QUALITY ASSURED

Our quality system focuses on the continuing high quality of our components and the best possible service for our customers. We have a three-sided quality strategy: we apply a system of total quality control and assurance; we operate customer-oriented dynamic improvement programmes; and we promote a partnering relationship with our customers and suppliers.

PRODUCT SAFETY

In striving for state-of-the-art perfection, we continuously improve components and processes with respect to environmental demands. Our components offer no hazard to the environment in normal use when operated or stored within the limits specified in the data sheet.

Some components unavoidably contain substances that, if exposed by accident or misuse, are potentially hazardous to health. Users of these components are informed of the danger by warning notices in the data sheets supporting the components. Where necessary the warning notices also indicate safety precautions to be taken and disposal instructions to be followed. Obviously users of these components, in general the set-making industry, assume responsibility towards the consumer with respect to safety matters and environmental demands.

All used or obsolete components should be disposed of according to the regulations applying at the disposal location. Depending on the location, electronic components are considered to be 'chemical', 'special' or sometimes 'industrial' waste. Disposal as domestic waste is usually not permitted.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

PREFACE

Dear Customer

We are pleased to introduce this new Philips Semiconductors data handbook SC13. This data book contains a complete overview of the Philips Semiconductor product offering in small-signal, medium and high power MOS transistors for switching applications.

We would like to draw your attention to our extensive range of TrenchMOS products, setting new standards for low $R_{DS(ON)}$ performance and cost-effectiveness. Also of note are

- N- and P-Channel MOS transistors in a wide choice of surface mount and through-hole packages ranging from SOT323 and TSOP6 to SOT429 (TO247) and SO24.
- TOPFET, self protected power MOSFETs
- IGBT's

Notes

1. Data on spice parameters is available on SC13 CD-ROM.
2. Minimum value.
3. Typical values.
4. Dual FET.
5. 4 - FET array.
6. 6 - FET/Schottky array.
7. 7 - FET array.
8. V_{GSth} at I_D = 250 μA instead of 1 mA.

Internet World Wide Web Home Page

WHAT IS IT?

Welcome to our place in cyberspace.

The Discretes Group now has its own home page within Philips Semiconductors. Explore our Web pages and take a look at our product offering of advance Discrete Applications and Products.

In addition we offer you the latest information on Products, News, Support, Employment and Offices.

