

Using the Document Object Model

196.3.11 xmldom.SameNamespace Function

Indicates whether a specified node is defined within a specified namespace.

Pascal

```
function SameNamespace(const Node: IDOMNode; const namespaceURI: WideString): Boolean;
overload;
```

```
function SameNamespace(const URI1: WideString; const URI2: WideString): Boolean; overload;
```

C++

```
Boolean SameNamespace(const IDOMNode Node, const BSTR namespaceURI);
Boolean SameNamespace(const BSTR URI1, const BSTR URI2);
```

File

xmldom

Description

Call SameNamespace to determine whether the two parameters identify the same namespace.

Using the first syntax, the Node parameter identifies a node and the NamespaceURI parameter a namespace. SameNamespace checks whether the node is defined in the specified namespace.

Using the second syntax, both parameters are namespace URI values. SameNamespace checks whether they both identify the same namespace.

Tip: Given an IXMLNode interface, you can obtain the IDOMNode (see page 26306) interface required for the Node parameter by reading its DOMNode property.

See Also

ExtractLocalName (see page 26354)

ExtractPrefix (see page 26355)

IXMLNode

SameNamespace

IXMLNode

IXMLNode

196.3.12 xmldom.UnRegisterDOMVendor Function

Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 26359) .

Pascal

```
procedure UnRegisterDOMVendor(const Vendor: TDOMVendor);
```

C++

```
UnRegisterDOMVendor(const TDOMVendor Vendor);
```

File

xmldom

Description

Call UnRegisterDOMVendor to unregister a DOM implementation when it is no longer available. After unregistering a DOM implementation, it can't be used by TXMLDocument for parsing XML documents.

Vendor is the TDOMVendor (see page 26263) descendant the represents the DOM implementation that is to be unregistered. It must be the same object used when registering the DOM implementation when you called RegisterDOMVendor (see page 26359).

See Also

RegisterDOMVendor (see page 26359)

TXMLDocument

TXMLDocument

DOMVendors (see page 26365)

Using the Document Object Model

196.4 Types

The following table lists types in this documentation.

Types

Name	Description
DOMNodeType (see page 26362)	DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.
DOMString (see page 26362)	DOMString is the type for strings that are used by a DOM parser.
DOMTimeStamp (see page 26363)	This is type xmldom.DOMTimeStamp.
TAsyncEventHandler (see page 26363)	TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.
TDOMVendorArray (see page 26364)	This is type xmldom.TDOMVendorArray.

196.4.1 xmldom.DOMNodeType Type

DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.

Pascal

```
DOMNodeType = Word;
```

C++

```
Word DOMNodeType;
```

File

xmldom

Description

DOMNodeType is the type of the nodeType property on the IDOMNode (see page 26306) interface. It is a flag, defined by W3C, that indicates the role played by a node in the parsed version of an XML document.

See Also

IDOMNode

196.4.2 xmldom.DOMString Type

DOMString is the type for strings that are used by a DOM parser.

Pascal

```
DOMString = WideString;
```

C++

```
BSTR DOMString;
```

File

xmldom

Description

DOM implementations work with wide characters. The strings that are used, therefore, when working with DOM interfaces, are of type DOMString, which simply maps to the WideString type.

196.4.3 xmldom.DOMTimeStamp Type

Pascal

```
DOMTimeStamp = Int64;
```

C++

```
Int64 DOMTimeStamp;
```

File

xmldom

Description

This is type xmldom.DOMTimeStamp.

196.4.4 xmldom.TAsyncEventHandler Type

TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.

Pascal

```
TAsyncEventHandler = procedure (Sender: TObject; AsyncLoadState: Integer) of object;
```

C++

```
(Sender: TObject; AsyncLoadState: Integer) ( TAsyncEventHandler)();
```

File

xmldom

Description

TAsyncEventHandler is the type for event handlers that respond at various stages during the asynchronous parsing of an XML document.

Sender is the TXMLDocument object that receives the event.

AsyncLoadState is an integer that indicates the current stage of the parsing process. Its value is vendor-specific, and corresponds to the document's AsyncLoadState property.

See Also

TXMLDocument

IXMLDocument

AsyncLoadState

196.4.5 xmldom.TDOMVendorArray Type

Pascal

```
TDOMVendorArray = array of TDOMVendor;
```

C++

```
array of TDOMVendor TDOMVendorArray;
```

File

xmldom

Description

This is type xmldom.TDOMVendorArray.

196.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefaultDOMVendor (see page 26365)	This is variable xmldom.DefaultDOMVendor.
DOMVendors (see page 26365)	This is variable xmldom.DOMVendors.

196.5.1 xmldom.DefaultDOMVendor Variable

Pascal

```
DefaultDOMVendor: string;
```

C++

```
AnsiString DefaultDOMVendor;
```

File

xmldom

Description

This is variable xmldom.DefaultDOMVendor.

196.5.2 xmldom.DOMVendors Variable

Pascal

```
DOMVendors: TDOMVendorList;
```

C++

```
TDOMVendorList DOMVendors;
```

File

xmldom

Description

This is variable xmldom.DOMVendors.

196.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ATTRIBUTE_NODE (see page 26366)	This is constant xmldom.ATTRIBUTE_NODE.
CDATA_SECTION_NODE (see page 26367)	This is constant xmldom.CDATA_SECTION_NODE.
COMMENT_NODE (see page 26367)	This is constant xmldom.COMMENT_NODE.
DOCUMENT_FRAGMENT_NODE (see page 26367)	This is constant xmldom.DOCUMENT_FRAGMENT_NODE.
DOCUMENT_NODE (see page 26368)	This is constant xmldom.DOCUMENT_NODE.
DOCUMENT_TYPE_NODE (see page 26368)	This is constant xmldom.DOCUMENT_TYPE_NODE.
DOMSTRING_SIZE_ERR (see page 26368)	This is constant xmldom.DOMSTRING_SIZE_ERR.
DOMWrapperVersion (see page 26369)	This is constant xmldom.DOMWrapperVersion.
ELEMENT_NODE (see page 26369)	This is constant xmldom.ELEMENT_NODE.
ENTITY_NODE (see page 26369)	This is constant xmldom.ENTITY_NODE.
ENTITY_REFERENCE_NODE (see page 26370)	This is constant xmldom.ENTITY_REFERENCE_NODE.
HIERARCHY_REQUEST_ERR (see page 26370)	This is constant xmldom.HIERARCHY_REQUEST_ERR.
INDEX_SIZE_ERR (see page 26370)	This is constant xmldom.INDEX_SIZE_ERR.
INUSE_ATTRIBUTE_ERR (see page 26371)	This is constant xmldom.INUSE_ATTRIBUTE_ERR.
INVALID_ACCESS_ERR (see page 26371)	This is constant xmldom.INVALID_ACCESS_ERR.
INVALID_CHARACTER_ERR (see page 26371)	This is constant xmldom.INVALID_CHARACTER_ERR.
INVALID_MODIFICATION_ERR (see page 26372)	This is constant xmldom.INVALID_MODIFICATION_ERR.
INVALID_STATE_ERR (see page 26372)	This is constant xmldom.INVALID_STATE_ERR.
NAMESPACE_ERR (see page 26372)	This is constant xmldom.NAMESPACE_ERR.
NO_DATA_ALLOWED_ERR (see page 26373)	This is constant xmldom.NO_DATA_ALLOWED_ERR.
NO_MODIFICATION_ALLOWED_ERR (see page 26373)	This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.
NOT_FOUND_ERR (see page 26373)	This is constant xmldom.NOT_FOUND_ERR.
NOT_SUPPORTED_ERR (see page 26374)	This is constant xmldom.NOT_SUPPORTED_ERR.
NOTATION_NODE (see page 26374)	This is constant xmldom.NOTATION_NODE.
NSDelim (see page 26374)	This is constant xmldom.NSDelim.
PROCESSING_INSTRUCTION_NODE (see page 26375)	This is constant xmldom.PROCESSING_INSTRUCTION_NODE.
SEncoding (see page 26375)	This is constant xmldom.SEncoding.
SHttp (see page 26375)	This is constant xmldom.SHttp.
SStandalone (see page 26376)	This is constant xmldom.SStandalone.
SVersion (see page 26376)	This is constant xmldom.SVersion.
SXML (see page 26376)	This is constant xmldom.SXML.
SXMLNamespaceURI (see page 26377)	This is constant xmldom.SXMLNamespaceURI.
SXMLNS (see page 26377)	This is constant xmldom.SXMLNS.
SXMLPrefixNamespaceURI (see page 26377)	This is constant xmldom.SXMLPrefixNamespaceURI.
SYNTAX_ERR (see page 26378)	This is constant xmldom.SYNTAX_ERR.
TEXT_NODE (see page 26378)	This is constant xmldom.TEXT_NODE.
WRONG_DOCUMENT_ERR (see page 26378)	This is constant xmldom.WRONG_DOCUMENT_ERR.

196.6.1 xmldom.ATTRIBUTE_NODE Constant

Pascal

```
ATTRIBUTE_NODE = 2;
```

C++

```
ATTRIBUTE_NODE = 2;
```

File

xmldom

Description

This is constant xmldom.ATTRIBUTE_NODE.

196.6.2 xmldom.CDATA_SECTION_NODE Constant

Pascal

```
CDATA_SECTION_NODE = 4;
```

C++

```
CDATA_SECTION_NODE = 4;
```

File

xmldom

Description

This is constant xmldom.CDATA_SECTION_NODE.

196.6.3 xmldom.COMMENT_NODE Constant

Pascal

```
COMMENT_NODE = 8;
```

C++

```
COMMENT_NODE = 8;
```

File

xmldom

Description

This is constant xmldom.COMMENT_NODE.

196.6.4 xmldom.DOCUMENT_FRAGMENT_NODE Constant

Pascal

```
DOCUMENT_FRAGMENT_NODE = 11;
```

C++

```
DOCUMENT_FRAGMENT_NODE = 11;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_FRAGMENT_NODE.

196.6.5 xmldom.DOCUMENT_NODE Constant

Pascal

```
DOCUMENT_NODE = 9;
```

C++

```
DOCUMENT_NODE = 9;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_NODE.

196.6.6 xmldom.DOCUMENT_TYPE_NODE Constant

Pascal

```
DOCUMENT_TYPE_NODE = 10;
```

C++

```
DOCUMENT_TYPE_NODE = 10;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_TYPE_NODE.

196.6.7 xmldom.DOMSTRING_SIZE_ERR Constant

Pascal

```
DOMSTRING_SIZE_ERR = 2;
```

C++

```
DOMSTRING_SIZE_ERR = 2;
```

File

xmldom

Description

This is constant xmldom.DOMSTRING_SIZE_ERR.

196.6.8 xmldom.DOMWrapperVersion Constant

Pascal

```
DOMWrapperVersion = 1.2;
```

C++

```
DOMWrapperVersion = 1.2;
```

File

xmldom

Description

This is constant xmldom.DOMWrapperVersion.

196.6.9 xmldom.ELEMENT_NODE Constant

Pascal

```
ELEMENT_NODE = 1;
```

C++

```
ELEMENT_NODE = 1;
```

File

xmldom

Description

This is constant xmldom.ELEMENT_NODE.

196.6.10 xmldom.ENTITY_NODE Constant

Pascal

```
ENTITY_NODE = 6;
```

C++

```
ENTITY_NODE = 6;
```

File

xmldom

Description

This is constant xmldom.ENTITY_NODE.

196.6.11 xmldom.ENTITY_REFERENCE_NODE Constant

Pascal

```
ENTITY_REFERENCE_NODE = 5;
```

C++

```
ENTITY_REFERENCE_NODE = 5;
```

File

xmldom

Description

This is constant xmldom.ENTITY_REFERENCE_NODE.

196.6.12 xmldom.HIERARCHY_REQUEST_ERR Constant

Pascal

```
HIERARCHY_REQUEST_ERR = 3;
```

C++

```
HIERARCHY_REQUEST_ERR = 3;
```

File

xmldom

Description

This is constant xmldom.HIERARCHY_REQUEST_ERR.

196.6.13 xmldom.INDEX_SIZE_ERR Constant

Pascal

```
INDEX_SIZE_ERR = 1;
```

C++

```
INDEX_SIZE_ERR = 1;
```

File

xmldom

Description

This is constant xmldom.INDEX_SIZE_ERR.

196.6.14 xmldom.INUSE_ATTRIBUTE_ERR Constant

Pascal

```
INUSE_ATTRIBUTE_ERR = 10;
```

C++

```
INUSE_ATTRIBUTE_ERR = 10;
```

File

xmldom

Description

This is constant xmldom.INUSE_ATTRIBUTE_ERR.

196.6.15 xmldom.INVALID_ACCESS_ERR Constant

Pascal

```
INVALID_ACCESS_ERR = 15;
```

C++

```
INVALID_ACCESS_ERR = 15;
```

File

xmldom

Description

This is constant xmldom.INVALID_ACCESS_ERR.

196.6.16 xmldom.INVALID_CHARACTER_ERR Constant

Pascal

```
INVALID_CHARACTER_ERR = 5;
```

C++

```
INVALID_CHARACTER_ERR = 5;
```

File

xmldom

Description

This is constant xmldom.INVALID_CHARACTER_ERR.

196.6.17 xmldom.INVALID_MODIFICATION_ERR Constant

Pascal

```
INVALID_MODIFICATION_ERR = 13;
```

C++

```
INVALID_MODIFICATION_ERR = 13;
```

File

xmldom

Description

This is constant xmldom.INVALID_MODIFICATION_ERR.

196.6.18 xmldom.INVALID_STATE_ERR Constant

Pascal

```
INVALID_STATE_ERR = 11;
```

C++

```
INVALID_STATE_ERR = 11;
```

File

xmldom

Description

This is constant xmldom.INVALID_STATE_ERR.

196.6.19 xmldom.NAMESPACE_ERR Constant

Pascal

```
NAMESPACE_ERR = 14;
```

C++

```
NAMESPACE_ERR = 14;
```

File

xmldom

Description

This is constant xmldom.NAMESPACE_ERR.

196.6.20 xmldom.NO_DATA_ALLOWED_ERR Constant

Pascal

```
NO_DATA_ALLOWED_ERR = 6;
```

C++

```
NO_DATA_ALLOWED_ERR = 6;
```

File

xmldom

Description

This is constant xmldom.NO_DATA_ALLOWED_ERR.

196.6.21 xmldom.NO_MODIFICATION_ALLOWED_ERR Constant

Pascal

```
NO_MODIFICATION_ALLOWED_ERR = 7;
```

C++

```
NO_MODIFICATION_ALLOWED_ERR = 7;
```

File

xmldom

Description

This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.

196.6.22 xmldom.NOT_FOUND_ERR Constant

Pascal

```
NOT_FOUND_ERR = 8;
```

C++

```
NOT_FOUND_ERR = 8;
```

File

xmldom

Description

This is constant xmldom.NOT_FOUND_ERR.

196.6.23 xmldom.NOT_SUPPORTED_ERR Constant

Pascal

```
NOT_SUPPORTED_ERR = 9;
```

C++

```
NOT_SUPPORTED_ERR = 9;
```

File

xmldom

Description

This is constant xmldom.NOT_SUPPORTED_ERR.

196.6.24 xmldom.NOTATION_NODE Constant

Pascal

```
NOTATION_NODE = 12;
```

C++

```
NOTATION_NODE = 12;
```

File

xmldom

Description

This is constant xmldom.NOTATION_NODE.

196.6.25 xmldom.NSDelim Constant

Pascal

```
NSDelim = ':';
```

C++

```
NSDelim = ':';
```

File

xmldom

Description

This is constant xmldom.NSDelim.

196.6.26 xmldom.PROCESSING_INSTRUCTION_NODE Constant

Pascal

```
PROCESSING_INSTRUCTION_NODE = 7;
```

C++

```
PROCESSING_INSTRUCTION_NODE = 7;
```

File

xmldom

Description

This is constant xmldom.PROCESSING_INSTRUCTION_NODE.

196.6.27 xmldom.SEncoding Constant

Pascal

```
SEncoding = 'encoding';
```

C++

```
SEncoding = 'encoding';
```

File

xmldom

Description

This is constant xmldom.SEncoding.

196.6.28 xmldom.SHttp Constant

Pascal

```
SHttp = 'http:/';
```

C++

```
SHttp = 'http:/';
```

File

xmldom

Description

This is constant xmldom.SHttp.

196.6.29 xmldom.SStandalone Constant

Pascal

```
SStandalone = 'standalone';
```

C++

```
SStandalone = 'standalone';
```

File

xmldom

Description

This is constant xmldom.SStandalone.

196.6.30 xmldom.SVersion Constant

Pascal

```
SVersion = 'version';
```

C++

```
SVersion = 'version';
```

File

xmldom

Description

This is constant xmldom.SVersion.

196.6.31 xmldom.SXML Constant

Pascal

```
SXML = 'xml';
```

C++

```
SXML = 'xml';
```

File

xmldom

Description

This is constant xmldom.SXML.

196.6.32 xmldom.SXMLNamespaceURI Constant

Pascal

```
SXMLNamespaceURI = SHttp+'/www.w3.org/2000/xmlns/';
```

C++

```
SXMLNamespaceURI = SHttp+'/www.w3.org/2000/xmlns/';
```

File

xmldom

Description

This is constant xmldom.SXMLNamespaceURI.

196.6.33 xmldom.SXMLNS Constant

Pascal

```
SXMLNS = 'xmlns';
```

C++

```
SXMLNS = 'xmlns';
```

File

xmldom

Description

This is constant xmldom.SXMLNS.

196.6.34 xmldom.SXMLPrefixNamespaceURI Constant

Pascal

```
SXMLPrefixNamespaceURI = SHttp+'/www.w3.org/XML/1998/namespace';
```

C++

```
SXMLPrefixNamespaceURI = SHttp+'/www.w3.org/XML/1998/namespace';
```

File

xmldom

Description

This is constant xmldom.SXMLPrefixNamespaceURI.

196.6.35 xmldom.SYNTAX_ERR Constant

Pascal

```
SYNTAX_ERR = 12;
```

C++

```
SYNTAX_ERR = 12;
```

File

xmldom

Description

This is constant xmldom.SYNTAX_ERR.

196.6.36 xmldom.TEXT_NODE Constant

Pascal

```
TEXT_NODE = 3;
```

C++

```
TEXT_NODE = 3;
```

File

xmldom

Description

This is constant xmldom.TEXT_NODE.

196.6.37 xmldom.WRONG_DOCUMENT_ERR Constant

Pascal

```
WRONG_DOCUMENT_ERR = 4;
```

C++

```
WRONG_DOCUMENT_ERR = 4;
```

File

xmldom

Description

This is constant xmldom.WRONG_DOCUMENT_ERR.

197 XMLIntf Namespace

This is namespace XMLIntf.

Topics

Name	Description
Classes (see page 26381)	The following table lists classes in this documentation.
Interfaces (see page 26382)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 26458)	The following table lists structs, records, enums in this documentation.
Types (see page 26463)	The following table lists types in this documentation.
Constants (see page 26464)	The following table lists constants in this documentation.

Classes

	Name	Description
	EXMLDocError (see page 26381)	EXMLDocError is the exception class for errors editing or parsing an XML document.

Constants

Name	Description
NodeTypeNames (see page 26464)	This is constant XMLIntf.NodeTypeNames.

Interfaces

	Name	Description
	IXMLDocument (see page 26382)	IXMLDocument represents an XML (see page 26410) document.
	IXMLNode (see page 26411)	IXMLNode is the interface for a node in an XML (see page 26439) document.
	IXMLNodeCollection (see page 26440)	IXMLNodeCollection is the interface for a set of child nodes that are all the same type.
	IXMLNodeList (see page 26445)	IXMLNodeList represents a set of nodes in an XML document.

Structs, Records, Enums

	Name	Description
	TNodeType (see page 26458)	TNodeType identifies the type of a node in an XML document.
	TParseOption (see page 26460)	TParseOption and TParseOptions (see page 26463) represent implementation-specific options that are followed when parsing the XML document.
	TXMLDocOption (see page 26460)	TXMLDocOption and TXMLDocOptions (see page 26463) indicate types of information that an XML document automatically supplies.
	TXMLEncodingType (see page 26461)	TXMLEncodingType indicates the character set used to encode characters in an XML document.

Types

Name	Description
TParseOptions (see page 26463)	This is type XMLIntf.TParseOptions.
TXMLDocOptions (see page 26463)	This is type XMLIntf.TXMLDocOptions.

197.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXMLDocError (see page 26381)	EXMLDocError is the exception class for errors editing or parsing an XML document.

197.1.1 EXMLDocError Class

EXMLDocError is the exception class for errors editing or parsing an XML document.

Class Hierarchy

Pascal

```
EXMLDocError = class(Exception);
```

C++

```
class EXMLDocError : public Exception;
```

File

XMLIntf

Description

EXMLDocError is raised by TXMLDocument or TXMLNode when

An error occurs when loading an XML document.

An error occurs when creating a node in an XML document.

A required DOM interface is not found.

An option is requested that is not supported by the DOM implementation.

An attempt is made to perform an action that is not consistent with the specified node type.

See Also

XMLDocError

TXMLDocument (see page 26097)

TXMLNode (see page 26147)

197.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IXMLDocument (see page 26382)	IXMLDocument represents an XML (see page 26410) document.
	IXMLNode (see page 26411)	IXMLNode is the interface for a node in an XML (see page 26439) document.
	IXMLNodeCollection (see page 26440)	IXMLNodeCollection is the interface for a set of child nodes that are all the same type.
	IXMLNodeList (see page 26445)	IXMLNodeList represents a set of nodes in an XML document.

197.2.1 IXMLDocument Interface

IXMLDocument represents an XML (see page 26410) document.

Class Hierarchy

Pascal

```
IXMLDocument = interface(IInterface);
```

C++

```
__interface IXMLDocument : public IInterface;
```

File

XMLIntf

Description

Use IXMLDocument to work with an XML (see page 26410) document. Applications can obtain an IXMLDocument interface through a TXMLDocument component, using the global LoadXMLDocument function, or through the OwnerDocument property of any node in the document.

Like the related DOM interface IDOMDocument, you can use IXMLDocument to access the contents of an XML (see page 26410) document and to create new nodes. In addition, IXMLDocument lets you load an XML (see page 26410) document that is stored on disk or assign a string of raw (unparsed) XML (see page 26410) as the contents of the document.

TXMLDocument implements the IXMLDocument interface. Typically, the TXMLDocument component is the starting point for working with an XML (see page 26410) document.

Note: C++ method declarations that use IXMLDocument use the _di_IXMLDocument type instead. This type is a DelphiInterface wrapper around the IXMLDocument interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLDocument >  _di_IXMLDocument;
```

See Also

IXMLNode (see page 26411)

EXMLDocError (see page 26381)

TXMLDocument (see page 26097)

IXMLNode (see page 26411)

LoadXMLDocument

197.2.1.1 IXMLDocument Members

The following tables list the members exposed by IXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.

	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	Options (see page 26408)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

197.2.1.2 IXMLDocument Methods

The methods of the IXMLDocument class are listed here.

Public Methods

	Name	Description
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.

	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.

197.2.1.2.1 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	IXMLDocument.AddChild (DOMString) (see page 26385)	Creates and adds a node to the child nodes of this document.
	IXMLDocument.AddChild (DOMString, DOMString) (see page 26385)	Creates and adds a node to the child nodes of this document.

197.2.1.2.1.1 IXMLDocument.AddChild Method (DOMString)

Creates and adds a node to the child nodes of this document.

Pascal

```
function AddChild(const TagName: DOMString): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI);
```

Description

Call AddChild to add a new child element node to the document itself. The new node is added to the end of the list maintained by the ChildNodes (see page 26405) property.

TagName is the tag name for the new element node.

NamespaceURI identifies the namespace, if any, that includes the new node's definition.

AddChild returns the interface for the newly created node.

Note: Do not call AddChild to add a child to the document element of this document. When adding data to the XML (see page 26410) document, use the AddChild method of the document element or of the node in the hierarchy that should be the parent of the new node.

See Also

AddChild (see page 26414)

CreateNode (see page 26387)

CreateElement (see page 26386)

ChildNodes (see page 26405)

DocumentElement (see page 26405)

197.2.1.2.2 IXMLDocument.CreateElement Method

Creates a new element node that is associated with this document.

Pascal

```
function CreateElement(const TagOrData: DOMString; const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateElement(const DOMString TagOrData, const DOMString NamespaceURI);
```

Description

Call CreateElement to create a new generic element node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 26405) list of any node in the document (including this document's ChildNodes (see page 26405) property). It can also be assigned to the DocumentElement (see page 26405) property to replace the entire data hierarchy of this document.

TagOrData provides the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

CreateElement returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 26385) method.

See Also

AddChild (see page 26414)

ChildNodes (see page 26405)

DocumentElement (see page 26405)

AddChild (see page 26385)

CreateNode (see page 26387)

197.2.1.2.3 IXMLDocument.CreateNode Method

Creates a new node that is associated with this document.

Pascal

```
function CreateNode(const NameOrData: DOMString; NodeType: TNodeType = ntElement; const
AddlData: DOMString = ''): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNode(const DOMString NameOrData, TNodeType NodeType = ntElement,
const DOMString AddlData = '');
```

Description

Call CreateNode to create a new generic XML (see page 26410) node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 26405) or AttributeNodes list of any node in the document (including this document's ChildNodes (see page 26405) property).

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.

ntProcessingInstr	The content of the processing instruction, except for the target.

CreateNode returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 26385) method.

See Also

AddChild (see page 26414)

ChildNodes (see page 26405)

AttributeNodes (see page 26430)

DocumentElement (see page 26405)

CreateElement (see page 26386)

AddChild (see page 26385)

197.2.1.2.4 IXMLDocument.GeneratePrefix Method

Generates a unique namespace prefix that can be used for a node in the document.

Pascal

```
function GeneratePrefix(const Node: IXMLNode): DOMString;
```

C++

```
__fastcall DOMString GeneratePrefix(const IXMLNode Node);
```

Description

The AddChild (see page 26385) method for each node allows the caller to specify that the new node should use an automatically-generated namespace prefix. When this option is specified, the node calls GeneratePrefix to generate a unique string to act as a namespace prefix.

Node (see page 26407) is the interface for the node which will use the newly-generated namespace prefix.

GeneratePrefix returns a unique string that is not already used in the document to represent a namespace URI. The generated namespace prefixes are only unique within a single document.

See Also

AddChild (see page 26414)

197.2.1.2.5 IXMLDocument.GetActive Method

Returns the value of the Active (see page 26403) property.

Pascal

```
function GetActive: Boolean;
```

C++

```
__fastcall Boolean GetActive();
```

Description

GetActive is the read implementation of the Active (see page 26403) property.

See Also

Active (see page 26403)

197.2.1.2.6 IXMLDocument.GetAsyncLoadState Method

Returns the value of the AsyncLoadState (see page 26404) property.

Pascal

```
function GetAsyncLoadState: Integer;
```

C++

```
__fastcall int GetAsyncLoadState();
```

Description

GetAsyncLoadState is the read implementation of the AsyncLoadState (see page 26404) property.

See Also

AsyncLoadState (see page 26404)

197.2.1.2.7 IXMLDocument.GetChildNodes Method

Returns the value of the ChildNodes (see page 26405) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes (see page 26405) property.

See Also

ChildNodes (see page 26405)

197.2.1.2.8 IXMLDocument.GetDocBinding Method

Replaces a specified child node with an instance of a specified implementation class.

Pascal

```
function GetDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI: DOMString
= ''): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call GetDocBinding to specify the implementation class for one of the child nodes of the document node. After replacing the specified node with an instance of the specified class, GetDocBinding returns the interface of the document element.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 26405)

RegisterDocBinding (see page 26396)

ChildNodes (see page 26405)

197.2.1.2.9 IXMLDocument.GetDocumentElement Method

Returns the value of the DocumentElement (see page 26405) property.

Pascal

```
function GetDocumentElement: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentElement();
```

Description

GetDocumentElement is the read implementation of the DocumentElement (see page 26405) property.

See Also

DocumentElement (see page 26405)

197.2.1.2.10 IXMLDocument.GetDocumentNode Method

Returns the value of the Node (see page 26407) property.

Pascal

```
function GetDocumentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentNode();
```

Description

GetDocumentNode is the read implementation of the Node (see page 26407) property.

See Also

Node (see page 26407)

197.2.1.2.11 IXMLDocument.GetDOMDocument Method

Returns the value of the DOMDocument (see page 26405) property.

Pascal

```
function GetDOMDocument: IDOMDocument;
```

C++

```
__fastcall IDOMDocument GetDOMDocument();
```

Description

GetDOMDocument is the read implementation of the DOMDocument (see page 26405) property.

See Also

DOMDocument (see page 26405)

197.2.1.2.12 IXMLDocument.GetEncoding Method

Returns the value of the Encoding (see page 26406) property.

Pascal

```
function GetEncoding: DOMString;
```

C++

```
__fastcall DOMString GetEncoding();
```

Description

GetEncoding is the read implementation of the Encoding (see page 26406) property.

See Also

Encoding (see page 26406)

197.2.1.2.13 IXMLDocument.GetFileName Method

Returns the value of the FileName (see page 26406) property.

Pascal

```
function GetFileName: DOMString;
```

C++

```
__fastcall DOMString GetFileName();
```

Description

GetFileName is the read implementation of the FileName (see page 26406) property.

See Also

FileName (see page 26406)

197.2.1.2.14 IXMLDocument.GetModified Method

Returns the value of the Modified (see page 26407) property.

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

GetModified is the read implementation of the Modified (see page 26407) property.

See Also

Modified (see page 26407)

197.2.1.2.15 IXMLDocument.GetNodeIndentStr Method

Returns the value of the NodeIndentStr (see page 26408) property.

Pascal

```
function GetNodeIndentStr: DOMString;
```

C++

```
__fastcall DOMString GetNodeIndentStr();
```

Description

GetNodeIndentStr is the read implementation of the NodeIndentStr (see page 26408) property.

See Also

NodeIndentStr (see page 26408)

197.2.1.2.16 IXMLDocument.GetOptions Method

Returns the value of the Options (see page 26408) property.

Pascal

```
function GetOptions: TXMLDocOptions;
```

C++

```
__fastcall TXMLDocOptions GetOptions();
```

Description

GetOptions is the read implementation of the Options (see page 26408) property.

See Also

Options (see page 26408)

197.2.1.2.17 IXMLDocument.GetParseOptions Method

Returns the value of the ParseOptions (see page 26409) property.

Pascal

```
function GetParseOptions: TParseOptions;
```

C++

```
__fastcall TParseOptions GetParseOptions();
```

Description

GetParseOptions is the read implementation of the ParseOptions (see page 26409) property.

See Also

ParseOptions (see page 26409)

197.2.1.2.18 IXMLDocument.GetSchemaRef Method

Returns the value of the SchemaRef (see page 26409) property.

Pascal

```
function GetSchemaRef: DOMString;
```

C++

```
__fastcall DOMString GetSchemaRef();
```

Description

GetSchemaRef is the read implementation of the SchemaRef (see page 26409) property.

See Also

SchemaRef (see page 26409)

197.2.1.2.19 IXMLDocument.GetStandAlone Method

Returns the value of the StandAlone (see page 26410) property.

Pascal

```
function GetStandAlone: DOMString;
```

C++

```
__fastcall DOMString GetStandAlone();
```

Description

GetStandAlone is the read implementation of the StandAlone (see page 26410) property.

See Also

StandAlone (see page 26410)

197.2.1.2.20 IXMLDocument.GetVersion Method

Returns the value of the Version (see page 26410) property.

Pascal

```
function GetVersion: DOMString;
```

C++

```
__fastcall DOMString GetVersion();
```

Description

GetVersion is the read implementation of the Version (see page 26410) property.

See Also

Version (see page 26410)

197.2.1.2.21 IXMLDocument.GetXML Method

Returns the value of the XML (see page 26410) property.

Pascal

```
function GetXML: TStrings;
```

C++

```
__fastcall TStrings GetXML();
```

Description

GetXML is the read implementation of the XML (see page 26410) property.

See Also

XML (see page 26410)

197.2.1.2.22 IXMLDocument.IsEmptyDoc Method

Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.

Pascal

```
function IsEmptyDoc: Boolean;
```

C++

```
__fastcall Boolean IsEmptyDoc();
```

Description

Call IsEmptyDoc to determine whether the IXMLDocument (see page 26382) instance represents an empty document. IsEmptyDoc returns true if the DOMDocument (see page 26405) property is not set (for example, if there is no DOM implementation) or if this interface represents a document with no child nodes.

See Also

XML (see page 26410)

ChildNodes (see page 26405)

DOMDocument (see page 26405)

197.2.1.2.23 IXMLDocument.LoadFromFile Method

Loads an XML (see page 26410) document from disk.

Pascal

```
procedure LoadFromFile(const AFileName: DOMString);
```

C++

```
__fastcall LoadFromFile(const DOMString AFileName);
```

Description

Call LoadFromFile to load the XML (see page 26410) document specified by AFileName so that you can examine or modify it.

AFileName is the name of the file to load.

Once you have loaded an XML (see page 26410) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 26397) method.

See Also

SaveToFile (see page 26397)

XML (see page 26410)

FileName (see page 26406)

197.2.1.2.24 IXMLDocument.LoadFromStream Method

Loads an XML (see page 26410) document from a stream and activates it.

Pascal

```
procedure LoadFromStream(const Stream: TStream; EncodingType: TXMLEncodingType = xetUnknown);
```

C++

```
__fastcall LoadFromStream(const TStream Stream, TXMLEncodingType EncodingType = xetUnknown);
```

Description

Call LoadFromStream to load the XML (see page 26410) document from a stream.

Stream is a stream object that can be used to read the string of XML (see page 26410) that makes up the document.

EncodingType indicates the character set that is used for Stream. If EncodingType is xetUnknown (the default), LoadFromStream attempts to infer the encoding type from the XML (see page 26410) encoding declaration at the beginning of the document.

After loading the document from Stream, LoadFromStream sets the Active (see page 26403) property to true.

See Also

SaveToStream (see page 26398)

LoadFromFile (see page 26394)

LoadFromXML (see page 26395)

Active (see page 26403)

197.2.1.2.25 LoadFromXML Method

This is the overview for the LoadFromXML method overload.

Overload List

	Name	Description
	IXMLDocument.LoadFromXML (DOMString) (see page 26395)	Loads a string representation of an XML (see page 26410) document and activates it.
	IXMLDocument.LoadFromXML (string) (see page 26395)	Loads a string representation of an XML (see page 26410) document and activates it.

197.2.1.2.25.1 IXMLDocument.LoadFromXML Method (DOMString)

Loads a string representation of an XML (see page 26410) document and activates it.

Pascal

```
procedure LoadFromXML(const XML: string); overload;
procedure LoadFromXML(const XML: DOMString); overload;
```

C++

```
__fastcall LoadFromXML(const AnsiString XML);
__fastcall LoadFromXML(const DOMString XML);
```

Description

Call LoadFromXML to assign a string as the value of the XML (see page 26410) document. Unlike the XML (see page

26410) property, which lets you assign XML (see page 26410) on a line-by-line basis, LoadFromXML treats the text of the XML (see page 26410) document as a whole.

After assigning the XML (see page 26410) property as the contents of the document, LoadFromXML sets the Active (see page 26403) property to true.

See Also

SaveToXML (see page 26398)

LoadFromFile (see page 26394)

Active (see page 26403)

LoadFromStream (see page 26395)

XML (see page 26410)

197.2.1.2.26 IXMLDocument.Refresh Method

Updates the parsed XML (see page 26410) document to reflect external changes.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the XML (see page 26410) document specified by FileName (see page 26406) has changed due to an external cause. Refresh updates the parsed version of the XML (see page 26410) document (which can be traversed starting with DocumentElement (see page 26405)) to reflect the current contents of the file specified by FileName (see page 26406).

The Active (see page 26403) property must be true when you call Refresh.

Note: Do not call Refresh after making changes directly to the XML (see page 26410) property, because assigning a value to XML (see page 26410) automatically closes the XML (see page 26410) document. To refresh the XML (see page 26410) document after assigning a new value to XML (see page 26410), set the Active (see page 26403) property to true.

See Also

FileName (see page 26406)

Active (see page 26403)

DOMDocument (see page 26405)

DocumentElement (see page 26405)

Resync (see page 26397)

197.2.1.2.27 IXMLDocument.RegisterDocBinding Method

Registers an implementation class for child nodes with a specified tag name.

Pascal

```
procedure RegisterDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI:
DOMString = '');
```

C++

```
__fastcall RegisterDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call RegisterDocBinding to specify the implementation class for one of the child nodes of the document node. RegisterDocBinding replaces the specified node with an instance of the specified class.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 26405)

GetDocBinding (see page 26389)

ChildNodes (see page 26405)

197.2.1.2.28 IXMLDocument.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the document to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 26405)

197.2.1.2.29 IXMLDocument.SaveToFile Method

Saves the XML (see page 26410) document to disk.

Pascal

```
procedure SaveToFile(const AFileName: DOMString);
```

C++

```
__fastcall SaveToFile(const DOMString AFileName);
```

Description

Call SaveToFile to save any modifications you have made to the parsed XML (see page 26410) document.

AFileName is the name of the file to save.

Tip: To save the modifications back to the file from which the document was originally read, use the value of the FileName (see page 26406) property for the AFileName parameter.

See Also

LoadFromFile (see page 26394)

XML (see page 26410)

FileName (see page 26406)

197.2.1.2.30 IXMLDocument.SaveToStream Method

Saves the XML (see page 26410) document to a stream.

Pascal

```
procedure SaveToStream(const Stream: TStream);
```

C++

```
__fastcall SaveToStream(const TStream Stream);
```

Description

Call SaveToStream to save the contents of the XML (see page 26410) document to the stream specified by Stream. Regardless of the encoding system of the original XML (see page 26410) document, SaveToStream always saves the stream in UTF-16.

See Also

LoadFromStream (see page 26395)

SaveToXML (see page 26398)

SaveToFile (see page 26397)

197.2.1.2.31 SaveToXML Method

This is the overview for the SaveToXML method overload.

Overload List

	Name	Description
	IXMLDocument.SaveToXML (DOMString) (see page 26398)	Saves the XML (see page 26410) document to a string-type variable.
	IXMLDocument.SaveToXML (string) (see page 26398)	Saves the XML (see page 26410) document to a string-type variable.

197.2.1.2.31.1 IXMLDocument.SaveToXML Method (DOMString)

Saves the XML (see page 26410) document to a string-type variable.

Pascal

```
procedure SaveToXML(var XML: DOMString); overload;
procedure SaveToXML(var XML: string); overload;
```

C++

```
__fastcall SaveToXML(DOMString XML);
__fastcall SaveToXML(AnsiString XML);
```

Description

Call SaveToXML to save the contents of the XML (see page 26410) document to the string-type variable specified by XML (

see page 26410). SaveToXML writes the contents of XML (see page 26410) document using UTF-8 or UTF-16 as an encoding system, depending on the type of the XML (see page 26410) parameter.

Unlike the XML (see page 26410) property, which lets you write individual lines from the XML (see page 26410) document, SaveToXML writes the entire text of the XML (see page 26410) document.

See Also

LoadFromXML (see page 26395)

SaveToStream (see page 26398)

SaveToFile (see page 26397)

XML (see page 26410)

197.2.1.2.32 IXMLDocument.SetActive Method

Sets the value of the Active (see page 26403) property.

Pascal

```
procedure SetActive(const Value: Boolean);
```

C++

```
__fastcall SetActive(const Boolean Value);
```

Description

SetActive is the write implementation of the Active (see page 26403) property.

Value is the new value to set.

See Also

Active (see page 26403)

197.2.1.2.33 IXMLDocument.SetDocumentElement Method

Sets the value of the DocumentElement (see page 26405) property.

Pascal

```
procedure SetDocumentElement(const Value: IXMLNode);
```

C++

```
__fastcall SetDocumentElement(const IXMLNode Value);
```

Description

SetDocumentElement is the write implementation of the DocumentElement (see page 26405) property.

Value is the interface for the node tree that replaces the current document element.

See Also

DocumentElement (see page 26405)

197.2.1.2.34 IXMLDocument.SetDOMDocument Method

Sets the value of the DOMDocument (see page 26405) property.

Pascal

```
procedure SetDOMDocument(const Value: IDOMDocument);
```

C++

```
__fastcall SetDOMDocument(const IDOMDocument Value);
```

Description

SetDOMDocument is the write implementation of the DOMDocument (see page 26405) property.

Value is the DOM interface for the document to assign.

See Also

DOMDocument (see page 26405)

197.2.1.2.35 IXMLDocument.SetEncoding Method

Sets the value of the Encoding (see page 26406) property.

Pascal

```
procedure SetEncoding(const Value: DOMString);
```

C++

```
__fastcall SetEncoding(const DOMString Value);
```

Description

SetEncoding is the write implementation of the Encoding (see page 26406) property.

Value is the value of the encoding attribute of the document type node.

See Also

Encoding (see page 26406)

197.2.1.2.36 IXMLDocument.SetFileName Method

Sets the value of the FileName (see page 26406) property.

Pascal

```
procedure SetFileName(const Value: DOMString);
```

C++

```
__fastcall SetFileName(const DOMString Value);
```

Description

SetFileName is the write implementation of the FileName (see page 26406) property.

Value is the name of an XML (see page 26410) document or, if the vendor supports it, an URL for the XML (see page 26410) document.

See Also

FileName (see page 26406)

197.2.1.2.37 IXMLDocument.SetNodeIndentStr Method

Sets the value of the NodeIndentStr (see page 26408) property.

Pascal

```
procedure SetNodeIndentStr(const Value: DOMString);
```

C++

```
__fastcall SetNodeIndentStr(const DOMString Value);
```

Description

SetNodeIndentStr is the write implementation of the NodeIndentStr (see page 26408) property.

Value is the string that is inserted before nested nodes to indicate a level of nesting.

See Also

NodeIndentStr (see page 26408)

197.2.1.2.38 IXMLDocument.SetOnAsyncLoad Method

Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.

Pascal

```
procedure SetOnAsyncLoad(const Value: TAsyncEventHandler);
```

C++

```
__fastcall SetOnAsyncLoad(const TAsyncEventHandler Value);
```

Description

Use SetOnAsyncLoad to supply a callback that responds when the asynchronous parsing of an XML (see page 26410) document progresses to a certain point.

Value is a method that is called when the AsyncLoadState (see page 26404) property changes to reflect a new stage in the parsing process.

See Also

AsyncLoadState (see page 26404)

197.2.1.2.39 IXMLDocument.SetOptions Method

Sets the value of the Options (see page 26408) property.

Pascal

```
procedure SetOptions(const Value: TXMLDocOptions);
```

C++

```
__fastcall SetOptions(const TXMLDocOptions Value);
```

Description

GetOptions (see page 26392) is the write implementation of the Options (see page 26408) property.

Value is the set of options to assign.

See Also

Options (see page 26408)

197.2.1.2.40 IXMLDocument.SetParseOptions Method

Sets the value of the ParseOptions (see page 26409) property.