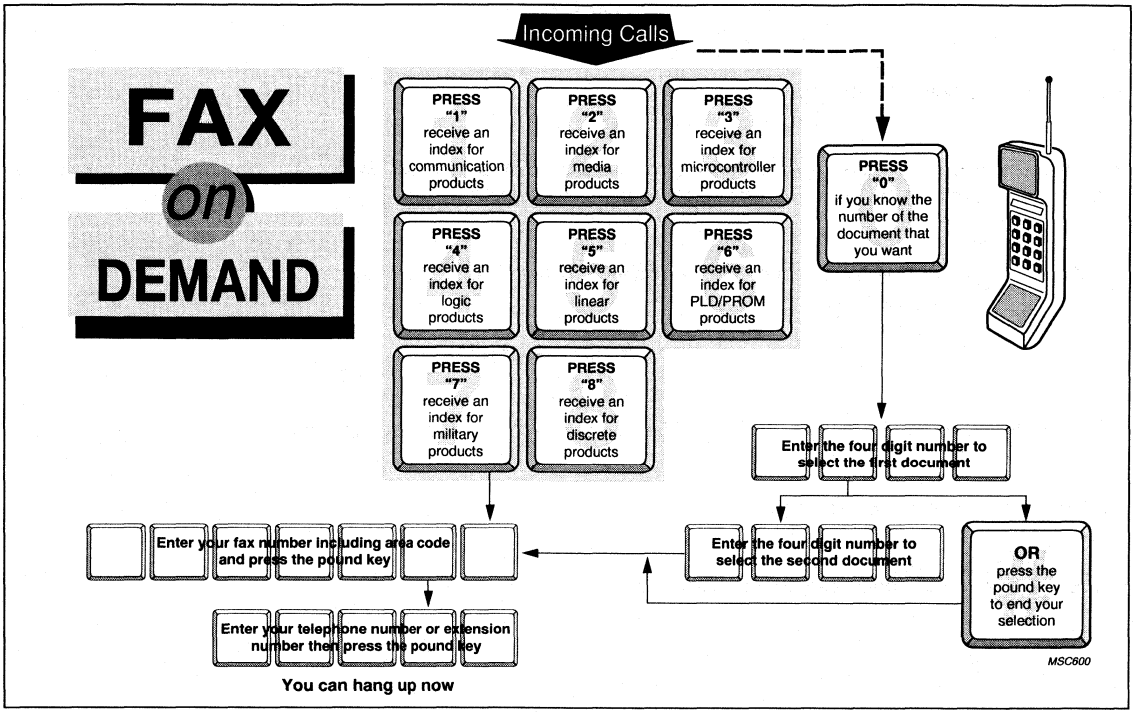
HOW TO REACH US

For access to the Philips Semiconductors Home Page go to the World Wide Web location:

http://www.semiconductors.philips.com

You can find us in the Product category of Discretes.

FAX-on-DEMAND System



WHAT IS IT?

The FAX-on-DEMAND system is a computer facsimile system that allows customers to receive selected documents by fax automatically.

HOW DOES IT WORK?

To order a document, you simply enter the document number. This number can be obtained by asking for an index of available documents to be faxed to you the first time you call the system.

Our system has a selection of the latest product data sheets from Philips with varying page counts. As you know, it takes approximately one minute to FAX one page. This isn't bad if the number of pages is less than 10. But if the document is 37 pages long, be ready for a long transmission!

Philips Semiconductors also maintains product information on the World-Wide-Web. Our home page can be located at:

http://www.semiconductors.philips.com

WHO DO I CONTACT IF I HAVE A QUESTION ABOUT FAX-ON-DEMAND?

Contact your local Philips sales office.

FAX-ON-DEMAND PHONE NUMBERS

United Kingdom, Ireland, Benelux & Scandinavia	44-181-730-5020
North America	1-800-282-2000
Asia/Pacific (Australia, China/HK, India, Indonesia, Japan, Korea, Malaysia, New Zealand, Philippines, Singapore, Taiwan & Thailand)	+852 2811 9173

REPLACED/WITHDRAWN TYPES

TOTAL QUALITY MANAGEMENT

Philips Semiconductors is a Quality Company, renowned for the high quality of our products and service. We keep alive this tradition by constantly aiming towards one ultimate standard, that of zero defects. This aim is guided by our Total Quality Management (TQM) system, the basis of which is described in the following paragraphs.

Quality assurance

Based on ISO 9000 standards, customer standards such as Ford TQE and IBM MDQ. Our factories are certified to ISO 9000 by external inspectorates.

Partnerships with customers

PPM co-operations, design-in agreements, ship-to-stock, just-in-time and self-qualification programmes, and application support.

Partnerships with suppliers

Ship-to-stock, statistical process control and ISO 9000 audits.

Quality improvement programme

Continuous process and system improvement, design improvement, complete use of statistical process control, realization of our final objective of zero defects, and logistics improvement by ship-to-stock and just-in-time agreements.

ADVANCED QUALITY PLANNING

During the design and development of new products and processes, quality is built-in by advanced quality planning. Through failure-mode-and-effect analysis the critical parameters are detected and measures taken to ensure good performance on these parameters. The capability of process steps is also planned in this phase.

PRODUCT CONFORMANCE

The assurance of product conformance is an integral part of our quality assurance (QA) practice. This is achieved by:

- Incoming material management through partnerships with suppliers.
- In-line quality assurance to monitor process reproducibility during manufacture and initiate any necessary corrective action. Critical process steps are 100% under statistical process control.
- Acceptance tests on finished products to verify conformance with the device specification. The test results are used for quality feedback and corrective actions. The inspection and test requirements are detailed in the general quality specifications.
- Periodic inspections to monitor and measure the conformance of products.