Pascal

```
procedure SetParseOptions(const Value: TParseOptions);
```

C++

```
__fastcall SetParseOptions(const TParseOptions Value);
```

Description

GetParseOptions (see page 26392) is the write implementation of the ParseOptions (see page 26409) property.

Value is the set of parser options to assign.

See Also

ParseOptions (see page 26409)

197.2.1.2.41 IXMLDocument.SetStandAlone Method

Sets the value of the StandAlone (see page 26410) property.

Pascal

```
procedure SetStandAlone(const Value: DOMString);
```

C++

```
__fastcall SetStandAlone(const DOMString Value);
```

Description

SetStandAlone is the write implementation of the StandAlone (see page 26410) property.

Value is the value of the stand-alone attribute of the document type node.

See Also

StandAlone (see page 26410)

197.2.1.2.42 IXMLDocument.SetVersion Method

Sets the value of the Version (see page 26410) property.

Pascal

```
procedure SetVersion(const Value: DOMString);
```

C++

```
__fastcall SetVersion(const DOMString Value);
```

Description

SetVersion is the write implementation of the Version (see page 26410) property.

Value is the value of the version attribute of the document type node.

See Also

Version (see page 26410)

197.2.1.2.43 IXMLDocument.SetXML Method

Sets the value of the XML (see page 26410) property.

Pascal

```
procedure SetXML(const Value: TStrings);
```

C++

```
__fastcall SetXML(const TStrings Value);
```

Description

SetXML is the write implementation of the XML (see page 26410) property.

Value contains the raw (unparsed) XML (see page 26410) to assign.

See Also

XML (see page 26410)

197.2.1.3 IXMLDocument Properties

The properties of the IXMLDocument class are listed here.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	Options (see page 26408)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

197.2.1.3.1 IXMLDocument.Active Property

Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before you can use IXMLDocument (see page 26382) to examine or change the contents of an XML (see page 26410) document, it must be active. Setting Active to true results in the parsing of the XML (see page 26410) document specified by the FileName (see page 26406) property or by the XML (see page 26410) property. If both FileName (see page 26406) and XML (see page 26410) are empty strings, Setting Active to true causes IXMLDocument (see page 26382) to represent an empty document.

Active must be true before you can access the DOMDocument (see page 26405) or DocumentElement (see page 26405) properties.

See Also

DOMDocument (see page 26405)

DocumentElement (see page 26405)

FileName (see page 26406)

XML (see page 26410)

197.2.1.3.2 IXMLDocument.AsyncLoadState Property

Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.

Pascal

```
property AsyncLoadState: Integer;
```

C++

```
__property int AsyncLoadState;
```

Description

Use AsyncLoadState to determine that status of the DOM parser when it is parsing an XML (see page 26410) document asynchronously. The value of AsyncLoadState is vendor-specific. That is, each DOM parser that loads and parses an XML (see page 26410) document asynchronously supplies its own flags to indicate state information.

When the DOM vendor is MSXML, AsyncLoadState can have any of the following values:

Value	Meaning
0	Uninitialized: The AsyncLoadState is not assigned. (Usually indicates that the parser has not tried to parse a document or it is not parsing the document asynchronously.)
1	Loading: The parser is currently parsing the structure of the XML (see page 26410) document.
2	Loaded: The parser has finished reading and parsing the structure of the XML (see page 26410) document, but the corresponding DOM interfaces are not yet available.
3	Interactive: The parser has parsed the structure of the XML (see page 26410) document, the corresponding DOM interfaces are available, but the parser has not finished reading all the node values.
4	Complete: The parser has fully read and parsed the XML (see page 26410) document.

See Also

SetOnAsyncLoad (see page 26401)

197.2.1.3.3 IXMLDocument.ChildNodes Property

Lists all of the child nodes of the document.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access all of the nodes that are children of the document object. In addition to DocumentElement (see page 26405), which is the root of the data hierarchy, ChildNodes can include nodes for comments, processing instructions, and so on.

See Also

DocumentElement (see page 26405)

Node (see page 26407)

197.2.1.3.4 IXMLDocument.DocumentElement Property

Provides access to the root node of the XML (see page 26410) document.

Pascal

```
property DocumentElement: IXMLNode;
```

C++

```
__property IXMLNode DocumentElement;
```

Description

Use DocumentElement to access the root node of the XML (see page 26410) document. Because XML (see page 26410) documents are hierarchical in structure, DocumentElement is the entry point to all data in the XML (see page 26410) document. Setting DocumentElement replaces the entire data hierarchy with a new hierarchy of nodes.

The IXMLNode (see page 26411) interface includes properties and methods for examining and changing the text and attributes of a node, for adding and deleting child nodes, and for traversing the hierarchy of nodes rooted at that node.

See Also

DOMDocument (see page 26405)

ChildNodes (see page 26405)

197.2.1.3.5 IXMLDocument.DOMDocument Property

Provides access to the DOM interface for the parsed XML (see page 26410) document.

Pascal

```
property DOMDocument: IDOMDocument;
```

C++

```
__property IDOMDocument DOMDocument;
```

Description

Use DOMDocument to directly access the IDOMDocument interface for the parsed XML (see page 26410) document. This is the interface supported by the DOM parser for the document.

Most applications do not need to use the DOMDocument property directly. Instead, it supplies the underlying support for parsing and manipulating the nodes accessed through DocumentElement (see page 26405). If you do want to make use of DOMDocument's low-level support, you must be familiar with the W3C Document Object Model (DOM) Specification.

See Also

DocumentElement (see page 26405)

197.2.1.3.6 IXMLDocument.Encoding Property

Indicates the character set that the XML (see page 26410) document uses to encode characters.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Encoding is the encoding name that appears in the document type declaration of the XML (see page 26410) document. It is a string such as 'UTF-8', 'UTF-16', or 'ISO-10646-UCS-2' that indicates the character set used in the document.

See Also

FileName (see page 26406)

DOMDocument (see page 26405)

XML (see page 26410)

197.2.1.3.7 IXMLDocument.FileName Property

Indicates the XML (see page 26410) document file, if any, that this interface represents.

Pascal

```
property FileName: DOMString;
```

C++

```
__property DOMString FileName;
```

Description

Use FileName to get or set the name of the XML (see page 26410) file that this document represents. FileName is set automatically when an application calls the LoadFromFile (see page 26394) method or when this interface is obtained from the global LoadXMLDocument function.

When you set the value of FileName, the XML (see page 26410) property automatically changes (at runtime) to represent the contents of that file.

Note: The content of this XML (see page 26410) document, which is available as the value of the XML (see page 26410) property, may not be the same as the content of the specified file. If an application uses IXMLDocument (see page 26382) to

edit the document, those changes are not saved back to the XML (see page 26410) document file until you call the SaveToFile (see page 26397) method.

Tip: If the underlying DOM implementation supports it, you can use FileName to specify an URL rather than a file on disk.

See Also

SaveToFile (see page 26397)

LoadFromFile (see page 26394)

LoadXMLDocument (see page 26241)

XML (see page 26410)

197.2.1.3.8 IXMLDocument.Modified Property

Indicates whether the XML (see page 26410) document has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Read Modified to determine whether the application has made any changes to the nodes in the XML (see page 26410) document. When Modified is true, the value of the XML (see page 26410) property may differ from the contents of the file specified by FileName (see page 26406). You can call the SaveToFile (see page 26397) method to update the XML (see page 26410) document file to reflect the changes.

See Also

Resync (see page 26397)

SaveToFile (see page 26397)

XML (see page 26410)

FileName (see page 26406)

197.2.1.3.9 IXMLDocument.Node Property

Provides access to the document node for the XML (see page 26410) document.

Pascal

```
property Node: IXMLNode;
```

C++

```
__property IXMLNode Node;
```

Description

Read Node to access the document node for the XML (see page 26410) document. The document node represents information about the entire document. It may have several child nodes, which represent comments, processing instructions, and which include the DocumentElement (see page 26405) node that acts as the root of the data hierarchy.

See Also

DocumentElement (see page 26405)

ChildNodes (see page 26405)

197.2.1.3.10 IXMLDocument.NodeIndentStr Property

Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.

Pascal

```
property NodeIndentStr: DOMString;
```

C++

```
__property DOMString NodeIndentStr;
```

Description

Use NodeIndentStr to customize how the document formats nodes that are added. When the Options (see page 26408) property includes doNodeAutoIndent, this string is inserted in the generated XML (see page 26410) before any newly added node, once for each nesting level.

If you do not assign a value to NodeIndentStr, IXMLDocument (see page 26382) inserts two spaces to represent each nesting level.

See Also

Options (see page 26408)

NestingLevel (see page 26180)

FormatXMLData (see page 26240)

XML (see page 26410)

197.2.1.3.11 IXMLDocument.Options Property

Influences various aspects of the document's behavior.

Pascal

```
property Options: TXMLDocOptions;
```

C++

```
__property TXMLDocOptions Options;
```

Description

Set Options to configure how you want the document to respond when the application tries to read nodes or attributes that do not exist, when it creates a new namespace when adding a node, when it generates XML (see page 26410) text from the nodes in the document, or whether it saves its value automatically when you close the document. Options can include any of the following values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList (see page 26445) interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML (see page 26410) text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.

doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null Variant (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.
doNamespaceDecl	When the AddChild (see page 26385) method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild (see page 26385) creates the new namespace but does not add an attribute to declare it.
doAutoSave	When you close the document (set Active (see page 26403) to false), any changes are automatically saved back to the file specified by FileName (see page 26406) or to the XML (see page 26410) property.

See Also

Nodes (see page 26456)

Attributes (see page 26430)

AddChild (see page 26414)

197.2.1.3.12 IXMLDocument.ParseOptions Property

Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.

Pascal

```
property ParseOptions: TParseOptions;
```

C++

```
__property TParseOptions ParseOptions;
```

Description

Set ParseOptions to influence the way the DOM implementation parses the XML (see page 26410) document. Different DOM implementations support different options. If you attempt to use an option that is not supported by your DOM implementation, IXMLDocument (see page 26382) raises an EXMLDocError (see page 26381) exception.

See Also

domimplementation (see page 26137)

EXMLDocError (see page 26381)

197.2.1.3.13 IXMLDocument.SchemaRef Property

Returns the name of the schema associated with this XML (see page 26410) document.

Pascal

```
property SchemaRef: DOMString;
```

C++

```
__property DOMString SchemaRef;
```

Description

Read SchemaRef to determine the schema associated with this XML (see page 26410) document. If the document does not have an attribute that identifies an associated schema, the value of SchemaRef is an empty string.

See Also

DOMDocument (see page 26405)

197.2.1.3.14 IXMLDocument.StandAlone Property

Indicates whether the XML (see page 26410) document includes any external markup declarations.

Pascal

```
property StandAlone: DOMString;
```

C++

```
__property DOMString StandAlone;
```

Description

StandAlone is the value of the stand-alone attribute on the document type declaration of the XML (see page 26410) document. StandAlone has a value of 'yes' or 'no'.

When StandAlone is 'yes', the document contains no external markup declarations. It may, however, still contain references to external entities, as long as they are not declarations.

When StandAlone is 'no', the document may or may not contain external markup declarations.

See Also

DOMDocument (see page 26405)

197.2.1.3.15 IXMLDocument.Version Property

Indicates the XML (see page 26410) version that the document uses.

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

Version indicates the XML (see page 26410) version number that the document uses. An XML (see page 26410) version number is a string of the form 'n.m', where n is the major version number and m is the minor version number.

See Also

XML (see page 26410)

197.2.1.3.16 IXMLDocument.XML Property

Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

Pascal

```
property XML: TStrings;
```

C++

```
__property TStrings XML;
```

Description

Read XML to obtain the contents of the associated XML document. Set XML to specify the raw (unparsed) XML you want to

examine or manipulate.

XML is a TStrings object. This means you can manipulate the XML line by line. To read or write the XML in the document as a single string, use the LoadFromXML (see page 26395) or SaveToXML (see page 26398) method.

Note: If you call the LoadFromFile (see page 26394), LoadFromStream (see page 26395), or LoadFromXML (see page 26395) method, XML is automatically updated to reflect the contents of that file.

See Also

LoadFromFile (see page 26394)

DocumentElement (see page 26405)

TXMLDocument (see page 26097)

LoadFromXML (see page 26395)

SaveToXML (see page 26398)

LoadFromStream (see page 26395)

197.2.2 IXMLNode Interface

IXMLNode is the interface for a node in an XML (see page 26439) document.

Class Hierarchy

XMLIntf.IXMLNode

Pascal

```
IXMLNode = interface;
```

C++

```
__interface IXMLNode;
```

File

XMLIntf

Description

Use IXMLNode to work with a node in an XML (see page 26439) document. The IXMLNode interface is designed to work with TXMLDocument and the code generated by the Data Binding wizard.

IXMLNode is similar to the IDOMNode interface that is defined as part of the Document Object Model (DOM) specification. However, IXMLNode is designed to simplify the task of navigating and editing XML (see page 26439) documents by

including some of the properties and methods from the IDOMElement interface, resulting in a simpler model for examining an XML (see page 26439) node.

including additional properties and methods to simplify access to data in common XML (see page 26439) structures.

The Data Binding wizard generates descendants of IXMLNode that further simplify the task of working with XML (see page 26439) documents by converting the attributes and child nodes of a node into properties of the node interface.

Note: C++ method declarations that use IXMLNode use the _di_IXMLNode type instead. This type is a DelphiInterface wrapper around the IXMLNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNode >  _di_IXMLNode;
```

See Also

TXMLNode (see page 26147)

TXMLDocument (see page 26097)

IXMLNodeCollection (see page 26440)

IDOMNode (see page 26306)

IXMLNodeList (see page 26445)

Working with XML Nodes

197.2.2.1 IXMLNode Members

The following tables list the members exposed by IXMLNode.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

197.2.2.2 IXMLNode Methods

The methods of the IXMLNode class are listed here.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.

	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

197.2.2.2.1 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	IXMLNode.AddChild (DOMString, DOMString, Boolean, Integer) (see page 26414)	Adds a new child node to this node.
	IXMLNode.AddChild (DOMString, Integer) (see page 26414)	Adds a new child node to this node.

197.2.2.2.1.1 IXMLNode.AddChild Method (DOMString, DOMString, Boolean, Integer)

Adds a new child node to this node.

Pascal

```
function AddChild(const TagName: DOMString; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; GenPrefix: Boolean
= False; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI, Boolean
GenPrefix = False, int Index = -1);
```

Description

AddChild creates a new element node as the child of this node.

TagName provides the tag name of the newly created node.

NamespaceURI (see page 26435) identifies the namespace that includes the new node's definition. If NamespaceURI (see page 26435) is omitted (the second syntax), the namespace of the new node is deduced from the namespace prefix of TagName. If TagName has no namespace prefix and there is no NamespaceURI (see page 26435) parameter, the

namespace is the same as this node's NamespaceURI (see page 26435) property.

GenPrefix controls whether AddChild generates a namespace prefix for the namespace URI when the NamespaceURI (see page 26435) parameter identifies a URI that is not already declared in the document. Note that setting GenPrefix to true does not cause AddChild to add a declaration of the new namespace prefix unless the document's Options property includes doNamespaceDecl.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

AddChild returns the interface for the newly created child node.

Tip: AddChild only adds element nodes. To add other types of child nodes, use the XML (see page 26439) document's CreateNode method instead, and then add the resulting node to the ChildNodes (see page 26431) property array.

See Also

Delete (see page 26449)

ChildNodes (see page 26431)

CreateNode (see page 26387)

NamespaceURI (see page 26435)

Options (see page 26141)

Working with XML Nodes

197.2.2.2.2 IXMLNode.CloneNode Method

Creates a copy of this node and returns its interface.

Pascal

```
function CloneNode(Deep: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode CloneNode(Boolean Deep);
```

Description

CloneNode returns a copy of this node that has no parent. Any attributes of this node are copied as well, including attribute nodes that represent default values.

Deep indicates whether the child nodes of this node should be cloned as well. For example, if an element node contains any text, CloneNode only copies then text when deep is true, because in the underlying DOM implementation, the text is contained in a child node.

After calling CloneNode to create a new node, you can add that node into the ChildNodes (see page 26431) property of another node (or, if this node represents an attribute, into the AttributeNodes (see page 26430) property) by calling ChildNodes (see page 26431). ->Add or ChildNodes (see page 26431). ->Insert.

See Also

ChildNodes (see page 26431)

AddChild (see page 26414)

ParentNode (see page 26437)

CloneNode (see page 26309)

Add (see page 26447)

Insert (see page 26454)

197.2.2.2.3 IXMLNode.DeclareNamespace Method

Adds an attribute to the node that declares a specified namespace URI.

Pascal

```
procedure DeclareNamespace(const Prefix: DOMString; const URI: DOMString);
```

C++

```
__fastcall DeclareNamespace(const DOMString Prefix, const DOMString URI);
```

Description

DeclareNamespace adds an attribute to this node that declares the specified namespace URI as the value of the specified prefix.

Prefix (see page 26438) is the namespace prefix that appears in tag names that reference the namespace.

URI is the corresponding namespace URI.

Note: This method is called automatically for newly created nodes when the document's Options property includes doNamespaceDecl.

See Also

Options (see page 26408)

Attributes (see page 26430)

FindNamespaceDecl (see page 26416)

197.2.2.2.4 IXMLNode.FindNamespaceDecl Method

Returns the attribute node that declares a specified Namespace URI.

Pascal

```
function FindNamespaceDecl(const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNamespaceDecl(const DOMString NamespaceURI);
```

Description

FindNamespaceDecl searches the node hierarchy that contains this node for an attribute that specifies the mapping between a namespace prefix and the namespace URI identified by NamespaceURI (see page 26435). If it finds such a mapping, FindNamespaceDecl returns the interface for the Attribute node. If it does not find a mapping, FindNamespaceDecl returns nil (Delphi) or NULL (C++).

NamespaceURI (see page 26435) is the namespace URI to locate.

See Also

FindNamespaceURI (see page 26416)

DeclareNamespace (see page 26416)

197.2.2.2.5 IXMLNode.FindNamespaceURI Method

Returns the namespace URI for a namespace prefix or qualified tag name.

Pascal

```
function FindNamespaceURI(const TagOrPrefix: DOMString): DOMString;
```

C++

```
__fastcall DOMString FindNamespaceURI(const DOMString TagOrPrefix);
```

Description

FindNamespaceDecl (see page 26416) searches the node hierarchy that contains this node for an attribute that specifies the mapping between the namespace prefix identified by TagOrPrefix and a namespace URI. If it finds such a mapping, FindNamespaceURI returns the namespace URI. If it does not find a mapping, FindNamespaceURI returns an empty string.

TagOrPrefix is the namespace prefix or a tag name that includes the namespace prefix.

See Also

GetNamespaceURI (see page 26421)

GetPrefix (see page 26422)

FindNamespaceDecl (see page 26416)

197.2.2.2.6 IXMLNode.GetAttribute Method

Returns the value of one of this node's attributes.

Pascal

```
function GetAttribute(const AttrName: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttribute(const DOMString AttrName);
```

Description

GetAttribute is the read implementation of the Attributes (see page 26430) property.

AttrName is the name of the attribute.

GetAttribute returns the value of the specified attribute. Typically, this value is a string. If the node does not have an attribute with the name specified by AttrName, GetAttribute returns a Null Variant.

Note: Do not call GetAttribute unless this node is an element node. Only element nodes have attributes.

See Also

Attributes (see page 26430)

GetAttributeNS (see page 26418)

197.2.2.2.7 IXMLNode.GetAttributeNodes Method

Returns the value of the AttributeNodes (see page 26430) property.

Pascal

```
function GetAttributeNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetAttributeNodes();
```

Description

GetAttributeNodes is the read implementation of the AttributeNodes (see page 26430) property.

See Also

AttributeNodes (see page 26430)

197.2.2.2.8 IXMLNode.GetAttributeNS Method

Returns the value of a specified attribute.

Pascal

```
function GetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI);
```

Description

Call GetAttributeNS to determine the value of an attribute when you must explicitly specify the namespace for the attribute.

AttrName is the name of the attribute whose value you want to fetch.

NamespaceURI (see page 26435) identifies the namespace in which the attribute resides.

GetAttributeNS returns the value of the attribute. If AttrName and NamespaceURI (see page 26435) do not identify an attribute of this node, GetAttributeNS returns a Null Variant.

See Also

AttributeNodes (see page 26430)

Attributes (see page 26430)

NamespaceURI (see page 26435)

SetAttributeNS (see page 26426)

197.2.2.2.9 IXMLNode.GetChildNodes Method

Returns the value of the ChildNodes (see page 26431) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes (see page 26431) property.

See Also

ChildNodes (see page 26431)

197.2.2.2.10 IXMLNode.GetChildValue Method

Returns the value of a specified child node.

Pascal

```
function GetChildValue(const IndexOrName: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetChildValue(const OleVariant IndexOrName);
```

Description

GetChildValue is the read implementation of the ChildValues (see page 26432) property.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

The return value depends on the type of the child node, as indicated in the following table:

NodeType (see page 26436)	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, reading the child's value causes an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

See Also

ChildValues (see page 26432)

197.2.2.2.11 IXMLNode.GetCollection Method

Returns the value of the Collection (see page 26432) property.

Pascal

```
function GetCollection: IXMLNodeCollection;
```

C++

```
__fastcall IXMLNodeCollection GetCollection();
```

Description

GetCollection is the read implementation of the Collection (see page 26432) property.

See Also

Collection (see page 26432)

197.2.2.2.12 IXMLNode.GetDOMNode Method

Returns the value of the DOMNode (see page 26433) property.

Pascal

```
function GetDOMNode: IDOMNode;
```

C++

```
__fastcall IDOMNode GetDOMNode();
```

Description

GetDOMNode is the read implementation of the DOMNode (see page 26433) property.

See Also

DOMNode (see page 26433)

197.2.2.2.13 IXMLNode.GetHasChildNodes Method

Indicates whether the node has any child nodes.

Pascal

```
function GetHasChildNodes: Boolean;
```

C++

```
__fastcall Boolean GetHasChildNodes();
```

Description

GetHasChildNodes is the read implementation of the HasChildNodes (see page 26433) property.

See Also

HasChildNodes (see page 26433)

197.2.2.2.14 IXMLNode.GetIsTextElement Method

Indicates whether the node has a single text value.

Pascal

```
function GetIsTextElement: Boolean;
```

C++

```
__fastcall Boolean GetIsTextElement();
```

Description

GetIsTextElement is the read implementation of the IsTextElement (see page 26434) property.

See Also

IsTextElement (see page 26434)

197.2.2.2.15 IXMLNode.GetLocalName Method

Returns the name of the node without any namespace prefix.

Pascal

```
function GetLocalName: DOMString;
```

C++

```
__fastcall DOMString GetLocalName();
```

Description

GetLocalName is the read implementation of the LocalName (see page 26434) property.

See Also

LocalName (see page 26434)

197.2.2.2.16 IXMLNode.GetNamespaceURI Method

Returns the namespace URI for the node's qualified name.

Pascal

```
function GetNamespaceURI: DOMString;
```

C++

```
__fastcall DOMString GetNamespaceURI();
```

Description

GetNamespaceURI is the read implementation of the NamespaceURI (see page 26435) property.

See Also

NamespaceURI (see page 26435)

197.2.2.2.17 IXMLNode.GetNodeName Method

Returns the name of the node.

Pascal

```
function GetNodeName: DOMString;
```

C++

```
__fastcall DOMString GetNodeName();
```

Description

GetNodeName is the read implementation of the NodeName (see page 26435) property.

See Also

NodeName (see page 26435)

197.2.2.2.18 IXMLNode.GetNodeType Method

Returns the type of the node.

Pascal

```
function GetNodeType: TNodeType;
```

C++

```
__fastcall TNodeType GetNodeType();
```

Description

GetNodeType is the read implementation of the NodeType (see page 26436) property.

See Also

NodeType (see page 26436)

197.2.2.2.19 IXMLNode.GetNodeValue Method

Returns the value of the node.

Pascal

```
function GetNodeValue: OleVariant;
```

C++

```
__fastcall OleVariant GetNodeValue();
```

Description

GetNodeValue is the read implementation of the NodeValue (see page 26436) property.

See Also

NodeValue (see page 26436)

197.2.2.2.20 IXMLNode.GetOwnerDocument Method

Returns the interface for the document in which this node appears.

Pascal

```
function GetOwnerDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument GetOwnerDocument();
```

Description

GetOwnerDocument is the read implementation of the OwnerDocument (see page 26437) property.

See Also

OwnerDocument (see page 26437)

197.2.2.2.21 IXMLNode.GetParentNode Method

Returns the interface for the node's parent node.

Pascal

```
function GetParentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetParentNode();
```

Description

GetParentNode is the read implementation of the ParentNode (see page 26437) property.

See Also

ParentNode (see page 26437)

197.2.2.2.22 IXMLNode.GetPrefix Method

Returns the namespace prefix from the node's name.

Pascal

```
function GetPrefix: DOMString;
```

C++

```
__fastcall DOMString GetPrefix();
```

Description

GetPrefix is the read implementation of the Prefix (see page 26438) property.

See Also

Prefix (see page 26438)

197.2.2.2.23 IXMLNode.GetReadOnly Method

Returns the value of the ReadOnly (see page 26438) property.

Pascal

```
function GetReadOnly: Boolean;
```

C++

```
__fastcall Boolean GetReadOnly();
```

Description

GetReadOnly is the read implementation of the ReadOnly (see page 26438) property.

See Also

ReadOnly (see page 26438)

197.2.2.2.24 IXMLNode.GetText Method

Returns the text value of the node.

Pascal

```
function GetText: DOMString;
```

C++

```
__fastcall DOMString GetText();
```

Description

GetText is the read implementation for the Text (see page 26439) property.

See Also

Text (see page 26439)

197.2.2.2.25 IXMLNode.GetXML Method

Returns the value of the XML (see page 26439) property.

Pascal

```
function GetXML: DOMString;
```

C++

```
__fastcall DOMString GetXML();
```

Description

GetXML is the read implementation of this node's XML (see page 26439) property.

See Also

XML (see page 26439)

197.2.2.2.26 HasAttribute Method

This is the overview for the HasAttribute method overload.

Overload List

	Name	Description
	IXMLNode.HasAttribute (DOMString) (see page 26424)	Indicates whether the node has an attribute with a specified name.
	IXMLNode.HasAttribute (DOMString, DOMString) (see page 26424)	Indicates whether the node has an attribute with a specified name.

197.2.2.2.26.1 IXMLNode.HasAttribute Method (DOMString)

Indicates whether the node has an attribute with a specified name.

Pascal

```
function HasAttribute(const Name: DOMString): Boolean; overload;
function HasAttribute(const Name: DOMString; const NamespaceURI: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasAttribute(const DOMString Name);
__fastcall Boolean HasAttribute(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call HasAttribute to determine whether this node has a specified attribute.

Name is the name of the attribute about which you want to know.

NamespaceURI (see page 26435) is the namespace of the attribute.

HasAttribute returns true if this node has the specified attribute, false otherwise.

See Also

AttributeNodes (see page 26430)

Attributes (see page 26430)

197.2.2.2.27 IXMLNode.NextSibling Method

Returns the next child of this node's parent.

Pascal

```
function NextSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode NextSibling();
```

Description

NextSibling returns the node that follows this one in the parent node's ChildNodes (see page 26431) property list.

If this node is the last node in its parent's child list, NextSibling raises an exception.

See Also

ParentNode (see page 26437)

PreviousSibling (see page 26425)

ChildNodes (see page 26431)

197.2.2.2.28 IXMLNode.Normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure Normalize;
```

C++

```
__fastcall Normalize();
```

Description

Use the IXMLNode (see page 26411) interface to call the protected Normalize method. Normalize consolidates adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes, only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes.

See Also

ChildNodes (see page 26431)

AttributeNodes (see page 26430)

197.2.2.2.29 IXMLNode.PreviousSibling Method

Returns the previous child of this node's parent.

Pascal

```
function PreviousSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode PreviousSibling();
```

Description

PreviousSibling returns the node that precedes this one in the parent node's ChildNodes (see page 26431) property list.

If this node is the first node in its parent's child list, PreviousSibling raises an exception.

See Also

ParentNode (see page 26437)

NextSibling (see page 26424)

ChildNodes (see page 26431)

197.2.2.2.30 IXMLNode.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the node to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 26431)

AttributeNodes (see page 26430)

Refresh (see page 26123)

197.2.2.2.31 IXMLNode.SetAttribute Method

Sets the value of one of this node's attributes.

Pascal

```
procedure SetAttribute(const AttrName: DOMString; const Value: OleVariant);
```

C++

```
__fastcall SetAttribute(const DOMString AttrName, const OleVariant Value);
```

Description

SetAttribute is the write implementation for the Attributes (see page 26430) property.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

Attributes (see page 26430)

SetAttributeNS (see page 26426)

197.2.2.2.32 IXMLNode.SetAttributeNS Method

Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

Pascal

```
procedure SetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString; const
Value: OleVariant);
```

C++

```
__fastcall SetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI, const
OleVariant Value);
```

Description

SetAttributeNS sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

NamespaceURI (see page 26435) is the namespace for the attribute.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

SetAttribute (see page 26426)

GetAttributeNS (see page 26418)

AttributeNodes (see page 26430)

197.2.2.2.33 IXMLNode.SetChildValue Method

Sets the value of a specified child node.

Pascal

```
procedure SetChildValue(const IndexOrName: OleVariant; const Value: OleVariant);
```

C++

```
__fastcall SetChildValue(const OleVariant IndexOrName, const OleVariant Value);
```

Description

SetChildValue is the write implementation of the ChildValues (see page 26432) property.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

Value is the value to assign.

See Also

ChildValues (see page 26432)

197.2.2.2.34 IXMLNode.SetNodeValue Method

Sets the value of this node.

Pascal

```
procedure SetNodeValue(const Value: OleVariant);
```

C++

```
__fastcall SetNodeValue(const OleVariant Value);
```

Description

SetNodeValue is the write implementation of the NodeValue (see page 26436) property.

Value is the value to assign.

See Also

NodeValue (see page 26436)

197.2.2.2.35 IXMLNode.SetReadOnly Method

Specifies whether the node can be modified.

Pascal

```
procedure SetReadOnly(const Value: Boolean);
```

C++

```
__fastcall SetReadOnly(const Boolean Value);
```

Description

SetReadOnly is the write implementation of the ReadOnly (see page 26438) property.

Value is the new read-only status of the node.

See Also

ReadOnly (see page 26438)

197.2.2.2.36 IXMLNode.SetText Method

Sets the text value of the node.

Pascal

```
procedure SetText(const Value: DOMString);
```

C++

```
__fastcall SetText(const DOMString Value);
```

Description

SetText is the write implementation for the Text (see page 26439) property.

Value is the new text value for the node.

See Also

Text (see page 26439)

197.2.2.2.37 TransformNode Method

This is the overview for the TransformNode method overload.

Overload List

	Name	Description
	IXMLNode.TransformNode (IXMLNode, IXMLDocument) (see page 26429)	Transforms the subtree rooted at this node, using a specified XSL interface.
	IXMLNode.TransformNode (IXMLNode, WideString) (see page 26429)	Transforms the subtree rooted at this node, using a specified XSL interface.

197.2.2.2.37.1 IXMLNode.TransformNode Method (IXMLNode, IXMLDocument)

Transforms the subtree rooted at this node, using a specified XSL interface.

Pascal

```
procedure TransformNode(const stylesheet: IXMLNode; var output: WideString); overload;
procedure TransformNode(const stylesheet: IXMLNode; const output: IXMLDocument); overload;
```

C++

```
__fastcall TransformNode(const IXMLNode stylesheet, BSTR output);
__fastcall TransformNode(const IXMLNode stylesheet, const IXMLDocument output);
```

Description

Call TransformNode to transform the XML (see page 26439) that is the value of the XML (see page 26439) property using the transformation specified by an XSL document.

stylesheet is a node in an XML (see page 26439) document that represents an XSL transformation. Typically, it is the document element of that document.

output represents the result of the transformation. If output is a WideString, TransformNode returns a string of XML (see page 26439). If output is the interface to an XML (see page 26439) document, TransformNode replaces the content of that document with the results of the transformation.

Note: TransformNode is only available when the DOMVendor used to parse this node's XML (see page 26439) document is MSXML.

See Also

XML (see page 26439)

197.2.2.3 IXMLNode Properties

The properties of the IXMLNode class are listed here.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

197.2.2.3.1 IXMLNode.AttributeNodes Property

Lists the interfaces for nodes that represent attributes of this node.

Pascal

```
property AttributeNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList AttributeNodes;
```

Description

Use AttributeNodes to access the attributes of this node using an IXMLNode (see page 26411) interface. Attributes (see page 26430) modify a node in an XML (see page 26439) document. For example, given the node for

```
<Movie genre="scifi" title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

If an attribute consists of a simple Name=Value pair, it is simpler to use the Attributes (see page 26430) property to read or set attribute values. AttributeNodes is an IXMLNodeList (see page 26445) interface, which can be used to

Read the count of attributes before iterating over all the attributes of this node.

Add or delete attribute nodes from this node.

Access attributes through an XML (see page 26439) node interface (for example, to read the attribute names from the nodes).

Only element nodes have attributes, and not every element node has them. If the node does not have any attributes, AttributeNodes is the interface for an empty list.

Note: Attributes (see page 26430) are not considered child nodes of a node and can't be accessed using the ChildNodes (see page 26431) property.

See Also

ChildNodes (see page 26431)

Attributes (see page 26430)

197.2.2.3.2 IXMLNode.Attributes Property

Represents the values of this node's attributes.

Pascal

```
property Attributes [const AttrName: DOMString]: OleVariant;
```

C++

```
__property OleVariant Attributes[DOMString const AttrName];
```

Description

Use Attributes to read or set the values of this node's attributes. Attributes modify a node in an XML (see page 26439) document. For example, given the node for

```
<Movie genre="scifi" title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

The AttrName index gives the name of the attribute to access. In the previous example, "genre" and "title" are the names of the attributes. When setting Attributes, if you specify the name of an attribute that already exists for a node, you change that attribute's value. If you specify an attribute name that does not correspond to an existing attribute of the node, a new attribute is

created.

When reading Attributes, if you specify the name of an attribute that does not exist for the node, the value depends on the Options property of the document that contains the node. If Options includes doAttrNull, reading an attribute that does not exist for the node results in a Null Variant. When Options does not include doAttrNull, reading an attribute that does not exist results in an empty string.

The value of Attributes is the text of the specified attribute. When setting attributes, the value string is not parsed. Any markup in the supplied value (for example, an entity reference) is treated as literal text. If you set an attribute to nil (Delphi) or NULL (C++), it is removed from this node. Note that you can set an attribute's value to an empty string.

See Also

AttributeNodes (see page 26430)

GetAttributeNS (see page 26418)

SetAttributeNS (see page 26426)

Options (see page 26141)

Working with XML Nodes

197.2.2.3.3 IXMLNode.ChildNodes Property

Represents the child nodes of the node.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access the children of a node. ChildNodes is an IXMLNodeList (see page 26445) interface, which can be used to access individual child nodes or to add child nodes to or delete them from this node. Each child node specifies this node as its parent node.

Tip: To get or set the values of the child nodes rather than their interfaces, use the ChildValues (see page 26432) property instead.

Note: Attributes (see page 26430) are not considered child nodes of a node. To get the values of this node's attributes, use the Attributes (see page 26430) or AttributeNodes (see page 26430) property instead.

See Also

ChildValues (see page 26432)

AttributeNodes (see page 26430)

ParentNode (see page 26437)

Attributes (see page 26430)

Working with XML Nodes

197.2.2.3.4 IXMLNode.ChildValues Property

Represents the values of this node's child nodes.

Pascal

```
property ChildValues [const IndexOrName: OleVariant]: OleVariant;
```

C++

```
__property OleVariant ChildValues[OleVariant const IndexOrName];
```

Description

Use ChildValues to access the values of this node's children.

IndexOrName identifies the desired child node either by its interface, or by a string that is the local name of the child node. If IndexOrName does not identify a child of this node, trying to get or set ChildValues causes an exception.

The value of a child node depends on the type of the child node, as indicated in the following table:

NodeType (see page 26436)	Value
ntElement	If the element contains only text, this is that text value. Otherwise, it is the Value of the first child node.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the child node is any other node type, reading or setting ChildValues causes an exception.	

Note: In Delphi, ChildValues is the default property for IXMLNode (see page 26411). That means that you can omit the property name when using this property. For example

```
Edit1.Text := XMLDocument1.DocumentElement.ChildValues['Name'];
```

can also be written

```
Edit1.Text := XMLDocument1.DocumentElement['Name'];
```

Note: Attributes (see page 26430) are not considered child nodes of a node. To get or set the values of this node's attributes, use the Attributes (see page 26430) property instead.

See Also

ChildNodes (see page 26431)

ParentNode (see page 26437)

Attributes (see page 26430)

197.2.2.3.5 IXMLNode.Collection Property

Indicates the collection in which this node appears.

Pascal

```
property Collection: IXMLNodeCollection;
```

C++

```
__property IXMLNodeCollection Collection;
```

Description

Read Collection to determine whether this node is one of a repeating set of child nodes. The node specified by Collection represents the same node in the XML (see page 26439) document as this node's ParentNode (see page 26437) property, but it is specialized to work with this node and any other child nodes of the same type.

For example, consider the following XML (see page 26439) fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

If this node represents one of the <student> nodes, then ParentNode (see page 26437) represents the <students> node, and Collection represents a copy of the <students> node that is used for only those children that are <student> nodes, and not the <auditor> nodes.

If this node does not represent one of a set of repeating child elements, Collection is nil (Delphi) or NULL (C++).

See Also

ParentNode (see page 26437)

197.2.2.3.6 IXMLNode.DOMNode Property

Provides access to the IDOMNode interface for this node.

Pascal

```
property DOMNode: IDOMNode;
```

C++

```
__property IDOMNode DOMNode;
```

Description

IDOMNode is the interface for this node provided by the DOM implementation that parsed the XML (see page 26439) document. You can use this interface to work with the node using the lower-level properties and methods of the DOM.

Typically, applications use the IXMLNode (see page 26411) interface to work with a node rather than the IDOMNode interface. For more information on DOM interfaces, see the DOM specification on the W3 website or the documentation provided by your DOM vendor.

197.2.2.3.7 IXMLNode.HasChildNodes Property

Indicates whether this node has any child nodes.

Pascal

```
property HasChildNodes: Boolean;
```

C++

```
__property Boolean HasChildNodes;
```

Description

HasChildNodes is true if the underlying DOM node has any child nodes, false if it has no children.

Note that in the underlying DOM implementation, given the following XML (see page 26439)

```
<Title> Understanding XML </Title>
```

the "Title" node has a single child (a text node with the value 'Understanding XML (see page 26439)').

See Also

ChildNodes (see page 26431)

DOMNode (see page 26433)

197.2.2.3.8 IXMLNode.IsTextElement Property

Indicates whether the node has a single text value.

Pascal

```
property IsTextElement: Boolean;
```

C++

```
__property Boolean IsTextElement;
```

Description

Read IsTextElement to determine whether this node represents a single text value. For example, if the node represents the following:

```
<Title> Understanding XML </Title>
```

IsTextElement is true, because the node represents a tagged element and the text that is its value.

Note: In the underlying DOM implementation, nodes for which IsTextElement is true are element nodes that have a single child node that is a text node. IXMLNode (see page 26411) flattens this out so that you can use the element node to work with the text value (through the Text (see page 26439) property), rather than requiring you to use a separate node for the text value.

See Also

NodeType (see page 26436)

Text (see page 26439)

Working with XML Nodes

197.2.2.3.9 IXMLNode.LocalName Property

Indicates the name of the node without any namespace prefix.

Pascal

```
property LocalName: DOMString;
```

C++

```
__property DOMString LocalName;
```

Description

Read LocalName to determine the local name of the underlying DOM node. LocalName is only defined for nodes of type ntElement or ntAttrribute.

For element nodes, LocalName is derived from the name that appears in the XML (see page 26439) tag. For example, the

local name for <xsi:Name First="John" Last="Doe"> is 'Name'. (The string "xsi" is called the prefix).

For attribute nodes, the local name is derived from the string that appears to the left of the equals sign in the attribute declaration. For example, the element <xsi:Name xsi:First="John" xsi:Last="Doe"> results in two attribute nodes, with the local names 'First' and 'Last'.

For any other node types, localName is nil (Delphi) or NULL (C++).

To get the name of a node when localName is not defined, use the NodeName (see page 26435) property instead. If the node's name has no namespace prefix, LocalName has the same value as NodeName (see page 26435).

See Also

NamespaceURI (see page 26435)

Prefix (see page 26438)

NodeName (see page 26435)

197.2.2.3.10 IXMLNode.NamespaceURI Property

Identifies the URI for the namespace used in the qualified node name.

Pascal

```
property NamespaceURI: DOMString;
```

C++

```
__property DOMString NamespaceURI;
```

Description

NamespaceURI is the URI for the namespace that should be used to interpret the node's name.

Only element and attribute nodes can have a namespace URI value. For any other node type, NamespaceURI is an empty string.

The namespace URI is only available if it is explicitly assigned when the node is created. By default, IXMLNode (see page 26411) does not assign namespaces to the new nodes it creates.

See Also

NodeName (see page 26435)

NodeType (see page 26436)

Prefix (see page 26438)

LocalName (see page 26434)

CreateDOMNode (see page 26238)

NamespaceURI (see page 26318)

197.2.2.3.11 IXMLNode.NodeName Property

Indicates the node name.

Pascal

```
property NodeName: DOMstring;
```

C++

```
__property DOMstring NodeName;
```

Description

NodeName is the name of the underlying DOM node.

The node's name depends on the type of the node, as indicated in the following table:

NodeType (see page 26436)	NodeName
ntAttribute	The attribute name
ntElement	The tag name
ntText	'#text'
ntCData	'#cdata-section'
ntEntityRef	The name of the entity reference.
ntEntity	The entity name
ntProcessingInstr	the target of the processing instruction
ntComment	'#comment'
ntDocument	'#document'
ntDocType	The document type name
ntDocFragment	'#document-fragment'
ntNotation	The notation name

Note: If Prefix (see page 26438) and LocalName (see page 26434) are both defined for a node, the node name is the combination of these two values.

See Also

NodeType (see page 26436)

Prefix (see page 26438)

LocalName (see page 26434)

197.2.2.3.12 IXMLNode.NodeType Property

Indicates the type of the node.

Pascal

```
property NodeType: TNodeType;
```

C++

```
__property TNodeType NodeType;
```

Description

Read NodeType to determine the type of the node. The type reflects the way the node is used in the XML (see page 26439) document.

See Also

IsTextElement (see page 26434)

197.2.2.3.13 IXMLNode.NodeValue Property

Specifies the value of this node.

Pascal

```
property NodeValue: OleVariant;
```

C++

```
__property OleVariant NodeValue;
```

Description

Use NodeValue to get or set the value of the node. The meaning of a node's value depends on the type of the node, as indicated in the following table:

NodeType (see page 26436)	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, trying to read or set NodeValue causes an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.

Trying to read or set the value of any other node type causes an exception.

See Also

ChildValues (see page 26432)

Text (see page 26439)

197.2.2.3.14 IXMLNode.OwnerDocument Property

Identifies the document in which this node appears.

Pascal

```
property OwnerDocument: IXMLDocument;
```

C++

```
__property IXMLDocument OwnerDocument;
```

Description

Read OwnerDocument to obtain the IXMLDocument (see page 26382) interface of the document to which this node belongs.

See Also

ParentNode (see page 26437)

197.2.2.3.15 IXMLNode.ParentNode Property

Identifies the interface of the node's parent node.

Pascal

```
property ParentNode: IXMLNode;
```

C++

```
__property IXMLNode ParentNode;
```

Description

Read ParentNode to access the node's parent node.

See Also

ChildNodes (see page 26431)

197.2.2.3.16 IXMLNode.Prefix Property

Identifies the namespace prefix of the node's name.

Pascal

```
property Prefix: DOMString;
```

C++

```
__property DOMString Prefix;
```

Description

Prefix is the namespace prefix of an element or attribute node's name. A namespace prefix is a symbolic name for a namespace URI.

For element nodes, the namespace prefix is derived from the name that appears in the XML (see page 26439) tag. For example, the namespace prefix for <xsi:Name First="John" Last="Doe"> is 'xsi'.

For attribute nodes, the namespace prefix is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <xsi:Name xsn:First="John" Last="Doe"> results in two attribute nodes, with namespace prefixes of 'xsn' and '', respectively. Note that the attribute never inherits a namespace prefix from the node to which it is attached.

For any other node types, the namespace prefix is nil (Delphi) or NULL (C++).

See Also

LocalName (see page 26434)

NodeType (see page 26436)

NamespaceURI (see page 26435)

197.2.2.3.17 IXMLNode.ReadOnly Property

Specifies whether the node can be modified.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

ReadOnly specifies whether the value, child nodes, or attributes of the node can be changed. When ReadOnly is true, the node can't be modified. Read-only nodes raise an exception when an attempt is made to modify them.

When ReadOnly is false, the node can be modified.

See Also

AttributeNodes (see page 26430)

ChildNodes (see page 26431)

NodeValue (see page 26436)

197.2.2.3.18 IXMLNode.Text Property

Represents the Text of the node.

Pascal

```
property Text: DOMString;
```

C++

```
__property DOMString Text;
```

Description

Text represents the text of the node. For example, if the node corresponds to

```
<Title> Understanding XML </Title>
```

The text of the node is the string 'Understanding XML (see page 26439)'.

Text is intended for use nodes where the IsTextElement (see page 26434) property is true. If IsTextElement (see page 26434) is false, then

If the node has no children, the value of Text is an empty string. Setting Text is this case result in a node where IsTextElement (see page 26434) istrue.

If the node has children (other than a single DOM text node), reading or setting Text causes an exception.

See Also

IsTextElement (see page 26434)

NodeValue (see page 26436)

Working with XML Nodes

197.2.2.3.19 IXMLNode.XML Property

Indicates the XML that corresponds to the subtree rooted at this node.

Pascal

```
property XML: DOMString;
```

C++

```
__property DOMString XML;
```

Description

XML is the XML that corresponds to the document fragment that consists of this node and any child nodes it contains.

Note: XML is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

Text (see page 26439)

ChildValues (see page 26432)

DOMVendor (see page 26137)

197.2.3 IXMLNodeCollection Interface

IXMLNodeCollection is the interface for a set of child nodes that are all the same type.

Class Hierarchy

Pascal

```
IXMLNodeCollection = interface(IXMLNode);
```

C++

```
__interface IXMLNodeCollection : public IXMLNode;
```

File

XMLIntf

Description

Use IXMLNodeCollection to work with repeating elements in an XML (see page 26439) document. The XML (see page 26439) Data Binding wizard generates descendants of IXMLNodeCollection interface to represent sets of child nodes that are all of a particular type.

IXMLNodeCollection is a descendant of IXMLNode (see page 26411). As such, it provides generic support for working with a node in an XML (see page 26439) document. In addition, IXMLNodeCollection introduces properties and methods that manage a set of child nodes that are all the same type of node (that all have the same tag names or that are defined as the same type in an XML (see page 26439) schema).

Note: C++ method declarations that use IXMLNodeCollection use the _di_IXMLNodeCollection type instead. This type is a DelphiInterface wrapper around the IXMLNodeCollection interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNodeCollection >
_di_IXMLNodeCollection;
```

See Also

TXMLDocument (see page 26097)

IXMLNode (see page 26411)

TXMLNodeCollection (see page 26196)

197.2.3.1 IXMLNodeCollection Members

The following tables list the members exposed by IXMLNodeCollection.