PRODUCT RELIABILITY

With the increasing complexity of Original Equipment Manufacturer (OEM) equipment, component reliability must be extremely high. Our research laboratories and development departments study the failure mechanisms of semiconductors. Their studies result in design rules and process optimization for the highest built-in product reliability. Highly accelerated tests are applied to the products reliability evaluation. Rejects from reliability tests and from customer complaints are submitted to failure analysis, to result in corrective action.

CUSTOMER RESPONSES

Our quality improvement depends on joint action with our customer. We need our customer's inputs and we invite constructive comments on all aspects of our performance. Please contact our local sales representative.

RECOGNITION

The high quality of our products and services is demonstrated by many Quality Awards granted by major customers and international organizations.

RATING SYSTEMS

The rating systems described are those recommended by the IEC in its publication number 134.

Definitions of terms used

ELECTRONIC DEVICE

An electronic tube or valve, transistor or other semiconductor device. This definition excludes inductors, capacitors, resistors and similar components.

CHARACTERISTIC

A characteristic is an inherent and measurable property of a device. Such a property may be electrical, mechanical, thermal, hydraulic, electro-magnetic or nuclear, and can be expressed as a value for stated or recognized conditions. A characteristic may also be a set of related values, usually shown in graphical form.

BOGEY ELECTRONIC DEVICE

An electronic device whose characteristics have the published nominal values for the type. A bogey electronic device for any particular application can be obtained by considering only those characteristics that are directly related to the application.

RATING

A value that establishes either a limiting capability or a limiting condition for an electronic device. It is determined for specified values of environment and operation, and may be stated in any suitable terms. Limiting conditions may be either maxima or minima.

RATING SYSTEM

The set of principles upon which ratings are established and which determine their interpretation. The rating system indicates the division of responsibility between the device manufacturer and the circuit designer, with the object of ensuring that the working conditions do not exceed the ratings.

Absolute maximum rating system

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type, as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout the life of the device, no absolute maximum value for the intended service is exceeded with any device, under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

Design maximum rating system

Design maximum ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking responsibility for the effects of changes in operating conditions due to variations in the characteristics of the electronic device under consideration.

The equipment manufacturer should design so that, initially and throughout the life of the device, no design maximum value for the intended service is exceeded with a bogey electronic device, under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, variation in characteristics of all other devices in the equipment, equipment control adjustment, load variation, signal variation and environmental conditions.

Design centre rating system

Design centre ratings are limiting values of operating and environmental conditions applicable to a bogey electronic device of a specified type as defined by its published data, and should not be exceeded under normal conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device in average applications, taking responsibility for normal changes in operating conditions due to rated supply voltage variation, equipment component variation, equipment control adjustment, load variation, signal variation, environmental conditions, and variations in the characteristics of all electronic devices.

The equipment manufacturer should design so that, initially, no design centre value for the intended service is exceeded with a bogey electronic device in equipment operating at the stated normal supply voltage.

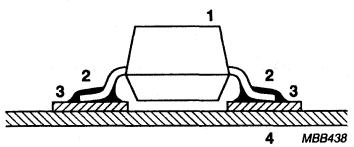
THERMAL CONSIDERATIONS

Thermal resistance

Circuit performance and long-term reliability are affected by the temperature of the transistor die. Normally, both are improved by keeping the die temperature (junction temperature) low.

Electrical power dissipated in any semiconductor device is a source of heat. This increases the temperature of the die about some reference point, normally an ambient temperature of 25 °C in still air. The size of the increase in temperature depends on the amount of power dissipated in the circuit and the net thermal resistance between the heat source and the reference point.

Devices lose most of their heat by conduction when mounted on a a printed board, a substrate or heatsink. Referring to Fig.1 (for surface mounted devices mounted on a substrate), heat conducts from its source (the junction) via the package leads and soldered connections to the substrate. Some heat radiates from the package into the surrounding air where it is dispersed by convection or by forced cooling air. Heat that radiates from the substrate is dispersed in the same way.