Public Methods

	Name	Description
	AddChild (see page 26414)	This is the overview for the AddChild method overload.
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	CloneNode (see page 26415)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 26416)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.

	FindNamespaceDecl (see page 26416)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 26416)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 26417)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 26417)	Returns the value of the AttributeNodes (see page 26430) property.
	GetAttributeNS (see page 26418)	Returns the value of a specified attribute.
	GetChildNodes (see page 26418)	Returns the value of the ChildNodes (see page 26431) property.
	GetChildValue (see page 26418)	Returns the value of a specified child node.
	GetCollection (see page 26419)	Returns the value of the Collection (see page 26432) property.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetDOMNode (see page 26419)	Returns the value of the DOMNode (see page 26433) property.
	GetHasChildNodes (see page 26420)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 26420)	Indicates whether the node has a single text value.
	GetLocalName (see page 26420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 26421)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 26421)	Returns the name of the node.
	GetNodeType (see page 26421)	Returns the type of the node.
	GetNodeValue (see page 26422)	Returns the value of the node.
	GetOwnerDocument (see page 26422)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 26422)	Returns the interface for the node's parent node.
	GetPrefix (see page 26422)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 26423)	Returns the value of the ReadOnly (see page 26438) property.
	GetText (see page 26423)	Returns the text value of the node.
	GetXML (see page 26423)	Returns the value of the XML (see page 26439) property.
	HasAttribute (see page 26424)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 26424)	Returns the next child of this node's parent.
	Normalize (see page 26425)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 26425)	Returns the previous child of this node's parent.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.
	Resync (see page 26426)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 26426)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 26426)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 26427)	Sets the value of a specified child node.
	SetNodeValue (see page 26427)	Sets the value of this node.
	SetReadOnly (see page 26428)	Specifies whether the node can be modified.
	SetText (see page 26428)	Sets the text value of the node.
	TransformNode (see page 26428)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 26430)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 26430)	Represents the values of this node's attributes.
R	ChildNodes (see page 26431)	Represents the child nodes of the node.
	ChildValues (see page 26432)	Represents the values of this node's child nodes.
R	Collection (see page 26432)	Indicates the collection in which this node appears.
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	DOMNode (see page 26433)	Provides access to the IDOMNode interface for this node.
R	HasChildNodes (see page 26433)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 26434)	Indicates whether the node has a single text value.
R	LocalName (see page 26434)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 26435)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 26435)	Indicates the node name.

R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 26436)	Indicates the type of the node.
	NodeValue (see page 26436)	Specifies the value of this node.
R	OwnerDocument (see page 26437)	Identifies the document in which this node appears.
R	ParentNode (see page 26437)	Identifies the interface of the node's parent node.
R	Prefix (see page 26438)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 26438)	Specifies whether the node can be modified.
	Text (see page 26439)	Represents the Text of the node.
R	XML (see page 26439)	Indicates the XML that corresponds to the subtree rooted at this node.

197.2.3.2 IXMLNodeCollection Methods

The methods of the IXMLNodeCollection class are listed here.

Public Methods

	Name	Description
	Clear (see page 26442)	Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.
	Delete (see page 26442)	Removes one of the repeating child nodes from this node.
	GetCount (see page 26443)	Returns the value of the Count (see page 26444) property.
	GetNode (see page 26443)	Returns the interface for one of the repeating child nodes.
	Remove (see page 26443)	Removes one of the repeating child nodes from this node.

197.2.3.2.1 IXMLNodeCollection.Clear Method

Removes all child nodes in the Nodes (see page 26445) property from the ChildList and Nodes (see page 26445) properties.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Clear deletes every child node from the collection (all the nodes in the Nodes (see page 26445) property), along with the corresponding nodes in the ChildNodes (see page 26431) property.

See Also

Nodes (see page 26445)

Delete (see page 26442)

Remove (see page 26443)

ChildNodes (see page 26431)

197.2.3.2.2 IXMLNodeCollection.Delete Method

Removes one of the repeating child nodes from this node.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Delete removes a specified child node from this node.

Index identifies the child to remove. It is the index of the child in the Nodes (see page 26445) property list of repeating child nodes. The index 0 represents the first repetition, 1 represents the second repetition, and so on.

See Also

Remove (see page 26443)

AddChild (see page 26414)

Nodes (see page 26445)

Clear (see page 26442)

197.2.3.2.3 IXMLNodeCollection.GetCount Method

Returns the value of the Count (see page 26444) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 26444) property.

See Also

Count (see page 26444)

197.2.3.2.4 IXMLNodeCollection.GetNode Method

Returns the interface for one of the repeating child nodes.

Pascal

```
function GetNode(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(int Index);
```

Description

GetNode is the read implementation of the Nodes (see page 26445) property.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on.

See Also

Nodes (see page 26445)

197.2.3.2.5 IXMLNodeCollection.Remove Method

Removes one of the repeating child nodes from this node.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes a specified child node from the collection of repeating child nodes. It removes the node from both the collection, and from the ChildNodes (see page 26431) property, which lists all children of this node.

Node is the interface of the child to remove. It must represent on of the repeating child nodes.

To remove a child that is not one of the repeating child nodes, use the ChildNodes (see page 26431) property instead.

See Also

Delete (see page 26442)

ChildNodes (see page 26431)

Nodes (see page 26445)

197.2.3.3 IXMLNodeCollection Properties

The properties of the IXMLNodeCollection class are listed here.

Public Properties

	Name	Description
R	Count (see page 26444)	Indicates the number of repeating child nodes.
R	Nodes (see page 26445)	Lists the interfaces of the repeating child nodes.

197.2.3.3.1 IXMLNodeCollection.Count Property

Indicates the number of repeating child nodes.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to obtain the number of repeating children of this node. Use Count to obtain an upper limit when addressing child nodes by index (for example, when iterating over all nodes in the Nodes (see page 26445) property list).

Count is changed when you add child nodes using the AddChild (see page 26414) method or delete them using the Delete (see page 26442) or Remove (see page 26443) method. You can access the individual repeating child nodes using the Nodes (see page 26445) property.

See Also

Nodes (see page 26445)

AddChild (see page 26414)

Remove (see page 26443)

Delete (see page 26442)

197.2.3.3.2 IXMLNodeCollection.Nodes Property

Lists the interfaces of the repeating child nodes.

Pascal

```
property Nodes [Index: Integer]: IXMLNode;
```

C++

```
__property IXMLNode Nodes[int Index];
```

Description

Use Nodes to access nodes from the set of repeating child nodes. The value of Nodes is the IXMLNode (see page 26411) interface that represents a specified child node.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on.

Note: The XML (see page 26439) Data Binding wizard generates a nearly identical property in IXMLNodeCollection (see page 26440) descendants called Items. Items differs from Nodes in that the value is an IXMLNode (see page 26411) descendant specific to the type of the repeating element, rather than the generic IXMLNode (see page 26411) interface.

Note: In Delphi, ChildNodes (see page 26431) is the default property for IXMLNodeCollection (see page 26440). That means that you can omit the property name when using this property. In IXMLNodeCollection (see page 26440) descendants that are generated by the XML (see page 26439) Data Binding wizard, the Items property is the default property instead.

Note: As a descendant of IXMLNode (see page 26411), IXMLNodeCollection (see page 26440) also inherits the ChildNodes (see page 26431) property, which lists all the child nodes for this node. Nodes differs from ChildNodes (see page 26431) in that it contains only those child nodes that are in the repeating collection.

See Also

Count (see page 26444)

ChildNodes (see page 26431)

197.2.4 IXMLNodeList Interface

IXMLNodeList represents a set of nodes in an XML document.

Class Hierarchy

Pascal

```
IXMLNodeList = interface;
```

C++

```
__interface IXMLNodeList;
```

File

XMLIntf

Description

Use IXMLNodeList to work with a set of related nodes in an XML document. IXMLNodeList can be used to add or delete nodes from the set, or to access specific nodes.

Note: C++ method declarations that use IXMLNodeList use the _di_IXMLNodeList type instead. This type is a DelphiInterface wrapper around the IXMLNodeList interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNodeList >  _di_IXMLNodeList;
```

See Also

TXMLNodeList (see page 26211)

IXMLNode (see page 26411)

IXMLNode (see page 26411)

TXMLDocument (see page 26097)

197.2.4.1 IXMLNodeList Members

The following tables list the members exposed by IXMLNodeList.

Public Methods

	Name	Description
	Add (see page 26447)	Adds a new node to the end of the list.
	BeginUpdate (see page 26447)	Increments the value of UpdateCount (see page 26457).
	Clear (see page 26448)	Removes all nodes from the list.
	Delete (see page 26448)	This is the overview for the Delete method overload.
	EndUpdate (see page 26449)	Decrements the value of UpdateCount (see page 26457).
	FindNode (see page 26450)	This is the overview for the FindNode method overload.
	FindSibling (see page 26451)	Returns a node that appears a specified amount before or after another node.
	First (see page 26451)	Returns the first node in the list.
	Get (see page 26452)	Returns a specified node in the list.
	GetCount (see page 26452)	Returns the number of nodes in the list.
	GetNode (see page 26452)	Returns a specified node from the list.
	GetUpdateCount (see page 26453)	Returns the value of the UpdateCount (see page 26457) property.
	IndexOf (see page 26453)	This is the overview for the IndexOf method overload.
	Insert (see page 26454)	Inserts a new node into a specified position in the list.
	Last (see page 26454)	Returns the last node in the list.
	Remove (see page 26455)	Removes a specified node from the list.
	ReplaceNode (see page 26455)	Replaces a specified node in the list with another node.

Public Properties

	Name	Description
R	Count (see page 26456)	Indicates the number of nodes in the list.
R	Nodes (see page 26456)	Provides access to the nodes in the list.
R	UpdateCount (see page 26457)	Indicates the number of times an application has called BeginUpdate (see page 26447) without a matching call to EndUpdate (see page 26449).

197.2.4.2 IXMLNodeList Methods

The methods of the IXMLNodeList class are listed here.

Public Methods

	Name	Description
	Add (see page 26447)	Adds a new node to the end of the list.
	BeginUpdate (see page 26447)	Increments the value of UpdateCount (see page 26457).
	Clear (see page 26448)	Removes all nodes from the list.
	Delete (see page 26448)	This is the overview for the Delete method overload.
	EndUpdate (see page 26449)	Decrements the value of UpdateCount (see page 26457).
	FindNode (see page 26450)	This is the overview for the FindNode method overload.
	FindSibling (see page 26451)	Returns a node that appears a specified amount before or after another node.
	First (see page 26451)	Returns the first node in the list.
	Get (see page 26452)	Returns a specified node in the list.
	GetCount (see page 26452)	Returns the number of nodes in the list.
	GetNode (see page 26452)	Returns a specified node from the list.
	GetUpdateCount (see page 26453)	Returns the value of the UpdateCount (see page 26457) property.
	IndexOf (see page 26453)	This is the overview for the IndexOf method overload.
	Insert (see page 26454)	Inserts a new node into a specified position in the list.
	Last (see page 26454)	Returns the last node in the list.
	Remove (see page 26455)	Removes a specified node from the list.
	ReplaceNode (see page 26455)	Replaces a specified node in the list with another node.

197.2.4.2.1 IXMLNodeList.Add Method

Adds a new node to the end of the list.

Pascal

```
function Add(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Add(const IXMLNode Node);
```

Description

Call Add to add a node to the end of the list. Add returns the index of the node once it is added, where 0 is the index of the first node in the list, 1 is the index of the second node, and so on.

Node is the node to add to the list.

See Also

Delete (see page 26449)

Remove (see page 26455)

IndexOf (see page 26453)

Insert (see page 26454)

Nodes (see page 26456)

197.2.4.2.2 IXMLNodeList.BeginUpdate Method

Increments the value of UpdateCount (see page 26457).

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before making several changes to the nodes in the list (such as adding or removing several nodes). BeginUpdate increments the UpdateCount (see page 26457) property, to keep track of the fact that the list is in the middle of an update. When the update is complete, call EndUpdate (see page 26449) to decrement the UpdateCount (see page 26457) property.

Every call to BeginUpdate should be matched by a call to EndUpdate (see page 26449), so that the UpdateCount (see page 26457) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 26457)

EndUpdate (see page 26449)

197.2.4.2.3 IXMLNodeList.Clear Method

Removes all nodes from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the list.

Note: Clear does not call the BeginUpdate (see page 26447) and EndUpdate (see page 26449) methods, even though it may result in the deletion of more than one node.

See Also

Delete (see page 26449)

Remove (see page 26455)

Nodes (see page 26456)

197.2.4.2.4 Delete Method

This is the overview for the Delete method overload.

Overload List

	Name	Description
	IXMLNodeList.Delete (DOMString) (see page 26449)	Removes a specified node from the list.
	IXMLNodeList.Delete (DOMString, DOMString) (see page 26449)	Removes a specified node from the list.
	IXMLNodeList.Delete (Integer) (see page 26449)	Removes a specified node from the list.

197.2.4.2.4.1 IXMLNodeList.Delete Method (DOMString)

Removes a specified node from the list.

Pascal

```
function Delete(const Index: Integer): Integer; overload;
function Delete(const Name: DOMString): Integer; overload;
function Delete(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int Delete(const int Index);
__fastcall int Delete(const DOMString Name);
__fastcall int Delete(const DOMString Name, const DOMString NamespaceURI);
```

Description

Delete removes the node specified by the Index or Name parameter.

Name identifies the node to remove from the list. This is the local name of the node to remove.

NamespaceURI identifies the namespace to use when interpreting Name (if necessary).

Index identifies the node to remove by index rather than name. Index ranges from 0 to one less than the value of the Count (see page 26456) property.

Delete returns the index of the node that was removed. If there was no node that matched the value of Index or Name, Delete returns –1.

See Also

Remove (see page 26455)

Clear (see page 26448)

IndexOf (see page 26453)

LocalName (see page 26434)

NamespaceURI (see page 26435)

Working with XML Nodes

197.2.4.2.5 IXMLNodeList.EndUpdate Method

Decrements the value of UpdateCount (see page 26457).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after making several changes to the nodes in the list (such as adding or removing several nodes). EndUpdate decrements the UpdateCount (see page 26457) property, which was incremented by a previous call to BeginUpdate (see page 26447).

Every call to BeginUpdate (see page 26447) should be matched by a call to EndUpdate, so that the UpdateCount (see page 26457) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 26457)

BeginUpdate (see page 26447)

197.2.4.2.6 FindNode Method

This is the overview for the FindNode method overload.

Overload List

	Name	Description
	IXMLNodeList.FindNode (DOMString) (see page 26450)	Returns a specified node from the list.
	IXMLNodeList.FindNode (DOMString, DOMString) (see page 26450)	Returns a specified node from the list.
	IXMLNodeList.FindNode (TGuid) (see page 26450)	Returns a specified node from the list.

197.2.4.2.6.1 IXMLNodeList.FindNode Method (DOMString)

Returns a specified node from the list.

Pascal

```
function FindNode(NodeName: DOMString): IXMLNode; overload;
function FindNode(NodeName: DOMString; NamespaceURI: DOMString): IXMLNode; overload;
function FindNode(ChildNodeType: TGuid): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode FindNode(DOMString NodeName);
__fastcall IXMLNode FindNode(DOMString NodeName, DOMString NamespaceURI);
__fastcall IXMLNode FindNode(TGuid ChildNodeType);
```

Description

Call FindNode to access a particular node in the list.

NodeName is the node to access. It specifies the LocalName property of the desired node.

NamespaceURI identifies the namespace that qualifies NodeName. It is the same as the NamespaceURI property of the desired node.

ChildNodeType identifies the node to access by its interface type (GUID), rather than by name.

FindNode returns the interface for the node if it is in the list. If NodeName or ChildNodeType does not specify a node in the list, FindNode returns nil (Delphi) or NULL (C++).

See Also

FindSibling (see page 26451)

First (see page 26451)

Last (see page 26454)

IndexOf (see page 26453)

LocalName (see page 26434)

Nodes (see page 26456)

NamespaceURI (see page 26435)

197.2.4.2.7 IXMLNodeList.FindSibling Method

Returns a node that appears a specified amount before or after another node.

Pascal

```
function FindSibling(const Node: IXMLNode; Delta: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode FindSibling(const IXMLNode Node, int Delta);
```

Description

Call FindSibling to access the node whose position has a specified relationship to another node.

Node is a node in the list to use as a reference point.

Delta indicates where the desired node appears, relative to Node. If Delta is positive, FindSibling returns the node that appears Delta positions after Node. If Delta is negative, FindSibling returns a node that appears before Node.

FindSibling returns the node that appears at the position offset by Delta, relative to the position of Node. If Delta specifies a position before the first node or after the last node in the list, FindSibling returns nil (Delphi) or NULL (C++).

See Also

FindNode (see page 26450)

First (see page 26451)

Last (see page 26454)

IndexOf (see page 26453)

197.2.4.2.8 IXMLNodeList.First Method

Returns the first node in the list.

Pascal

```
function First: IXMLNode;
```

C++

```
__fastcall IXMLNode First();
```

Description

Call First to access the first node in the list. If the list is empty, First raises an exception.

See Also

FindNode (see page 26450)

FindSibling (see page 26451)

Last (see page 26454)

Nodes (see page 26456)

197.2.4.2.9 IXMLNodeList.Get Method

Returns a specified node in the list.

Pascal

```
function Get(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode Get(int Index);
```

Description

Call Get to retrieve a node from the list, given its index.

Index specifies the node to fetch, where 0 identifies the first node, 1 identifies the second node, and so on. Index should be less than the value of the Count (see page 26456) property.

See Also

Nodes (see page 26456)

GetNode (see page 26452)

Count (see page 26456)

197.2.4.2.10 IXMLNodeList.GetCount Method

Returns the number of nodes in the list.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 26456) property.

See Also

Count (see page 26456)

197.2.4.2.11 IXMLNodeList.GetNode Method

Returns a specified node from the list.

Pascal

```
function GetNode(const IndexOrName: OleVariant): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(const OleVariant IndexOrName);
```

Description

GetNode is the read implementation of the Nodes (see page 26456) property.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, GetNode tries to create a new node with the name specified by IndexOrName. If it can't create the new node, GetNode raises an exception.

See Also

FindNode (see page 26450)

Nodes (see page 26456)

LocalName (see page 26434)

Get (see page 26452)

197.2.4.2.12 IXMLNodeList.GetUpdateCount Method

Returns the value of the UpdateCount (see page 26457) property.

Pascal

```
function GetUpdateCount: Integer;
```

C++

```
__fastcall int GetUpdateCount();
```

Description

GetUpdateCount is the read implementation of the UpdateCount (see page 26457) property.

See Also

UpdateCount (see page 26457)

197.2.4.2.13 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	IXMLNodeList.IndexOf (DOMString) (see page 26453)	Returns the index of a specified node.
	IXMLNodeList.IndexOf (DOMString, DOMString) (see page 26453)	Returns the index of a specified node.
	IXMLNodeList.IndexOf (IXMLNode) (see page 26453)	Returns the index of a specified node.

197.2.4.2.13.1 IXMLNodeList.IndexOf Method (DOMString)

Returns the index of a specified node.

Pascal

```
function IndexOf(const Node: IXMLNode): Integer; overload;
function IndexOf(const Name: DOMString): Integer; overload;
function IndexOf(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int IndexOf(const IXMLNode Node);
```

```
__fastcall int IndexOf(const DOMString Name);
__fastcall int IndexOf(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call IndexOf to locate a node in the list. You can specify which node to locate using its name or its interface.

Name is the LocalName property of the node to locate.

NamespaceURI identifies the namespace to use when interpreting LocalName (if necessary).

Node is the interface of the node to locate.

IndexOf returns the index of the specified node, where 0 is the index of the first node, 1 is the index of the second node, and so on. If the specified node is not in the list, IndexOf returns -1.

See Also

FindNode (see page 26450)

LocalName (see page 26434)

Nodes (see page 26456)

NamespaceURI (see page 26435)

197.2.4.2.14 IXMLNodeList.Insert Method

Inserts a new node into a specified position in the list.

Pascal

```
procedure Insert(Index: Integer; const Node: IXMLNode);
```

C++

```
__fastcall Insert(int Index, const IXMLNode Node);
```

Description

Call Insert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index does not specify a valid index, Insert raises an exception.

Node is the node to add to the list.

See Also

Delete (see page 26449)

Remove (see page 26455)

IndexOf (see page 26453)

Add (see page 26447)

Nodes (see page 26456)

197.2.4.2.15 IXMLNodeList.Last Method

Returns the last node in the list.

Pascal

```
function Last: IXMLNode;
```

C++

```
__fastcall IXMLNode Last();
```

Description

Call Last to access the last node in the list. If the list is empty, Last raises an exception.

See Also

FindNode (see page 26450)

FindSibling (see page 26451)

First (see page 26451)

Nodes (see page 26456)

197.2.4.2.16 IXMLNodeList.Remove Method

Removes a specified node from the list.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes the specified node from the list.

Node is the node to remove from the list.

Remove returns the index of Node before it was removed. If node is not a node in the list, Remove returns -1.

See Also

Delete (see page 26449)

Clear (see page 26448)

197.2.4.2.17 IXMLNodeList.ReplaceNode Method

Replaces a specified node in the list with another node.

Pascal

```
function ReplaceNode(const OldNode: IXMLNode; const NewNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode ReplaceNode(const IXMLNode OldNode, const IXMLNode NewNode);
```

Description

Call ReplaceNode to replace the node specified by OldNode with the node specified by NewNode.

OldNode is the node to replace. If OldNode does not appear in the list, then ReplaceNode adds the new node to the end of the list.

NewNode is the node to add to the list in place of OldNode.

ReplaceNode returns OldNode (even if OldNode did not appear in the list).

Remove (see page 26455)

Insert (see page 26454)

197.2.4.3 IXMLNodeList Properties

The properties of the IXMLNodeList class are listed here.

Public Properties

	Name	Description
R	Count (see page 26456)	Indicates the number of nodes in the list.
R	Nodes (see page 26456)	Provides access to the nodes in the list.
R	UpdateCount (see page 26457)	Indicates the number of times an application has called BeginUpdate (see page 26447) without a matching call to EndUpdate (see page 26449).

197.2.4.3.1 IXMLNodeList.Count Property

Indicates the number of nodes in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read Count to determine the number of nodes in the list. Count provides an upper limit to the indexes that can be used with the Nodes (see page 26456) property.

To change the value of Count, add nodes using the Add (see page 26447) or Insert (see page 26454) method, or remove them using the Delete (see page 26449) or Remove (see page 26455) method.

See Also

Nodes (see page 26456)

Add (see page 26447)

Delete (see page 26449)

Remove (see page 26455)

Insert (see page 26454)

197.2.4.3.2 IXMLNodeList.Nodes Property

Provides access to the nodes in the list.

Pascal

```
property Nodes [const IndexOrName: OleVariant]: IXMLNode;
```

C++

```
__property IXMLNode Nodes[OleVariant const IndexOrName];
```

Description

Read Nodes to access a specified node in the list.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on. The Count (see page 26456) property provides an upper bound on the indexes you can specify.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, and if the document that contains this node list's parent includes doNodeAutoCreate in its Options property, then the node list tries to create a new node with the name specified by IndexOrName. If the node list can't create the new node, it raises an exception.

See Also

Count (see page 26456)

FindNode (see page 26450)

LocalName (see page 26434)

Options (see page 26141)

197.2.4.3.3 IXMLNodeList.UpdateCount Property

Indicates the number of times an application has called BeginUpdate (see page 26447) without a matching call to EndUpdate (see page 26449).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether all update operations have been completed. When an application starts making changes to the list, it calls BeginUpdate (see page 26447), which increments UpdateCount. When those changes are complete, it calls EndUpdate (see page 26449), which decrements UpdateCount. Thus, UpdateCount allows calls to BeginUpdate (see page 26447) and EndUpdate (see page 26449) to be nested.

Applications can avoid responding to updates in a piecemeal fashion by checking UpdateCount and only responding when it is 0.

See Also

BeginUpdate (see page 26447)

EndUpdate (see page 26449)

197.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TNodeType (see page 26458)	TNodeType identifies the type of a node in an XML document.
	TParseOption (see page 26460)	TParseOption and TParseOptions (see page 26463) represent implementation-specific options that are followed when parsing the XML document.
	TXMLDocOption (see page 26460)	TXMLDocOption and TXMLDocOptions (see page 26463) indicate types of information that an XML document automatically supplies.
	TXMLEncodingType (see page 26461)	TXMLEncodingType indicates the character set used to encode characters in an XML document.

197.3.1 XMLIntf.TNodeType Enumeration

TNodeType identifies the type of a node in an XML document.

Pascal

```
TNodeType = (
  ntReserved,
  ntElement,
  ntAttribute,
  ntText,
  ntCData,
  ntEntityRef,
  ntEntity,
  ntProcessingInstr,
  ntComment,
  ntDocument,
  ntDocType,
  ntDocFragment,
  ntNotation
);
```

C++

```
enum TNodeType {
  ntReserved,
  ntElement,
  ntAttribute,
  ntText,
  ntCData,
  ntEntityRef,
  ntEntity,
  ntProcessingInstr,
  ntComment,
  ntDocument,
  ntDocType,
  ntDocFragment,
  ntNotation
};
```

File

XMLIntf

Description

TNodeType identifies the type of a node in an XML document. The following table lists the possible values:

Value	Meaning
ntReserved	Not used
ntElement	The node represents an element. Element nodes represent simple tags that have child nodes. (Note that sometimes these child nodes do not appear when using IXMLNode (see page 26411). For example child nodes of type ntText are typically hidden by IXMLNode (see page 26411) and appear only as the value of the Text property). The child nodes of an element node can have the following node types: ntElement, ntText, ntCData, ntEntityRef, ntProcessingInstr, and ntComment. Element nodes can also have attributes (ntAttribute). Element nodes can be the child of a node of type ntDocument, ntDocFragment, ntEntityRef, and ntElement.
ntAttribute	The node represents an attribute of an element. It is not the child of another node, but its value can be accessed using the Attribute property of the element node's IXMLNode (see page 26411) interface. An attribute node can have child nodes of type ntText and ntEntityRef.
ntText	The node represents the text content of a tag. A text node cannot have any child nodes, but can appear as the child node of a node of type ntAttribute, ntDocFragment, ntElement, or ntEntityRef.
ntCData	The node represents a CDATA section in the XML source. CDATA sections identify blocks of text that would otherwise be interpreted as markup. An ntCData node can't have any child nodes. They can appear as the child of an ntDocFragment, ntEntityRef, or ntElement node.
ntEntityRef	The node represents a reference to an entity in the XML document. This can be any type of entity, including character entity references. The children of an entity reference node can be of the following types: ntElement, ntProcessingInstr, ntComment, ntText, ntCData, and ntEntityRef. The entity reference node can appear as the child of an ntAttribute, ntDocFragment, ntElement, or ntEntityRef node.
ntEntity	The node represents an expanded entity. Entity nodes can have child nodes that represent the expanded entity (for example, ntText and ntEntityRef nodes). Entity nodes only appear as the child of an ntDocType node.
ntProcessingInstr	The node represents a processing instruction (PI) from the XML document. A PI node cannot have any child nodes, but can appear as the child node of a node of type ntDocument, ntDocFragment, ntElement, or ntEntityRef.
ntComment	The node represents a comment in the XML document. Comment nodes do not have child nodes. They appear as the child of an ntDocument, ntDocFragment, ntElement, or ntEntityRef node.
ntDocument	The node represents a document object, which is the root of the entire XML document. Document nodes have a single ntElement node as a child (the DocumentElement). In addition, they can have child nodes of type ntProcessingInstr, ntComment, and ntDocType. Because the document is the root of the XML document, it never appears as a child node.
ntDocType	The node represents the document type declaration, indicated by the <!DOCTYPE > tag. The document type node can child nodes of type ntNotation and ntEntity. It always appears as the child of the document node.
ntDocFragment	The node represents a document fragment. A document fragment node associates a node or subtree with a document without actually being contained in the document. Document fragment nodes can have child nodes of type ntElement, ntProcessingInstr, ntComment, ntText, ntCData, and ntEntityRef. It never appears as the child of another node.
ntNotation	A node represents a notation in the document type declaration. It always appears as the child of an ntDocType node and never has any child nodes.

197.3.2 XMLIntf.TParseOption Enumeration

TParseOption and TParseOptions (see page 26463) represent implementation-specific options that are followed when parsing the XML document.

Pascal

```
TParseOption = (
  poResolveExternals,
  poValidateOnParse,
  poPreserveWhiteSpace,
  poAsyncLoad
);
```

C++

```
enum TParseOption {
  poResolveExternals,
  poValidateOnParse,
  poPreserveWhiteSpace,
  poAsyncLoad
};
```

File

XMLIntf

Description

TParseOptions (see page 26463) is a set of TParseOption values. Each TParseOption value provides information about how a DOM parser should parse an XML document. Different DOM implementations support different options.

The following table lists the possible values:

OptionDOM VendorMeaning

Option	DOM Vendor	Meaning
poResolveExternals	MSXML	External definitions (resolvable namespaces, DTD external subsets, and external entity references) are resolved at parse time.
poValidateOnParse	MSXML	The DOM parser validates the XML document against its schema information as well as verifying that it is well-formed XML.
poPreserveWhiteSpace	MSXML	White space in the text of the XML document is not stripped off.
poAsyncLoad	MSXML	The DOM parser works asynchronously. This can speed up performance, especially when parsing a large XML document, but can also lead to exceptions if the application tries to access nodes in the document before it is completely parsed.

197.3.3 XMLIntf.TXMLDocOption Enumeration

TXMLDocOption and TXMLDocOptions (see page 26463) indicate types of information that an XML document automatically supplies.

Pascal

```
TXMLDocOption = (
```

```
    doNodeAutoCreate,
    doNodeAutoIndent,
    doAttrNull,
    doAutoPrefix,
    doNamespaceDecl,
    doAutoSave
  );
```

C++

```
  enum TXMLDocOption {
    doNodeAutoCreate,
    doNodeAutoIndent,
    doAttrNull,
    doAutoPrefix,
    doNamespaceDecl,
    doAutoSave
  };
```

File

XMLIntf

Description

TXMLDocOptions (see page 26463) is a set of TXMLDocOption values. The following table lists the TXMLDocOption values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList (see page 26445) interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.
doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null Variant (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.
doNamespaceDecl	When the AddChild method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild creates the new namespace but does not add an attribute to declare it.
doAutoSave	When the XML document closes, any changes are automatically saved back to the XML document file or to the XML property.

197.3.4 XMLIntf.TXMLEncodingType Enumeration

TXMLEncodingType indicates the character set used to encode characters in an XML document.

Pascal

```
  TXMLEncodingType = (
    xetUnknown,
    xetUCS_4BE,
    xetUCS_4LE,
    xetUCS_4Order2134,
    xetUCS_4Order3412,
    xetUTF_16BE,
    xetUTF_16LE,
    xetUTF_8,
```

```
    xetUCS_4Like,
    xetUTF_16BELike,
    xetUTF_16LELike,
    xetUTF_8Like,
    xetEBCDICLike
  );
```

C++

```
  enum TXMLEncodingType {
    xetUnknown,
    xetUCS_4BE,
    xetUCS_4LE,
    xetUCS_4Order2134,
    xetUCS_4Order3412,
    xetUTF_16BE,
    xetUTF_16LE,
    xetUTF_8,
    xetUCS_4Like,
    xetUTF_16BELike,
    xetUTF_16LELike,
    xetUTF_8Like,
    xetEBCDICLike
  };
```

File

XMLIntf

Description

The following table lists the possible TXMLEncodingType values:

Value	Character encoding
xetUnknown	The character set is unknown.
xetUCS_4BE	UCS-4, big-endian (1234).
xetUCS_4LE	UCS-4, little-endian (4321).
xetUCS_4Order2134	UCS-4, unusual octet order (2134)
xetUCS_4Order3412	UCS-4, unusual octet order (3412)
xetUTF_16BE	UTF-16, big-endian order
xetUTF_16LE	UTF-16, little-endian order
xetUTF_8	UTF-8
xetUCS_4Like	Any UCS-4 encoding
xetUTF_16BELike	Any UTF-16, big-endian encoding, may be without byte order mark
xetUTF_16LELike	Any UTF-16, little-endian encoding, my be without byte order mark
xetUTF_8Like	UTF-8, ISO 646, ASCII, or other 7- or 8-bit encoding, including multi-byte character sets such as Shift-JIS.
xetEBCDICLike	EBCDIC

197.4 Types

The following table lists types in this documentation.

Types

Name	Description
TParseOptions (see page 26463)	This is type XMLIntf.TParseOptions.
TXMLDocOptions (see page 26463)	This is type XMLIntf.TXMLDocOptions.

197.4.1 XMLIntf.TParseOptions Type

Pascal

```
TParseOptions = set of TParseOption;
```

C++

```
TParseOption TParseOptions;
```

File

XMLIntf

Description

This is type XMLIntf.TParseOptions.

197.4.2 XMLIntf.TXMLDocOptions Type

Pascal

```
TXMLDocOptions = set of TXMLDocOption;
```

C++

```
TXMLDocOption TXMLDocOptions;
```

File

XMLIntf

Description

This is type XMLIntf.TXMLDocOptions.

197.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
NodeTypeNames (see page 26464)	This is constant XMLIntf.NodeTypeNames.

197.5.1 XMLIntf.NodeTypeNames Constant

Pascal

```
NodeTypeNames: array[TNodeType] of string = ('', 'Element','Attribute','Text','CDATASection',
'EntityRef','Entity', 'ProcessingInstr', 'Comment','Document','DocumentType',
'DocumentFragment','Notation');
```

C++

```
array[TNodeType] of string NodeTypeNames = ('', 'Element','Attribute','Text','CDATASection',
'EntityRef','Entity', 'ProcessingInstr', 'Comment','Document','DocumentType',
'DocumentFragment','Notation');
```

File

XMLIntf

Description

This is constant XMLIntf.NodeTypeNames.

198 Xmlxform Namespace

This is namespace Xmlxform.

Topics

Name	Description
Classes (see page 26466)	The following table lists classes in this documentation.
Types (see page 26509)	The following table lists types in this documentation.

Classes

	Name	Description
	TranslateException (see page 26466)	TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.
	TXMLTransform (see page 26467)	TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.
	TXMLTransformClient (see page 26482)	TXMLTransformClient acts as an adapter between an XML document and a provider component.
	TXMLTransformProvider (see page 26492)	TXMLTransformProvider provides data from and resolves updates to an XML document.

Types

Name	Description
TRowEvent (see page 26509)	This is type Xmlxform.TRowEvent.
TTranslateEvent (see page 26509)	This is type Xmlxform.TTranslateEvent.

198.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TranslateException (see page 26466)	TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.
	TXMLTransform (see page 26467)	TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.
	TXMLTransformClient (see page 26482)	TXMLTransformClient acts as an adapter between an XML document and a provider component.
	TXMLTransformProvider (see page 26492)	TXMLTransformProvider provides data from and resolves updates to an XML document.

198.1.1 TranslateException Class

TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.

Class Hierarchy

Pascal

```
TranslateException = class(Exception);
```

C++

```
class TranslateException : public Exception;
```

File

Xmlxform

Description

TranslateException is raised by the transform components (TXMLTransform (see page 26467), TXMLTransformClient (see page 26482), and TXMLTransformProvider (see page 26492)) when they can't find a file that is needed to perform a transformation. The missing file can be the XML document that is to be translated into a data packet, or a transformation file that contains instructions on how to map between a data packet and an XML document.

See Also

TXMLTransform (see page 26467)

TXMLTransformClient (see page 26482)

TXMLTransformProvider (see page 26492)

198.1.2 TXMLTransform Class

TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.

Class Hierarchy

Pascal

```
TXMLTransform = class(TComponent);
```

C++

```
class TXMLTransform : public TComponent;
```

File

Xmlxform

Description

Use TXMLTransform to convert an XML document into a data packet or an XML data packet into an XML document that is not a data packet. You can use a TXMLTransform component by itself, or specify the transformation to be performed on a TXMLTransform component that is part of another component such as TXMLTransformClient (see page 26482) or TXMLTransformProvider (see page 26492).

TXMLTransform uses a special XML document called a transformation, which indicates how to perform the conversion. This transformation is specified by the TransformationFile (see page 26478) or TransformationDocument (see page 26478) property. You can generate a transformation file using the xmlmapper.exe utility.

There are three ways to specify the source document or data packet that TXMLTransform converts:

Use the SourceXmlFile (see page 26477) property if the source document is a file on disk.

Use the SourceXml (see page 26476) property if the source document is an in-memory string of XML.

Use the SourceXmlDocument (see page 26476) property if the source document is available through a DOM interface (IDOMDocument).

TXMLTransform performs its transformation when you read the Data (see page 26473) property or call the TransformXML (see page 26472) method. Once the source XML has been transformed, you can access the DOM interface for the resulting XML document or data packet using the ResultDocument (see page 26475) property, or read the Data (see page 26473) property to directly access the string of XML.

Converting XML Documents into Data Packets

198.1.2.1 TXMLTransform Members

The following tables list the members exposed by TXMLTransform.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	DoTransform (see page 26471)	This is DoTransform, a member of class TXMLTransform.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetData (see page 26471)	This is GetData, a member of class TXMLTransform.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetResultString (see page 26471)	This is GetResultString, a member of class TXMLTransform.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Transform (see page 26472)	This is Transform, a member of class TXMLTransform.
	Translate (see page 26473)	This is Translate, a member of class TXMLTransform.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.

	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	TransformXML (see page 26472)	Converts an XML document using the specifications in a transformation file.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 26473)	Represents the translated string of XML.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	EmptyDestinationDocument (see page 26474)	Specifies the DOM interface for an XML document that defines the structure of the transformation result.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
R	ResultDocument (see page 26475)	Specifies the DOM interface for the results of the transformation.
R	ResultString (see page 26475)	Specifies the results of the transformation.
	SourceXml (see page 26476)	Specifies a string of XML to be translated.
	SourceXmlDocument (see page 26476)	Specifies the DOM interface for the XML document to be converted.
	SourceXmlFile (see page 26477)	Specifies an XML document or XML data packet file to be translated.
	TransformationDocument (see page 26478)	Specifies the transformation that indicates how to convert the source XML document.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterEachRow (see page 26479)	Occurs after TXMLTransform (see page 26467) has finished transforming a record in the XML data packet.
	AfterEachRowSet (see page 26480)	Occurs after TXMLTransform (see page 26467) has finished transforming the entire XML data packet or a nested detail set.
	BeforeEachRow (see page 26480)	Occurs immediately before TXMLTransform (see page 26467) starts transforming a record in the XML data packet.
	BeforeEachRowSet (see page 26481)	Occurs immediately before TXMLTransform (see page 26467) starts transforming the entire XML data packet or a nested detail set.
	OnTranslate (see page 26481)	Occurs when the TXMLTransform (see page 26467) component needs to translate a user-defined node.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
	TransformationFile (see page 26478)	Specifies the transformation file that indicates how to convert the source XML document.