Heat radiates from the package '1' to ambient.
Heat conducts via leads '2', solder joints '3' to the substrate '4'.

Fig.1 Heat losses.

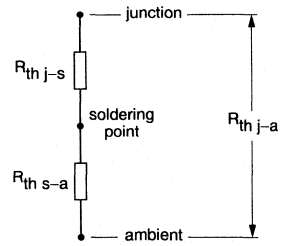


Fig.2 Representation of thermal resistance paths of a device mounted on a substrate or printed circuit board.

The elements of thermal resistance shown in Fig.2 are defined as follows:

$R_{th\ j-mb}$	thermal resistance from junction to mounting base
$R_{th\ j-c}$	thermal resistance from junction to case
$R_{th\ j-s}$	thermal resistance from junction to soldering point
$R_{th\ s-a}$	thermal resistance from soldering point to ambient
$R_{th\ c-a}$	thermal resistance from case to ambient ($R_{th\ s-a}$ and $R_{th\ c-a}$ are the same for most packages)
$R_{th\ j-a}$	thermal resistance from junction to ambient.

The temperature at the junction depends on the ability of the package and its mounting to transfer heat from the junction region to the ambient environment. The basic relationship between junction temperature and power dissipation is:

$$T_{j\ max} = T_{amb} + P_{tot\ max}\ (R_{th\ j-s} + R_{th\ s-a})$$
$$= T_{amb} + P_{tot\ max}\ (R_{th\ j-a})$$

where:

$T_{j\ max}$	is the maximum junction temperature
T_{amb}	is the ambient temperature
$P_{tot\ max}$	is the maximum power handling capability of the device, including the effects of external loads when applicable.

In the expression for $T_{j\ max}$, only T_{amb} and $R_{th\ s-a}$ can be varied by the user. The package mounting technique and the flow of cooling air are factors that affect $R_{th\ s-a}$. The device power dissipation can be controlled to a limited extent but under recommended usage, the supply voltage and circuit loading dictate a fixed power maximum. The $R_{th\ j-s}$ value is essentially independent of external mounting method and cooling air; but is sensitive to the materials used in the package construction, the die bonding method and the die area, all of which are fixed.

Values of $T_{j\ max}$ and $R_{th\ j-s}$, or $R_{th\ j-c}$ or $R_{th\ j-a}$ are given in the device data sheets. For applications where the temperature of the case is stabilized by a large or temperature-controlled heatsink, the junction temperature can be calculated from:

$T_j = T_{case} + P_{tot} \times R_{th\ j-c}$ or, using the soldering point (T_s) definition, from $T_j = T_s + P_{tot} \times R_{th\ j-s}$.

The thermal resistance from soldering point to ambient, and that from case to ambient depends on the substrate or PCB material used. Refer to figures 3 and 4 for R_{th} versus mounting substrate area.

(2) Single-sided, plated.
(3) Double-sided, unplated.
(4) Double-sided, plated.

Fig.3 Thermal resistance ($R_{th\ s\text{-}a}$) as a function of pad area on different configurations of FR4 epoxy fibre-glass circuit board.

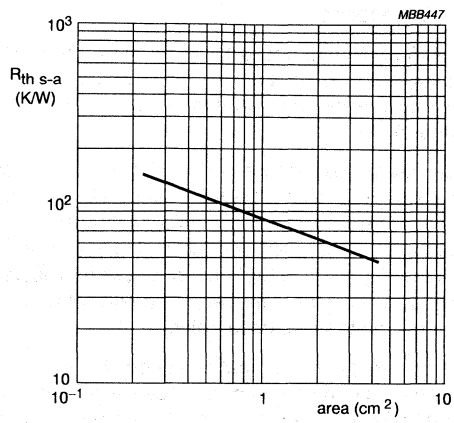

Fig.4 Thermal resistance ($R_{th\ s\text{-}a}$) as a function of area of ceramic substrate.

ELECTROSTATIC CHARGES

Electrostatic charges can exist in many things; for example, man-made-fibre clothing, moving machinery, objects with air blowing across them, plastic storage bins, sheets of paper stored in plastic envelopes, paper from electrostatic copying machines, and people. The charges are caused by friction between two surfaces, at least one of which is non-conductive. The magnitude and polarity of the charges depend on the different affinities for electrons of the two materials rubbing together, the friction force and the humidity of the surrounding air.

Electrostatic discharge is the transfer of an electrostatic charge between bodies at different potentials and occurs with direct contact or when induced by an electrostatic field. All of our MOS devices are internally protected against electrostatic discharge but they **can** be damaged if the following precautions are not taken.

WORK STATION

Figure 5 shows a working area suitable for safely handling electrostatic sensitive devices. It has a work bench, the surface of which is conductive or covered by an antistatic sheet. Typical resistivity for the bench surface is between 1 and 500 kΩ per cm^2. The floor should also be covered with antistatic material. The following precautions should be observed:

- Persons at a work bench should be earthed via a wrist strap and a resistor.
- All mains-powered electrical equipment should be connected via an earth leakage switch.
- Equipment cases should be earthed.
- Relative humidity should be maintained between 50 and 65%.
- An ionizer should be used to neutralize objects with immobile static charges.

RECEIPT AND STORAGE

MOS devices are packed for dispatch in antistatic/conductive containers, usually boxes, tubes or blister tape. The fact that the contents are sensitive to electrostatic discharge is shown by warning labels on both primary and secondary packing.

The devices should be kept in their original packing whilst in storage. If a bulk container is partially unpacked, the unpacking should be performed at a protected work station. Any MOS devices that are stored temporarily should be packed in conductive or antistatic packing or carriers.

ASSEMBLY

MOS devices must be removed from their protective packing with earthed component pincers or short-circuit clips. Short-circuit clips must remain in place during mounting, soldering and cleansing/drying processes. Do not remove more devices from the storage packing than are needed at any one time. Production/assembly documents should state that the product contains electrostatic sensitive devices and that special precautions need to be taken.

During assembly, ensure that the MOS devices are the last of the components to be mounted and that this is done at a protected work station.

All tools used during assembly, including soldering tools and solder baths, must be earthed. All hand tools should be of conductive or antistatic material and, where possible, should not be insulated.

Measuring and testing of completed circuit boards must be done at a protected work station. Place the soldered side of the circuit board on conductive or antistatic foam and remove the short-circuit clips. Remove the circuit board from the foam, holding the board only at the edges. Make sure the circuit board does not touch the conductive surface of the work bench. After testing, replace the circuit board on the conductive foam to await packing.

Assembled circuit boards containing MOS devices should be handled in the same way as unmounted MOS devices. They should also carry warning labels and be packed in conductive or antistatic packing.

l manufacturers of power MOSFETs provide a data ıeet for every type produced. The purpose of the data ıeet is primarily to give an indication as to the capabilities a particular product. It is also useful for the purpose of ılecting device equivalents between different anufacturers. In some cases however data on a number parameters may be quoted under subtly different ınditions by different manufacturers, particularly on ıcond order parameters such as switching times. In ıdition the information contained within the data sheet ıes not always appear relevant for the application. Using ıta sheets and selecting device equivalents therefore quires caution and an understanding of exactly what the ıta means and how it can be interpreted. Throughout is chapter the BUK553-100A is used as an example, is device is a 100 V logic level MOSFET.

ıformation contained in the Philips data sheet

ıe data sheet is divided into 8 sections as follows:

Quick reference data

Limiting values

Thermal resistances

Static characteristics

Dynamic characteristics

Reverse diode limiting values and characteristics

Avalanche limiting value

Graphical data

he information contained within each of these sections now described.

ıuick reference data

his data is presented for the purpose of quick selection. lists what is considered to be the key parameters of the evice such that a designer can decide at a glance 'hether the device is likely to be the correct one for the pplication or not. Five parameters are listed, the two most nportant are the drain-source voltage V_{DS} and rain-source on-state resistance, $R_{DS(ON)}$. V_{DS} is the ıaximum voltage the device will support between drain nd source terminals in the off-state. $R_{DS(ON)}$ is the ıaximum on-state resistance at the quoted gate voltage, $_{GS}$, and a junction temperature of 25 °C. (NB $R_{DS(ON)}$ is ɜmperature dependent, see static characteristics). It is ıese two parameters which provide a first order indication f the devices capability.