198.1.2.2 TXMLTransform Methods

The methods of the TXMLTransform class are listed here.

Protected Methods

	Name	Description
	DoTransform (see page 26471)	This is DoTransform, a member of class TXMLTransform.
	GetData (see page 26471)	This is GetData, a member of class TXMLTransform.
	GetResultString (see page 26471)	This is GetResultString, a member of class TXMLTransform.
	Transform (see page 26472)	This is Transform, a member of class TXMLTransform.
	Translate (see page 26473)	This is Translate, a member of class TXMLTransform.

Public Methods

	Name	Description
	TransformXML (see page 26472)	Converts an XML document using the specifications in a transformation file.

198.1.2.2.1 TXMLTransform.DoTransform Method

Pascal

```
function DoTransform(const XMLSrc: IDOMDocument; const XMLExtract: IDOMDocument; const XMLOut:
IDOMDocument): string;
```

C++

```
__fastcall AnsiString DoTransform(const IDOMDocument XMLSrc, const IDOMDocument XMLExtract,
const IDOMDocument XMLOut);
```

Description

This is DoTransform, a member of class TXMLTransform.

198.1.2.2.2 TXMLTransform.GetData Method

Pascal

```
function GetData: string;
```

C++

```
__fastcall AnsiString GetData();
```

Description

This is GetData, a member of class TXMLTransform.

198.1.2.2.3 TXMLTransform.GetResultString Method

Pascal

```
function GetResultString: string;
```

C++

```
__fastcall AnsiString GetResultString();
```

Description

This is GetResultString, a member of class TXMLTransform.

198.1.2.2.4 TXMLTransform.Transform Method

Pascal

```
procedure Transform(TransNode: IDOMNode; SrcNode: IDOMNode; DestNode: IDOMNode; Count:
Integer; InFromList: TStringList; InDestList: TStringList; InIdStrList: TStringList;
InValueList: TStringList; InOptionalList: TStringList; InDateFormatList: TStringList;
InDateFormatTypeList: TStringList; InMapValuesList: TStringList);
```

C++

```
__fastcall Transform(IDOMNode TransNode, IDOMNode SrcNode, IDOMNode DestNode, int Count,
TStringList InFromList, TStringList InDestList, TStringList InIdStrList, TStringList
InValueList, TStringList InOptionalList, TStringList InDateFormatList, TStringList
InDateFormatTypeList, TStringList InMapValuesList);
```

Description

This is Transform, a member of class TXMLTransform.

198.1.2.2.5 TXMLTransform.TransformXML Method

Converts an XML document using the specifications in a transformation file.

Pascal

```
function TransformXML(const SourceXml: string; const ATransformationFile: string = ''): string;
```

C++

```
__fastcall AnsiString TransformXML(const AnsiString SourceXml, const AnsiString
ATransformationFile = '');
```

Description

Call TransformXML to convert an XML document when the source XML is an in-memory string.

SourceXml (see page 26476) is a string of XML to be transformed. It can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation document used to perform the transformation. If the transformation converts a specific type of XML document into a data packet, SourceXml (see page 26476) must conform to the expected schema. If the transformation converts a data packet into an XML document, SourceXml (see page 26476) must be an XML data packet with the expected metadata.

ATransformationFile is the transformation file to use when performing the translation. A transformation file is a special type of XML file with the .xtr extension. Each transformation file is specific to a particular XML schema and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformation files.

If the ATransformationFile parameter is omitted, TransformXML uses the file specified by the TransformationFile (see page 26478) property, or the document specified by the TransformationDocument (see page 26478) property.

TransformXML returns the results of the conversion as a string of XML.

See Also

Data (see page 26473)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

198.1.2.2.6 TXMLTransform.Translate Method

Pascal

```
procedure Translate(const Id: string; const SrcNode: IDOMNode; var SrcValue: string; const
DestNode: IDOMNode); dynamic;
```

C++

```
__fastcall Translate(const AnsiString Id, const IDOMNode SrcNode, AnsiString SrcValue, const
IDOMNode DestNode);
```

Description

This is Translate, a member of class TXMLTransform.

198.1.2.3 TXMLTransform Properties

The properties of the TXMLTransform class are listed here.

Public Properties

	Name	Description
R	Data (see page 26473)	Represents the translated string of XML.
	EmptyDestinationDocument (see page 26474)	Specifies the DOM interface for an XML document that defines the structure of the transformation result.
R	ResultDocument (see page 26475)	Specifies the DOM interface for the results of the transformation.
R	ResultString (see page 26475)	Specifies the results of the transformation.
	SourceXml (see page 26476)	Specifies a string of XML to be translated.
	SourceXmlDocument (see page 26476)	Specifies the DOM interface for the XML document to be converted.
	SourceXmlFile (see page 26477)	Specifies an XML document or XML data packet file to be translated.
	TransformationDocument (see page 26478)	Specifies the transformation that indicates how to convert the source XML document.

Published Properties

	Name	Description
	TransformationFile (see page 26478)	Specifies the transformation file that indicates how to convert the source XML document.

198.1.2.3.1 TXMLTransform.Data Property

Represents the translated string of XML.

Pascal

```
property Data: string;
```

C++

```
__property AnsiString Data;
```

Description

Read Data to obtain the results of the transformation. Reading the Data property causes TXMLTransform (see page 26467) to translate its source XML document or data packet into the destination format, which becomes the value of the Data property. The resulting XML string is not cached in memory: reading Data a second time causes TXMLTransform (see page 26467) to perform its transformation a second time.

If the source XML is an XML document and the transformation indicates how to convert it into a data packet, Data is the contents

of a data packet in XML format.

If the source XML is an XML data packet and the transformation indicates how to convert it into another type of XML document, Data is the contents of the resulting document.

There are three ways to specify the source document or data packet that is converted to produce Data:

- Use the SourceXmlFile (see page 26477) property if the source document is a file on disk.
- Use the SourceXml (see page 26476) property if the source document is an in-memory string of XML.
- Use the SourceXmlDocument (see page 26476) property if the source document is available through a DOM interface (IDOMDocument).
- If SourceXMLFile is set to an invalid file name or SourceXMLFile is an empty string and SourceXml (see page 26476) is not a valid string of XML, or SourceXMLFile and SourceXML are both empty strings and SourceXmlDocument (see page 26476) is not set, TXMLTransform (see page 26467) raises a TranslateException (see page 26466) when you try to read Data.
- There are two ways to specify the transformation that converts the source XML into Data:
- Use the TransformationFile (see page 26478) property if the transformation is stored in a file on disk.
- Use the TransformationDocument (see page 26478) method if the transformation is available through a DOM interface (IDOMDocument).
- If TransformationFile (see page 26478) is set to an invalid file name or TransformationFile (see page 26478) is an empty string and TransformationDocument (see page 26478) is not set, TXMLTransform (see page 26467) raises a TranslateException (see page 26466) when you try to read Data.
- You can augment the transformation by using the EmptyDestinationDocument (see page 26474) property to supply a skeleton document that gives the form for the resulting XML document.
- When you read Data, for every user-defined node in the source XML document, TXMLTransform (see page 26467) generates an OnTranslate (see page 26481) event to convert the node.

Tip: When converting an XML document into a data packet, the value of Data can be assigned to a client dataset's XMLData property.

SourceXml (see page 26476)

Converting XML Documents into Data Packets

198.1.2.3.2 TXMLTransform.EmptyDestinationDocument Property

Specifies the DOM interface for an XML document that defines the structure of the transformation result.

Pascal

```
property EmptyDestinationDocument: IDOMDocument;
```

C++

```
__property IDOMDocument EmptyDestinationDocument;
```

Description

The transformation defined by TransformationFile (see page 26478) or TransformationDocument (see page 26478) contains a default structure for the results of transforming the source document in addition to the mappings between nodes in the source document and nodes in the destination. You can override this default structure, however, by setting EmptyDestinationDocument. This is the DOM interface for an XML document that has the desired structure, but with no values in the nodes that should be filled in using values in the source document. This is useful, for example, when you want to add additional information that does not come from the source document.

EmptyDestinationDocument is not changed when TXMLTransform (see page 26467) performs its transformation. To obtain a DOM interface for the resulting document, use the ResultDocument (see page 26475) property.

See Also

ResultDocument (see page 26475)

Data (see page 26473)

TransformXML (see page 26472)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

198.1.2.3.3 TXMLTransform.ResultDocument Property

Specifies the DOM interface for the results of the transformation.

Pascal

```
property ResultDocument: IDOMDocument;
```

C++

```
__property IDOMDocument ResultDocument;
```

Description

Read ResultDocument to work with the results of the transformation using a DOM interface. ResultDocument is created when you call the TransformXML (see page 26472) method to perform the transformation.

See Also

SourceXmlDocument (see page 26476)

Data (see page 26473)

TransformXML (see page 26472)

EmptyDestinationDocument (see page 26474)

ResultString (see page 26475)

198.1.2.3.4 TXMLTransform.ResultString Property

Specifies the results of the transformation.

Pascal

```
property ResultString: string;
```

C++

```
__property AnsiString ResultString;
```

Description

Read ResultString to obtain the results of the transformation as a string of XML. ResultString is created when you call the TransformXML (see page 26472) method to perform the transformation.

See Also

SourceXmlDocument (see page 26476)

Data (see page 26473)

TransformXML (see page 26472)

EmptyDestinationDocument (see page 26474)

ResultString

198.1.2.3.5 TXMLTransform.SourceXml Property

Specifies a string of XML to be translated.

Pascal

```
property SourceXml: string;
```

C++

```
__property AnsiString SourceXml;
```

Description

Specify the XML to be translated as the value of SourceXml. SourceXml can be the text of any XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 26478) or TransformationDocument (see page 26478). If the transformation converts a specific type of XML document into a data packet, SourceXml must conform to the expected schema. If the transformation converts a data packet into an XML document, SourceXml is an XML data packet with the expected metadata.

SourceXmlDocument (see page 26476) is used only if the SourceXMLFile property has not been set. If both SourceXMLFile and SourceXml are empty strings, TXMLTransform (see page 26467) uses the SourceXmlDocument (see page 26476) property instead. SourceXml takes precedence over SourceXmlDocument (see page 26476): If SourceXmlDocument (see page 26476) is set, TXMLTransform (see page 26467) still uses SourceXml (even if its value is not a valid string of XML).

See Also

SourceXmlDocument (see page 26476)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

SourceXmlFile (see page 26477)

Converting XML Documents into Data Packets

198.1.2.3.6 TXMLTransform.SourceXmlDocument Property

Specifies the DOM interface for the XML document to be converted.

Pascal

```
property SourceXmlDocument: IDOMDocument;
```

C++

```
__property IDOMDocument SourceXmlDocument;
```

Description

Specify the document to be translated as the value of SourceXmlDocument. SourceXmlDocument can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 26478) or TransformationDocument (see page 26478). If the transformation converts a specific type of XML document into a data packet, then SourceXmlDocument is a document with the expected schema. If the transformation converts a data packet into an XML document, SourceXmlDocument is the interface to an XML data packet with the expected metadata.

SourceXmlDocument is used only if the SourceXMLFile and SourceXml (see page 26476) properties have not been set.

See Also

SourceXmlFile (see page 26477)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

SourceXml (see page 26476)

Converting XML Documents into Data Packets

198.1.2.3.7 TXMLTransform.SourceXmlFile Property

Specifies an XML document or XML data packet file to be translated.

Pascal

```
property SourceXmlFile: string;
```

C++

```
__property AnsiString SourceXmlFile;
```

Description

Specify the file to be translated as the value of SourceXmlFile. SourceXmlFile can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 26478) or TransformationDocument (see page 26478). If the transformation converts a specific type of XML document into a data packet, SourceXmlFile is a document with the expected schema. If the transformation converts a data packet into an XML document, SourceXmlFile is an XML data packet with the expected metadata.

If SourceXmlFile is an empty string, TXMLTransform (see page 26467) uses the SourceXml (see page 26476) or SourceXmlDocument (see page 26476) property instead. SourceXmlFile takes precedence over both of these other properties. If SourceXml (see page 26476) or SourceXmlDocument (see page 26476) is set, TXMLTransform (see page 26467) still uses SourceXmlFile (even if it does not specify a valid file name).

TransformationDocument (see page 26478)

SourceXml (see page 26476)

Converting XML Documents into Data Packets

198.1.2.3.8 TXMLTransform.TransformationDocument Property

Specifies the transformation that indicates how to convert the source XML document.

Pascal

```
property TransformationDocument: IDOMDocument;
```

C++

```
__property IDOMDocument TransformationDocument;
```

Description

TransformationDocument is the DOM interface for the transformation that contains instructions for converting the source XML document into the XML that is the value of Data (see page 26473) and ResultDocument (see page 26475).

A transformation is a special type of XML document that defines the mapping between the nodes of a source document and a destination document and the structure of the destination document. Each transformation is specific to a particular XML schema and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformations.

If the EmptyDestinationDocument (see page 26474) property is set, TXMLTransform (see page 26467) uses that to override the default structure for the destination document that is defined in TransformationDocument.

TransformationDocument is used only if the value of TransformationFile (see page 26478) is an empty string.

Using an XML Document as the Client of a Provider

Using an XML Document as the Source for a Provider

198.1.2.3.9 TXMLTransform.TransformationFile Property

Specifies the transformation file that indicates how to convert the source XML document.

Pascal

```
property TransformationFile: string;
```

C++

```
__property AnsiString TransformationFile;
```

Description

TransformationFile is a file that contains instructions for converting the source XML document into the XML that is the value of Data (see page 26473) and ResultDocument (see page 26475). If the source document is a general XML document, TransformationFile represents a transformation from that document's schema into a data packet. If the source document is an XML data packet, TransformationFile represents a transformation from that data packet into another type of XML document.

A transformation file is a special type of XML file with the .xtr extension. Each transformation file is specific to a particular XML schema and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformation files.

If the EmptyDestinationDocument (see page 26474) property is set, TXMLTransform (see page 26467) uses that to override the default structure for the destination document that is defined in the transformation file.

TransformationFile takes precedence over the TransformationDocument (see page 26478) property. That is, TXMLTransform (see page 26467) only uses TransformationDocument (see page 26478) if TransformationFile is an empty string.

Using an XML Document as the Source for a Provider

198.1.2.4 TXMLTransform Events

The events of the TXMLTransform class are listed here.

Published Events

	Name	Description
	AfterEachRow (see page 26479)	Occurs after TXMLTransform (see page 26467) has finished transforming a record in the XML data packet.
	AfterEachRowSet (see page 26480)	Occurs after TXMLTransform (see page 26467) has finished transforming the entire XML data packet or a nested detail set.
	BeforeEachRow (see page 26480)	Occurs immediately before TXMLTransform (see page 26467) starts transforming a record in the XML data packet.
	BeforeEachRowSet (see page 26481)	Occurs immediately before TXMLTransform (see page 26467) starts transforming the entire XML data packet or a nested detail set.
	OnTranslate (see page 26481)	Occurs when the TXMLTransform (see page 26467) component needs to translate a user-defined node.

198.1.2.4.1 TXMLTransform.AfterEachRow Event

Occurs after TXMLTransform (see page 26467) has finished transforming a record in the XML data packet.

Pascal

```
property AfterEachRow: TRowEvent;
```

C++

```
__property TRowEvent AfterEachRow;
```

Description

Write an AfterEachRow event handler to take specific action after the XML transform component has translated each row in the data packet. For example, you can use AfterEachRow to read the data from the generated row and use it to compute the value of an internally calculated field.

See Also

TransformXML (see page 26472)

AfterEachRowSet (see page 26480)

BeforeEachRow (see page 26480)

Data (see page 26473)

198.1.2.4.2 TXMLTransform.AfterEachRowSet Event

Occurs after TXMLTransform (see page 26467) has finished transforming the entire XML data packet or a nested detail set.

Pascal

```
property AfterEachRowSet: TRowEvent;
```

C++

```
__property TRowEvent AfterEachRowSet;
```

Description

Write an AfterEachRowSet event handler to take specific action after the XML transform component has translated an entire dataset. This can be a nested detail set, or the entire XML data packet.

For example, you can use AfterEachRowSet with the BeforeEachRowSet (see page 26481) and OnTranslate (see page 26481) methods to compute summary values: initialize a variable in the BeforeEachRowSet (see page 26481) method, update it for every OnTranslate (see page 26481) event, and use the result in the AfterEachRowSet event.

See Also

TransformXML (see page 26472)

AfterEachRow (see page 26479)

BeforeEachRow (see page 26480)

Data (see page 26473)

198.1.2.4.3 TXMLTransform.BeforeEachRow Event

Occurs immediately before TXMLTransform (see page 26467) starts transforming a record in the XML data packet.

Pascal

```
property BeforeEachRow: TRowEvent;
```

C++

```
__property TRowEvent BeforeEachRow;
```

Description

Write a BeforeEachRow event handler to take specific action before the XML transform component starts translating each row in the data packet.

See Also

TransformXML (see page 26472)

BeforeEachRowSet (see page 26481)

AfterEachRow (see page 26479)

Data (see page 26473)

198.1.2.4.4 TXMLTransform.BeforeEachRowSet Event

Occurs immediately before TXMLTransform (see page 26467) starts transforming the entire XML data packet or a nested detail set.

Pascal

```
property BeforeEachRowSet: TRowEvent;
```

C++

```
__property TRowEvent BeforeEachRowSet;
```

Description

Write an BeforeEachRowSet event handler to take specific action before the XML transform component starts translating a dataset. This can be a nested detail set, or the entire XML data packet.

For example, you can use BeforeEachRowSet with the AfterEachRowSet (see page 26480) and OnTranslate (see page 26481) methods to compute summary values: initialize a variable in the BeforeEachRowSet method, update it for every OnTranslate (see page 26481) event, and use the result in the AfterEachRowSet (see page 26480) event.

See Also

TransformXML (see page 26472)

AfterEachRowSet (see page 26480)

BeforeEachRow (see page 26480)

Data (see page 26473)

198.1.2.4.5 TXMLTransform.OnTranslate Event

Occurs when the TXMLTransform (see page 26467) component needs to translate a user-defined node.

Pascal

```
property OnTranslate: TTranslateEvent;
```

C++

```
__property TTranslateEvent OnTranslate;
```

Description

Write an OnTranslate event handler to provide the translation for user-defined nodes.

TXMLTransform (see page 26467) performs a translation when an application reads the Data (see page 26473) property or calls the TransformXML (see page 26472) method. If the transformation document that governs how to perform that translation indicates that a node in the XML document is user defined, TXMLTransform (see page 26467) generates an OnTranslate event when it needs to translate to or from that node. OnTranslate only occurs for nodes that are marked as user defined.

If you do not translate a user-defined node in an OnTranslate event handler, the corresponding node in the translated XML is assigned the source XML node's value, if available. Otherwise, it is left blank.

Converting XML Documents into Data Packets

Using an XML Document as the Client of a Provider

Using an XML Document as the Source for a Provider

198.1.3 TXMLTransformClient Class

TXMLTransformClient acts as an adapter between an XML document and a provider component.

Class Hierarchy

Pascal

```
TXMLTransformClient = class(TComponent);
```

C++

```
class TXMLTransformClient : public TComponent;
```

File

Xmlxform

Description

Use TXMLTransformClient to convert the data from a provider into an XML document or to apply updates in the form of an XML document to a provider component. TXMLTransformClient can act as the client of any provider component, local or remote. It uses a transformation file that is generated using the xmlmapper utility to convert between XML documents and the data packets and delta packets used by the provider.

Using an XML Document as the Client of a Provider

198.1.3.1 TXMLTransformClient Members

The following tables list the members exposed by TXMLTransformClient.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.

	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetupAppServer (see page 26489)	This is SetupAppServer, a member of class TXMLTransformClient.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	ApplyUpdates (see page 26486)	Inserts or deletes the records corresponding to the data in an XML document.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.

	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 26485)	Creates and initializes a TXMLTransformClient (see page 26482) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26485)	Destroys the instance of a TXMLTransformClient (see page 26482) component.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
V	GetDataAsXml (see page 26487)	Fetches a data packet from the provider and converts it to an XML document.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetParentComponent (see page 2778)	Returns the containing Component.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetParams (see page 26488)	Sets input parameters to values supplied in an XML document.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Properties

	Name	Description
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	ProviderName (see page 26489)	Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.
	RemoteServer (see page 26490)	Specifies the connection component that this XML transform client uses to connect to an application server.
	Tag (see page 2808)	Stores an integer value as part of a component.
R	TransformApplyUpdates (see page 26490)	Specifies the TXMLTransform (see page 26467) component that converts XML into delta packets that are then sent to the provider to apply updates.
R	TransformGetData (see page 26491)	Specifies the TXMLTransform (see page 26467) component that converts data packets from the provider into XML.
R	TransformSetParams (see page 26491)	Specifies the TXMLTransform (see page 26467) component that converts the XML supplied to the SetParams (see page 26488) method into a data packet format.

198.1.3.2 TXMLTransformClient.Create Constructor

Creates and initializes a TXMLTransformClient (see page 26482) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLTransformClient(TComponent * AOwner);
```

Description

Call Create to instantiate an XML transform client at runtime. XML transform clients placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (typically a form or data module) that is responsible for freeing the TXMLTransformClient (see page 26482) object.

See Also

Owner (see page 2807)

198.1.3.3 TXMLTransformClient.Destroy Destructor

Destroys the instance of a TXMLTransformClient (see page 26482) component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLTransformClient();
```

Description

Do not call Destroy directly in an application. Usually destruction of TXMLTransformClient (see page 26482) objects is handled automatically. If an application creates its own instances of TXMLTransformClient (see page 26482) without assigning an Owner, however, it should call Free, which verifies that the dataset component is not nil before calling Destroy.

See Also

Owner (see page 2807)

Create (see page 26485)

Free (see page 22300)

198.1.3.4 TXMLTransformClient Methods

The methods of the TXMLTransformClient class are listed here.

Protected Methods

	Name	Description
	SetupAppServer (see page 26489)	This is SetupAppServer, a member of class TXMLTransformClient.

Public Methods

	Name	Description
	ApplyUpdates (see page 26486)	Inserts or deletes the records corresponding to the data in an XML document.
	GetDataAsXml (see page 26487)	Fetches a data packet from the provider and converts it to an XML document.
	SetParams (see page 26488)	Sets input parameters to values supplied in an XML document.

198.1.3.4.1 TXMLTransformClient.ApplyUpdates Method

Inserts or deletes the records corresponding to the data in an XML document.

Pascal

```
function ApplyUpdates(const UpdateXML: string; const UpdateTransformFile: string; MaxErrors:
Integer): Integer; virtual;
```

C++

```
virtual __fastcall int ApplyUpdates(const AnsiString UpdateXML, const AnsiString
UpdateTransformFile, int MaxErrors);
```

Description

Call ApplyUpdates to transform an XML document into a delta packet that inserts or deletes all of the resulting records and send it to the associated provider so that it can be applied. Before you can call ApplyUpdates, you must define the transformation to use by setting properties on the XML transform component specified by TransformApplyUpdates (see page 26490).

UpdateXML is the XML document that can be transformed into a delta packet. Typically, it contains the contents of an XML document file.

UpdateTransformFile is the name of a transformation file that converts UpdateXML into an insert or delete delta packet. A transformation file is a special type of XML file with the .xtr extension. The transformation file is specific to a particular XML

schema, data packet format, and update operation (insert or delete). Use the xmlmapper utility to create the transformation file.

Note: If UpdateTransformFile includes any user-defined conversions, ApplyUpdates generates an OnTranslate event on TransformApplyUpdates (see page 26490) when it needs to transform user-defined nodes in the UpdateXML string into corresponding field values.

MaxErrors indicates the maximum number of errors that the provider should allow before prematurely stopping the update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

ApplyUpdates returns the number of errors it encountered.

See Also

ProviderName (see page 26489)

TransformApplyUpdates (see page 26490)

ApplyUpdates

Using an XML Document as the Client of a Provider

198.1.3.4.2 TXMLTransformClient.GetDataAsXml Method

Fetches a data packet from the provider and converts it to an XML document.

Pascal

```
function GetDataAsXml(const PublishTransformFile: string): string; virtual;
```

C++

```
virtual __fastcall AnsiString GetDataAsXml(const AnsiString PublishTransformFile);
```

Description

Call GetDataAsXml to obtain an XML document that is the translation of a data packet from the associated provider. GetDataAsXml

1. Passes any parameters supplied to the SetParams (see page 26488) method to the provider specified by ProviderName (see page 26489).
2. Obtains a data packet that the provider returns.
3. Uses the transform component specified by TransformGetData (see page 26491) to convert the data packet to an XML document. If the PublishTransformFile parameter is not an empty string, GetDataAsXml uses the file specified by this parameter as the transformation file. Otherwise, it uses the transformation file specified on the TransformGetData (see page 26491) property.
4. Generates an OnTranslate event for every user-defined conversion in its transformation. The application can use this event to perform the user-defined conversion that converts field values into XML nodes.
5. Returns the resulting XML document as a string.

Once you have obtained the resulting, translated XML document, you can assign it to a TXMLDocument component or save it to a file.

Note: Before you can call GetDataAsXml, you must supply any input parameters using the SetParams (see page 26488) method and set properties on TransformGetData (see page 26491) to indicate what transformation to perform.

See Also

ProviderName (see page 26489)

TransformGetData (see page 26491)

XML (see page 26144)

OnTranslate (see page 26481)

SetParams (see page 26488)

Using an XML Document as the Client of a Provider

198.1.3.4.3 TXMLTransformClient.SetParams Method

Sets input parameters to values supplied in an XML document.

Pascal

```
procedure SetParams(const ParamsXml: string; const ParamsTransformFile: string);
```

C++

```
__fastcall SetParams(const AnsiString ParamsXml, const AnsiString ParamsTransformFile);
```

Description

Call SetParams to supply input parameter values before fetching data from the provider. Parameter values can represent the input parameters to a query or stored procedure, or they can represent field values that filter the data when the provider represents the data in a TTable or TSQLTable component.

ParamsXML is the XML document that represents the parameter values to set. Typically, it contains the contents of an XML document file.

ParamsTransformFile is the name of a transformation file that converts ParamsXml into a data packet. A transformation file is a special type of XML file with the .xtr extension. The transformation file is specific to a particular XML schema and data packet format. Use the xmlmapper.exe utility to create the transformation file.

Note: If ParamsTransformFile includes any user-defined conversions, the component specified by TransformSetParams (see page 26491) generates an OnTranslate event when it needs to transform user-defined nodes in the ParamsXml string into corresponding parameter values.

The TXMLTransformClient (see page 26482) component stores parameter values internally. Each time you call SetParams, you update those internally stored values. Parameter values from previous calls are not cleared, so be sure to set every parameter value you want to change.

The next the GetDataAsXml (see page 26487) method is called, TXMLTransformClient (see page 26482) sends the currently stored parameter values to the provider.

TTable (see page 10168)

TSQLTable (see page 20337)

TransformSetParams (see page 26491)

Using an XML Document as the Client of a Provider

198.1.3.4.4 TXMLTransformClient.SetupAppServer Method

Pascal

```
procedure SetupAppServer;
```

C++

```
__fastcall SetupAppServer();
```

Description

This is SetupAppServer, a member of class TXMLTransformClient.

198.1.3.5 TXMLTransformClient Properties

The properties of the TXMLTransformClient class are listed here.

Published Properties

	Name	Description
	ProviderName (see page 26489)	Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.
	RemoteServer (see page 26490)	Specifies the connection component that this XML transform client uses to connect to an application server.
R	TransformApplyUpdates (see page 26490)	Specifies the TXMLTransform (see page 26467) component that converts XML into delta packets that are then sent to the provider to apply updates.
R	TransformGetData (see page 26491)	Specifies the TXMLTransform (see page 26467) component that converts data packets from the provider into XML.
R	TransformSetParams (see page 26491)	Specifies the TXMLTransform (see page 26467) component that converts the XML supplied to the SetParams (see page 26488) method into a data packet format.

198.1.3.5.1 TXMLTransformClient.ProviderName Property

Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.

Pascal

```
property ProviderName: string;
```

C++

```
__property AnsiString ProviderName;
```

Description

Use ProviderName to specify the provider object that supplies the XML transform client with data packets and applies updates on its behalf. This property is passed as a parameter to IAppServer interface calls when the client fetches data from or applies updates to the source dataset, its database server, or the source XML document.

The provider specified by ProviderName can reside in the same application as the XML transform client or in an application server running on another system.

If the provider is in the same application as the XML transform client, it must have the same Owner as the client.

If the provider is on a remote application server, it must be exported by that application server. If the application server contains multiple provider objects, you can set ProviderName to any of them once the XML transform client establishes an initial connection to the application server through its RemoteServer (see page 26490) property.

ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer (see page 26490) property is set if

The connection component is a SOAP connection.

The connection component is a Web connection or socket connection (Windows only).

The application server is COM-based and registered on the client system using TRegsvr.exe (Windows only).

RemoteServer (see page 26490)

GetDataAsXml (see page 26487)

IAppServer (see page 16450)

ApplyUpdates (see page 26486)

Using an XML Document as the Client of a Provider

198.1.3.5.2 TXMLTransformClient.RemoteServer Property

Specifies the connection component that this XML transform client uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

If the XML transform client is in the client portion of a multi-tiered application, use RemoteServer to specify the connection component that connects to the application server. The connection component locates the application server and obtains its IAppServer interface, which the XML transform client can use for communicating with a remote provider.

If a client application uses more than connection component, the application can change which connection an XML transform client uses by changing the value for this property.

See Also

ProviderName (see page 26489)

TSocketConnection (see page 18928)

TDCOMConnection (see page 16008)

TWebConnection (see page 18968)

TSOAPConnection

AppServer (see page 8532)

IAppServer (see page 16450)

Using an XML Document as the Client of a Provider

198.1.3.5.3 TXMLTransformClient.TransformApplyUpdates Property

Specifies the TXMLTransform (see page 26467) component that converts XML into delta packets that are then sent to the provider to apply updates.

Pascal

```
property TransformApplyUpdates: TXMLTransform;
```

C++

```
__property TXMLTransform TransformApplyUpdates;
```

Description

Use TransformApplyUpdates to access the subcomponent that transforms the XML passed as the UpdateXML parameter of the ApplyUpdates (see page 26486) method into a delta packet, which is then forwarded to the provider. If the transformation passed to the ApplyUpdates (see page 26486) method includes any user-defined nodes, you must supply TransformApplyUpdates with an OnTranslate event handler.

See Also

ApplyUpdates (see page 26486)

ProviderName (see page 26489)

OnTranslate (see page 26481)

198.1.3.5.4 TXMLTransformClient.TransformGetData Property

Specifies the TXMLTransform (see page 26467) component that converts data packets from the provider into XML.

Pascal

```
property TransformGetData: TXMLTransform;
```

C++

```
__property TXMLTransform TransformGetData;
```

Description

Use TransformGetData to access the subcomponent that performs the transformation of data packets from the provider into another XML format. When an application calls the GetDataAsXml (see page 26487) method, this subcomponent converts the data packet from the provider into XML.

Before you can call GetDataAsXml (see page 26487), you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformGetData with an OnTranslate event handler.

See Also

GetDataAsXml (see page 26487)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

OnTranslate (see page 26481)

Using an XML Document as the Client of a Provider

198.1.3.5.5 TXMLTransformClient.TransformSetParams Property

Specifies the TXMLTransform (see page 26467) component that converts the XML supplied to the SetParams (see page 26488) method into a data packet format.

Pascal

```
property TransformSetParams: TXMLTransform;
```

C++

```
__property TXMLTransform TransformSetParams;
```

Description

Use TransformSetParams to directly access the subcomponent that performs the transformation of an XML document into a set of parameter values. When an application calls the SetParams (see page 26488) method, this subcomponent converts the XML supplied as the ParamsXml parameter into a data packet, which it then uses to read and store parameter values. These parameter values are later passed to the provider when you call GetDataAsXml (see page 26487).

If the transformation passed to the SetParams (see page 26488) method includes any user-defined nodes, you must supply TransformSetParams with an OnTranslate event handler.

Using an XML Document as the Client of a Provider

198.1.4 TXMLTransformProvider Class

TXMLTransformProvider provides data from and resolves updates to an XML document.

Class Hierarchy

Pascal

```
TXMLTransformProvider = class(TCustomProvider);
```

C++

```
class TXMLTransformProvider : public TCustomProvider;
```

File

Xmlxform

Description

Use TXMLTransformProvider to provide data from an XML document to a client dataset or XML broker and to resolve updates from that client dataset or XML broker back to the source XML document. TXMLTransformProvider can be a part of the same application as the client dataset or XML broker, or it can be placed in the application server of a multi-tiered application. It serves as a translator between an XML document and a client dataset.

TDataSetProvider packages data from the source XML document and passes it in one or more transportable data packets to the client dataset or XML broker.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the source XML document.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the

provider, which applies them to the source XML document.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported property must be true, and its Owner property must specify the remote data module.

Determining the Source of Data

Using Provider Components

Using an XML Document as the Source for a Provider

198.1.4.1 TXMLTransformProvider Members

The following tables list the members exposed by TXMLTransformProvider.

Protected Events

	Name	Description
	AfterExecute (see page 18476)	Occurs after the provider passes an execute command to its dataset.
	AfterGetParams (see page 18477)	This is AfterGetParams, a member of class TCustomProvider.
	BeforeExecute (see page 18479)	This is BeforeExecute, a member of class TCustomProvider.
	BeforeGetParams (see page 18480)	Occurs before the provider creates an OleVariant that encodes the current parameter values and sends them to a client dataset.
	OnValidate (see page 18483)	This is OnValidate, a member of class TCustomProvider.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DoAfterApplyUpdates (see page 18460)	Generates an AfterApplyUpdates (see page 18475) event.
V	DoAfterExecute (see page 18461)	Generates an AfterExecute (see page 18476) event.

	DoAfterGetParams (see page 18461)	Generates an AfterGetParams (see page 18477) event.
	DoAfterGetRecords (see page 18462)	Generates an AfterGetRecords (see page 18477) event.
	DoAfterRowRequest (see page 18462)	Generates an AfterRowRequest (see page 18478) event.
	DoApplyUpdates (see page 18463)	This is DoApplyUpdates, a member of class TCustomProvider.
	DoBeforeApplyUpdates (see page 18463)	Generates a BeforeApplyUpdates (see page 18479) event.
	DoBeforeExecute (see page 18464)	Generates a BeforeExecute (see page 18479) event.
	DoBeforeGetParams (see page 18464)	Generates a BeforeGetParams (see page 18480) event.
	DoBeforeGetRecords (see page 18465)	Generates a BeforeGetRecords (see page 18480) event.
	DoBeforeRowRequest (see page 18465)	Generates a BeforeRowRequest (see page 18482) event.
	DoGetRecords (see page 18466)	This is DoGetRecords, a member of class TCustomProvider.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (displDs).
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	InternalApplyUpdates (see page 26498)	Provides the underlying implementation of the ApplyUpdates method.
	InternalExecute (see page 18470)	Provides the underlying implementation of the Execute (see page 18466) method.
	InternalGetParams (see page 18471)	Returns the requested parameter values as a Variant array.
	InternalGetRecords (see page 26498)	Provides the underlying implementation of the GetRecords method.
	InternalRowRequest (see page 18472)	Provides the underlying implementation of the RowRequest (see page 18472) method.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
	Notification (see page 2783)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	SetActiveUpdateException (see page 18473)	This is SetActiveUpdateException, a member of class TCustomProvider.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteState (see page 2793)	This is WriteState, a member of class TComponent.

Protected Properties

	Name	Description
R	ActiveUpdateException (see page 18474)	This is ActiveUpdateException, a member of class TCustomProvider.
	OwnerData (see page 18475)	This is OwnerData, a member of class TCustomProvider.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	ApplyUpdates (see page 18459)	This is the overview for the ApplyUpdates method overload.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 26497)	Creates and initializes a TXMLTransformProvider (see page 26492) object.
V	DataRequest (see page 18460)	Generates an OnDataRequest (see page 18482) event.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26497)	Frees an instance of a provider object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Execute (see page 18466)	Executes a query, stored procedure, or custom SQL statement.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
V	GetParams (see page 18467)	Returns the current parameter values.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetRecords (see page 18468)	This is the overview for the GetRecords method overload.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
V	RowRequest (see page 18472)	Returns information from a specified record.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
R	Data (see page 18474)	Denotes a data packet created by the provider.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
	Exported (see page 18474)	Allows client applications to pass calls to the provider when it resides on an application server.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.

Published Events

	Name	Description
	AfterApplyUpdates (see page 26502)	Occurs after the provider applies updates.
	AfterGetRecords (see page 26503)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 26504)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 26504)	Occurs before the provider applies updates from a client dataset.
	BeforeGetRecords (see page 26505)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 26506)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 26507)	Occurs when a provider calls its DataRequest method.

Published Properties

	Name	Description
	CacheData (see page 26499)	Specifies whether the provider caches the data packet internally in memory.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	Tag (see page 2808)	Stores an integer value as part of a component.
R	TransformRead (see page 26500)	Specifies the TXMLTransform (see page 26467) component that converts the source XML document into data packets.
R	TransformWrite (see page 26500)	Specifies the TXMLTransform (see page 26467) component that generates the new value of the source XML document when updates are applied.

	XMLDataFile (see page 26501)	Specifies the XML document from which the provider creates data packets and to which it applies updates.

Strict private Fields

	Name	Description
	FActiveUpdateAbortException (see page 18455)	This is FActiveUpdateAbortException, a member of class TCustomProvider.
	FAfterApplyUpdates (see page 18455)	This is FAfterApplyUpdates, a member of class TCustomProvider.
	FAfterExecute (see page 18456)	This is FAfterExecute, a member of class TCustomProvider.
	FAfterGetParams (see page 18456)	This is FAfterGetParams, a member of class TCustomProvider.
	FAfterGetRecords (see page 18456)	This is FAfterGetRecords, a member of class TCustomProvider.
	FAfterRowRequest (see page 18456)	This is FAfterRowRequest, a member of class TCustomProvider.
	FBeforeApplyUpdates (see page 18456)	This is FBeforeApplyUpdates, a member of class TCustomProvider.
	FBeforeExecute (see page 18457)	This is FBeforeExecute, a member of class TCustomProvider.
	FBeforeGetParams (see page 18457)	This is FBeforeGetParams, a member of class TCustomProvider.
	FBeforeGetRecords (see page 18457)	This is FBeforeGetRecords, a member of class TCustomProvider.
	FBeforeRowRequest (see page 18457)	This is FBeforeRowRequest, a member of class TCustomProvider.
	FExported (see page 18458)	This is FExported, a member of class TCustomProvider.
	FOnDataRequest (see page 18458)	This is FOnDataRequest, a member of class TCustomProvider.
	FOnValidate (see page 18458)	This is FOnValidate, a member of class TCustomProvider.
	FOwnerData (see page 18458)	This is FOwnerData, a member of class TCustomProvider.

Strict private Methods

	Name	Description
	GetData (see page 18467)	This is GetData, a member of class TCustomProvider.

198.1.4.2 TXMLTransformProvider.Create Constructor

Creates and initializes a TXMLTransformProvider (see page 26492) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLTransformProvider(TComponent * AOwner);
```

Description

Call Create to instantiate an XML transform provider at runtime. Providers placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (typically a form or data module) that is responsible for freeing the provider.

See Also

Owner (see page 2807)

198.1.4.3 TXMLTransformProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLTransformProvider();
```

Description

Do not call Destroy directly. Instead, use the delete keyword, which indirectly calls Destroy.

See Also

delete

198.1.4.4 TXMLTransformProvider Methods

The methods of the TXMLTransformProvider class are listed here.

Protected Methods

	Name	Description
	InternalApplyUpdates (see page 26498)	Provides the underlying implementation of the ApplyUpdates method.
	InternalGetRecords (see page 26498)	Provides the underlying implementation of the GetRecords method.

198.1.4.4.1 TXMLTransformProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates event and before generating the AfterApplyUpdates event. The InternalApplyUpdates method of TCustomProvider is abstract (Delphi) or pure virtual (C++), meaning that it has no implementation. Descendant classes override this method to apply updates, resolve update errors, and return any updates that could not be applied.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

applyupdates (see page 18459)

198.1.4.4.2 TXMLTransformProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords to apply the CommandText and Params and generate a BeforeGetRecords event. As implemented in TCustomProvider, InternalGetRecords always returns NULL. Descendant classes override this method to fetch the requested records and assemble them into a data packet.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable object, Params specifies field values that filter the result set. On exit from GetRecords, Params returns any output parameters.

Records are returned as a data packet in a Variant.

See Also

GetRecords (see page 18468)

DoBeforeGetRecords (see page 18465)

198.1.4.5 TXMLTransformProvider Properties

The properties of the TXMLTransformProvider class are listed here.

Published Properties

	Name	Description
	CacheData (see page 26499)	Specifies whether the provider caches the data packet internally in memory.
R	TransformRead (see page 26500)	Specifies the TXMLTransform (see page 26467) component that converts the source XML document into data packets.
R	TransformWrite (see page 26500)	Specifies the TXMLTransform (see page 26467) component that generates the new value of the source XML document when updates are applied.
	XMLDataFile (see page 26501)	Specifies the XML document from which the provider creates data packets and to which it applies updates.

198.1.4.5.1 TXMLTransformProvider.CacheData Property

Specifies whether the provider caches the data packet internally in memory.

Pascal

```
property CacheData: Boolean;
```

C++

```
__property Boolean CacheData;
```

Description

Set CacheData to true to specify that the provider should cache its data packet in memory after the first time it is read from the source XML document. When CacheData is false, every time the Data property is read, the GetRecords method is called, or updates are applied, the provider must reread the source document specified by XMLDataFile (see page 26501).

Caching the data improves performance on subsequent data fetches or when applying updates, but consumes additional resources.

See Also

Data (see page 18474)

TransformRead (see page 26500)

GetRecords (see page 18468)

TransformRead (see page 26500)

XMLDataFile (see page 26501)

198.1.4.5.2 TXMLTransformProvider.TransformRead Property

Specifies the TXMLTransform (see page 26467) component that converts the source XML document into data packets.

Pascal

```
property TransformRead: TXMLTransform;
```

C++

```
__property TXMLTransform TransformRead;
```

Description

Use TransformRead to access the subcomponent that transforms the source XML document into the data packet that is the value of the Data property. Before you can use TXMLTransformProvider (see page 26492), you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformRead with an OnTranslate event handler.

See Also

XMLDataFile (see page 26501)

TransformWrite (see page 26500)

Data (see page 18474)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

OnTranslate (see page 26481)

Determining the Source of Data

Using an XML Document as the Source for a Provider

198.1.4.5.3 TXMLTransformProvider.TransformWrite Property

Specifies the TXMLTransform (see page 26467) component that generates the new value of the source XML document when

updates are applied.

Pascal

```
property TransformWrite: TXMLTransform;
```

C++

```
__property TXMLTransform TransformWrite;
```

Description

Use TransformWrite to access the subcomponent that transforms a data packet back into the format required by the source XML document. When a client calls the ApplyUpdates method, the delta packet is merged into the transformed data from the XML document, and then TransformWrite converts the resulting dataset into the format of the source XML document.

Before you can use TXMLTransformProvider (see page 26492) to apply updates, you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformWrite with an OnTranslate event handler.

See Also

applyupdates (see page 18459)

TransformRead (see page 26500)

TransformationFile (see page 26478)

TransformationDocument (see page 26478)

OnTranslate (see page 26481)

Using an XML Document as the Source for a Provider

198.1.4.5.4 TXMLTransformProvider.XMLDataFile Property

Specifies the XML document from which the provider creates data packets and to which it applies updates.

Pascal

```
property XMLDataFile: string;
```

C++

```
__property AnsiString XMLDataFile;
```

Description

Use XMLDataFile to specify the XML document whose data the provider represents. When the Data property is read or the GetRecords method is called, TXMLTransformProvider (see page 26492) reads the contents of XMLDataFile and converts it into a data packet using the transform component specified by TransformRead (see page 26500). When the ApplyUpdates method is called, TXMLTransformProvider (see page 26492) uses the transform component specified by TransformWrite (see page 26500) to convert the data into the proper format for XMLDataFile and updates this XML document accordingly.

XMLDataFile is the same as the SourceXmlFile property of TransformRead (see page 26500).

Determining the Source of Data

Using an XML Document as the Source for a Provider

198.1.4.6 TXMLTransformProvider Events

The events of the TXMLTransformProvider class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 26502)	Occurs after the provider applies updates.
	AfterGetRecords (see page 26503)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 26504)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 26504)	Occurs before the provider applies updates from a client dataset.
	BeforeGetRecords (see page 26505)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 26506)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 26507)	Occurs when a provider calls its DataRequest method.

198.1.4.6.1 TXMLTransformProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, on entry to the event handler the OwnerData parameter contains the value set in the BeforeApplyUpdates event handler and it is ignored on exit from the AfterApplyUpdates event handler.

Responding to Client Update Requests

Communicating with the Client Dataset

198.1.4.6.2 TXMLTransformProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Communicating with the Client Dataset

Responding to Client Data Requests

198.1.4.6.3 TXMLTransformProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

RefreshRecord (see page 8442)

Communicating with the Client Dataset

198.1.4.6.4 TXMLTransformProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of

the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, the OwnerData parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates event handler but not returned to the caller.

Responding to Client Update Requests

Communicating with the Client Dataset

198.1.4.6.5 TXMLTransformProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Communicating with the Client Dataset

Responding to Client Data Requests

198.1.4.6.6 TXMLTransformProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest: TRemoteEvent;
```

C++

```
__property TRemoteEvent BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

RefreshRecord (see page 8442)

Communicating with the Client Dataset

198.1.4.6.7 TXMLTransformProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest: TDataRequestEvent;
```

C++

```
__property TDataRequestEvent OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

198.2 Types

The following table lists types in this documentation.

Types

Name	Description
TRowEvent (see page 26509)	This is type Xmlxform.TRowEvent.
TTranslateEvent (see page 26509)	This is type Xmlxform.TTranslateEvent.

198.2.1 Xmlxform.TRowEvent Type

Pascal

```
TRowEvent = procedure (Sender: TObject; Id: string; SrcNode: IDOMNode; DestNode: IDOMNode) of
object;
```

C++

```
(Sender: TObject; Id: string; SrcNode: IDOMNode; DestNode: IDOMNode) ( TRowEvent)();
```

File

Xmlxform

Description

This is type Xmlxform.TRowEvent.

198.2.2 Xmlxform.TTranslateEvent Type

Pascal

```
TTranslateEvent = procedure (Sender: TObject; Id: string; SrcNode: IDOMNode; var Value:
string; DestNode: IDOMNode) of object;
```

C++

```
(Sender: TObject; Id: string; SrcNode: IDOMNode; var Value: string; DestNode: IDOMNode) (
TTranslateEvent)();
```

File

Xmlxform

Description

This is type Xmlxform.TTranslateEvent.

199 XSBuiltIns Namespace

This is namespace XSBuiltIns.

Topics

Name	Description
Classes (see page 26513)	The following table lists classes in this documentation.
Functions (see page 26571)	The following table lists functions in this documentation.
Types (see page 26575)	The following table lists types in this documentation.
Constants (see page 26576)	The following table lists constants in this documentation.

Classes

	Name	Description
	EXSDateTimeException (see page 26513)	EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.
	EXSDecimalException (see page 26514)	EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.
	EXSHexBinaryException (see page 26514)	EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.
	TXSCustomDateTime (see page 26515)	TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.
	TXSDate (see page 26534)	TXSDate implements the XML schema date type so that it can be used on invokable interfaces.
	TXSDateTime (see page 26541)	TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.
	TXSDecimal (see page 26545)	TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.
	TXSDuration (see page 26548)	TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.
	TXSHexBinary (see page 26553)	TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.
	TXSString (see page 26556)	This is class XSBuiltIns.TXSString.
	TXSTime (see page 26558)	TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

Constants

Name	Description
IncrementAmount (see page 26576)	This is constant XSBuiltIns.IncrementAmount.
MaxDay (see page 26577)	This is constant XSBuiltIns.MaxDay.
MaxMonth (see page 26577)	This is constant XSBuiltIns.MaxMonth.

MinDay (see page 26577)	This is constant XSBuiltIns.MinDay.
MinMonth (see page 26578)	This is constant XSBuiltIns.MinMonth.
SDecimal (see page 26578)	This is constant XSBuiltIns.SDecimal.
SHexMarker (see page 26578)	This is constant XSBuiltIns.SHexMarker.
SLocalTimeMarker (see page 26579)	This is constant XSBuiltIns.SLocalTimeMarker.
SNAN (see page 26579)	This is constant XSBuiltIns.SNAN.
SNegative (see page 26579)	This is constant XSBuiltIns.SNegative.
SoapDecimalSeparator (see page 26580)	This is constant XSBuiltIns.SoapDecimalSeparator.
SoapTimePrefix (see page 26580)	This is constant XSBuiltIns.SoapTimePrefix.
SPlus (see page 26580)	This is constant XSBuiltIns.SPlus.
SSciNotationMarker (see page 26581)	This is constant XSBuiltIns.SSciNotationMarker.
XMLDateSeparator (see page 26581)	This is constant XSBuiltIns.XMLDateSeparator.
XMLDayPos (see page 26581)	This is constant XSBuiltIns.XMLDayPos.
XMLDefaultYearDigits (see page 26582)	This is constant XSBuiltIns.XMLDefaultYearDigits.
XMLDurationDay (see page 26582)	This is constant XSBuiltIns.XMLDurationDay.
XMLDurationHour (see page 26582)	This is constant XSBuiltIns.XMLDurationHour.
XMLDurationMinute (see page 26583)	This is constant XSBuiltIns.XMLDurationMinute.
XMLDurationMonth (see page 26583)	This is constant XSBuiltIns.XMLDurationMonth.
XMLDurationSecond (see page 26583)	This is constant XSBuiltIns.XMLDurationSecond.
XMLDurationStart (see page 26584)	This is constant XSBuiltIns.XMLDurationStart.
XMLDurationYear (see page 26584)	This is constant XSBuiltIns.XMLDurationYear.
XMLHourOffsetMinusMarker (see page 26584)	This is constant XSBuiltIns.XMLHourOffsetMinusMarker.
XMLHourOffsetPlusMarker (see page 26585)	This is constant XSBuiltIns.XMLHourOffsetPlusMarker.
XMLMilSecPos (see page 26585)	This is constant XSBuiltIns.XMLMilSecPos.
XMLMonthPos (see page 26585)	This is constant XSBuiltIns.XMLMonthPos.
XMLTimeSeparator (see page 26586)	This is constant XSBuiltIns.XMLTimeSeparator.
XMLYearPos (see page 26586)	This is constant XSBuiltIns.XMLYearPos.

Functions

	Name	Description
	DateTimeToXMLTime (see page 26571)	Returns the XML string that represents a TDateTime value.
	DateTimeToXSDateTime (see page 26571)	Returns a TXSDateTime (see page 26541) object that encodes a TDateTime value.
	GetDataFromFile (see page 26572)	This is function XSBuiltIns.GetDataFromFile.
	InitXSTypes (see page 26572)	This is function XSBuiltIns.InitXSTypes.
	SoapFloatToStr (see page 26573)	This is function XSBuiltIns.SoapFloatToStr.
	SoapStrToFloat (see page 26573)	This is function XSBuiltIns.SoapStrToFloat.
	XMLTimeToDateTime (see page 26573)	Returns a TDateTime value to represent an XML datetime value.

Types

Name	Description
TXSTimeInstant (see page 26575)	This is type XSBuiltIns.TXSTimeInstant.

199.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXSDateTimeException (see page 26513)	EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.
	EXSDecimalException (see page 26514)	EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.
	EXSHexBinaryException (see page 26514)	EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.
	TXSCustomDateTime (see page 26515)	TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.
	TXSDate (see page 26534)	TXSDate implements the XML schema date type so that it can be used on invokable interfaces.
	TXSDateTime (see page 26541)	TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.
	TXSDecimal (see page 26545)	TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.
	TXSDuration (see page 26548)	TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.
	TXSHexBinary (see page 26553)	TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.
	TXSString (see page 26556)	This is class XSBuiltIns.TXSString.
	TXSTime (see page 26558)	TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

199.1.1 EXSDateTimeException Class

EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.

Class Hierarchy

Pascal

```
EXSDateTimeException = class(Exception);
```

C++

```
class EXSDateTimeException : public Exception;
```

File

XSBuiltIns

Description

EXSDateTimeException is raised by the TXSDate (see page 26534), TXSTime (see page 26558), TXSDateTime (see page 26541), and TXSDuration (see page 26548) objects when

An application assigns a value that is out of range to one of their properties. Such values include Month values greater than 12, Hour values greater than 23, Minute values greater than 59, and so on.

The string that represents the object's value does not have the proper format and can't be parsed.

See Also

TXSTime (see page 26558)

TXSDate (see page 26534)

TXSDateTime (see page 26541)

TXSDuration (see page 26548)

199.1.2 EXSDecimalException Class

EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.

Class Hierarchy

Pascal

```
EXSDecimalException = class(Exception);
```

C++

```
class EXSDecimalException : public Exception;
```

File

XSBuiltIns

Description

EXSDecimalException is raised by TXSDecimal (see page 26545) when it is unable to convert between its string value and a TBcd value.

See Also

TXSDecimal (see page 26545)

TBcd

199.1.3 EXSHexBinaryException Class

EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.

Class Hierarchy

Pascal

```
EXSHexBinaryException = class(Exception);
```

C++

```
class EXSHexBinaryException : public Exception;
```

File

XSBuiltIns

Description

EXSHexBinaryException is raised by TXSHexBinary (see page 26553) when it encounters a string that contains invalid characters for a hexadecimal value.

See Also

TXSDecimal (see page 26545)

TBcd

199.1.4 TXSCustomDateTime Class

TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.

Class Hierarchy

Pascal

```
TXSCustomDateTime = class(TRemotableXS);
```

C++

```
class TXSCustomDateTime : public TRemotableXS;
```

File

XSBuiltIns

Description

Use TXSCustomDateTime as a base class when defining a class to represent a type that includes both date and time portions and that represents a scalar value in a WSDL document. When creating a TXSCustomDateTime descendant, override the XSToNative and NativeToXS methods to indicate how the value of the class can be converted to and from the string representation that is used to encode the value for transport.

On server applications, instances of TXSCustomDateTime descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSCustomDateTime descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSCustomDateTime instances that it passes as input parameters, and for freeing any TXSCustomDateTime instances it creates or that are returned as output parameters or method results.

See Also

IInvokable (see page 22398)

TXSDateTime (see page 26541)

TXSDuration (see page 26548)

199.1.4.1 TXSCustomDateTime Members

The following tables list the members exposed by TXSCustomDateTime.

Protected Fields

	Name	Description
	FDateTime (see page 26518)	This is FDateTime, a member of class TXSCustomDateTime.
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
	GetAsDateTime (see page 26519)	Returns the value of the AsDateTime (see page 26527) property.
	GetAsUTCDateTime (see page 26519)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 26519)	Returns the value of the Day (see page 26528) property.
	GetFractionalSeconds (see page 26520)	Returns the value of the FractionalSeconds (see page 26529) property.
	GetHour (see page 26520)	Returns the value of the Hour (see page 26529) property.
	GetHourOffset (see page 26520)	Returns the value of the HourOffset (see page 26530) property.
	GetMillisecond (see page 26521)	Returns the value of the Millisecond (see page 26530) property.
	GetMinute (see page 26521)	Returns the value of the Minute (see page 26531) property.
	GetMinuteOffset (see page 26521)	Returns the value of the MinuteOffset (see page 26531) property.
	GetMonth (see page 26521)	Returns the value of the Month (see page 26532) property.
	GetSecond (see page 26522)	Returns the value of the Second (see page 26532) property.
	GetUseZeroMilliseconds (see page 26522)	Returns the value of the UseZeroMilliseconds (see page 26533) property.
	GetYear (see page 26522)	Returns the value of the Year (see page 26533) property.
	SetAsDateTime (see page 26523)	Sets the value of the AsDateTime (see page 26527) property.
	SetAsUTCDateTime (see page 26523)	Sets the value of the AsUTCDateTime (see page 26528) property.
V	SetDay (see page 26523)	Sets the value of the Day (see page 26528) property.
	SetFractionalSeconds (see page 26524)	Sets the value of the FractionalSeconds (see page 26529) property.
V	SetHour (see page 26524)	Sets the value of the Hour (see page 26529) property.
V	SetHourOffset (see page 26524)	Sets the value of the HourOffset (see page 26530) property.
V	SetMillisecond (see page 26524)	Sets the value of the Millisecond (see page 26530) property.
V	SetMinute (see page 26525)	Sets the value of the Minute (see page 26531) property.
V	SetMinuteOffset (see page 26525)	Sets the value of the MinuteOffset (see page 26531) property.
V	SetMonth (see page 26525)	Sets the value of the Month (see page 26532) property.
V	SetSecond (see page 26526)	Sets the value of the Second (see page 26532) property.
	SetUseZeroMilliseconds (see page 26526)	Sets the value of the UseZeroMilliseconds (see page 26533) property.
V	SetYear (see page 26526)	Sets the value of the Year (see page 26533) property.

Protected Properties

	Name	Description
	Millisecond (see page 26530)	Indicates the Millisecond of the second that the object represents.

Public Methods

	Name	Description
V	Create (see page 26517)	Creates and initializes a TXSCustomDateTime (see page 26515) object.
V	Destroy (see page 26517)	Frees the memory associated with the TXSCustomDateTime (see page 26515) object.
A	NativeToXS (see page 15581)	Returns a string that represents the value of a TRemotableXS (see page 15580) instance.
V	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.

V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
A	XSToNative (see page 15583)	Assigns the value of a string to the TRemotableXS (see page 15580) instance.

Public Properties

	Name	Description
	AsDateTime (see page 26527)	Represents the object's value as a TDateTime value.
	AsUTCDateTime (see page 26528)	Represents the object's value as a TDateTime value using UTC time.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	Day (see page 26528)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 26529)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26532) property.
	Hour (see page 26529)	Indicates the hour of the day that the object represents.
	HourOffset (see page 26530)	Indicates the difference between the Hour (see page 26529) property and the hour in the local time zone.
	Minute (see page 26531)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26531)	Indicates the difference between the Minute (see page 26531) property and the minute of the hour in local time.
	Month (see page 26532)	Indicates the month of the year that the object represents.
	Second (see page 26532)	Indicates the second of the minute that the object represents.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
	UseZeroMilliseconds (see page 26533)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 26530) is zero.
	Year (see page 26533)	Indicates the year that the object represents.

199.1.4.2 TXSCustomDateTime.Create Constructor

Creates and initializes a TXSCustomDateTime (see page 26515) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSCustomDateTime();
```

Description

Call Create to create a TXSCustomDateTime (see page 26515) object at runtime.

See Also

Destroy (see page 26517)

199.1.4.3 TXSCustomDateTime.Destroy Destructor

Frees the memory associated with the TXSCustomDateTime (see page 26515) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXSCustomDateTime();
```

Description

Do not call Destroy to free a TXSCustomDateTime (see page 26515) object. Instead, use the Free method, which checks that the TXSCustomDatetime reference is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TXSCustomDateTime (see page 26515) instance (for example, one created as a return value or output parameter). By default, when a TXSCustomDateTime (see page 26515) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TCustomXSDateTime objects that are passed in as a parameter belong to the data context.

On client applications, TXSCustomDateTime (see page 26515) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

DataContext (see page 15561)

199.1.4.4 TXSCustomDateTime Fields

The fields of the TXSCustomDateTime class are listed here.

Protected Fields

	Name	Description
	FDateTime (see page 26518)	This is FDateTime, a member of class TXSCustomDateTime.

199.1.4.4.1 TXSCustomDateTime.FDateTime Field

Pascal

```
FDateTime: WideString;
```

C++

```
BSTR FDateTime;
```

Description

This is FDateTime, a member of class TXSCustomDateTime.

199.1.4.5 TXSCustomDateTime Methods

The methods of the TXSCustomDateTime class are listed here.

Protected Methods

	Name	Description
	GetAsDateTime (see page 26519)	Returns the value of the AsDateTime (see page 26527) property.
	GetAsUTCDateTime (see page 26519)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 26519)	Returns the value of the Day (see page 26528) property.
	GetFractionalSeconds (see page 26520)	Returns the value of the FractionalSeconds (see page 26529) property.
	GetHour (see page 26520)	Returns the value of the Hour (see page 26529) property.
	GetHourOffset (see page 26520)	Returns the value of the HourOffset (see page 26530) property.
	GetMillisecond (see page 26521)	Returns the value of the Millisecond (see page 26530) property.
	GetMinute (see page 26521)	Returns the value of the Minute (see page 26531) property.
	GetMinuteOffset (see page 26521)	Returns the value of the MinuteOffset (see page 26531) property.
	GetMonth (see page 26521)	Returns the value of the Month (see page 26532) property.

	GetSecond (see page 26522)	Returns the value of the Second (see page 26532) property.
	GetUseZeroMilliseconds (see page 26522)	Returns the value of the UseZeroMilliseconds (see page 26533) property.
	GetYear (see page 26522)	Returns the value of the Year (see page 26533) property.
	SetAsDateTime (see page 26523)	Sets the value of the AsDateTime (see page 26527) property.
	SetAsUTCDateTime (see page 26523)	Sets the value of the AsUTCDateTime (see page 26528) property.
V	SetDay (see page 26523)	Sets the value of the Day (see page 26528) property.
	SetFractionalSeconds (see page 26524)	Sets the value of the FractionalSeconds (see page 26529) property.
V	SetHour (see page 26524)	Sets the value of the Hour (see page 26529) property.
V	SetHourOffset (see page 26524)	Sets the value of the HourOffset (see page 26530) property.
V	SetMillisecond (see page 26524)	Sets the value of the Millisecond (see page 26530) property.
V	SetMinute (see page 26525)	Sets the value of the Minute (see page 26531) property.
V	SetMinuteOffset (see page 26525)	Sets the value of the MinuteOffset (see page 26531) property.
V	SetMonth (see page 26525)	Sets the value of the Month (see page 26532) property.
V	SetSecond (see page 26526)	Sets the value of the Second (see page 26532) property.
	SetUseZeroMilliseconds (see page 26526)	Sets the value of the UseZeroMilliseconds (see page 26533) property.
V	SetYear (see page 26526)	Sets the value of the Year (see page 26533) property.

199.1.4.5.1 TXSCustomDateTime.GetAsDateTime Method

Returns the value of the AsDateTime (see page 26527) property.

Pascal

```
function GetAsDateTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsDateTime();
```

Description

GetAsDateTime is the protected read implementation of the AsDateTime (see page 26527) property.

See Also

AsDateTime (see page 26527)

199.1.4.5.2 TXSCustomDateTime.GetAsUTCDateTime Method

Pascal

```
function GetAsUTCDateTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsUTCDateTime();
```

Description

This is GetAsUTCDateTime, a member of class TXSCustomDateTime.

199.1.4.5.3 TXSCustomDateTime.GetDay Method

Returns the value of the Day (see page 26528) property.

Pascal

```
function GetDay: Word;
```

C++

```
__fastcall Word GetDay();
```

Description

GetDay is the protected read implementation of the Day (see page 26528) property.

See Also

Day (see page 26528)

199.1.4.5.4 TXSCustomDateTime.GetFractionalSeconds Method

Returns the value of the FractionalSeconds (see page 26529) property.

Pascal

```
function GetFractionalSeconds: Double;
```

C++

```
__fastcall Double GetFractionalSeconds();
```

Description

GetFractionalSeconds is the protected read implementation of the FractionalSeconds (see page 26529) property.

See Also

FractionalSeconds (see page 26529)

199.1.4.5.5 TXSCustomDateTime.GetHour Method

Returns the value of the Hour (see page 26529) property.

Pascal

```
function GetHour: Word;
```

C++

```
__fastcall Word GetHour();
```

Description

GetHour is the protected read implementation of the Hour (see page 26529) property.

See Also

Hour (see page 26529)

199.1.4.5.6 TXSCustomDateTime.GetHourOffset Method

Returns the value of the HourOffset (see page 26530) property.

Pascal

```
function GetHourOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetHourOffset();
```

Description

GetHourOffset is the protected read implementation of the HourOffset (see page 26530) property.

See Also

HourOffset (see page 26530)

199.1.4.5.7 TXSCustomDateTime.GetMillisecond Method

Returns the value of the Millisecond (see page 26530) property.

Pascal

```
function GetMillisecond: Word;
```

C++

```
__fastcall Word GetMillisecond();
```

Description

GetMillisecond is the protected read implementation of the Millisecond (see page 26530) property.

See Also

Millisecond (see page 26530)

199.1.4.5.8 TXSCustomDateTime.GetMinute Method

Returns the value of the Minute (see page 26531) property.

Pascal

```
function GetMinute: Word;
```

C++

```
__fastcall Word GetMinute();
```

Description

GetMinute is the protected read implementation of the Minute (see page 26531) property.

See Also

Minute (see page 26531)

199.1.4.5.9 TXSCustomDateTime.GetMinuteOffset Method

Returns the value of the MinuteOffset (see page 26531) property.

Pascal

```
function GetMinuteOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetMinuteOffset();
```

Description

GetMinuteOffset is the protected read implementation of the MinuteOffset (see page 26531) property.

See Also

MinuteOffset (see page 26531)

199.1.4.5.10 TXSCustomDateTime.GetMonth Method

Returns the value of the Month (see page 26532) property.

Pascal

```
function GetMonth: Word;
```

C++

```
__fastcall Word GetMonth();
```

Description

GetMonth is the protected read implementation of the Month (see page 26532) property.

See Also

Month (see page 26532)

199.1.4.5.11 TXSCustomDateTime.GetSecond Method

Returns the value of the Second (see page 26532) property.

Pascal

```
function GetSecond: Word;
```

C++

```
__fastcall Word GetSecond();
```

Description

GetSecond is the protected read implementation of the Second (see page 26532) property.

See Also

Second (see page 26532)

199.1.4.5.12 TXSCustomDateTime.GetUseZeroMilliseconds Method

Returns the value of the UseZeroMilliseconds (see page 26533) property.

Pascal

```
function GetUseZeroMilliseconds: Boolean;
```

C++

```
__fastcall Boolean GetUseZeroMilliseconds();
```

Description

GetUseZeroMilliseconds is the protected read implementation of the UseZeroMilliseconds (see page 26533) property.

See Also

UseZeroMilliseconds (see page 26533)

199.1.4.5.13 TXSCustomDateTime.GetYear Method

Returns the value of the Year (see page 26533) property.

Pascal

```
function GetYear: Integer;
```

C++

```
__fastcall int GetYear();
```

Description

GetYear is the protected read implementation of the Year (see page 26533) property.

See Also

Year (see page 26533)

199.1.4.5.14 TXSCustomDateTime.SetAsDateTime Method

Sets the value of the AsDateTime (see page 26527) property.

Pascal

```
procedure SetAsDateTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsDateTime(const TDateTime Value);
```

Description

SetAsDateTime is the protected write implementation of the AsDateTime (see page 26527) property.

See Also

AsDateTime (see page 26527)

199.1.4.5.15 TXSCustomDateTime.SetAsUTCDateTime Method

Sets the value of the AsUTCDateTime (see page 26528) property.

Pascal

```
procedure SetAsUTCDateTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsUTCDateTime(const TDateTime Value);
```

Description

SetAsUTCDateTime is the protected write implementation of the AsUTCDateTime (see page 26528) property.

See Also

AsUTCDateTime (see page 26528)

199.1.4.5.16 TXSCustomDateTime.SetDay Method

Sets the value of the Day (see page 26528) property.

Pascal

```
procedure SetDay(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetDay(const Word Value);
```

Description

SetDay is the protected write implementation of the Day (see page 26528) property.

See Also

Day (see page 26528)

199.1.4.5.17 TXSCustomDateTime.SetFractionalSeconds Method

Sets the value of the FractionalSeconds (see page 26529) property.

Pascal

```
procedure SetFractionalSeconds(const Value: Double);
```

C++

```
__fastcall SetFractionalSeconds(const Double Value);
```

Description

SetDay (see page 26523) is the protected write implementation of the FractionalSeconds (see page 26529) property.

Value is the fraction of a second. It is a value between 0 and 1.

See Also

FractionalSeconds (see page 26529)

199.1.4.5.18 TXSCustomDateTime.SetHour Method

Sets the value of the Hour (see page 26529) property.

Pascal

```
procedure SetHour(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetHour(const Word Value);
```

Description

SetHour is the protected write implementation of the Hour (see page 26529) property.

See Also

Hour (see page 26529)

199.1.4.5.19 TXSCustomDateTime.SetHourOffset Method

Sets the value of the HourOffset (see page 26530) property.

Pascal

```
procedure SetHourOffset(const Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetHourOffset(const SmallInt Value);
```

Description

SetHourOffset is the protected write implementation of the HourOffset (see page 26530) property.

See Also

HourOffset (see page 26530)

199.1.4.5.20 TXSCustomDateTime.SetMillisecond Method

Sets the value of the Millisecond (see page 26530) property.

Pascal

```
procedure SetMillisecond(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMillisecond(const Word Value);
```

Description

SetMillisecond is the protected write implementation for the Millisecond (see page 26530) property.

See Also

Millisecond (see page 26530)

199.1.4.5.21 TXSCustomDateTime.SetMinute Method

Sets the value of the Minute (see page 26531) property.

Pascal

```
procedure SetMinute(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMinute(const Word Value);
```

Description

SetMinute is the protected write implementation of the Minute (see page 26531) property.

See Also

Minute (see page 26531)

199.1.4.5.22 TXSCustomDateTime.SetMinuteOffset Method

Sets the value of the MinuteOffset (see page 26531) property.

Pascal

```
procedure SetMinuteOffset(const Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetMinuteOffset(const SmallInt Value);
```

Description

SetMinuteOffest is the protected write implementation of the MinuteOffset (see page 26531) property.

See Also

MinuteOffset (see page 26531)

199.1.4.5.23 TXSCustomDateTime.SetMonth Method

Sets the value of the Month (see page 26532) property.

Pascal

```
procedure SetMonth(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMonth(const Word Value);
```

Description

SetMonth is the protected write implementation of the Month (see page 26532) property.

See Also

Month (see page 26532)

199.1.4.5.24 TXSCustomDateTime.SetSecond Method

Sets the value of the Second (see page 26532) property.

Pascal

```
procedure SetSecond(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetSecond(const Word Value);
```

Description

SetSecond is the protected write implementation of the Second (see page 26532) property.

See Also

Second (see page 26532)

199.1.4.5.25 TXSCustomDateTime.SetUseZeroMilliseconds Method

Sets the value of the UseZeroMilliseconds (see page 26533) property.

Pascal

```
procedure SetUseZeroMilliseconds(const Value: Boolean);
```

C++

```
__fastcall SetUseZeroMilliseconds(const Boolean Value);
```

Description

SetUseZeroMilliseconds is the protected write implementation of the UseZeroMilliseconds (see page 26533) property.

See Also

UseZeroMilliseconds (see page 26533)

199.1.4.5.26 TXSCustomDateTime.SetYear Method

Sets the value of the Year (see page 26533) property.

Pascal

```
procedure SetYear(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetYear(const int Value);
```

Description

SetYear is the protected write implementation of the Year (see page 26533) property.

See Also

Year (see page 26533)

199.1.4.6 TXSCustomDateTime Properties

The properties of the TXSCustomDateTime class are listed here.

Protected Properties

	Name	Description
	Millisecond (see page 26530)	Indicates the Millisecond of the second that the object represents.

Public Properties

	Name	Description
	AsDateTime (see page 26527)	Represents the object's value as a TDateTime value.
	AsUTCDateTime (see page 26528)	Represents the object's value as a TDateTime value using UTC time.
	Day (see page 26528)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 26529)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26532) property.
	Hour (see page 26529)	Indicates the hour of the day that the object represents.
	HourOffset (see page 26530)	Indicates the difference between the Hour (see page 26529) property and the hour in the local time zone.
	Minute (see page 26531)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26531)	Indicates the difference between the Minute (see page 26531) property and the minute of the hour in local time.
	Month (see page 26532)	Indicates the month of the year that the object represents.
	Second (see page 26532)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 26533)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 26530) is zero.
	Year (see page 26533)	Indicates the year that the object represents.

199.1.4.6.1 TXSCustomDateTime.AsDateTime Property

Represents the object's value as a TDateTime value.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Use AsDateTime to read the value of the TXSCustomDateTime (see page 26515) object into a variable of type TDateTime or set its value from a TDateTime value. AsDateTime handles the mapping between a TDateTime value and the Year (see page 26533), Month (see page 26532), Day (see page 26528), Hour (see page 26529), Minute (see page 26531), and Second (see page 26532) values.

Note: AsDateTime represents the local date-and-time, without using Coordinated Universal Time (UTC). That is, AsDateTime ignores the HourOffset (see page 26530) and MinuteOffset (see page 26531) properties. To get or set the value taking the HourOffset (see page 26530) and MinuteOffset (see page 26531) properties into account, use the AsUTCDateTime (see page 26528) property instead.

See Also

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Month (see page 26532)

Second (see page 26532)

Year (see page 26533)

HourOffset (see page 26530)

MinuteOffset (see page 26531)

Millisecond (see page 26530)

AsUTCDateTime (see page 26528)

199.1.4.6.2 TXSCustomDateTime.AsUTCDateTime Property

Represents the object's value as a TDateTime value using UTC time.

Pascal

```
property AsUTCDateTime: TDateTime;
```

C++

```
__property TDateTime AsUTCDateTime;
```

Description

Use AsUTCDateTime to read the value of the TXSCustomDateTime (see page 26515) object into a variable of type TDateTime or set its value from a TDateTime value. AsUTCDateTime handles the mapping between a TDateTime value and the Year (see page 26533), Month (see page 26532), Day (see page 26528), Hour (see page 26529), Minute (see page 26531), and Second (see page 26532) values. It also makes an adjustment for the HourOffset (see page 26530) and MinuteOffset (see page 26531) properties, so that the value of AsUTCDateTime is a Coordinated Universal Time (UTC) value rather than a local time value.

Note: To get or set the value as a local time value ignoring the HourOffset (see page 26530) and MinuteOffset (see page 26531) properties, use the AsDateTime (see page 26527) property instead.

See Also

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Month (see page 26532)

Second (see page 26532)

Year (see page 26533)

HourOffset (see page 26530)

MinuteOffset (see page 26531)

Millisecond (see page 26530)

AsDateTime (see page 26527)

199.1.4.6.3 TXSCustomDateTime.Day Property

Indicates the Day of the month that the object represents.

Pascal

```
property Day: Word;
```

C++

```
__property Word Day;
```

Description

Use Day to get or set the day portion of the date-and-time value. Valid Day values are 1 through 28, 29, 30, or 31, depending on the Month (see page 26532) value.

See Also

AsDateTime (see page 26527)

Hour (see page 26529)

Minute (see page 26531)

Month (see page 26532)

Second (see page 26532)

Year (see page 26533)

Millisecond (see page 26530)

199.1.4.6.4 TXSCustomDateTime.FractionalSeconds Property

Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26532) property.

Pascal

```
property FractionalSeconds: Double;
```

C++

```
__property Double FractionalSeconds;
```

Description

Use FractionalSeconds to get or set the fractional seconds of the time value. FractionalSeconds represents the same information as the Millisecond (see page 26530) property, but can provide greater precision.

See Also

AsDateTime (see page 26527)

Minute (see page 26531)

Second (see page 26532)

Millisecond (see page 26530)

UseZeroMilliseconds (see page 26533)

199.1.4.6.5 TXSCustomDateTime.Hour Property

Indicates the hour of the day that the object represents.

Pascal

```
property Hour: Word;
```

C++

```
__property Word Hour;
```

Description

Use Hour to get or set the hour portion of the date-and-time value. Valid Hour values are 0 through 23.

Note: Hour represents the hour using Coordinated Universal Time (UTC). To convert the hour to local time, you must add the hour offset.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Minute (see page 26531)

Month (see page 26532)

Second (see page 26532)

Year (see page 26533)

HourOffset (see page 26530)

Millisecond (see page 26530)

199.1.4.6.6 TXSCustomDateTime.HourOffset Property

Indicates the difference between the Hour (see page 26529) property and the hour in the local time zone.

Pascal

```
property HourOffset: SmallInt;
```

C++

```
__property SmallInt HourOffset;
```

Description

The Hour (see page 26529) property represents the hour of the day using Coordinated Universal Time (UTC). HourOffset is the correction factor you can add to Hour (see page 26529) to obtain the hour of the day in local time.

See Also

Hour (see page 26529)

199.1.4.6.7 TXSCustomDateTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the date-and-time value. Valid Millisecond values are 1 through 59.

Note: Millisecond values are not used by TXSDuration (see page 26548).

Note: You can also use the FractionalSeconds (see page 26529) property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds (see page 26529) returns a fraction of a second.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Second (see page 26532)

Year (see page 26533)

Month (see page 26532)

UseZeroMilliseconds (see page 26533)

FractionalSeconds (see page 26529)

199.1.4.6.8 TXSCustomDateTime.Minute Property

Indicates the minute of the hour that the object represents.

Pascal

```
property Minute: Word;
```

C++

```
__property Word Minute;
```

Description

Use Minute to get or set the minute portion of the date-and-time value. Valid Minute values are 0 through 59.

Note: Minute represents the minute using Coordinated Universal Time (UTC). To convert the minutes to local time, you must add the minute offset.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Hour (see page 26529)

Month (see page 26532)

Second (see page 26532)

Year (see page 26533)

MinuteOffset (see page 26531)

Millisecond (see page 26530)

199.1.4.6.9 TXSCustomDateTime.MinuteOffset Property

Indicates the difference between the Minute (see page 26531) property and the minute of the hour in local time.

Pascal

```
property MinuteOffset: SmallInt;
```

C++

```
__property SmallInt MinuteOffset;
```

Description

The Minute (see page 26531) property represents the minute of the hour using Coordinated Universal Time (UTC). MinuteOffset is the correction factor you can add to Minute (see page 26531) to obtain the minute of the hour in local time.

See Also

Minute (see page 26531)

199.1.4.6.10 TXSCustomDateTime.Month Property

Indicates the month of the year that the object represents.

Pascal

```
property Month: Word;
```

C++

```
__property Word Month;
```

Description

Use Month to get or set the month portion of the date-and-time value. Valid Month values are 1 through 12.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Second (see page 26532)

Year (see page 26533)

Millisecond (see page 26530)

199.1.4.6.11 TXSCustomDateTime.Second Property

Indicates the second of the minute that the object represents.

Pascal

```
property Second: Word;
```

C++

```
__property Word Second;
```

Description

Use Second to get or set the seconds portion of the date-and-time value. Valid Second values are 0 through 59.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Second

Year (see page 26533)

Millisecond (see page 26530)

199.1.4.6.12 TXSCustomDateTime.UseZeroMilliseconds Property

Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 26530) is zero.

Pascal

```
property UseZeroMilliseconds: Boolean;
```

C++

```
__property Boolean UseZeroMilliseconds;
```

Description

By default, the NativeToXS method does not include the milliseconds in the string encoding of this object's value when the value of the Millisecond (see page 26530) property is zero. If you set UseZeroMilliseconds, NativeToXS changes its encoding to include the milliseconds even when the value is zero. This is necessary for some Web Services that do not support the full schema defined by W3C.

See Also

Millisecond (see page 26530)

NativeToXS (see page 15581)

199.1.4.6.13 TXSCustomDateTime.Year Property

Indicates the year that the object represents.

Pascal

```
property Year: Integer;
```

C++

```
__property int Year;
```

Description

Use Year to get or set the year portion of the date-and-time value. Valid Year values are 1 through 9999.

See Also

AsDateTime (see page 26527)

Day (see page 26528)

Hour (see page 26529)

Minute (see page 26531)

Second (see page 26532)

Month (see page 26532)

Millisecond (see page 26530)

199.1.5 TXSDate Class

TXSDate implements the XML schema date type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDate = class(TRemotableXS);
```

C++

```
class TXSDate : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSDate acts as a wrapper for the simple scalar type date that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDate enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDate value to a TDateTime value, use the AsDate (see page 26539) property. Other properties give the Year (see page 26540), Month (see page 26540), and Day (see page 26539) that make up that value.

On server applications, instances of TXSDate that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDate instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDate instances that it passes as input parameters, and for freeing any TXSDate instances it creates or that are returned as output parameters or method results.

IInvokable (see page 22398)

TXSDate

TXSDuration (see page 26548)

TXSTime (see page 26558)

199.1.5.1 TXSDate Members

The following tables list the members exposed by TXSDate.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
	GetAsDate (see page 26536)	This is GetAsDate, a member of class TXSDate.
	GetDay (see page 26537)	This is GetDay, a member of class TXSDate.
	GetMonth (see page 26537)	This is GetMonth, a member of class TXSDate.
	GetYear (see page 26537)	This is GetYear, a member of class TXSDate.
	SetAsDate (see page 26538)	This is SetAsDate, a member of class TXSDate.
	SetDay (see page 26538)	This is SetDay, a member of class TXSDate.
	SetMonth (see page 26538)	This is SetMonth, a member of class TXSDate.
	SetYear (see page 26538)	This is SetYear, a member of class TXSDate.

Public Methods

	Name	Description
	Clone (see page 26536)	Returns a new TXSDate (see page 26534) object that represents the same value as this one.
V	Create (see page 26535)	Creates and initializes a Create object.
V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
V	NativeToXS (see page 26537)	Returns a string that represents the value of a TXSDate (see page 26534) instance.
V	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
V	XSToNative (see page 26538)	Assigns the properties of the TXSDate (see page 26534) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDate (see page 26539)	Represents the object's value as a TDateTime value.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	Day (see page 26539)	Indicates the Day of the month that the object represents.
	Month (see page 26540)	Indicates the month of the year that the object represents.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
	Year (see page 26540)	Indicates the year that the object represents.

199.1.5.2 TXSDate.Create Constructor

Creates and initializes a Create object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSDate();
```

Description

Call Create indirectly, using the new keyword, to create a Create object at runtime.

199.1.5.3 TXSDate Methods

The methods of the TXSDate class are listed here.

Protected Methods

	Name	Description
	GetAsDate (see page 26536)	This is GetAsDate, a member of class TXSDate.
	GetDay (see page 26537)	This is GetDay, a member of class TXSDate.
	GetMonth (see page 26537)	This is GetMonth, a member of class TXSDate.
	GetYear (see page 26537)	This is GetYear, a member of class TXSDate.
	SetAsDate (see page 26538)	This is SetAsDate, a member of class TXSDate.
	SetDay (see page 26538)	This is SetDay, a member of class TXSDate.
	SetMonth (see page 26538)	This is SetMonth, a member of class TXSDate.
	SetYear (see page 26538)	This is SetYear, a member of class TXSDate.

Public Methods

	Name	Description
	Clone (see page 26536)	Returns a new TXSDate (see page 26534) object that represents the same value as this one.
V	NativeToXS (see page 26537)	Returns a string that represents the value of a TXSDate (see page 26534) instance.
V	XSToNative (see page 26538)	Assigns the properties of the TXSDate (see page 26534) instance from the string representation of its value.

199.1.5.3.1 TXSDate.Clone Method

Returns a new TXSDate (see page 26534) object that represents the same value as this one.

Pascal

```
function Clone: TXSDate;
```

C++

```
__fastcall TXSDate Clone();
```

Description

Call Clone to obtain a new TXSDate (see page 26534) instance that represents the same time as this one. Clone returns the new TXSDate (see page 26534) object.

199.1.5.3.2 TXSDate.GetAsDate Method

Pascal

```
function GetAsDate: TDateTime;
```

C++

```
__fastcall TDateTime GetAsDate();
```

Description

This is GetAsDate, a member of class TXSDate.

199.1.5.3.3 TXSDate.GetDay Method

Pascal

```
function GetDay: Word;
```

C++

```
__fastcall Word GetDay();
```

Description

This is GetDay, a member of class TXSDate.

199.1.5.3.4 TXSDate.GetMonth Method

Pascal

```
function GetMonth: Word;
```

C++

```
__fastcall Word GetMonth();
```

Description

This is GetMonth, a member of class TXSDate.

199.1.5.3.5 TXSDate.GetYear Method

Pascal

```
function GetYear: Integer;
```

C++

```
__fastcall int GetYear();
```

Description

This is GetYear, a member of class TXSDate.

199.1.5.3.6 TXSDate.NativeToXS Method

Returns a string that represents the value of a TXSDate (see page 26534) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDate (see page 26534) in a SOAP packet.

See Also

XSToNative (see page 26538)

199.1.5.3.7 TXSDate.SetAsDate Method

Pascal

```
procedure SetAsDate(const Value: TDateTime);
```

C++

```
__fastcall SetAsDate(const TDateTime Value);
```

Description

This is SetAsDate, a member of class TXSDate.

199.1.5.3.8 TXSDate.SetDay Method

Pascal

```
procedure SetDay(const Value: Word);
```

C++

```
__fastcall SetDay(const Word Value);
```

Description

This is SetDay, a member of class TXSDate.

199.1.5.3.9 TXSDate.SetMonth Method

Pascal

```
procedure SetMonth(const Value: Word);
```

C++

```
__fastcall SetMonth(const Word Value);
```

Description

This is SetMonth, a member of class TXSDate.

199.1.5.3.10 TXSDate.SetYear Method

Pascal

```
procedure SetYear(const Value: Integer);
```

C++

```
__fastcall SetYear(const int Value);
```

Description

This is SetYear, a member of class TXSDate.

199.1.5.3.11 TXSDate.XSToNative Method

Assigns the properties of the TXSDate (see page 26534) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a date value. It uses this information to set the properties of the TXSDate (see page 26534) object.

See Also

NativeToXS (see page 26537)

199.1.5.4 TXSDate Properties

The properties of the TXSDate class are listed here.

Public Properties

	Name	Description
	AsDate (see page 26539)	Represents the object's value as a TDateTime value.
	Day (see page 26539)	Indicates the Day of the month that the object represents.
	Month (see page 26540)	Indicates the month of the year that the object represents.
	Year (see page 26540)	Indicates the year that the object represents.

199.1.5.4.1 TXSDate.AsDate Property

Represents the object's value as a TDateTime value.

Pascal

```
property AsDate: TDateTime;
```

C++

```
__property TDateTime AsDate;
```

Description

Use AsDate to read the value of the TXSDate (see page 26534) object into a variable of type TDateTime or set this objects value from a TDateTime value. AsDate handles the mapping between a TDateTime value and the Year (see page 26540), Month (see page 26540), and Day (see page 26539) properties. When reading AsDate, the resulting TDateTime value has a time portion of 0. When setting AsDate, the time portion is ignored.

See Also

Day (see page 26539)

Month (see page 26540)

Year (see page 26540)

199.1.5.4.2 TXSDate.Day Property

Indicates the Day of the month that the object represents.

Pascal

```
property Day: Word;
```

C++

```
__property Word Day;
```

Description

Use Day to get or set the day portion of the date-and-time value. Valid Day values are 1 through 28, 29, 30, or 31, depending on the Month (see page 26540) value.

See Also

AsDate (see page 26539)

Month (see page 26540)

Year (see page 26540)

199.1.5.4.3 TXSDate.Month Property

Indicates the month of the year that the object represents.

Pascal

```
property Month: Word;
```

C++

```
__property Word Month;
```

Description

Use Month to get or set the month portion of the date-and-time value. Valid Month values are 1 through 12.

See Also

AsDate (see page 26539)

Day (see page 26539)

Year (see page 26540)

199.1.5.4.4 TXSDate.Year Property

Indicates the year that the object represents.

Pascal

```
property Year: Integer;
```

C++

```
__property int Year;
```

Description

Use Year to get or set the year portion of the date-and-time value. Valid Year values are 1 through 9999.

See Also

AsDate (see page 26539)

Day (see page 26539)

Month (see page 26540)

199.1.6 TXSDateTime Class

TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDateTime = class(TXSCustomDateTime);
```

C++

```
class TXSDateTime : public TXSCustomDateTime;
```

File

XSBuiltIns

Description

TXSDateTime acts as a wrapper for the simple scalar type datetime that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDateTime enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDateTime value to a TDateTime value, use the AsDateTime (see page 26527) property. The resulting value represents the time portion using Coordinated Universal Time (UTC). To convert that to a local time zone, adjust the hour and minute portions using the HourOffset (see page 26530) and MinuteOffset (see page 26531) properties.