ı drain current value (I_D) and a figure for total power lissipation are also given in this section. These figures hould be treated with caution since they are quoted for ɔnditions that are rarely attainable in real applications. See limiting values.) For most applications the usable dc ɔurrent will be less than the quoted figure in the quick eference data. Typical power dissipations that can be ɔlerated by the majority of designers are less than 20 W for discrete devices), depending on the heatsinking ırrangement used. The junction temperature (T_J) is usually given as either 150 °C or 175 °C. It is not recommended that the internal device temperature be allowed to exceed this figure.

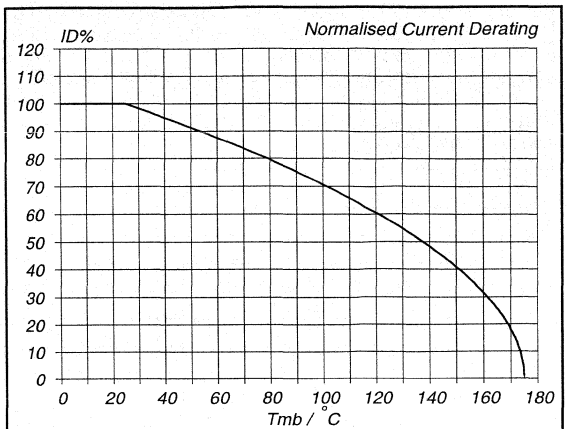

Fig.1 Normalised continuous drain current. ID% = 100 . $I_D/I_{D25\,°C} = f(T_{mb})$; conditions: $V_{GS} \geq 5$ V

Limiting values

This table lists the absolute maximum values of six parameters. The device may be operated right up to these maximum levels however they must not be exceeded, to do so may incur damage to the device.

Drain-source voltage and drain-gate voltage have the same value. The figure given is the maximum voltage that may be applied between the respective terminals. Gate-source voltage, $\pm V_{GS}$, gives the maximum value that may be allowed between the gate and source terminals. To exceed this voltage, even for the shortest period can cause permanent damage to the gate oxide. Two values for the dc drain current, I_D, are quoted, one at a mounting base temperature of 25 °C and one at a mounting base temperature of 100 °C. Again these currents do not represent attainable operating levels. These currents are the values that will cause the junction temperature to reach its maximum value when the mounting base is held at the quoted value. The maximum current rating is therefore a function of the mounting base temperature and the quoted figures are just two points on the derating curve ,see Fig.1.

The third current level quoted is the pulse peak value, I_{DM}. PowerMOS devices generally speaking have a very high peak current handling capability. It is the internal bond wires which connect to the chip that provide the final limitation. The pulse width for which I_{DM} can be applied depends upon the thermal considerations (see section on calculating currents.) The total power dissipation, P_{tot}, and maximum junction temperature are also stated as for the quick reference data. The P_{tot} figure is calculated from the simple quotient given in equation 1 (see section on safe

operating area). It is quoted for the condition where the mounting base temperature is maintained at 25 °C. As an example, for the BUK553-100A the P_{tot} figure is 75 W, dissipating this amount of power while maintaining the mounting base at 25 °C would be a challenge! For higher mounting base temperatures the total power that can be dissipated is less. Obviously if the mounting base temperature was made equal to the max permitted junction temperature, then no power could be dissipated internally. A derating curve is given as part of the graphical data, an example is shown in Fig.2 for a device with a limiting T_j of 175 °C.