On server applications, instances of TXSDateTime that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDateTime instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDateTime instances that it passes as input parameters, and for freeing any TXSDateTime instances it creates or that are returned as output parameters or method results.

TXSTime (see page 26558)

199.1.6.1 TXSDateTime Members

The following tables list the members exposed by TXSDateTime.

Protected Fields

	Name	Description
	FDateTime (see page 26518)	This is FDateTime, a member of class TXSCustomDateTime.
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
	GetAsDateTime (see page 26519)	Returns the value of the AsDateTime (see page 26527) property.
	GetAsUTCDateTime (see page 26519)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 26519)	Returns the value of the Day (see page 26528) property.
	GetFractionalSeconds (see page 26520)	Returns the value of the FractionalSeconds (see page 26529) property.
	GetHour (see page 26520)	Returns the value of the Hour (see page 26529) property.
	GetHourOffset (see page 26520)	Returns the value of the HourOffset (see page 26530) property.
	GetMillisecond (see page 26521)	Returns the value of the Millisecond (see page 26530) property.
	GetMinute (see page 26521)	Returns the value of the Minute (see page 26531) property.
	GetMinuteOffset (see page 26521)	Returns the value of the MinuteOffset (see page 26531) property.
	GetMonth (see page 26521)	Returns the value of the Month (see page 26532) property.
	GetSecond (see page 26522)	Returns the value of the Second (see page 26532) property.
	GetUseZeroMilliseconds (see page 26522)	Returns the value of the UseZeroMilliseconds (see page 26533) property.
	GetYear (see page 26522)	Returns the value of the Year (see page 26533) property.
	SetAsDateTime (see page 26523)	Sets the value of the AsDateTime (see page 26527) property.
	SetAsUTCDateTime (see page 26523)	Sets the value of the AsUTCDateTime (see page 26528) property.
	SetDay (see page 26523)	Sets the value of the Day (see page 26528) property.
	SetFractionalSeconds (see page 26524)	Sets the value of the FractionalSeconds (see page 26529) property.
	SetHour (see page 26524)	Sets the value of the Hour (see page 26529) property.
	SetHourOffset (see page 26524)	Sets the value of the HourOffset (see page 26530) property.
	SetMillisecond (see page 26524)	Sets the value of the Millisecond (see page 26530) property.
	SetMinute (see page 26525)	Sets the value of the Minute (see page 26531) property.
	SetMinuteOffset (see page 26525)	Sets the value of the MinuteOffset (see page 26531) property.
	SetMonth (see page 26525)	Sets the value of the Month (see page 26532) property.
	SetSecond (see page 26526)	Sets the value of the Second (see page 26532) property.
	SetUseZeroMilliseconds (see page 26526)	Sets the value of the UseZeroMilliseconds (see page 26533) property.
	SetYear (see page 26526)	Sets the value of the Year (see page 26533) property.

Public Methods

	Name	Description
	Clone (see page 26543)	Returns a new TXSDateTime (see page 26541) object that represents the same value as this one.
	CompareDateTimeParam (see page 26543)	This is CompareDateTimeParam, a member of class TXSDateTime.
	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
	Create (see page 26517)	Creates and initializes a TXSCustomDateTime (see page 26515) object.
	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
	Destroy (see page 26517)	Frees the memory associated with the TXSCustomDateTime (see page 26515) object.
	NativeToXS (see page 26544)	Returns a string that represents the value of a TXSDateTime (see page 26541) instance.
	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
	XSToNative (see page 26544)	Assigns the properties of the TXSDateTime (see page 26541) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDateTime (see page 26527)	Represents the object's value as a TDateTime value.
	AsUTCDateTime (see page 26528)	Represents the object's value as a TDateTime value using UTC time.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.

	Day (see page 26528)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 26529)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26532) property.
	Hour (see page 26529)	Indicates the hour of the day that the object represents.
	HourOffset (see page 26530)	Indicates the difference between the Hour (see page 26529) property and the hour in the local time zone.
	Millisecond (see page 26544)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 26531)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26531)	Indicates the difference between the Minute (see page 26531) property and the minute of the hour in local time.
	Month (see page 26532)	Indicates the month of the year that the object represents.
	Second (see page 26532)	Indicates the second of the minute that the object represents.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
	UseZeroMilliseconds (see page 26533)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 26530) is zero.
	Year (see page 26533)	Indicates the year that the object represents.

199.1.6.2 TXSDateTime Methods

The methods of the TXSDateTime class are listed here.

Public Methods

	Name	Description
	Clone (see page 26543)	Returns a new TXSDateTime (see page 26541) object that represents the same value as this one.
	CompareDateTimeParam (see page 26543)	This is CompareDateTimeParam, a member of class TXSDateTime.
V	NativeToXS (see page 26544)	Returns a string that represents the value of a TXSDateTime (see page 26541) instance.
V	XSToNative (see page 26544)	Assigns the properties of the TXSDateTime (see page 26541) instance from the string representation of its value.

199.1.6.2.1 TXSDateTime.Clone Method

Returns a new TXSDateTime (see page 26541) object that represents the same value as this one.

Pascal

```
function Clone: TXSDateTime;
```

C++

```
__fastcall TXSDateTime Clone();
```

Description

Call Clone to obtain a new TXSDateTime (see page 26541) instance that represents the same date and time as this one. Clone returns the new TXSDateTime (see page 26541) object.

199.1.6.2.2 TXSDateTime.CompareDateTimeParam Method

Pascal

```
function CompareDateTimeParam(const Value1: TXSDateTime; const Value2: TXSDateTime):
TXSDuration;
```

C++

```
__fastcall TXSDuration CompareDateTimeParam(const TXSDateTime Value1, const TXSDateTime
Value2);
```

Description

This is CompareDateTimeParam, a member of class TXSDateTime.

199.1.6.2.3 TXSDateTime.NativeToXS Method

Returns a string that represents the value of a TXSDateTime (see page 26541) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDateTime (see page 26541) in a SOAP packet.

See Also

XSToNative (see page 26544)

UseZeroMilliseconds (see page 26533)

199.1.6.2.4 TXSDateTime.XSToNative Method

Assigns the properties of the TXSDateTime (see page 26541) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a datetime value. It uses this information to set the properties of the TXSDateTime (see page 26541) object.

See Also

NativeToXS (see page 26544)

199.1.6.3 TXSDateTime Properties

The properties of the TXSDateTime class are listed here.

Public Properties

	Name	Description
	Millisecond (see page 26544)	Indicates the Millisecond of the second that the object represents.

199.1.6.3.1 TXSDateTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the date-and-time value. Valid Millisecond values are 1 through 59.

Note: Millisecond values are not used by TXSDuration.

Note: You can also use the FractionalSeconds property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds returns a fraction of a second.

199.1.7 TXSDecimal Class

TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDecimal = class(TRemotableXS);
```

C++

```
class TXSDecimal : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSDecimal acts as a wrapper for the simple scalar decimal type that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDecimal enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDecimal value to a TBcd value, use the AsBcd (see page 26547) property.

On server applications, instances of TXSDecimal that are input parameters on an invokable interface are automatically created

when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDecimal instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDecimal instances that it passes as input parameters, and for freeing any TXSDecimal instances it creates or that are returned as output parameters or method results.

199.1.7.1 TXSDecimal Members

The following tables list the members exposed by TXSDecimal.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
	NativeToXS (see page 26547)	Returns a string that represents the value of a TXSDecimal (see page 26545) instance.
	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
	XSToNative (see page 26547)	Assigns a string as the value of the TXSDecimal (see page 26545) instance.

Public Properties

	Name	Description
	AsBcd (see page 26547)	Represents the object's value as a TBcd value.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	DecimalString (see page 26548)	Represents the object's value as a string.
	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

199.1.7.2 TXSDecimal Methods

The methods of the TXSDecimal class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 26547)	Returns a string that represents the value of a TXSDecimal (see page 26545) instance.
	XSToNative (see page 26547)	Assigns a string as the value of the TXSDecimal (see page 26545) instance.

199.1.7.2.1 TXSDecimal.NativeToXS Method

Returns a string that represents the value of a TXSDecimal (see page 26545) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDecimal (see page 26545) object in a SOAP packet. That is, NativeToXS converts the DecimalString (see page 26548) property to a WideString and returns the result.

See Also

XSToNative (see page 26547)

DecimalString (see page 26548)

199.1.7.2.2 TXSDecimal.XSToNative Method

Assigns a string as the value of the TXSDecimal (see page 26545) instance.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative sets the value of this TXSDecimal (see page 26545) object to a string that represents a formatted decimal value.

Data is the SOAP encoding of a decimal value. It becomes the value of the DecimalString (see page 26548) property.

See Also

NativeToXS (see page 26547)

DecimalString (see page 26548)

199.1.7.3 TXSDecimal Properties

The properties of the TXSDecimal class are listed here.

Public Properties

	Name	Description
	AsBcd (see page 26547)	Represents the object's value as a TBcd value.
	DecimalString (see page 26548)	Represents the object's value as a string.

199.1.7.3.1 TXSDecimal.AsBcd Property

Represents the object's value as a TBcd value.

Pascal

```
property AsBcd: TBcd;
```

C++

```
__property TBcd AsBcd;
```

Description

Use AsBcd to get or set this object's value as a TBcd type. TXSDecimal (see page 26545) converts between the internal string representation that is the value of the DecimalString (see page 26548) property and a TBcd value when the application gets or sets this property. Thus, if the string representation is ill-formed, reading AsBcd can cause an EXSDecimalException (see page 26514) exception. Similarly, setting AsBcd can cause an EXSDecimalException (see page 26514) exception if the TBcd value has an invalid scale or precision.

See Also

BcdToStr (see page 13639)

TryStrToBCD

DecimalString (see page 26548)

EXSDecimalException (see page 26514)

199.1.7.3.2 TXSDecimal.DecimalString Property

Represents the object's value as a string.

Pascal

```
property DecimalString: string;
```

C++

```
__property AnsiString DecimalString;
```

Description

Use DecimalString to obtain the value of the TXSDecimal (see page 26545) object as a string. This value is the same as the string that appears in XML documents to represent the decimal value. To work with this object's value as a TBcd value, use the AsBcd (see page 26547) property instead.

Note: If you do not need the precision of binary-coded decimal values, you can use global functions such as StrToFloat and FloatToStr or StrToCurr and CurrToStr to convert this string to a floating-point representation.

See Also

StrToCurr (see page 22962)

CurrToStr (see page 22819)

StrToFloat (see page 22967)

FloatToStr (see page 22890)

AsBcd (see page 26547)

199.1.8 TXSDuration Class

TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDuration = class(TXSCustomDateTime);
```

C++

```
class TXSDuration : public TXSCustomDateTime;
```

File

XSBuiltIns

Description

TXSDuration acts as a wrapper for the simple scalar type duration that W3C defines for XML schemas. That is, TXSDuration represents the interval between two points in time. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDuration enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDuration value to a TDateTime value, use the AsDateTime (see page 26527) property.

On server applications, instances of TXSDuration that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDuration instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDuration instances that it passes as input parameters, and for freeing any TXSDuration instances it creates or that are returned as output parameters or method results.

TXSDuration

TXSTime (see page 26558)

199.1.8.1 TXSDuration Members

The following tables list the members exposed by TXSDuration.

Protected Fields

	Name	Description
	FDateTime (see page 26518)	This is FDateTime, a member of class TXSCustomDateTime.
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
	GetAsDateTime (see page 26519)	Returns the value of the AsDateTime (see page 26527) property.
	GetAsUTCDateTime (see page 26519)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 26519)	Returns the value of the Day (see page 26528) property.
	GetDecimalSecond (see page 26551)	This is GetDecimalSecond, a member of class TXSDuration.
	GetFractionalSeconds (see page 26520)	Returns the value of the FractionalSeconds (see page 26529) property.

	GetHour (see page 26520)	Returns the value of the Hour (see page 26529) property.
	GetHourOffset (see page 26520)	Returns the value of the HourOffset (see page 26530) property.
	GetMillisecond (see page 26521)	Returns the value of the Millisecond (see page 26530) property.
	GetMinute (see page 26521)	Returns the value of the Minute (see page 26531) property.
	GetMinuteOffset (see page 26521)	Returns the value of the MinuteOffset (see page 26531) property.
	GetMonth (see page 26521)	Returns the value of the Month (see page 26532) property.
	GetSecond (see page 26522)	Returns the value of the Second (see page 26532) property.
	GetUseZeroMilliseconds (see page 26522)	Returns the value of the UseZeroMilliseconds (see page 26533) property.
	GetYear (see page 26522)	Returns the value of the Year (see page 26533) property.
	SetAsDateTime (see page 26523)	Sets the value of the AsDateTime (see page 26527) property.
	SetAsUTCDateTime (see page 26523)	Sets the value of the AsUTCDateTime (see page 26528) property.
V	SetDay (see page 26523)	Sets the value of the Day (see page 26528) property.
	SetDecimalSecond (see page 26552)	This is SetDecimalSecond, a member of class TXSDuration.
	SetFractionalSeconds (see page 26524)	Sets the value of the FractionalSeconds (see page 26529) property.
V	SetHour (see page 26524)	Sets the value of the Hour (see page 26529) property.
V	SetHourOffset (see page 26524)	Sets the value of the HourOffset (see page 26530) property.
V	SetMillisecond (see page 26524)	Sets the value of the Millisecond (see page 26530) property.
V	SetMinute (see page 26525)	Sets the value of the Minute (see page 26531) property.
V	SetMinuteOffset (see page 26525)	Sets the value of the MinuteOffset (see page 26531) property.
V	SetMonth (see page 26525)	Sets the value of the Month (see page 26532) property.
V	SetSecond (see page 26526)	Sets the value of the Second (see page 26532) property.
	SetUseZeroMilliseconds (see page 26526)	Sets the value of the UseZeroMilliseconds (see page 26533) property.
V	SetYear (see page 26526)	Sets the value of the Year (see page 26533) property.

Protected Properties

	Name	Description
	Millisecond (see page 26530)	Indicates the Millisecond of the second that the object represents.

Public Methods

	Name	Description
V	Create (see page 26551)	Creates and initializes a TXSDuration (see page 26548) object.
V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
V	Destroy (see page 26517)	Frees the memory associated with the TXSCustomDateTime (see page 26515) object.
V	NativeToXS (see page 26552)	Returns a string that represents the value of a TXSDuration (see page 26548) instance.
V	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
V	XSToNative (see page 26552)	Assigns the properties of the TXSDuration (see page 26548) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDateTime (see page 26527)	Represents the object's value as a TDateTime value.
	AsUTCDateTime (see page 26528)	Represents the object's value as a TDateTime value using UTC time.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	Day (see page 26528)	Indicates the Day of the month that the object represents.
	DecimalSecond (see page 26553)	Indicates the number of seconds, including fractional seconds, in the duration.
	FractionalSeconds (see page 26529)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26532) property.
	Hour (see page 26529)	Indicates the hour of the day that the object represents.

	HourOffset (see page 26530)	Indicates the difference between the Hour (see page 26529) property and the hour in the local time zone.
	Minute (see page 26531)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26531)	Indicates the difference between the Minute (see page 26531) property and the minute of the hour in local time.
	Month (see page 26532)	Indicates the month of the year that the object represents.
	Second (see page 26532)	Indicates the second of the minute that the object represents.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
	UseZeroMilliseconds (see page 26533)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 26530) is zero.
	Year (see page 26533)	Indicates the year that the object represents.

199.1.8.2 TXSDuration.Create Constructor

Creates and initializes a TXSDuration (see page 26548) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSDuration();
```

Description

Call Create to create a TXSDuration (see page 26548) object at runtime.

199.1.8.3 TXSDuration Methods

The methods of the TXSDuration class are listed here.

Protected Methods

	Name	Description
	GetDecimalSecond (see page 26551)	This is GetDecimalSecond, a member of class TXSDuration.
	SetDecimalSecond (see page 26552)	This is SetDecimalSecond, a member of class TXSDuration.

Public Methods

	Name	Description
V	NativeToXS (see page 26552)	Returns a string that represents the value of a TXSDuration (see page 26548) instance.
V	XSToNative (see page 26552)	Assigns the properties of the TXSDuration (see page 26548) instance from the string representation of its value.

199.1.8.3.1 TXSDuration.GetDecimalSecond Method

Pascal

```
function GetDecimalSecond: Double;
```

C++

```
__fastcall Double GetDecimalSecond();
```

Description

This is GetDecimalSecond, a member of class TXSDuration.

199.1.8.3.2 TXSDuration.NativeToXS Method

Returns a string that represents the value of a TXSDuration (see page 26548) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDuration (see page 26548) in a SOAP packet.

See Also

XSToNative (see page 26552)

199.1.8.3.3 TXSDuration.SetDecimalSecond Method

Pascal

```
procedure SetDecimalSecond(const Value: Double);
```

C++

```
__fastcall SetDecimalSecond(const Double Value);
```

Description

This is SetDecimalSecond, a member of class TXSDuration.

199.1.8.3.4 TXSDuration.XSToNative Method

Assigns the properties of the TXSDuration (see page 26548) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a duration value. It uses this information to set the properties of the TXSDuration (see page 26548) object.

See Also

NativeToXS (see page 26552)

199.1.8.4 TXSDuration Properties

The properties of the TXSDuration class are listed here.

Public Properties

	Name	Description
	DecimalSecond (see page 26553)	Indicates the number of seconds, including fractional seconds, in the duration.

199.1.8.4.1 TXSDuration.DecimalSecond Property

Indicates the number of seconds, including fractional seconds, in the duration.

Pascal

```
property DecimalSecond: Double;
```

C++

```
__property Double DecimalSecond;
```

Description

Use the DecimalSecond property to determine the size of the duration with a granularity finer than the Seconds property provides. DecimalSecond represents the number of seconds in the duration (above and beyond the years, months, days, hours and minutes represented by the other TXSDuration (see page 26548) properties), including any fractional seconds.

See Also

Second (see page 26532)

FractionalSeconds (see page 26529)

199.1.9 TXSHexBinary Class

TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSHexBinary = class(TRemotableXS);
```

C++

```
class TXSHexBinary : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSHexBinary acts as a wrapper for the simple scalar hexBinary type that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSHexBinary enables this marshaling because it is a descendant of TRemotable.

Use the AsByteArray (see page 26555) property to get or set the value of TXSHexBinary as an array of bytes. You can also set the value of TXSHexBinary from an integer using the global IntToHex function to convert an integer into a hexadecimal string and setting the HexBinaryString (see page 26556) property.

On server applications, instances of TXSHexBinary that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSHexBinary instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSHexBinary instances that it passes as input

parameters, and for freeing any TXSHexBinary instances it creates or that are returned as output parameters or method results.

IntToHex

EXSHexBinaryException (see page 26514)

199.1.9.1 TXSHexBinary Members

The following tables list the members exposed by TXSHexBinary.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
V	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
V	NativeToXS (see page 26555)	Returns a string that represents the value of a TXSHexBinary (see page 26553) instance.
V	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
V	XSToNative (see page 26555)	Assigns a string as the value of the TXSHexBinary (see page 26553) instance.

Public Properties

	Name	Description
	AsByteArray (see page 26555)	Represents the object's value as an array of bytes.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	HexBinaryString (see page 26556)	This is HexBinaryString, a member of class TXSHexBinary.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

199.1.9.2 TXSHexBinary Methods

The methods of the TXSHexBinary class are listed here.

Public Methods

	Name	Description
V	NativeToXS (see page 26555)	Returns a string that represents the value of a TXSHexBinary (see page 26553) instance.
V	XSToNative (see page 26555)	Assigns a string as the value of the TXSHexBinary (see page 26553) instance.

199.1.9.2.1 TXSHexBinary.NativeToXS Method

Returns a string that represents the value of a TXSHexBinary (see page 26553) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSHexBinary (see page 26553) object in a SOAP packet. That is, NativeToXS converts the HexBinaryString (see page 26556) property to a WideString and returns the result.

See Also

XSToNative (see page 26555)

hexbinarystring (see page 26556)

199.1.9.2.2 TXSHexBinary.XSToNative Method

Assigns a string as the value of the TXSHexBinary (see page 26553) instance.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative sets the value of this TXSHexBinary (see page 26553) object to a string that represents a formatted hexadecimal value.

Data is the SOAP encoding of a hexadecimal value. It becomes the value of the HexBinaryString (see page 26556) property.

See Also

NativeToXS (see page 26555)

hexbinarystring (see page 26556)

199.1.9.3 TXSHexBinary Properties

The properties of the TXSHexBinary class are listed here.

Public Properties

	Name	Description
	AsByteArray (see page 26555)	Represents the object's value as an array of bytes.
	HexBinaryString (see page 26556)	This is HexBinaryString, a member of class TXSHexBinary.

199.1.9.3.1 TXSHexBinary.AsByteArray Property

Represents the object's value as an array of bytes.

Pascal

```
property AsByteArray: TByteDynArray;
```

C++

```
__property TByteDynArray AsByteArray;
```

Description

Use AsByteArray to obtain the value of the TXSHexBinary (see page 26553) object as an array of bytes. This value is obtained from the HexBinaryString (see page 26556) property using the global HexToBin function. When you set AsByteArray, TXSHexBinary (see page 26553) uses the global BinToHex function to convert the binary value to a string and sets the HexBinaryString (see page 26556) property.

See Also

BinToHex

HexToBin

hexbinarystring (see page 26556)

199.1.9.3.2 TXSHexBinary.HexBinaryString Property

Pascal

```
property HexBinaryString: string;
```

C++

```
__property AnsiString HexBinaryString;
```

Description

This is HexBinaryString, a member of class TXSHexBinary.

199.1.10 TXSString Class

Class Hierarchy

Pascal

```
TXSString = class(TRemotableXS);
```

C++

```
class TXSString : public TRemotableXS;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXSString.

199.1.10.1 TXSString Members

The following tables list the members exposed by TXSString.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Public Methods

	Name	Description
	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
	NativeToXS (see page 26557)	Returns a string that represents the value of a TRemotableXS instance.
	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
	XSToNative (see page 26558)	Assigns the value of a string to the TRemotableXS instance.

Public Properties

	Name	Description
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.

199.1.10.2 TXSString Methods

The methods of the TXSString class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 26557)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 26558)	Assigns the value of a string to the TRemotableXS instance.

199.1.10.2.1 TXSString.NativeToXS Method

Returns a string that represents the value of a TRemotableXS instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

Override NativeToXS when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS instance. This string is used when marshaling the value of the TRemotableXS descendant.

Classes that implement NativeToXS must also override the XSToNative method so that it performs the converse transformation.

See Also

XSToNative (see page 15583)

Using Remotable Objects

199.1.10.2.2 TXSString.XSToNative Method

Assigns the value of a string to the TRemotableXS instance.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

Override XSToNative when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS interprets a string that represents the value of the TRemotableXS instance and uses it to make any necessary changes so that the TRemotableXS object reflects that value. It reverses the transformation that the NativeToXS method performs.

Data is a string that represents the value of the TRemotableXS instance.

NativeToXS (see page 15581)

Using Remotable Objects

199.1.11 TXSTime Class

TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSTime = class(TRemotableXS);
```

C++

```
class TXSTime : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSTime acts as a wrapper for the simple scalar type time that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSTime enables this marshaling because it is a descendant of TRemotable.

To convert a TXSTime value to a TDateTime value, use the AsTime (see page 26566) property. Other properties give the Hour (see page 26567), Minute (see page 26568), Second (see page 26569), and Millisecond (see page 26568) that make up that value. These properties represent the time using Coordinated Universal Time (UTC). To convert that to a local time zone, adjust the hour and minute portions using the HourOffset (see page 26567) and MinuteOffset (see page 26569) properties.

On server applications, instances of TXSTime that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSTime instance is created in a method that was called remotely using an invokable

interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSTime instances that it passes as input parameters, and for freeing any TXSTime instances it creates or that are returned as output parameters or method results.

See Also

IInvokable (see page 22398)

TXSDate (see page 26534)

TXSDuration (see page 26548)

TXSDateTime (see page 26541)

199.1.11.1 TXSTime Members

The following tables list the members exposed by TXSTime.

Protected Fields

	Name	Description
	FSerializationOptions (see page 15559)	This is FSerializationOptions, a member of class TRemotable.

Protected Methods

	Name	Description
	GetAsTime (see page 26561)	This is GetAsTime, a member of class TXSTime.
	GetFractionalSeconds (see page 26561)	This is GetFractionalSeconds, a member of class TXSTime.
	GetFractionalSecondString (see page 26561)	This is GetFractionalSecondString, a member of class TXSTime.
	GetHour (see page 26562)	This is GetHour, a member of class TXSTime.
	GetHourOffset (see page 26562)	This is GetHourOffset, a member of class TXSTime.
	GetMillisecond (see page 26562)	This is GetMillisecond, a member of class TXSTime.
	GetMinute (see page 26562)	This is GetMinute, a member of class TXSTime.
	GetMinuteOffset (see page 26563)	This is GetMinuteOffset, a member of class TXSTime.
	GetSecond (see page 26563)	This is GetSecond, a member of class TXSTime.
	SetAsTime (see page 26563)	This is SetAsTime, a member of class TXSTime.
	SetFractionalSeconds (see page 26564)	This is SetFractionalSeconds, a member of class TXSTime.
	SetHour (see page 26564)	This is SetHour, a member of class TXSTime.
	SetHourOffset (see page 26564)	This is SetHourOffset, a member of class TXSTime.
	SetMillisecond (see page 26564)	This is SetMillisecond, a member of class TXSTime.
	SetMinute (see page 26564)	This is SetMinute, a member of class TXSTime.
	SetMinuteOffset (see page 26565)	This is SetMinuteOffset, a member of class TXSTime.
	SetSecond (see page 26565)	This is SetSecond, a member of class TXSTime.

Protected Properties

	Name	Description
R	FractionalSecondString (see page 26567)	This is FractionalSecondString, a member of class TXSTime.

Public Methods

	Name	Description
	Clone (see page 26561)	Returns a new TXSTime (see page 26558) object that represents the same value as this one.
V	Create (see page 15558)	Creates and initializes a TRemotable (see page 15556) object.
V	Destroy (see page 15558)	Frees the memory associated with the TRemotable (see page 15556) object.
V	NativeToXS (see page 26563)	Returns a string that represents the value of a TXSTime (see page 26558) instance.

V	ObjectToSOAP (see page 15559)	Converts this remotable object to its SOAP representation.
V	ObjectToSOAP (see page 15582)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 15560)	Initializes this TRemotable (see page 15556) instance to represent the value of its SOAP representation.
V	SOAPToObject (see page 15582)	Initializes this TRemotableXS (see page 15580) instance to represent the value of its SOAP representation.
V	XSToNative (see page 26565)	Assigns the properties of the TXSTime (see page 26558) instance from the string representation of its value.

Public Properties

	Name	Description
	AsTime (see page 26566)	Represents the object's value as a TDateTime value.
	DataContext (see page 15561)	Specifies the object that controls the lifetime of a TRemotable (see page 15556) instance.
	FractionalSeconds (see page 26566)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26569) property.
	Hour (see page 26567)	Indicates the hour of the day that the object represents.
	HourOffset (see page 26567)	Indicates the difference between the Hour (see page 26567) property and the hour in the local time zone.
	Millisecond (see page 26568)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 26568)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26569)	Indicates the difference between the Minute (see page 26568) property and the minute of the hour in local time.
	Second (see page 26569)	Indicates the second of the minute that the object represents.
R	SerializationOptions (see page 15561)	Indicates how the value of the TRemotable (see page 15556) descendant encodes its value.
	UseZeroMilliseconds (see page 26569)	Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of Millisecond (see page 26568) and FractionalSeconds (see page 26566) is zero.

199.1.11.2 TXSTime Methods

The methods of the TXSTime class are listed here.

Protected Methods

	Name	Description
	GetAsTime (see page 26561)	This is GetAsTime, a member of class TXSTime.
	GetFractionalSeconds (see page 26561)	This is GetFractionalSeconds, a member of class TXSTime.
	GetFractionalSecondString (see page 26561)	This is GetFractionalSecondString, a member of class TXSTime.
	GetHour (see page 26562)	This is GetHour, a member of class TXSTime.
	GetHourOffset (see page 26562)	This is GetHourOffset, a member of class TXSTime.
	GetMillisecond (see page 26562)	This is GetMillisecond, a member of class TXSTime.
	GetMinute (see page 26562)	This is GetMinute, a member of class TXSTime.
	GetMinuteOffset (see page 26563)	This is GetMinuteOffset, a member of class TXSTime.
	GetSecond (see page 26563)	This is GetSecond, a member of class TXSTime.
	SetAsTime (see page 26563)	This is SetAsTime, a member of class TXSTime.
	SetFractionalSeconds (see page 26564)	This is SetFractionalSeconds, a member of class TXSTime.
	SetHour (see page 26564)	This is SetHour, a member of class TXSTime.
	SetHourOffset (see page 26564)	This is SetHourOffset, a member of class TXSTime.
	SetMillisecond (see page 26564)	This is SetMillisecond, a member of class TXSTime.
	SetMinute (see page 26564)	This is SetMinute, a member of class TXSTime.
	SetMinuteOffset (see page 26565)	This is SetMinuteOffset, a member of class TXSTime.
	SetSecond (see page 26565)	This is SetSecond, a member of class TXSTime.

Public Methods

	Name	Description
	Clone (see page 26561)	Returns a new TXSTime (see page 26558) object that represents the same value as this one.
V	NativeToXS (see page 26563)	Returns a string that represents the value of a TXSTime (see page 26558) instance.
V	XSToNative (see page 26565)	Assigns the properties of the TXSTime (see page 26558) instance from the string representation of its value.

199.1.11.2.1 TXSTime.Clone Method

Returns a new TXSTime (see page 26558) object that represents the same value as this one.

Pascal

```
function Clone: TXSTime;
```

C++

```
__fastcall TXSTime Clone();
```

Description

Call Clone to obtain a new TXSTime (see page 26558) instance that represents the same time as this one. Clone returns the new TXSTime (see page 26558) object.

199.1.11.2.2 TXSTime.GetAsTime Method

Pascal

```
function GetAsTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsTime();
```

Description

This is GetAsTime, a member of class TXSTime.

199.1.11.2.3 TXSTime.GetFractionalSeconds Method

Pascal

```
function GetFractionalSeconds: Double;
```

C++

```
__fastcall Double GetFractionalSeconds();
```

Description

This is GetFractionalSeconds, a member of class TXSTime.

199.1.11.2.4 TXSTime.GetFractionalSecondString Method

Pascal

```
function GetFractionalSecondString: string;
```

C++

```
__fastcall AnsiString GetFractionalSecondString();
```

Description

This is GetFractionalSecondString, a member of class TXSTime.

199.1.11.2.5 TXSTime.GetHour Method

Pascal

```
function GetHour: Word;
```

C++

```
__fastcall Word GetHour();
```

Description

This is GetHour, a member of class TXSTime.

199.1.11.2.6 TXSTime.GetHourOffset Method

Pascal

```
function GetHourOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetHourOffset();
```

Description

This is GetHourOffset, a member of class TXSTime.

199.1.11.2.7 TXSTime.GetMillisecond Method

Pascal

```
function GetMillisecond: Word;
```

C++

```
__fastcall Word GetMillisecond();
```

Description

This is GetMillisecond, a member of class TXSTime.

199.1.11.2.8 TXSTime.GetMinute Method

Pascal

```
function GetMinute: Word;
```

C++

```
__fastcall Word GetMinute();
```

Description

This is GetMinute, a member of class TXSTime.

199.1.11.2.9 TXSTime.GetMinuteOffset Method

Pascal

```
function GetMinuteOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetMinuteOffset();
```

Description

This is GetMinuteOffset, a member of class TXSTime.

199.1.11.2.10 TXSTime.GetSecond Method

Pascal

```
function GetSecond: Word;
```

C++

```
__fastcall Word GetSecond();
```

Description

This is GetSecond, a member of class TXSTime.

199.1.11.2.11 TXSTime.NativeToXS Method

Returns a string that represents the value of a TXSTime (see page 26558) instance.

Pascal

```
function NativeToXS: WideString; override;
```

C++

```
virtual __fastcall BSTR NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSTime (see page 26558) object in a SOAP packet.

See Also

XSToNative (see page 26565)

UseZeroMilliseconds (see page 26569)

199.1.11.2.12 TXSTime.SetAsTime Method

Pascal

```
procedure SetAsTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsTime(const TDateTime Value);
```

Description

This is SetAsTime, a member of class TXSTime.

199.1.11.2.13 TXSTime.SetFractionalSeconds Method

Pascal

```
procedure SetFractionalSeconds(const Value: Double);
```

C++

```
__fastcall SetFractionalSeconds(const Double Value);
```

Description

This is SetFractionalSeconds, a member of class TXSTime.

199.1.11.2.14 TXSTime.SetHour Method

Pascal

```
procedure SetHour(const Value: Word);
```

C++

```
__fastcall SetHour(const Word Value);
```

Description

This is SetHour, a member of class TXSTime.

199.1.11.2.15 TXSTime.SetHourOffset Method

Pascal

```
procedure SetHourOffset(const Value: SmallInt);
```

C++

```
__fastcall SetHourOffset(const SmallInt Value);
```

Description

This is SetHourOffset, a member of class TXSTime.

199.1.11.2.16 TXSTime.SetMillisecond Method

Pascal

```
procedure SetMillisecond(const Value: Word);
```

C++

```
__fastcall SetMillisecond(const Word Value);
```

Description

This is SetMillisecond, a member of class TXSTime.

199.1.11.2.17 TXSTime.SetMinute Method

Pascal

```
procedure SetMinute(const Value: Word);
```

C++

```
__fastcall SetMinute(const Word Value);
```

Description

This is SetMinute, a member of class TXSTime.

199.1.11.2.18 TXSTime.SetMinuteOffset Method

Pascal

```
procedure SetMinuteOffset(const Value: SmallInt);
```

C++

```
__fastcall SetMinuteOffset(const SmallInt Value);
```

Description

This is SetMinuteOffset, a member of class TXSTime.

199.1.11.2.19 TXSTime.SetSecond Method

Pascal

```
procedure SetSecond(const Value: Word);
```

C++

```
__fastcall SetSecond(const Word Value);
```

Description

This is SetSecond, a member of class TXSTime.

199.1.11.2.20 TXSTime.XSToNative Method

Assigns the properties of the TXSTime (see page 26558) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: WideString); override;
```

C++

```
virtual __fastcall XSToNative(BSTR Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a time value. It uses this information to set the properties of the TXSTime (see page 26558) object.

See Also

NativeToXS (see page 26563)

199.1.11.3 TXSTime Properties

The properties of the TXSTime class are listed here.

Protected Properties

	Name	Description
R	FractionalSecondString (see page 26567)	This is FractionalSecondString, a member of class TXSTime.

Public Properties

	Name	Description
	AsTime (see page 26566)	Represents the object's value as a TDateTime value.
	FractionalSeconds (see page 26566)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26569) property.
	Hour (see page 26567)	Indicates the hour of the day that the object represents.
	HourOffset (see page 26567)	Indicates the difference between the Hour (see page 26567) property and the hour in the local time zone.
	Millisecond (see page 26568)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 26568)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 26569)	Indicates the difference between the Minute (see page 26568) property and the minute of the hour in local time.
	Second (see page 26569)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 26569)	Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of Millisecond (see page 26568) and FractionalSeconds (see page 26566) is zero.

199.1.11.3.1 TXSTime.AsTime Property

Represents the object's value as a TDateTime value.

Pascal

```
property AsTime: TDateTime;
```

C++

```
__property TDateTime AsTime;
```

Description

Use AsTime to read the value of the TXSTime (see page 26558) object into a variable of type TDateTime or set its value from a TDateTime value. AsTime handles the mapping between a TDateTime value and the Hour (see page 26567), Minute (see page 26568), and Second (see page 26569) properties. When reading AsTime, the resulting TDateTime value is given a data portion of 0. When setting AsTime, the data portion is ignored.

Note: AsTime represents the time using Coordinated Universal Time (UTC). To convert this to a local time, add the offsets specified by HourOffset (see page 26567) and MinuteOffset (see page 26569) to the hours and minutes.

See Also

Hour (see page 26567)

Minute (see page 26568)

Second (see page 26569)

HourOffset (see page 26567)

MinuteOffset (see page 26569)

199.1.11.3.2 TXSTime.FractionalSeconds Property

Indicates any factional portion of a second beyond the seconds specified in the Second (see page 26569) property.

Pascal

```
property FractionalSeconds: Double;
```

C++

```
__property Double FractionalSeconds;
```

Description

Use FractionalSeconds to get or set the fractional seconds of the time value. FractionalSeconds represents the same information as the Millisecond (see page 26568) property, but can provide greater precision.

See Also

AsTime (see page 26566)

Minute (see page 26568)

Second (see page 26569)

Millisecond (see page 26568)

UseZeroMilliseconds (see page 26569)

199.1.11.3.3 TXSTime.FractionalSecondString Property

Pascal

```
property FractionalSecondString: string;
```

C++

```
__property AnsiString FractionalSecondString;
```

Description

This is FractionalSecondString, a member of class TXSTime.

199.1.11.3.4 TXSTime.Hour Property

Indicates the hour of the day that the object represents.

Pascal

```
property Hour: Word;
```

C++

```
__property Word Hour;
```

Description

Use Hour to get or set the hour portion of the time value. Valid Hour values are 0 through 23.

Note: Hour represents the hour using Coordinated Universal Time (UTC). To convert the hour to local time, you must add the value of the HourOffset (see page 26567) property.

See Also

AsTime (see page 26566)

Minute (see page 26568)

Second (see page 26569)

Millisecond (see page 26568)

HourOffset (see page 26567)

199.1.11.3.5 TXSTime.HourOffset Property

Indicates the difference between the Hour (see page 26567) property and the hour in the local time zone.

Pascal

```
property HourOffset: SmallInt;
```

C++

```
__property SmallInt HourOffset;
```

Description

The Hour (see page 26567) property represents the hour of the day using Coordinated Universal Time (UTC). HourOffset is the correction factor you can add to Hour (see page 26567) to obtain the hour of the day in local time.

See Also

Hour (see page 26567)

199.1.11.3.6 TXSTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the time value. Valid Millisecond values are 1 through 59.

Note: You can also use the FractionalSeconds (see page 26566) property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds (see page 26566) returns a fraction of a second.

See Also

AsTime (see page 26566)

Hour (see page 26567)

Minute (see page 26568)

Second (see page 26569)

UseZeroMilliseconds (see page 26569)

FractionalSeconds (see page 26566)

199.1.11.3.7 TXSTime.Minute Property

Indicates the minute of the hour that the object represents.

Pascal

```
property Minute: Word;
```

C++

```
__property Word Minute;
```

Description

Use Minute to get or set the minute portion of the time value. Valid Minute values are 0 through 59.

Note: Minute represents the minute using Coordinated Universal Time (UTC). To convert the minutes to local time, you must

add the value of the MinuteOffset (see page 26569) property.

See Also

AsTime (see page 26566)

Hour (see page 26567)

Second (see page 26569)

Millisecond (see page 26568)

MinuteOffset (see page 26569)

199.1.11.3.8 TXSTime.MinuteOffset Property

Indicates the difference between the Minute (see page 26568) property and the minute of the hour in local time.

Pascal

```
property MinuteOffset: SmallInt;
```

C++

```
__property SmallInt MinuteOffset;
```

Description

The Minute (see page 26568) property represents the minute of the hour using Coordinated Universal Time (UTC). MinuteOffset is the correction factor you can add to Minute (see page 26568) to obtain the minute of the hour in local time.

See Also

Minute (see page 26568)

199.1.11.3.9 TXSTime.Second Property

Indicates the second of the minute that the object represents.

Pascal

```
property Second: Word;
```

C++

```
__property Word Second;
```

Description

Use Second to get or set the seconds portion of the time value. Valid Second values are 0 through 59.

See Also

AsTime (see page 26566)

Millisecond (see page 26568)

Hour (see page 26567)

Minute (see page 26568)

Second

199.1.11.3.10 TXSTime.UseZeroMilliseconds Property

Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of

Millisecond (see page 26568) and FractionalSeconds (see page 26566) is zero.

Pascal

```
property UseZeroMilliseconds: Boolean;
```

C++

```
__property Boolean UseZeroMilliseconds;
```

Description

By default, the NativeToXS (see page 26563) method does not include the fractional portion of a second in the string encoding of this object's value when the value represents an exact number of seconds. If you set UseZeroMilliseconds, NativeToXS (see page 26563) changes its encoding to include milliseconds even when the value is zero. This is necessary for some Web Services that do not support the full time schema defined by W3C.