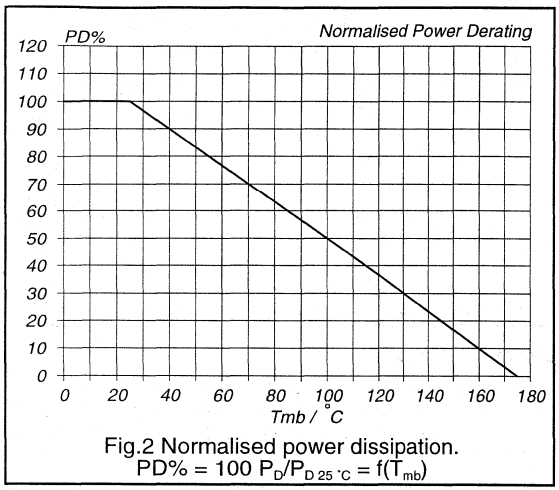

Fig.2 Normalised power dissipation.
PD% = 100 $P_D/P_{D\,25\,°C}$ = f(T_{mb})

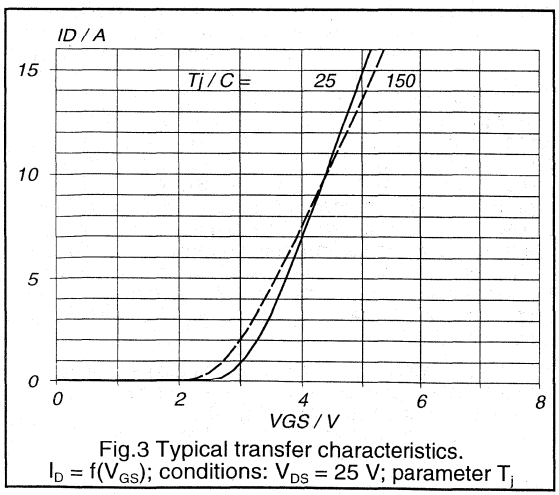

Fig.3 Typical transfer characteristics.
I_D = f(V_{GS}); conditions: V_{DS} = 25 V; parameter T_j

Storage temperature limits are also quoted, usua between -40 /-55 °C and +150 /+175 °C. Both the storag temperature limits and the junction temperature limit a figures at which extensive reliability work is performed l our Quality department. To exceed these figures w cause a reduction in long-term reliability.

Thermal resistance.

For non-isolated packages two thermal resistance valu are given. The value from junction to mounting bas ($R_{thj\text{-}mb}$) indicates how much the junction temperature w be raised above the temperature of the mounting bas when dissipating a given power. Eg a BUK553-100A ha a $R_{thj\text{-}mb}$ of 2 K/W, dissipating 10 W, the junctic temperature will be 20 °C above the temperature of i mounting base. The other figure quoted is from junctic to ambient. This is a much larger figure and indicates ho the junction temperature will rise if the device is NC mounted on a heatsink but operated in free air. Eg for BUK553-100A, $R_{thj\text{-}a}$ = 60 K/W, dissipating 1 W whi mounted in free air will produce a junction temperatu 60 °C above the ambient air temperature.

For isolated packages, (F-packs) the mounting base (th metal plate upon which the silicon chip is mounted) is ful encapsulated in plastic. Therefore it is not possible to giv a thermal resistance figure junction to mounting bas Instead a figure is quoted from junction to heatsink, $R_{thj\text{-}h}$ which assumes the use of heatsink compound. Cai should be taken when comparing thermal resistances isolated and non-isolated types. Consider the followin example:

The non-isolated BUK553-100A has a $R_{thj\text{-}mb}$ of 2 K/W The isolated BUK543-100A has a $R_{thj\text{-}hs}$ of 5 K/W. Thes devices have identical crystals but mounted in differer packages. At first glance the non-isolated type might b expected to offer much higher power (and hence curren handling capability. However for the BUK553-100A th thermal resistance junction to heatsink has to b calculated, this involves adding the extra therm resistance between mounting base and heatsink. Fc most applications some isolation is used, such as a mic washer. The thermal resistance mounting base t heatsink is then of the order 2 K/W. The total therm resistance junction to heatsink is therefore

$R_{thj\text{-}hs}$ (non isolated type) = $R_{thj\text{-}mb}$ + $R_{thmb\text{-}hs}$ = 4 K/W

It can be seen that the real performance differenc between the isolated and non isolated types will not b significant.