See Also

Millisecond (see page 26568)

NativeToXS (see page 26563)

FractionalSeconds (see page 26566)

199.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DateTimeToXMLTime (see page 26571)	Returns the XML string that represents a TDateTime value.
	DateTimeToXSDateTime (see page 26571)	Returns a TXSDateTime (see page 26541) object that encodes a TDateTime value.
	GetDataFromFile (see page 26572)	This is function XSBuiltIns.GetDataFromFile.
	InitXSTypes (see page 26572)	This is function XSBuiltIns.InitXSTypes.
	SoapFloatToStr (see page 26573)	This is function XSBuiltIns.SoapFloatToStr.
	SoapStrToFloat (see page 26573)	This is function XSBuiltIns.SoapStrToFloat.
	XMLTimeToDateTime (see page 26573)	Returns a TDateTime value to represent an XML datetime value.

199.2.1 XSBuiltIns.DateTimeToXMLTime Function

Returns the XML string that represents a TDateTime value.

Pascal

```
function DateTimeToXMLTime(Value: TDateTime; ApplyLocalBias: Boolean = True): WideString;
```

C++

```
BSTR DateTimeToXMLTime(TDateTime Value, Boolean ApplyLocalBias = True);
```

File

XSBuiltIns

Description

DateTimeToXMLTime returns the XML representation of a specified TDateTime value.

Value is the TDateTime value to convert. If the time zone information is important, this value is assumed to be given in Coordinated Universal Time (UTC).

CalcLocalBias indicates whether the XML string should include offsets for converting Value to the local time.

See Also

DateTimeToXSDateTime (see page 26571)

XMLTimeToDateTime (see page 26573)

199.2.2 XSBuiltIns.DateTimeToXSDateTime Function

Returns a TXSDateTime (see page 26541) object that encodes a TDateTime value.

Pascal

```
function DateTimeToXSDateTime(const Value: TDateTime; ApplyLocalBias: Boolean = False):
```

```
TXSDateTime;
```

C++

```
TXSDateTime DateTimeToXSDateTime(const TDateTime Value, Boolean ApplyLocalBias = False);
```

File

XSBuiltIns

Description

DateTimeToXSDateTime returns a TXSDateTime (see page 26541) object that corresponds to a specified TDateTime value. The TXSDateTime (see page 26541) object can be used to represent a date-and-time value on an invokable interface. As a remotable object, it can encoded in SOAP packets.

Value is the TDateTime value to convert. If the time zone information is important, this value is assumed to be given in Coordinated Universal Time (UTC).

CalcLocalBias indicates whether the TXSDateTime (see page 26541) object should include offsets for converting Value to the local time zone. If CalcLocalBias is true, DateTimeToXSDateTime looks up the local time zone and uses it to set the HourOffset and MinuteOffset properties of the return value.

IInvokable

TXSCustomDateTime (see page 26515)

TXSCustomDateTime (see page 26515)

199.2.3 XSBuiltIns.GetDataFromFile Function

Pascal

```
function GetDataFromFile(AFileName: string): string;
```

C++

```
AnsiString GetDataFromFile(AnsiString AFileName);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.GetDataFromFile.

199.2.4 XSBuiltIns.InitXSTypes Function

Pascal

```
procedure InitXSTypes;
```

C++

```
InitXSTypes();
```

File

XSBuiltIns

Description

This is function XSBuiltIns.InitXSTypes.

199.2.5 XSBuiltIns.SoapFloatToStr Function

Pascal

```
function SoapFloatToStr(Value: double): string;
```

C++

```
AnsiString SoapFloatToStr(double Value);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.SoapFloatToStr.

199.2.6 XSBuiltIns.SoapStrToFloat Function

Pascal

```
function SoapStrToFloat(Value: string): double;
```

C++

```
double SoapStrToFloat(AnsiString Value);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.SoapStrToFloat.

199.2.7 XSBuiltIns.XMLTimeToDateTime Function

Returns a TDateTime value to represent an XML datetime value.

Pascal

```
function XMLTimeToDateTime(const XMLDateTime: WideString; AsUTCTime: Boolean = False):
TDateTime;
```

C++

```
TDateTime XMLTimeToDateTime(const BSTR XMLDateTime, Boolean AsUTCTime = False);
```

File

XSBuiltIns

Description

XMLTimeToDateTime returns a TDateTime value for an XML date-and time value. This function is the inverse to the DateTimeToXMLTime (see page 26571) function.

Value is the XML string to convert.

See Also

DateTimeToXSDateTime (see page 26571)

DateTimeToXMLTime (see page 26571)

199.3 Types

The following table lists types in this documentation.

Types

Name	Description
TXSTimeInstant (see page 26575)	This is type XSBuiltIns.TXSTimeInstant.

199.3.1 XSBuiltIns.TXSTimeInstant Type

Pascal

```
TXSTimeInstant = TXSDateTime;
```

C++

```
TXSDateTime TXSTimeInstant;
```

File

XSBuiltIns

Description

This is type XSBuiltIns.TXSTimeInstant.

199.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IncrementAmount (see page 26576)	This is constant XSBuiltIns.IncrementAmount.
MaxDay (see page 26577)	This is constant XSBuiltIns.MaxDay.
MaxMonth (see page 26577)	This is constant XSBuiltIns.MaxMonth.
MinDay (see page 26577)	This is constant XSBuiltIns.MinDay.
MinMonth (see page 26578)	This is constant XSBuiltIns.MinMonth.
SDecimal (see page 26578)	This is constant XSBuiltIns.SDecimal.
SHexMarker (see page 26578)	This is constant XSBuiltIns.SHexMarker.
SLocalTimeMarker (see page 26579)	This is constant XSBuiltIns.SLocalTimeMarker.
SNAN (see page 26579)	This is constant XSBuiltIns.SNAN.
SNegative (see page 26579)	This is constant XSBuiltIns.SNegative.
SoapDecimalSeparator (see page 26580)	This is constant XSBuiltIns.SoapDecimalSeparator.
SoapTimePrefix (see page 26580)	This is constant XSBuiltIns.SoapTimePrefix.
SPlus (see page 26580)	This is constant XSBuiltIns.SPlus.
SSciNotationMarker (see page 26581)	This is constant XSBuiltIns.SSciNotationMarker.
XMLDateSeparator (see page 26581)	This is constant XSBuiltIns.XMLDateSeparator.
XMLDayPos (see page 26581)	This is constant XSBuiltIns.XMLDayPos.
XMLDefaultYearDigits (see page 26582)	This is constant XSBuiltIns.XMLDefaultYearDigits.
XMLDurationDay (see page 26582)	This is constant XSBuiltIns.XMLDurationDay.
XMLDurationHour (see page 26582)	This is constant XSBuiltIns.XMLDurationHour.
XMLDurationMinute (see page 26583)	This is constant XSBuiltIns.XMLDurationMinute.
XMLDurationMonth (see page 26583)	This is constant XSBuiltIns.XMLDurationMonth.
XMLDurationSecond (see page 26583)	This is constant XSBuiltIns.XMLDurationSecond.
XMLDurationStart (see page 26584)	This is constant XSBuiltIns.XMLDurationStart.
XMLDurationYear (see page 26584)	This is constant XSBuiltIns.XMLDurationYear.
XMLHourOffsetMinusMarker (see page 26584)	This is constant XSBuiltIns.XMLHourOffsetMinusMarker.
XMLHourOffsetPlusMarker (see page 26585)	This is constant XSBuiltIns.XMLHourOffsetPlusMarker.
XMLMilSecPos (see page 26585)	This is constant XSBuiltIns.XMLMilSecPos.
XMLMonthPos (see page 26585)	This is constant XSBuiltIns.XMLMonthPos.
XMLTimeSeparator (see page 26586)	This is constant XSBuiltIns.XMLTimeSeparator.
XMLYearPos (see page 26586)	This is constant XSBuiltIns.XMLYearPos.

199.4.1 XSBuiltIns.IncrementAmount Constant

Pascal

```
IncrementAmount: array[Boolean] of Integer = (1, -1);
```

C++

```
array[Boolean] of Integer IncrementAmount = (1, -1);
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.IncrementAmount.

199.4.2 XSBuiltIns.MaxDay Constant

Pascal

```
MaxDay = 31;
```

C++

```
MaxDay = 31;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MaxDay.

199.4.3 XSBuiltIns.MaxMonth Constant

Pascal

```
MaxMonth = 12;
```

C++

```
MaxMonth = 12;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MaxMonth.

199.4.4 XSBuiltIns.MinDay Constant

Pascal

```
MinDay = 1;
```

C++

```
MinDay = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MinDay.

199.4.5 XSBuiltIns.MinMonth Constant

Pascal

```
MinMonth = 1;
```

C++

```
MinMonth = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MinMonth.

199.4.6 XSBuiltIns.SDecimal Constant

Pascal

```
SDecimal: Char = '.';
```

C++

```
Char SDecimal = '.';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SDecimal.

199.4.7 XSBuiltIns.SHexMarker Constant

Pascal

```
SHexMarker = '$';
```

C++

```
SHexMarker = '$';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SHexMarker.

199.4.8 XSBuiltIns.SLocalTimeMarker Constant

Pascal

```
SLocalTimeMarker = 'Z';
```

C++

```
SLocalTimeMarker = 'Z';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SLocalTimeMarker.

199.4.9 XSBuiltIns.SNAN Constant

Pascal

```
SNAN = 'NAN';
```

C++

```
SNAN = 'NAN';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SNAN.

199.4.10 XSBuiltIns.SNegative Constant

Pascal

```
SNegative: Char = '-';
```

C++

```
Char SNegative = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SNegative.

199.4.11 XSBuiltIns.SoapDecimalSeparator Constant

Pascal

```
SoapDecimalSeparator = '.';
```

C++

```
SoapDecimalSeparator = '.';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SoapDecimalSeparator.

199.4.12 XSBuiltIns.SoapTimePrefix Constant

Pascal

```
SoapTimePrefix = 'T';
```

C++

```
SoapTimePrefix = 'T';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SoapTimePrefix.

199.4.13 XSBuiltIns.SPlus Constant

Pascal

```
SPlus: Char = '+';
```

C++

```
Char SPlus = '+';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SPlus.

199.4.14 XSBuiltIns.SSciNotationMarker Constant

Pascal

```
SSciNotationMarker: Char = 'E';
```

C++

```
Char SSciNotationMarker = 'E';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SSciNotationMarker.

199.4.15 XSBuiltIns.XMLDateSeparator Constant

Pascal

```
XMLDateSeparator = '-';
```

C++

```
XMLDateSeparator = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDateSeparator.

199.4.16 XSBuiltIns.XMLDayPos Constant

Pascal

```
XMLDayPos = 9;
```

C++

```
XMLDayPos = 9;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDayPos.

199.4.17 XSBuiltIns.XMLDefaultYearDigits Constant

Pascal

```
XMLDefaultYearDigits = 4;
```

C++

```
XMLDefaultYearDigits = 4;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDefaultYearDigits.

199.4.18 XSBuiltIns.XMLDurationDay Constant

Pascal

```
XMLDurationDay = 'D';
```

C++

```
XMLDurationDay = 'D';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationDay.

199.4.19 XSBuiltIns.XMLDurationHour Constant

Pascal

```
XMLDurationHour = 'H';
```

C++

```
XMLDurationHour = 'H';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationHour.

199.4.20 XSBuiltIns.XMLDurationMinute Constant

Pascal

```
XMLDurationMinute = 'M';
```

C++

```
XMLDurationMinute = 'M';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationMinute.

199.4.21 XSBuiltIns.XMLDurationMonth Constant

Pascal

```
XMLDurationMonth = 'M';
```

C++

```
XMLDurationMonth = 'M';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationMonth.

199.4.22 XSBuiltIns.XMLDurationSecond Constant

Pascal

```
XMLDurationSecond = 'S';
```

C++

```
XMLDurationSecond = 'S';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationSecond.

199.4.23 XSBuiltIns.XMLDurationStart Constant

Pascal

```
XMLDurationStart = 'P';
```

C++

```
XMLDurationStart = 'P';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationStart.

199.4.24 XSBuiltIns.XMLDurationYear Constant

Pascal

```
XMLDurationYear = 'Y';
```

C++

```
XMLDurationYear = 'Y';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationYear.

199.4.25 XSBuiltIns.XMLHourOffsetMinusMarker Constant

Pascal

```
XMLHourOffsetMinusMarker = '-';
```

C++

```
XMLHourOffsetMinusMarker = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLHourOffsetMinusMarker.

199.4.26 XSBuiltIns.XMLHourOffsetPlusMarker Constant

Pascal

```
XMLHourOffsetPlusMarker = '+';
```

C++

```
XMLHourOffsetPlusMarker = '+';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLHourOffsetPlusMarker.

199.4.27 XSBuiltIns.XMLMilSecPos Constant

Pascal

```
XMLMilSecPos = 10;
```

C++

```
XMLMilSecPos = 10;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLMilSecPos.

199.4.28 XSBuiltIns.XMLMonthPos Constant

Pascal

```
XMLMonthPos = 6;
```

C++

```
XMLMonthPos = 6;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLMonthPos.

199.4.29 XSBuiltIns.XMLTimeSeparator Constant

Pascal

```
XMLTimeSeparator = ':';
```

C++

```
XMLTimeSeparator = ':';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLTimeSeparator.

199.4.30 XSBuiltIns.XMLYearPos Constant

Pascal

```
XMLYearPos = 1;
```

C++

```
XMLYearPos = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLYearPos.

200 XSLProd Namespace

This is namespace XSLProd.

Topics

Name	Description
Classes (see page 26588)	The following table lists classes in this documentation.

Classes

	Name	Description
	EXSLPageProducerError (see page 26588)	EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 26605) encounters a problem.
	TCustomXSLPageProducer (see page 26588)	TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.
	TXSLPageProducer (see page 26605)	TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

200.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXSLPageProducerError (see page 26588)	EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 26605) encounters a problem.
	TCustomXSLPageProducer (see page 26588)	TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.
	TXSLPageProducer (see page 26605)	TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

200.1.1 EXSLPageProducerError Class

EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 26605) encounters a problem.

Class Hierarchy

Pascal

```
EXSLPageProducerError = class(EWebBrokerException);
```

C++

```
class EXSLPageProducerError : public EWebBrokerException;
```

File

XSLProd

Description

TXSLPageProducer (see page 26605) raises an EXSLPageProducerError exception when it tries to produce content and the WebSnap application has not yet specified the source XML document or the XSL template that transforms that source into the final content.

See Also

TXSLPageProducer (see page 26605)

200.1.2 TCustomXSLPageProducer Class

TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

Class Hierarchy

Pascal

```
TCustomXSLPageProducer = class(TXMLDocument, IProduceContent, IProduceContentFrom,
ISetAppDispatcher, IGetAppDispatcher, IProducerEditorViewSupport, IGetProducerTemplate);
```

C++

```
class TCustomXSLPageProducer : public TXMLDocument, public IProduceContent, public
IProduceContentFrom, public ISetAppDispatcher, public IGetAppDispatcher, public
IProducerEditorViewSupport, public IGetProducerTemplate;
```

File

XSLProd

Description

TCustomXSLPageProducer is the base class for components that transform the data in an XML document using an XSL template. This class introduces all the properties and methods necessary for specifying the XML document to transform, the XSL template that describes the transformation, and for performing the transformation.

The XMLData (see page 26605) property identifies the XML data that this component transforms. XMLData (see page 26605) must be set to a component that supports either the IXMLDocument interface (for example, TXMLDocument or one of its descendants) or the IGetXMLStream interface (for example, TXMLBroker).

To obtain the results of the transformation, you can use any of the following methods:

The Content (see page 26597) method performs the transformation using the XSL template that is specified by the FileName or XML property. When using the Content (see page 26597) method, you can also read an XSL document by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

The ContentFromString (see page 26598) and ContentFromWideString (see page 26599) methods perform the transformation using an XSL template that is supplied as a parameter.

The ContentFromStream (see page 26598) method performs the transformation using an XSL template that it reads from a specified stream.

200.1.2.1 TCustomXSLPageProducer Members

The following tables list the members exposed by TCustomXSLPageProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.
V	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 26113)	Returns the value of the Active property.
	GetAppDispatcher (see page 26599)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetModified (see page 26116)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
V	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.
	GetProducerTemplateFileName (see page 26599)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 26599)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.

	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetTemplateFileType (see page 26600)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 26600)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	GetXMLData (see page 26600)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 26600)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.
	GetXSLData (see page 26601)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 26601)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 26601)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 26601)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 26601)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.
	LoadData (see page 26120)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
V	Notification (see page 26602)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 26602)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 26602)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.
	ProduceContentFromString (see page 26603)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 26603)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.

	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.
	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26107)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 26597)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property.
V	ContentFromStream (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.
V	ContentFromWideString (see page 26599)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.

	Create (see page 26103)	This is the overview for the Create constructor overload.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.
	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26104)	Disposes of a TXMLDocument (see page 26097) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
V	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.

	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.

	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.
	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 26603)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
R	DispatcherComponent (see page 26604)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 26408)	Influences various aspects of the document's behavior.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.

	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.
R	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.
	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.
	XMLData (see page 26605)	Specifies the component that supplies the XML data that this component transforms.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.

200.1.2.2 TCustomXSLPageProducer Methods

The methods of the TCustomXSLPageProducer class are listed here.

Protected Methods

	Name	Description
	GetAppDispatcher (see page 26599)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetProducerTemplateFileName (see page 26599)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 26599)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.

	GetTemplateFileType (see page 26600)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 26600)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetXMLData (see page 26600)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 26600)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.
	GetXSLData (see page 26601)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 26601)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 26601)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 26601)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 26601)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
V	Notification (see page 26602)	Forwards notification messages to all owned components.
	ProduceContent (see page 26602)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 26602)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.
	ProduceContentFromString (see page 26603)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.
	SetAppDispatcher (see page 26603)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.

Public Methods

	Name	Description
V	Content (see page 26597)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property.
V	ContentFromStream (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.
V	ContentFromWideString (see page 26599)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.

200.1.2.2.1 TCustomXSLPageProducer.Content Method

Returns the transformed value of the XML supplied by the XMLData (see page 26605) property.

Pascal

```
function Content: string; virtual;
```

C++

```
virtual __fastcall AnsiString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. Content transforms the XML data that is supplied by the XMLData (see page 26605) property using the XSL template associated with this component. The XSL template can be specified in several ways:

If the FileName property is set, it specifies a file that contains the XSL template.

If FileName is not set, you can assign an XSL template using the XML property.

At runtime, you can supply an XSL template by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

XMLData (see page 26605)

FileName (see page 26138)

XML (see page 26144)

LoadFromFile (see page 26121)

LoadFromStream (see page 26121)

LoadFromXML (see page 26122)

200.1.2.2.2 TCustomXSLPageProducer.ContentFromStream Method

Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using an XSL template that can be read from a specified stream.

Pascal

```
function ContentFromStream(InStream: TStream): string; virtual;
```

C++

```
virtual __fastcall AnsiString ContentFromStream(TStream InStream);
```

Description

Call Content (see page 26597) to retrieve the content for using in an HTTP response message. Content (see page 26597) transforms the XML data that is supplied by the XMLData (see page 26605) property using the XSL template that is reads from InStream.

See Also

Content (see page 26597)

ContentFromString (see page 26598)

ContentFromWideString (see page 26599)

XMLData (see page 26605)

200.1.2.2.3 TCustomXSLPageProducer.ContentFromString Method

Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.

Pascal

```
function ContentFromString(const S: string): string;
```

C++

```
__fastcall AnsiString ContentFromString(const AnsiString S);
```

Description

Call Content (see page 26597) to retrieve the content for using in an HTTP response message. Content (see page 26597) transforms the XML data that is supplied by the XMLData (see page 26605) property using the XSL template specified by S.

See Also

Content (see page 26597)

ContentFromStream (see page 26598)

ContentFromWideString (see page 26599)

XMLData (see page 26605)

200.1.2.2.4 TCustomXSLPageProducer.ContentFromWideString Method

Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.

Pascal

```
function ContentFromWideString(const S: WideString): string; virtual;
```

C++

```
virtual __fastcall AnsiString ContentFromWideString(const BSTR S);
```

Description

Call Content (see page 26597) to retrieve the content for using in an HTTP response message. Content (see page 26597) transforms the XML data that is supplied by the XMLData (see page 26605) property using the XSL template specified by S.

See Also

Content (see page 26597)

ContentFromStream (see page 26598)

ContentFromString (see page 26598)

XMLData (see page 26605)

200.1.2.2.5 TCustomXSLPageProducer.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class TCustomXSLPageProducer.

200.1.2.2.6 TCustomXSLPageProducer.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall AnsiString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.

200.1.2.2.7 TCustomXSLPageProducer.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.

200.1.2.2.8 TCustomXSLPageProducer.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall AnsiString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class TCustomXSLPageProducer.

200.1.2.2.9 TCustomXSLPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomXSLPageProducer.

200.1.2.2.10 TCustomXSLPageProducer.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class TCustomXSLPageProducer.

200.1.2.2.11 TCustomXSLPageProducer.GetXMLDocument Method

Pascal

```
function GetXMLDocument(out AXMLDocument: IXMLDocument): Boolean;
```

C++

```
__fastcall Boolean GetXMLDocument(IXMLDocument AXMLDocument);
```

Description

This is GetXMLDocument, a member of class TCustomXSLPageProducer.

200.1.2.2.12 TCustomXSLPageProducer.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class TCustomXSLPageProducer.

200.1.2.2.13 TCustomXSLPageProducer.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.

200.1.2.2.14 TCustomXSLPageProducer.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class TCustomXSLPageProducer.

200.1.2.2.15 TCustomXSLPageProducer.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.

200.1.2.2.16 TCustomXSLPageProducer.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.

200.1.2.2.17 TCustomXSLPageProducer.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification (see page 2775)

InsertComponent (see page 2780)

RemoveComponent (see page 2785)

Owner (see page 2807)

200.1.2.2.18 TCustomXSLPageProducer.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall AnsiString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content (see page 15106)

200.1.2.2.19 TCustomXSLPageProducer.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall AnsiString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.

200.1.2.2.20 TCustomXSLPageProducer.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall AnsiString ProduceContentFromString(const AnsiString S);
```

Description

This is ProduceContentFromString, a member of class TCustomXSLPageProducer.

200.1.2.2.21 TCustomXSLPageProducer.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class TCustomXSLPageProducer.

200.1.2.3 TCustomXSLPageProducer Properties

The properties of the TCustomXSLPageProducer class are listed here.

Public Properties

	Name	Description
R	Dispatcher (see page 26603)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
R	DispatcherComponent (see page 26604)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	XMLData (see page 26605)	Specifies the component that supplies the XML data that this component transforms.

200.1.2.3.1 TCustomXSLPageProducer.Dispatcher Property

Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.

Pascal

```
property Dispatcher: IWebDispatcherAccess;
```

C++

```
__property IWebDispatcherAccess Dispatcher;
```

Description

Read Dispatcher to access the interface of the dispatcher. In Web Broker applications, this is the interface of a TWebDispatcher or TWebModule component. In WebSnap applications, this is the interface of a TWebAppComponents component.

The IWebDispatcherAccess interface has two methods:

Request, which returns the HTTP request message to which this page producer responds.

Response, which returns the HTTP response message for which this page producer generates content.

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

TWebAppComponents (see page 24958)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

DispatcherComponent (see page 26604)

200.1.2.3.2 TCustomXSLPageProducer.DispatcherComponent Property

Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.

Pascal

```
property DispatcherComponent: TComponent;
```

C++

```
__property TComponent * DispatcherComponent;
```

Description

Read DispatcherComponent to access the dispatcher that handles the HTTP request and response messages for this Web Server application. In Web Broker applications, this is the interface of a TWebDispatcherComponent or TWebModule component. In WebSnap applications, this is the interface of a TWebAppComponents component.

Dispatcher (see page 26603) implements the interface that is the value of the Dispatcher (see page 26603) property. The XSL page producer uses this property so that it can respond to notifications when the component is freed. To use the dispatcher, use the Dispatcher (see page 26603) property instead.

See Also

TWebModule (see page 15154)

TWebDispatcher (see page 15147)

TWebAppComponents (see page 24958)

TWebRequest (see page 15161)

TWebResponse (see page 15191)

Dispatcher (see page 26603)

200.1.2.3.3 TCustomXSLPageProducer.XMLData Property

Specifies the component that supplies the XML data that this component transforms.

Pascal

```
property XMLData: TComponent;
```

C++

```
__property TComponent * XMLData;
```

Description

Use the XMLData property to specify the XML data that this component transforms. XMLData must be set to a component that supports either the IXMLDocument interface (for example, TXMLDocument or one of its descendants) or the IGetXMLStream interface (for example, TXMLBroker).

See Also

TXMLDocument (see page 26097)

TXMLBroker (see page 26049)

200.1.3 TXSLPageProducer Class

TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

Class Hierarchy

Pascal

```
TXSLPageProducer = class(TCustomXSLPageProducer);
```

C++

```
class TXSLPageProducer : public TCustomXSLPageProducer;
```

File

XSLProd

Description

Use the Web Page Module wizard to create a web page that uses TXSLPageProducer. To produce content, TXSLPageProducer uses an XSL template to transform the data in an XML document. Typically, the XSL transforms the XML document into another XML document that is HTML compliant (that is, into a document whose tags are actually HTML tags). However, as specified by the XSL template, TXSLPageProducer can return any arbitrary output as a result of the transformation.

Use the XMLData (see page 26613) property to specify the XML data that this component transforms. XMLData (see page 26613) must be set to a component that supports either the IXMLDocument interface (for example, TXMLDocument or one of its descendants) or the IGetXMLStream interface (for example, TXMLBroker).

To obtain the results of the transformation, you can use any of the following methods:

The Content (see page 26597) method performs the transformation using the XSL template that is specified by the FileName or XML property. When using the Content (see page 26597) method, you can also read an XSL document by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

The ContentFromString (see page 26598) and ContentFromWideString (see page 26599) methods perform the transformation using an XSL template that is supplied as a parameter.

The ContentFromStream (see page 26598) method performs the transformation using an XSL template that it reads from a specified stream.

At design time, Web page modules that use the TXMLPageProducer have editor views called XML Tree and XSL Tree. These views provide a read only tree of the XML and XSL respectively.

See Also

TXMLDocument (see page 26097)

TXMLBroker (see page 26049)

200.1.3.1 TXSLPageProducer Members

The following tables list the members exposed by TXSLPageProducer.

Protected Fields

	Name	Description
	FComponentStyle (see page 2767)	This is FComponentStyle, a member of class TComponent.

Protected Methods

	Name	Description
	_AddRef (see page 2769)	Called when an application uses a component interface.
	_AddRef (see page 26106)	Called when an application uses a component interface.
	_Release (see page 2769)	Called when an application releases a component interface.
	_Release (see page 26106)	Called when an application releases a component interface.
	AssignParseOptions (see page 26108)	This is AssignParseOptions, a member of class TXMLDocument.
V	AssignTo (see page 2931)	Copies the properties of an object to a destination object.
	ChangeName (see page 2770)	Sets the private, internal storage for the Name (see page 2805) property to the string passed in NewName.
	CheckActive (see page 26108)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 26108)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 26109)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 2771)	Designates methods for storing an object's unpublished data on a stream such as a form file.
V	DefineProperties (see page 2931)	Provides an interface for a method that reads and writes otherwise unpublished data.

	DefineProperties (see page 26111)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 26111)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 26111)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 26112)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 26112)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 26112)	This is DoNodeChange, a member of class TXMLDocument.
	GetActive (see page 26113)	Returns the value of the Active property.
	GetAppDispatcher (see page 26599)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetAsyncLoadState (see page 26113)	Returns the value of the AsyncLoadState property.
	GetChildNodeClass (see page 26113)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 26113)	Returns the value of the ChildNodes property.
	GetChildOwner (see page 2776)	Returns the owner of a child component being read from a stream.
	GetChildParent (see page 2776)	Returns the parent, or if there is no parent, returns the owner of a child component being read from a stream.
	GetChildren (see page 2777)	This is GetChildren, a member of class TComponent.
	GetDocumentElement (see page 26114)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 26115)	Returns the value of the Node property.
	GetDocumentObject (see page 26115)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 26115)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 26115)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 26116)	Returns the value of the Encoding property.
	GetFileName (see page 26116)	Returns the value of the FileName property.
	GetIDsOfNames (see page 2777)	Maps a single member and an optional set of argument names to a corresponding set of integer dispatch identifiers (dispIDs).
	GetModified (see page 26116)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 26117)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 26117)	Returns the value of the Options property.
	GetOwner (see page 2778)	Returns the owner of a component.
	GetOwner (see page 2932)	Returns the owner of an object.
	GetParseOptions (see page 26117)	Returns the value of the ParseOptions property.
	GetProducerTemplateFileName (see page 26599)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 26599)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.
	GetPrologNode (see page 26117)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 26118)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 26118)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 26118)	Returns the value of the StandAlone property.
	GetTemplateFileType (see page 26600)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 26600)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetTypeInfo (see page 2779)	Retrieves the type information for an object.
	GetTypeInfoCount (see page 2779)	Returns the number of type information interfaces that an object provides (either 0 or 1).
	GetVersion (see page 26118)	Returns the value of the Version property.
	GetXML (see page 26119)	Returns the value of the XML property.
	GetXMLData (see page 26600)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 26600)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.
	GetXSLData (see page 26601)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 26601)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 26601)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 26601)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 26601)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
	InternalSetPrologValue (see page 26119)	This is InternalSetPrologValue, a member of class TXMLDocument.
	Invoke (see page 2781)	Provides access to Automation properties and methods when the component wraps an Automation object.

	LoadData (see page 26120)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 2782)	Initializes the component after the form file has been read into memory.
V	Loaded (see page 26120)	Initializes the component after the form file has been read into memory.
V	Notification (see page 2783)	Forwards notification messages to all owned components.
V	Notification (see page 26602)	Forwards notification messages to all owned components.
	PaletteCreated (see page 2783)	Responds when the component is created from the component palette.
	ProduceContent (see page 26602)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 26602)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.
	ProduceContentFromString (see page 26603)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.
V	QueryInterface (see page 2784)	Returns a reference to a specified interface if the object supports that interface.
	ReadDOMVendor (see page 26123)	This is ReadDOMVendor, a member of class TXMLDocument.
V	ReadState (see page 2784)	This is ReadState, a member of class TComponent.
	ReleaseDoc (see page 26124)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 26126)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 26127)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 26127)	Sets the value of the Active property.
	SetAncestor (see page 2787)	This is SetAncestor, a member of class TComponent.
	SetAppDispatcher (see page 26603)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.
	SetChildOrder (see page 2788)	This is SetChildOrder, a member of class TComponent.
	SetDesigning (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDesignInstance (see page 2788)	Ensures that components inserted at design time have their design-mode flag set.
	SetDocumentElement (see page 26127)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 26128)	Sets the value of the DOMDocument property.
	SetEncoding (see page 26128)	Sets the value of the Encoding property.
	SetFileName (see page 26128)	Sets the value of the FileName property.
	SetInline (see page 2789)	Sets the csInline bit of the component's ComponentState (see page 2804) property
	SetModified (see page 26129)	This is SetModified, a member of class TXMLDocument.
V	SetName (see page 2789)	Sets the value of the Name (see page 2805) property.
	SetNodeIndentStr (see page 26129)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 26129)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 26130)	Sets the value of the Options property.
	SetParentComponent (see page 2790)	This is SetParentComponent, a member of class TComponent.
	SetParseOptions (see page 26130)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 26130)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 26130)	Sets the value of the StandAlone property.
	SetVersion (see page 26131)	Sets the value of the Version property.
	SetXML (see page 26131)	Sets the value of the XML property.
	SetXMLStrings (see page 26131)	This is SetXMLStrings, a member of class TXMLDocument.
	Updated (see page 2791)	Clears the csUpdating state in the component's ComponentState (see page 2804) property when the component finishes updating.
V	UpdateRegistry (see page 2791)	Provides the interface for a method that adds type library and version information to the Registry (see page 18633) on components that implement COM interfaces.
	Updating (see page 2791)	Sets the csUpdating state in the component's ComponentState (see page 2804) property.
	ValidateContainer (see page 2792)	Determines whether an object can be inserted into a container.
	ValidateInsert (see page 2792)	Provides the interface for a method that validates an child component before it is inserted.
V	ValidateRename (see page 2792)	Ensures that renaming an owned component does not create name conflict.
	WriteDOMVendor (see page 26132)	This is WriteDOMVendor, a member of class TXMLDocument.
V	WriteState (see page 2793)	This is WriteState, a member of class TComponent.
	XMLStringsChanging (see page 26132)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 26135)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 26135)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 26137)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 26137)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 26142)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 22397)	Increments the reference count for this interface.
	_Release (see page 22397)	Decrements the reference count for this interface.
	AddChild (see page 26107)	This is the overview for the AddChild method overload.
	AddChild (see page 26385)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
V	AfterConstruction (see page 26107)	Responds after the last constructor has executed.
V	Assign (see page 2930)	Copies the contents of another, similar object.
V	BeforeDestruction (see page 2770)	Performs any necessary actions before the first destructor is called.
V	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
V	Content (see page 26597)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property.
V	ContentFromStream (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 26598)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.
V	ContentFromWideString (see page 26599)	Returns the transformed value of the XML supplied by the XMLData (see page 26605) property using a specified XSL template.
V	Create (see page 2766)	Allocates memory and constructs a safely initialized instance of a component.
	Create (see page 22287)	Constructs an object and initializes its data before the object is first used.
	Create (see page 26103)	This is the overview for the Create constructor overload.
	CreateElement (see page 26109)	Creates a new element node that is associated with this document.
	CreateElement (see page 26386)	Creates a new element node that is associated with this document.
	CreateNode (see page 26109)	Creates a new node that is associated with this document.
	CreateNode (see page 26387)	Creates a new node that is associated with this document.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 2766)	Disposes of the component and its owned components.
V	Destroy (see page 2929)	Destroys the TPersistent (see page 2928) instance and frees its memory.
V	Destroy (see page 22287)	Disposes of an object instance.
V	Destroy (see page 26104)	Disposes of a TXMLDocument (see page 26097) object.
	DestroyComponents (see page 2771)	Destroys all owned components.
	Destroying (see page 2772)	Indicates that the component and its owned components are about to be destroyed.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	ExecuteAction (see page 2772)	This is ExecuteAction, a member of class TComponent.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FindComponent (see page 2772)	Indicates whether a given component is owned by the component.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	FreeNotification (see page 2775)	Ensures that AComponent is notified that the component is going to be destroyed.
	FreeOnRelease (see page 2776)	Frees the interface reference for components that were created from COM classes.
	GeneratePrefix (see page 26112)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 26388)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 26388)	Returns the value of the Active (see page 26403) property.
	GetAppDispatcher (see page 15220)	This is GetAppDispatcher, a member of class IGetAppDispatcher.
	GetAsyncLoadState (see page 26389)	Returns the value of the AsyncLoadState (see page 26404) property.
	GetChildNodes (see page 26389)	Returns the value of the ChildNodes (see page 26405) property.
	GetComponent (see page 3197)	Returns a reference to the component associated by the implementing class.
	GetDocBinding (see page 26114)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 26389)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 26390)	Returns the value of the DocumentElement (see page 26405) property.
	GetDocumentNode (see page 26390)	Returns the value of the Node (see page 26407) property.
	GetDocumentObject (see page 26229)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 26390)	Returns the value of the DOMDocument (see page 26405) property.
	GetDOMPersist (see page 26229)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 26391)	Returns the value of the Encoding (see page 26406) property.
	GetEnumerator (see page 2777)	Returns a TComponent (see page 2762) enumerator.
	GetFileName (see page 26391)	Returns the value of the FileName (see page 26406) property.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetModified (see page 26391)	Returns the value of the Modified (see page 26407) property.
	GetNamePath (see page 2778)	Returns a string used by the Object Inspector.
	GetNamePath (see page 2932)	Returns the name of the object as it appears in the Object Inspector.
	GetNodeIndentStr (see page 26392)	Returns the value of the NodeIndentStr (see page 26408) property.
	GetOptions (see page 26392)	Returns the value of the Options (see page 26408) property.
	GetParentComponent (see page 2778)	Returns the containing Component.
	GetParseOptions (see page 26392)	Returns the value of the ParseOptions (see page 26409) property.
	GetProducerTemplateFileName (see page 15320)	This is GetProducerTemplateFileName, a member of class IGetProducerTemplate.
	GetProducerTemplateStream (see page 15320)	This is GetProducerTemplateStream, a member of class IGetProducerTemplate.
	GetSchemaRef (see page 26392)	Returns the value of the SchemaRef (see page 26409) property.
	GetStandAlone (see page 26393)	Returns the value of the StandAlone (see page 26410) property.
	GetTemplateFileType (see page 24780)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVersion (see page 26393)	Returns the value of the Version (see page 26410) property.
	GetXML (see page 26393)	Returns the value of the XML (see page 26410) property.
	GetXMLData (see page 24780)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 24780)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 24780)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasParent (see page 2780)	This is HasParent, a member of class TComponent.
	HasScriptView (see page 24780)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 24781)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 24781)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InsertComponent (see page 2780)	Establishes the component as the owner of a specified component.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.

	IsEmptyDoc (see page 26119)	Indicates whether the TXMLDocument (see page 26097) instance represents an empty document.
	IsEmptyDoc (see page 26394)	Indicates whether the IXMLDocument (see page 26382) instance represents an empty document.
	IsImplementorOf (see page 2782)	Indicates whether the component implements a specified interface.
	LoadFromFile (see page 26121)	Loads an XML (see page 26144) document and activates it.
	LoadFromFile (see page 26394)	Loads an XML (see page 26410) document from disk.
	LoadFromStream (see page 26121)	Loads an XML (see page 26144) document from a stream and activates it.
	LoadFromStream (see page 26395)	Loads an XML (see page 26410) document from a stream and activates it.
	LoadFromXML (see page 26122)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 26395)	This is the overview for the LoadFromXML method overload.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	NewInstance (see page 26122)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	ProduceContent (see page 15224)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 15225)	This is ProduceContentFromStream, a member of class IProduceContentFrom.
	ProduceContentFromString (see page 15226)	This is ProduceContentFromString, a member of class IProduceContentFrom.
	QueryInterface (see page 22398)	Returns a reference to a specified interface if the object supports that interface.
	ReferenceInterface (see page 2785)	Establishes or removes internal links that cause this component to be notified when the implementer of a specified interface is destroyed.
	Refresh (see page 26123)	Updates the parsed XML (see page 26144) document to reflect external changes.
	Refresh (see page 26396)	Updates the parsed XML (see page 26410) document to reflect external changes.
	RegisterDocBinding (see page 26124)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 26396)	Registers an implementation class for child nodes with a specified tag name.
	RemoveComponent (see page 2785)	Removes a specified component specified from the component's Components (see page 2799) list.
	RemoveFreeNotification (see page 2787)	Disables destruction notification that was enabled by FreeNotification (see page 2775)
	Resync (see page 26125)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 26397)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 2787)	Handles exceptions in methods declared using the safecall calling convention.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
	SaveToFile (see page 26125)	Saves the XML (see page 26144) document to disk.
	SaveToFile (see page 26397)	Saves the XML (see page 26410) document to disk.
	SaveToStream (see page 26125)	Saves the XML (see page 26144) document to a stream.
	SaveToStream (see page 26398)	Saves the XML (see page 26410) document to a stream.
	SaveToXML (see page 26126)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 26398)	This is the overview for the SaveToXML method overload.
	SetActive (see page 26399)	Sets the value of the Active (see page 26403) property.
	SetAppDispatcher (see page 15227)	This is SetAppDispatcher, a member of class ISetAppDispatcher.
	SetDocumentElement (see page 26399)	Sets the value of the DocumentElement (see page 26405) property.
	SetDOMDocument (see page 26399)	Sets the value of the DOMDocument (see page 26405) property.
	SetEncoding (see page 26400)	Sets the value of the Encoding (see page 26406) property.
	SetFileName (see page 26400)	Sets the value of the FileName (see page 26406) property.
	SetNodeIndentStr (see page 26400)	Sets the value of the NodeIndentStr (see page 26408) property.
	SetOnAsyncLoad (see page 26401)	Supplies an event handler that responds when the AsyncLoadState (see page 26404) property changes.
	SetOptions (see page 26401)	Sets the value of the Options (see page 26408) property.
	SetParseOptions (see page 26402)	Sets the value of the ParseOptions (see page 26409) property.
	SetStandAlone (see page 26402)	Sets the value of the StandAlone (see page 26410) property.
	SetSubComponent (see page 2790)	Identifies whether the component is a subcomponent.

	SetVersion (see page 26402)	Sets the value of the Version (see page 26410) property.
	SetXML (see page 26403)	Sets the value of the XML (see page 26410) property.
	UpdateAction (see page 2790)	This is UpdateAction, a member of class TComponent.

Public Properties

	Name	Description
	Active (see page 26403)	Specifies whether the XML (see page 26410) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 26134)	Indicates the state of the DOM parser when it parses the XML (see page 26144) document asynchronously.
R	AsyncLoadState (see page 26404)	Indicates the state of the DOM parser when it parses the XML (see page 26410) document asynchronously.
R	ChildNodes (see page 26135)	Lists all of the child nodes of the document.
R	ChildNodes (see page 26405)	Lists all of the child nodes of the document.
R	ComObject (see page 2793)	Specifies the interface reference implemented by the component.
R	ComponentCount (see page 2794)	Indicates the number of components owned by the component.
	ComponentIndex (see page 2799)	Indicates the position of the component in its owner's Components (see page 2799) property array.
R	Components (see page 2799)	Lists all components owned by the component.
R	ComponentState (see page 2804)	Describes the current state of the component, indicating when a component needs to avoid certain actions.
R	ComponentStyle (see page 2805)	Governs the behavior of the component.
	DesignInfo (see page 2805)	Contains information used by the Form designer.
R	Dispatcher (see page 26603)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
R	DispatcherComponent (see page 26604)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	DocumentElement (see page 26135)	Provides access to the root node of the XML (see page 26144) document.
	DocumentElement (see page 26405)	Provides access to the root node of the XML (see page 26410) document.
R	DocumentObject (see page 26229)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 26136)	Provides access to the DOM interface for the parsed XML (see page 26144) document.
	DOMDocument (see page 26405)	Provides access to the DOM interface for the parsed XML (see page 26410) document.
	DOMImplementation (see page 26137)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 26230)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 26138)	Indicates the character set that the XML (see page 26144) document uses to encode characters.
	Encoding (see page 26406)	Indicates the character set that the XML (see page 26410) document uses to encode characters.
	FileName (see page 26406)	Indicates the XML (see page 26410) document file, if any, that this interface represents.
R	Modified (see page 26139)	Indicates whether the XML (see page 26144) document has been modified.
R	Modified (see page 26407)	Indicates whether the XML (see page 26410) document has been modified.
R	Node (see page 26140)	Provides access to the document node for the XML (see page 26144) document.
R	Node (see page 26407)	Provides access to the document node for the XML (see page 26410) document.
	NodeIndentStr (see page 26408)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26410) text.
	NSPrefixBase (see page 26141)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 26408)	Influences various aspects of the document's behavior.
R	Owner (see page 2807)	Indicates the component that is responsible for streaming and freeing this component.
	ParseOptions (see page 26409)	Specifies implementation-specific options that are followed when parsing the XML (see page 26410) document.
R	SchemaRef (see page 26142)	Returns the name of the schema associated with this XML (see page 26144) document.

	SchemaRef (see page 26409)	Returns the name of the schema associated with this XML (see page 26410) document.
	StandAlone (see page 26143)	Indicates whether the XML (see page 26144) document includes any external markup declarations.
	StandAlone (see page 26410)	Indicates whether the XML (see page 26410) document includes any external markup declarations.
	VCLComObject (see page 2812)	Represents information used internally by components that support COM.
	Version (see page 26143)	Indicates the XML (see page 26144) version that the document uses.
	Version (see page 26410)	Indicates the XML (see page 26410) version that the document uses.
	XML (see page 26410)	Specifies the content of the XML document associated with this IXMLDocument (see page 26382) interface.

Published Events

	Name	Description
	AfterClose (see page 26144)	Occurs after the XML (see page 26144) document is closed.
	AfterNodeChange (see page 26145)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 26145)	Occurs immediately after the XML (see page 26144) document is opened.
	BeforeClose (see page 26146)	Occurs immediately before the XML (see page 26144) document is closed.
	BeforeNodeChange (see page 26146)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 26147)	Occurs immediately before the XML (see page 26144) document is opened.
	OnAsyncLoad (see page 26147)	Occurs at various stages during the asynchronous parsing of an XML (see page 26144) document.

Published Properties

	Name	Description
	Active (see page 26133)	Specifies whether the XML (see page 26144) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 26137)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 26144) document.
	FileName (see page 26138)	Specifies the file name for the XML (see page 26144) document associated with this TXMLDocument (see page 26097) object.
	Name (see page 2805)	Specifies the name of the component as referenced in code.
	NodeIndentStr (see page 26140)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 26144) text.
	Options (see page 26141)	Influences various aspects of the document's behavior.
	ParseOptions (see page 26142)	Specifies implementation-specific options that are followed when parsing the XML (see page 26144) document.
	Tag (see page 2808)	Stores an integer value as part of a component.
	XML (see page 26144)	Specifies the content of the XML document associated with this TXMLDocument (see page 26097) object.
	XMLData (see page 26613)	Specifies the component that supplies the XML data that this component transforms.

200.1.3.2 TXSLPageProducer Properties

The properties of the TXSLPageProducer class are listed here.

Published Properties

	Name	Description
	XMLData (see page 26613)	Specifies the component that supplies the XML data that this component transforms.

200.1.3.2.1 TXSLPageProducer.XMLData Property

Specifies the component that supplies the XML data that this component transforms.

Pascal

```
property XMLData: TComponent;
```

C++

```
__property TComponent * XMLData;
```

Description

Use the XMLData property to specify the XML data that this component transforms. XMLData must be set to a component that supports either the IXMLDocument interface (for example, TXMLDocument or one of its descendants) or the IGetXMLStream interface (for example, TXMLBroker).

See Also

TXMLDocument (see page 26097)

TXMLBroker (see page 26049)

201 ZLib Namespace

This is namespace ZLib.

Topics

Name	Description
Classes (see page 26617)	The following table lists classes in this documentation.
Functions (see page 26632)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 26637)	The following table lists structs, records, enums in this documentation.
Types (see page 26639)	The following table lists types in this documentation.
Constants (see page 26640)	The following table lists constants in this documentation.

Classes

	Name	Description
	ECompressionError (see page 26617)	This is class ZLib.ECompressionError.
	EDecompressionError (see page 26617)	This is class ZLib.EDecompressionError.
	EZlibError (see page 26618)	This is class ZLib.EZlibError.
	TCompressionStream (see page 26618)	Compresses data as it is written to the stream.
	TCustomZlibStream (see page 26623)	Abstract ancestor class for compression streams.
	TDecompressionStream (see page 26627)	Decompresses data that was written to a TCompressionStream (see page 26618) object.

Constants

Name	Description
Z_ASCII (see page 26640)	This is constant ZLib.Z_ASCII.
Z_BEST_COMPRESSION (see page 26641)	This is constant ZLib.Z_BEST_COMPRESSION.
Z_BEST_SPEED (see page 26641)	This is constant ZLib.Z_BEST_SPEED.
Z_BINARY (see page 26641)	This is constant ZLib.Z_BINARY.
Z_BUF_ERROR (see page 26642)	This is constant ZLib.Z_BUF_ERROR.
Z_DATA_ERROR (see page 26642)	This is constant ZLib.Z_DATA_ERROR.
Z_DEFAULT_COMPRESSION (see page 26642)	This is constant ZLib.Z_DEFAULT_COMPRESSION.
Z_DEFAULT_STRATEGY (see page 26643)	This is constant ZLib.Z_DEFAULT_STRATEGY.
Z_DEFLATED (see page 26643)	This is constant ZLib.Z_DEFLATED.
Z_ERRNO (see page 26643)	This is constant ZLib.Z_ERRNO.
Z_FILTERED (see page 26644)	This is constant ZLib.Z_FILTERED.
Z_FINISH (see page 26644)	This is constant ZLib.Z_FINISH.
Z_FULL_FLUSH (see page 26644)	This is constant ZLib.Z_FULL_FLUSH.

Z_HUFFMAN_ONLY (see page 26645)	This is constant ZLib.Z_HUFFMAN_ONLY.
Z_MEM_ERROR (see page 26645)	This is constant ZLib.Z_MEM_ERROR.
Z_NEED_DICT (see page 26645)	This is constant ZLib.Z_NEED_DICT.
Z_NO_COMPRESSION (see page 26646)	This is constant ZLib.Z_NO_COMPRESSION.
Z_NO_FLUSH (see page 26646)	This is constant ZLib.Z_NO_FLUSH.
Z_OK (see page 26646)	This is constant ZLib.Z_OK.
Z_PARTIAL_FLUSH (see page 26647)	This is constant ZLib.Z_PARTIAL_FLUSH.
Z_STREAM_END (see page 26647)	This is constant ZLib.Z_STREAM_END.
Z_STREAM_ERROR (see page 26647)	This is constant ZLib.Z_STREAM_ERROR.
Z_SYNC_FLUSH (see page 26648)	This is constant ZLib.Z_SYNC_FLUSH.
Z_UNKNOWN (see page 26648)	This is constant ZLib.Z_UNKNOWN.
Z_VERSION_ERROR (see page 26648)	This is constant ZLib.Z_VERSION_ERROR.
zlib_Version (see page 26649)	This is constant ZLib.zlib_Version.

Functions

	Name	Description
	CompressBuf (see page 26632)	This is function ZLib.CompressBuf.
	DecompressBuf (see page 26632)	This is function ZLib.DecompressBuf.
	DecompressToUserBuf (see page 26633)	This is function ZLib.DecompressToUserBuf.
	deflate (see page 26633)	This is function ZLib.deflate.
	deflateEnd (see page 26633)	This is function ZLib.deflateEnd.
	deflateInit_ (see page 26634)	This is function ZLib.deflateInit_.
	inflate (see page 26634)	This is function ZLib.inflate.
	inflateEnd (see page 26634)	This is function ZLib.inflateEnd.
	inflateInit_ (see page 26635)	This is function ZLib.inflateInit_.
	inflateReset (see page 26635)	This is function ZLib.inflateReset.
	zlibAllocMem (see page 26635)	This is function ZLib.zlibAllocMem.
	zlibFreeMem (see page 26636)	This is function ZLib.zlibFreeMem.

Structs, Records, Enums

	Name	Description
	TCompressionLevel (see page 26637)	TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.
	TZStreamRec (see page 26638)	This is record ZLib.TZStreamRec.

Types

Name	Description
TAlloc (see page 26639)	This is type ZLib.TAlloc.
TFree (see page 26639)	This is type ZLib.TFree.

201.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ECompressionError (see page 26617)	This is class ZLib.ECompressionError.
	EDecompressionError (see page 26617)	This is class ZLib.EDecompressionError.
	EZlibError (see page 26618)	This is class ZLib.EZlibError.
	TCompressionStream (see page 26618)	Compresses data as it is written to the stream.
	TCustomZlibStream (see page 26623)	Abstract ancestor class for compression streams.
	TDecompressionStream (see page 26627)	Decompresses data that was written to a TCompressionStream (see page 26618) object.

201.1.1 ECompressionError Class

Class Hierarchy

Pascal

```
ECompressionError = class(EZlibError);
```

C++

```
class ECompressionError : public EZlibError;
```

File

ZLib

Description

This is class ZLib.ECompressionError.

201.1.2 EDecompressionError Class

Class Hierarchy

Pascal

```
EDecompressionError = class(EZlibError);
```

C++

```
class EDecompressionError : public EZlibError;
```

File

ZLib

Description

This is class ZLib.EDecompressionError.

201.1.3 EZlibError Class

Class Hierarchy

Pascal

```
EZlibError = class(Exception);
```

C++

```
class EZlibError : public Exception;
```

File

ZLib

Description

This is class ZLib.EZlibError.

201.1.4 TCompressionStream Class

Compresses data as it is written to the stream.

Class Hierarchy

Pascal

```
TCompressionStream = class(TCustomZlibStream);
```

C++

```
class TCompressionStream : public TCustomZlibStream;
```

File

ZLib

Description

TCompressionStream is a write-only, sequential access stream that compresses data as it is written. The compressed data is written to a separate stream, which is passed to the TCompressionStream constructor. TCompressionStream does not take ownership of the output stream; you are responsible for creating, initializing, and destroying the stream when it is no longer needed.

Reading from a TCompressionStream object will raise an exception of type ECompressionError (see page 26617), with the message string set to "Invalid Stream Operation." Similarly, a Seek (see page 26621) operation causes an ECompressionError (see page 26617) exception, however, you can perform a Seek (see page 26621) operation with a zero offset from the current position. This will return the number of raw, uncompressed bytes that have been written to the stream.

You set the compression level to be used when you create the stream object. The possible compression levels are: clNone,

clFastest, clDefault, and clMax.

When the stream's output buffer is filled, a Write (see page 26622) operation on TCompressionStream will write the contents of the buffer to the output stream, and then call the OnProgress (see page 26623) event. You can use the OnProgress (see page 26623) event to update a user interface control such as a progress indicator.

See Also

TCustomZlibStream (see page 26623)

TDecompressionStream (see page 26627)

TStream (see page 2973)

201.1.4.1 TCompressionStream Members

The following tables list the members exposed by TCompressionStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	Progress (see page 26626)	Calls the OnProgress (see page 26626) method, if assigned.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Events

	Name	Description
	OnProgress (see page 26623)	Occurs after the stream's output buffer has been written.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 26620)	Creates and initializes an instance of a TCompressionStream (see page 26618) object.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 26620)	Destroys the TCompressionStream (see page 26618) object.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Read (see page 26621)	Raises an exception of type ECompressionError (see page 26617).
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Seek (see page 26621)	Raises an exception of type ECompressionErrror.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	Write (see page 26622)	Writes compressed data to the destination output stream.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
R	CompressionRate (see page 26622)	Returns the percentage by which the data has been compressed.
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

201.1.4.2 TCompressionStream.Create Constructor

Creates and initializes an instance of a TCompressionStream (see page 26618) object.

Pascal

```
constructor Create(CompressionLevel: TCompressionLevel; Dest: TStream);
```

C++

```
__fastcall TCompressionStream(TCompressionLevel CompressionLevel, TStream Dest);
```

Description

Call Create to instantiate a TCompressionStream (see page 26618) object.

The CompressionLevel parameter determines the type of compression algorithm to be used, and must be one of the following: clNone, clFastest, clDefault, or clMax.

The Dest parameter is a TStream object; compressed data will be written to this stream.

201.1.4.3 TCompressionStream.Destroy Destructor

Destroys the TCompressionStream (see page 26618) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCompressionStream();
```

Description

Do not call the Destroy method directly. Instead, use the Free method, as this will check the validity of the object before calling Destroy.

All data in the TCompressionStream (see page 26618)'s cache is flushed to the output stream when the object is destroyed.

201.1.4.4 TCompressionStream Methods

The methods of the TCompressionStream class are listed here.

Public Methods

	Name	Description
	Read (see page 26621)	Raises an exception of type ECompressionError (see page 26617).
	Seek (see page 26621)	Raises an exception of type ECompressionErrror.
	Write (see page 26622)	Writes compressed data to the destination output stream.

201.1.4.4.1 TCompressionStream.Read Method

Raises an exception of type ECompressionError (see page 26617).

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

Read operations are not permitted on a TCompressionStream (see page 26618) object. If a Read is attempted, an exception of type ECompressionError (see page 26617) will be raised, with the message string "Invalid Stream Operation."

See Also

Write (see page 26622)

Seek (see page 26621)

Read (see page 2982)

201.1.4.4.2 TCompressionStream.Seek Method

Raises an exception of type ECompressionErrror.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

A TCompressionStream (see page 26618) is a write-only, sequential access data stream. Read (see page 26621) operations are not permitted, and will raise an exception of type ECompressionError (see page 26617). Similarly, Seek

operations will also raise an ECompressionError (see page 26617), with the message string "Invalid Stream Operation."

However, you can call the Seek method with an offset of zero, and the Origin set to soFromCurrent. In this special case, the Seek method will return the number of raw (uncompressed) bytes that have been written to the stream so far.

See Also

Read (see page 26621)

Write (see page 26622)

Seek (see page 2988)

201.1.4.4.3 TCompressionStream.Write Method

Writes compressed data to the destination output stream.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

The Write method causes the data in the supplied buffer to be written the output stream. Buffer contains the raw (uncompressed) data to be written, and Count contains the number of bytes to write.

The TCompressionStream (see page 26618) object caches data internally; data is flushed to the output stream when the cache becomes full, and when the object is destroyed (if pending data remains in the cache).

After data is written to the output stream, the OnProgress (see page 26623) event is called. This gives you an opportunity to update a user interface control such as a progress indicator.

The result of the Write method is the number of bytes transferred from the buffer

See Also

Read (see page 26621)

Seek (see page 26621)

Write (see page 2989)

201.1.4.5 TCompressionStream Properties

The properties of the TCompressionStream class are listed here.

Public Properties

	Name	Description
R	CompressionRate (see page 26622)	Returns the percentage by which the data has been compressed.

201.1.4.5.1 TCompressionStream.CompressionRate Property

Returns the percentage by which the data has been compressed.

Pascal

```
property CompressionRate: Single;
```

C++

```
__property Single CompressionRate;
```

Description

The compression rate is a read-only property. Its value is calculated and updated as data is written to the stream. For example, if a total of 100 raw (uncompressed) bytes have been written to the stream, and only 25 compressed bytes have been written out, then reading the CompressionRate property will return a value of 75.

201.1.4.6 TCompressionStream Events

The events of the TCompressionStream class are listed here.

Public Events

	Name	Description
	OnProgress (see page 26623)	Occurs after the stream's output buffer has been written.

201.1.4.6.1 TCompressionStream.OnProgress Event

Occurs after the stream's output buffer has been written.

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

The OnProgress event is automatically called from a Write (see page 26622) operation, after the object's internal buffer has been filled and written to the output stream.

The OnProgress event is of type TNotifierEvent. When your procedure is called, the Sender parameter will be set to the object itself. You can use the OnProgress event to update a user interface control, such as a progress indicator. You can use the Position property, inherited from TStream, to determine the number of raw (uncompressed) bytes written to the output stream so far.

201.1.5 TCustomZlibStream Class

Abstract ancestor class for compression streams.

Class Hierarchy

Pascal

```
TCustomZlibStream = class(TStream);
```

C++

```
class TCustomZlibStream : public TStream;
```

File

ZLib

Description

TCustomZlibStream is an abstract class, which forms the base for TCompressionStream (see page 26618) and TDecompressionStream (see page 26627). Since it is an abstract class, instances of TCustomZlibStream cannot be directly instantiated. TCustomZlibStream serves as the starting point for your own custom data compression streams.

See Also

TCompressionStream (see page 26618)

TDecompressionStream (see page 26627)

TStream (see page 2973)

201.1.5.1 TCustomZlibStream Members

The following tables list the members exposed by TCustomZlibStream.

Protected Events

	Name	Description
	OnProgress (see page 26626)	Occurs when reading or writing a large block of data in a single call.

Protected Methods

	Name	Description
	Create (see page 26625)	Initializes an instance of a TCustomZlibStream (see page 26623)-derived object.
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	Progress (see page 26626)	Calls the OnProgress (see page 26626) method, if assigned.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
	Destroy (see page 22287)	Disposes of an object instance.
	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.

	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
A	Read (see page 2982)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
A	Write (see page 2989)	Introduces a pure virtual method for writing to the stream.
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

201.1.5.2 TCustomZlibStream.Create Constructor

Initializes an instance of a TCustomZlibStream (see page 26623)-derived object.

Pascal

```
constructor Create(Strm: TStream);
```

C++

```
__fastcall TCustomZlibStream(TStream Strm);
```

Description

TCustomZlibStream (see page 26623) is intended to be an abstract base class for your own custom data compression streams. Its constructor is protected; therefore you cannot directly instantiate an instance of this class.

A concrete class derived from TCustomZlibStream (see page 26623) should, in its own public constructor, call the constructor inherited from TCustomZlibStream (see page 26623).

201.1.5.3 TCustomZlibStream Methods

The methods of the TCustomZlibStream class are listed here.

Protected Methods

	Name	Description
	Progress (see page 26626)	Calls the OnProgress (see page 26626) method, if assigned.

201.1.5.3.1 TCustomZlibStream.Progress Method

Calls the OnProgress (see page 26626) method, if assigned.

Pascal

```
procedure Progress(Sender: TObject); dynamic;
```

C++

```
__fastcall Progress(TObject * Sender);
```

Description

Derived compression stream classes should call the Progress method when reading or writing a large block of data in a single call. This gives the derived class an opportunity to update a user interface control such as a progress indicator.

See Also

OnProgress (see page 26623)

OnProgress (see page 26631)

201.1.5.4 TCustomZlibStream Events

The events of the TCustomZlibStream class are listed here.

Protected Events

	Name	Description
	OnProgress (see page 26626)	Occurs when reading or writing a large block of data in a single call.

201.1.5.4.1 TCustomZlibStream.OnProgress Event

Occurs when reading or writing a large block of data in a single call.

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

Classes (see page 2685) derived from TCustomZlibStream (see page 26623) can use the OnProgress event to perform some action during a long read or write operation.

For example, the TCompressionStream (see page 26618) class calls the OnProgress event handler, after the stream's output buffer has been filled and subsequently written. Similarly, the TDecompressionStream (see page 26627) class calls the OnProgress event handler when its input buffer has been filled and is ready to be decompressed.

See Also

Progress (see page 26626)

OnProgress (see page 26623)

OnProgress (see page 26631)

201.1.6 TDecompressionStream Class

Decompresses data that was written to a TCompressionStream (see page 26618) object.

Class Hierarchy

Pascal

```
TDecompressionStream = class(TCustomZlibStream);
```

C++

```
class TDecompressionStream : public TCustomZlibStream;
```

File

ZLib

Description

TDecompressionStream is the analog of the TCompressionStream (see page 26618) class. It is a read-only, unidirectional stream; you can seek forward in the stream, but not backwards. A separate input stream provides the source data. The input stream will be a stream that was previously written to using a TCompressionStream (see page 26618) object. The input stream is passed to the constructor, however, TDecompressionStream does not take ownership of this object. You are responsible for creating, initializing, and destroying the input stream when it is no longer needed.

Writing to the stream will raise an exception, as will requesting the size of the stream, and attempting to perform a Seek (see page 26630) operation backwards or relative to the current position.

The TDecompressionStream object's OnProgress (see page 26631) event is called when a block of data is read from the input stream. You can read the TDecompressionStream object's Position property to determine the number of raw, uncompressed bytes that have been read from the input stream so far.

201.1.6.1 TDecompressionStream Members

The following tables list the members exposed by TDecompressionStream.

Protected Methods

	Name	Description
	GetSize (see page 2982)	This is GetSize, a member of class TStream.
	Progress (see page 26626)	Calls the OnProgress (see page 26626) method, if assigned.
	SetSize (see page 2989)	This is the overview for the SetSize method overload.

Public Events

	Name	Description
	OnProgress (see page 26631)	Occurs after a block of data has been read from the input stream.

Public Methods

	Name	Description
	AfterConstruction (see page 22289)	Responds after the last constructor has executed.
	BeforeDestruction (see page 22289)	Responds before the first destructor executes.
	ClassInfo (see page 22290)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 22290)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 22293)	Determines whether an object is of a specific type.
	ClassParent (see page 22293)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 22295)	Returns the class reference for the object's class.
	CleanupInstance (see page 22298)	Performs finalization on long strings, variants, and interface variables within a class.
	CopyFrom (see page 2979)	Copies a specified number of bytes from one stream to another.
	Create (see page 26628)	Creates and initializes an instance of a TDecompressionStream (see page 26627) object.
V	DefaultHandler (see page 22299)	Provides the interface for a method that processes message records.
V	Destroy (see page 26629)	Destroys the TDecompressionStream (see page 26627) object.
V	Dispatch (see page 22299)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	FieldAddress (see page 22299)	Returns the address of a published object field.
	FixupResourceHeader (see page 2981)	Patches the resource header for a resource that has been written to the stream.
	Free (see page 22300)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 22303)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 22306) method.
	GetInterface (see page 22303)	Retrieves a specified interface.
	GetInterfaceEntry (see page 22304)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 22304)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 22305)	Determines the relationship of two object types.
	InitInstance (see page 22305)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 22306)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 22306)	This is MethodAddress, a member of class TObject.
	MethodName (see page 22306)	This is MethodName, a member of class TObject.
V	NewInstance (see page 22306)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	Read (see page 26629)	Reads a block of data from the input stream, and decompresses it.
	ReadBuffer (see page 2983)	Reads bytes from the stream into Buffer.
	ReadComponent (see page 2983)	Initiates streaming of components and their properties.
	ReadComponentRes (see page 2987)	Reads components and their properties from a stream in a resource file format.
	ReadResHeader (see page 2987)	Reads a resource-file header from the stream.
V	SafeCallException (see page 22307)	Handles exceptions in methods declared using the safecall calling convention.
V	Seek (see page 26630)	Resets the input stream, or moves the position forward.
V	Seek (see page 2988)	This is the overview for the Seek method overload.
V	Write (see page 26630)	Raises an exception of type ECompressionError (see page 26617).
	WriteBuffer (see page 2990)	Writes Count bytes from Buffer onto the stream and advances the current position of the stream by Count bytes.
	WriteComponent (see page 2990)	Initiates the writing of components and their properties to a stream.
	WriteComponentRes (see page 2994)	Writes components and their properties to a stream from a resource file format.
	WriteDescendent (see page 2994)	Streams components and their properties in inherited forms.
	WriteDescendentRes (see page 2995)	Streams components and their properties in inherited forms.
	WriteResourceHeader (see page 2995)	Writes a resource-file header to the stream.

Public Properties

	Name	Description
	Position (see page 2996)	Indicates the current offset into the stream for reading and writing.
	Size (see page 2997)	Indicates the size in bytes of the stream.

201.1.6.2 TDecompressionStream.Create Constructor

Creates and initializes an instance of a TDecompressionStream (see page 26627) object.

Pascal

```
constructor Create(Source: TStream);
```

C++

```
__fastcall TDecompressionStream(TStream Source);
```

Description

Call Create to instantiate a TDecompressionStream (see page 26627) object.

The Source parameter is the source input stream, which was previously created with a TCompressionStream (see page 26618) object. Subsequent Read (see page 26629) operations will read data from the Source stream, and decompress the data on the fly.

201.1.6.3 TDecompressionStream.Destroy Destructor

Destroys the TDecompressionStream (see page 26627) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDecompressionStream();
```

Description

Do not call the Destroy method directly. Instead, use the Free method, as this will check the validity of the object before calling Destroy.

If there is data remaining in the object's internal buffer, the input stream position is moved backwards by the number of bytes remaining.

201.1.6.4 TDecompressionStream Methods

The methods of the TDecompressionStream class are listed here.

Public Methods

	Name	Description
	Read (see page 26629)	Reads a block of data from the input stream, and decompresses it.
	Seek (see page 26630)	Resets the input stream, or moves the position forward.
	Write (see page 26630)	Raises an exception of type ECompressionError (see page 26617).

201.1.6.4.1 TDecompressionStream.Read Method

Reads a block of data from the input stream, and decompresses it.

Pascal

```
function Read(var Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( Buffer, Longint Count);
```

Description

The Read method reads a block of data from the input stream, decompresses it, and stores it in the supplied buffer.

The Buffer parameter is the destination for the decompressed data.

Count is size of the destination buffer. The Read operation will end when the destination buffer is full, or when there are no more bytes available to be read from the input stream.

After reading a block of data, the OnProgress (see page 26631) event is fired by the object. This gives you a chance to update a user interface control such as a progress indicator during a long Read operation.

The result of the Read operation is the number of decompressed bytes placed into the destination buffer.

See Also

Write (see page 26630)

Seek (see page 26630)

Read (see page 2982)

201.1.6.4.2 TDecompressionStream.Seek Method

Resets the input stream, or moves the position forward.

Pascal

```
function Seek(Offset: Longint; Origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint Offset, Word Origin);
```

Description

A TDecompressionStream (see page 26627) is a read-only, unidirectional input stream. Write (see page 26630) operations are not permitted, and will raise an exception of type ECompressionError (see page 26617). Seek operations can be used to move the stream position forward, but a Seek operation that attempts to move the position backwards will raise an ECompressionError (see page 26617) exception, with the message string set to "Invalid Stream Operation."

You can call the Seek method with an Offset of zero, and the Origin set to soFromBeginning. This has the effect of resetting the input stream, effectively rewinding the stream back to the beginning.

Otherwise, the Offset parameter must be a positive Longint, and the Origin parameter must be either soFromCurrent, or soFromBeginning. This has the effect of moving the input stream position forward, decompressing data as it goes.

See Also

Read (see page 26629)

Write (see page 26622)

Seek (see page 2988)

201.1.6.4.3 TDecompressionStream.Write Method

Raises an exception of type ECompressionError (see page 26617).

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Write operations are not permitted on a TDecompressionStream (see page 26627) object. If a Write operation is attempted, an exception of type ECompressionError (see page 26617) will be raised, with the message string set to "Invalid Stream Operation."

See Also

Read (see page 26629)

Seek (see page 26630)

Write (see page 2989)

201.1.6.5 TDecompressionStream Events

The events of the TDecompressionStream class are listed here.

Public Events

	Name	Description
	OnProgress (see page 26631)	Occurs after a block of data has been read from the input stream.

201.1.6.5.1 TDecompressionStream.OnProgress Event

Occurs after a block of data has been read from the input stream.

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

The OnProgress event is automatically called from a Read (see page 26629) operation. The event occurs after a block of data has been read from the input stream, and before the data has been decompressed.

The OnProgress event is of type TNotifierEvent. When your procedure is called, the Sender parameter will be set to the object itself. You can use the OnProgress event to update a user interface control, such as a progress indicator. You can use the Position property, inherited from TStream, to determine the number of raw (uncompressed) bytes read from the input stream so far.

201.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CompressBuf (see page 26632)	This is function ZLib.CompressBuf.
	DecompressBuf (see page 26632)	This is function ZLib.DecompressBuf.
	DecompressToUserBuf (see page 26633)	This is function ZLib.DecompressToUserBuf.
	deflate (see page 26633)	This is function ZLib.deflate.
	deflateEnd (see page 26633)	This is function ZLib.deflateEnd.
	deflateInit_ (see page 26634)	This is function ZLib.deflateInit_.
	inflate (see page 26634)	This is function ZLib.inflate.
	inflateEnd (see page 26634)	This is function ZLib.inflateEnd.
	inflateInit_ (see page 26635)	This is function ZLib.inflateInit_.
	inflateReset (see page 26635)	This is function ZLib.inflateReset.
	zlibAllocMem (see page 26635)	This is function ZLib.zlibAllocMem.
	zlibFreeMem (see page 26636)	This is function ZLib.zlibFreeMem.

201.2.1 ZLib.CompressBuf Function

Pascal

```
procedure CompressBuf(const InBuf: Pointer; InBytes: Integer; out OutBuf: Pointer; out
OutBytes: Integer);
```

C++

```
CompressBuf(const void * InBuf, int InBytes, void * OutBuf, int OutBytes);
```

File

ZLib

Description

This is function ZLib.CompressBuf.

201.2.2 ZLib.DecompressBuf Function

Pascal

```
procedure DecompressBuf(const InBuf: Pointer; InBytes: Integer; OutEstimate: Integer; out
OutBuf: Pointer; out OutBytes: Integer);
```

C++

```
DecompressBuf(const void * InBuf, int InBytes, int OutEstimate, void * OutBuf, int OutBytes);
```

File

ZLib

Description

This is function ZLib.DecompressBuf.

201.2.3 ZLib.DecompressToUserBuf Function

Pascal

```
procedure DecompressToUserBuf(const InBuf: Pointer; InBytes: Integer; const OutBuf: Pointer;
BufSize: Integer);
```

C++

```
DecompressToUserBuf(const void * InBuf, int InBytes, const void * OutBuf, int BufSize);
```

File

ZLib

Description

This is function ZLib.DecompressToUserBuf.

201.2.4 ZLib.deflate Function

Pascal

```
function deflate(var strm: TZStreamRec; flush: Integer): Integer;
```

C++

```
int deflate(TZStreamRec strm, int flush);
```

File

ZLib

Description

This is function ZLib.deflate.

201.2.5 ZLib.deflateEnd Function

Pascal

```
function deflateEnd(var strm: TZStreamRec): Integer;
```

C++

```
int deflateEnd(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.deflateEnd.

201.2.6 ZLib.deflateInit_ Function

Pascal

```
function deflateInit_(var strm: TZStreamRec; level: Integer; version: PChar; recsize:
Integer): Integer;
```

C++

```
int deflateInit_(TZStreamRec strm, int level, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.deflateInit_.

201.2.7 ZLib.inflate Function

Pascal

```
function inflate(var strm: TZStreamRec; flush: Integer): Integer;
```

C++

```
int inflate(TZStreamRec strm, int flush);
```

File

ZLib

Description

This is function ZLib.inflate.

201.2.8 ZLib.inflateEnd Function

Pascal

```
function inflateEnd(var strm: TZStreamRec): Integer;
```

C++

```
int inflateEnd(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.inflateEnd.

201.2.9 ZLib.inflateInit_ Function

Pascal

```
function inflateInit_(var strm: TZStreamRec; version: PChar; recsize: Integer): Integer;
```

C++

```
int inflateInit_(TZStreamRec strm, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.inflateInit_.

201.2.10 ZLib.inflateReset Function

Pascal

```
function inflateReset(var strm: TZStreamRec): Integer;
```

C++

```
int inflateReset(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.inflateReset.

201.2.11 ZLib.zlibAllocMem Function

Pascal

```
function zlibAllocMem(AppData: Pointer; Items: Integer; Size: Integer): Pointer;
```

C++

```
void * zlibAllocMem(void * AppData, int Items, int Size);
```

File

ZLib

Description

This is function ZLib.zlibAllocMem.

201.2.12 ZLib.zlibFreeMem Function

Pascal

```
procedure zlibFreeMem(AppData: Pointer; Block: Pointer);
```

C++

```
zlibFreeMem(void * AppData, void * Block);
```

File

ZLib

Description

This is function ZLib.zlibFreeMem.

201.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCompressionLevel (see page 26637)	TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.

Records

	Name	Description
	TZStreamRec (see page 26638)	This is record ZLib.TZStreamRec.

201.3.1 ZLib.TCompressionLevel Enumeration

TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.

Pascal

```
TCompressionLevel = (
  clNone,
  clFastest,
  clDefault,
  clMax
);
```

C++

```
enum TCompressionLevel {
  clNone,
  clFastest,
  clDefault,
  clMax
};
```

File

ZLib

Description

The following table lists the possible values:

Value	Meaning
clNone	Specifies no compression; data is merely copied to the output stream.
clFastest	Specifies fastest compression, resulting in a larger archive.
clDefault	Compromise between speed and amount of compression.
clMax	Specifies maximum compression, resulting in a longer time to perform the operation.

See Also

TCustomZlibStream (see page 26623)

TDecompressionStream (see page 26627)

TCompressionStream (see page 26618)

201.3.2 ZLib.TZStreamRec Record

Pascal

```
TZStreamRec = packed record
  next_in: PChar;
  avail_in: Integer;
  total_in: Integer;
  next_out: PChar;
  avail_out: Integer;
  total_out: Integer;
  msg: PChar;
  internal: Pointer;
  zalloc: TAlloc;
  zfree: TFree;
  AppData: Pointer;
  data_type: Integer;
  adler: Integer;
  reserved: Integer;
end;
```

C++

```
struct TZStreamRec {
  const char * next_in;
  int avail_in;
  int total_in;
  const char * next_out;
  int avail_out;
  int total_out;
  const char * msg;
  void * internal;
  TAlloc zalloc;
  TFree zfree;
  void * AppData;
  int data_type;
  int adler;
  int reserved;
};
```

File

ZLib

Description

This is record ZLib.TZStreamRec.

201.4 Types

The following table lists types in this documentation.

Types

Name	Description
TAlloc (see page 26639)	This is type ZLib.TAlloc.
TFree (see page 26639)	This is type ZLib.TFree.

201.4.1 ZLib.TAlloc Type

Pascal

```
TAlloc = function (AppData: Pointer; Items, Size: Integer): Pointer;
```

C++

```
(AppData: Pointer; Items, Size: Integer): Pointer ( TAlloc)();
```

File

ZLib

Description

This is type ZLib.TAlloc.

201.4.2 ZLib.TFree Type

Pascal

```
TFree = procedure (AppData, Block: Pointer);
```

C++

```
(AppData, Block: Pointer) ( TFree)();
```

File

ZLib

Description

This is type ZLib.TFree.

201.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Z_ASCII (see page 26640)	This is constant ZLib.Z_ASCII.
Z_BEST_COMPRESSION (see page 26641)	This is constant ZLib.Z_BEST_COMPRESSION.
Z_BEST_SPEED (see page 26641)	This is constant ZLib.Z_BEST_SPEED.
Z_BINARY (see page 26641)	This is constant ZLib.Z_BINARY.
Z_BUF_ERROR (see page 26642)	This is constant ZLib.Z_BUF_ERROR.
Z_DATA_ERROR (see page 26642)	This is constant ZLib.Z_DATA_ERROR.
Z_DEFAULT_COMPRESSION (see page 26642)	This is constant ZLib.Z_DEFAULT_COMPRESSION.
Z_DEFAULT_STRATEGY (see page 26643)	This is constant ZLib.Z_DEFAULT_STRATEGY.
Z_DEFLATED (see page 26643)	This is constant ZLib.Z_DEFLATED.
Z_ERRNO (see page 26643)	This is constant ZLib.Z_ERRNO.
Z_FILTERED (see page 26644)	This is constant ZLib.Z_FILTERED.
Z_FINISH (see page 26644)	This is constant ZLib.Z_FINISH.
Z_FULL_FLUSH (see page 26644)	This is constant ZLib.Z_FULL_FLUSH.
Z_HUFFMAN_ONLY (see page 26645)	This is constant ZLib.Z_HUFFMAN_ONLY.
Z_MEM_ERROR (see page 26645)	This is constant ZLib.Z_MEM_ERROR.
Z_NEED_DICT (see page 26645)	This is constant ZLib.Z_NEED_DICT.
Z_NO_COMPRESSION (see page 26646)	This is constant ZLib.Z_NO_COMPRESSION.
Z_NO_FLUSH (see page 26646)	This is constant ZLib.Z_NO_FLUSH.
Z_OK (see page 26646)	This is constant ZLib.Z_OK.
Z_PARTIAL_FLUSH (see page 26647)	This is constant ZLib.Z_PARTIAL_FLUSH.
Z_STREAM_END (see page 26647)	This is constant ZLib.Z_STREAM_END.
Z_STREAM_ERROR (see page 26647)	This is constant ZLib.Z_STREAM_ERROR.
Z_SYNC_FLUSH (see page 26648)	This is constant ZLib.Z_SYNC_FLUSH.
Z_UNKNOWN (see page 26648)	This is constant ZLib.Z_UNKNOWN.
Z_VERSION_ERROR (see page 26648)	This is constant ZLib.Z_VERSION_ERROR.
zlib_Version (see page 26649)	This is constant ZLib.zlib_Version.

201.5.1 ZLib.Z_ASCII Constant

Pascal

```
Z_ASCII = 1;
```

C++

```
Z_ASCII = 1;
```

File

ZLib

Description

This is constant ZLib.Z_ASCII.

201.5.2 ZLib.Z_BEST_COMPRESSION Constant

Pascal

```
Z_BEST_COMPRESSION = 9;
```

C++

```
Z_BEST_COMPRESSION = 9;
```

File

ZLib

Description

This is constant ZLib.Z_BEST_COMPRESSION.

201.5.3 ZLib.Z_BEST_SPEED Constant

Pascal

```
Z_BEST_SPEED = 1;
```

C++

```
Z_BEST_SPEED = 1;
```

File

ZLib

Description

This is constant ZLib.Z_BEST_SPEED.

201.5.4 ZLib.Z_BINARY Constant

Pascal

```
Z_BINARY = 0;
```

C++

```
Z_BINARY = 0;
```

File

ZLib

Description

This is constant ZLib.Z_BINARY.

201.5.5 ZLib.Z_BUF_ERROR Constant

Pascal

```
Z_BUF_ERROR = (-5);
```

C++

```
Z_BUF_ERROR = (-5);
```

File

ZLib

Description

This is constant ZLib.Z_BUF_ERROR.

201.5.6 ZLib.Z_DATA_ERROR Constant

Pascal

```
Z_DATA_ERROR = (-3);
```

C++

```
Z_DATA_ERROR = (-3);
```

File

ZLib

Description

This is constant ZLib.Z_DATA_ERROR.

201.5.7 ZLib.Z_DEFAULT_COMPRESSION Constant

Pascal

```
Z_DEFAULT_COMPRESSION = (-1);
```

C++

```
Z_DEFAULT_COMPRESSION = (-1);
```

File

ZLib

Description

This is constant ZLib.Z_DEFAULT_COMPRESSION.

201.5.8 ZLib.Z_DEFAULT_STRATEGY Constant

Pascal

```
Z_DEFAULT_STRATEGY = 0;
```

C++

```
Z_DEFAULT_STRATEGY = 0;
```

File

ZLib

Description

This is constant ZLib.Z_DEFAULT_STRATEGY.

201.5.9 ZLib.Z_DEFLATED Constant

Pascal

```
Z_DEFLATED = 8;
```

C++

```
Z_DEFLATED = 8;
```

File

ZLib

Description

This is constant ZLib.Z_DEFLATED.

201.5.10 ZLib.Z_ERRNO Constant

Pascal

```
Z_ERRNO = (-1);
```

C++

```
Z_ERRNO = (-1);
```

File

ZLib

Description

This is constant ZLib.Z_ERRNO.

201.5.11 ZLib.Z_FILTERED Constant

Pascal

```
Z_FILTERED = 1;
```

C++

```
Z_FILTERED = 1;
```

File

ZLib

Description

This is constant ZLib.Z_FILTERED.

201.5.12 ZLib.Z_FINISH Constant

Pascal

```
Z_FINISH = 4;
```

C++

```
Z_FINISH = 4;
```

File

ZLib

Description

This is constant ZLib.Z_FINISH.

201.5.13 ZLib.Z_FULL_FLUSH Constant

Pascal

```
Z_FULL_FLUSH = 3;
```

C++

```
Z_FULL_FLUSH = 3;
```

File

ZLib

Description

This is constant ZLib.Z_FULL_FLUSH.

201.5.14 ZLib.Z_HUFFMAN_ONLY Constant

Pascal

```
Z_HUFFMAN_ONLY = 2;
```

C++

```
Z_HUFFMAN_ONLY = 2;
```

File

ZLib

Description

This is constant ZLib.Z_HUFFMAN_ONLY.

201.5.15 ZLib.Z_MEM_ERROR Constant

Pascal

```
Z_MEM_ERROR = (-4);
```

C++

```
Z_MEM_ERROR = (-4);
```

File

ZLib

Description

This is constant ZLib.Z_MEM_ERROR.

201.5.16 ZLib.Z_NEED_DICT Constant

Pascal

```
Z_NEED_DICT = 2;
```

C++

```
Z_NEED_DICT = 2;
```

File

ZLib

Description

This is constant ZLib.Z_NEED_DICT.

201.5.17 ZLib.Z_NO_COMPRESSION Constant

Pascal

```
Z_NO_COMPRESSION = 0;
```

C++

```
Z_NO_COMPRESSION = 0;
```

File

ZLib

Description

This is constant ZLib.Z_NO_COMPRESSION.

201.5.18 ZLib.Z_NO_FLUSH Constant

Pascal

```
Z_NO_FLUSH = 0;
```

C++

```
Z_NO_FLUSH = 0;
```

File

ZLib

Description

This is constant ZLib.Z_NO_FLUSH.

201.5.19 ZLib.Z_OK Constant

Pascal

```
Z_OK = 0;
```

C++

```
Z_OK = 0;
```

File

ZLib

Description

This is constant ZLib.Z_OK.

201.5.20 ZLib.Z_PARTIAL_FLUSH Constant

Pascal

```
Z_PARTIAL_FLUSH = 1;
```

C++

```
Z_PARTIAL_FLUSH = 1;
```

File

ZLib

Description

This is constant ZLib.Z_PARTIAL_FLUSH.

201.5.21 ZLib.Z_STREAM_END Constant

Pascal

```
Z_STREAM_END = 1;
```

C++

```
Z_STREAM_END = 1;
```

File

ZLib

Description

This is constant ZLib.Z_STREAM_END.

201.5.22 ZLib.Z_STREAM_ERROR Constant

Pascal

```
Z_STREAM_ERROR = (-2);
```

C++

```
Z_STREAM_ERROR = (-2);
```

File

ZLib

Description

This is constant ZLib.Z_STREAM_ERROR.

201.5.23 ZLib.Z_SYNC_FLUSH Constant

Pascal

```
Z_SYNC_FLUSH = 2;
```

C++

```
Z_SYNC_FLUSH = 2;
```

File

ZLib

Description

This is constant ZLib.Z_SYNC_FLUSH.

201.5.24 ZLib.Z_UNKNOWN Constant

Pascal

```
Z_UNKNOWN = 2;
```

C++

```
Z_UNKNOWN = 2;
```

File

ZLib

Description

This is constant ZLib.Z_UNKNOWN.

201.5.25 ZLib.Z_VERSION_ERROR Constant

Pascal

```
Z_VERSION_ERROR = (-6);
```

C++

```
Z_VERSION_ERROR = (-6);
```

File

ZLib

Description

This is constant ZLib.Z_VERSION_ERROR.

201.5.26 ZLib.zlib_Version Constant

Pascal

```
zlib_Version = '1.0.4';
```

C++

```
zlib_Version = '1.0.4';
```

File

ZLib

Description

This is constant ZLib.zlib_Version.