Static Characteristics

The parameters in this section characterise breakdow voltage, threshold voltage, leakage currents an on-resistance.

A drain-source breakdown voltage is specified as greate than the limiting value of drain-source voltage. It can b measured on a curve tracer, with gate terminal shorte to the source terminal, it is the voltage at which a drai current of 250 μA is observed. Gate threshold voltage $V_{GS(TO)}$, indicates the voltage required on the gate (wit

espect to the source) to bring the device into its onducting state. For logic level devices this is usually etween 1.0 and 2.0 V and for standard devices between .1 and 4 V.

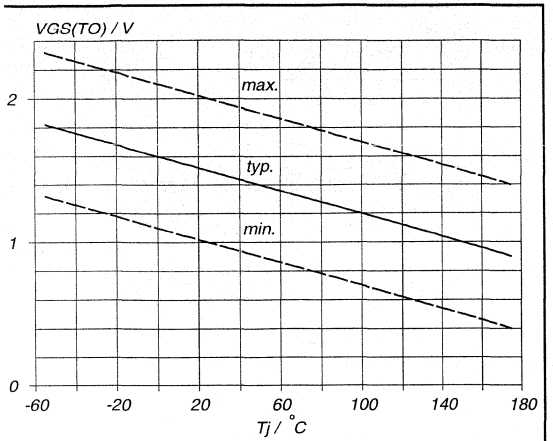

Fig.4 Gate threshold voltage.
$V_{GS(TO)} = f(T_j)$; conditions: I_D = 1 mA; $V_{DS} = V_{GS}$

Useful plots in the graphical data are the typical transfer characteristics (Fig.3) showing drain current as a function of V_{GS} and the gate threshold voltage variation with unction temperature (Fig.4). An additional plot also provided is the sub-threshold conduction, showing how he drain current varies with gate-source voltage below he threshold level (Fig.5).

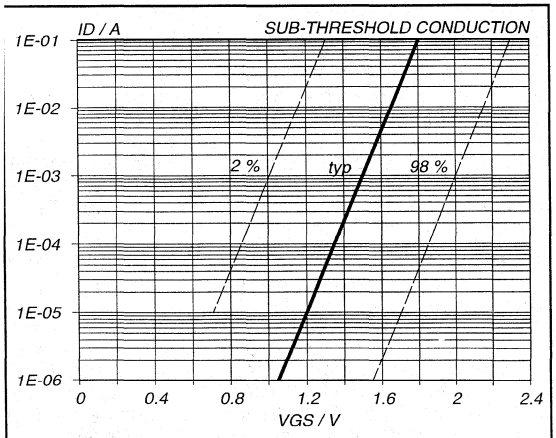

Fig.5 Sub-threshold drain current.
$I_D = f(V_{GS})$; conditions: T_j = 25 °C; $V_{DS} = V_{GS}$

Off-state leakage currents are specified for both the drain-source and gate-source under their respective maximum voltage conditions. Note, although gate-source leakage current is specified in nano-amps, values are typically of the order of a few pico-amps.

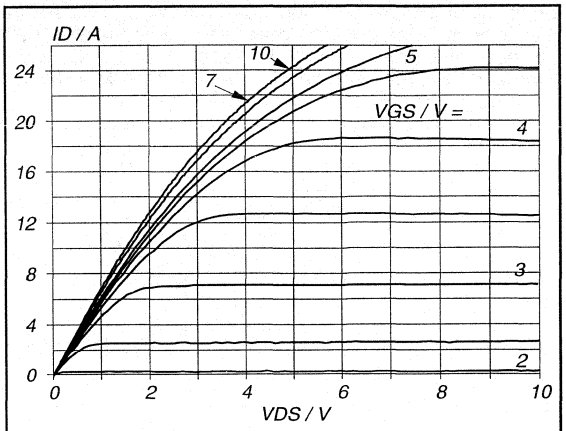

Fig.6 Typical output characteristics, T_j = 25 °C.
$I_D = f(V_{DS})$; parameter V_{GS}

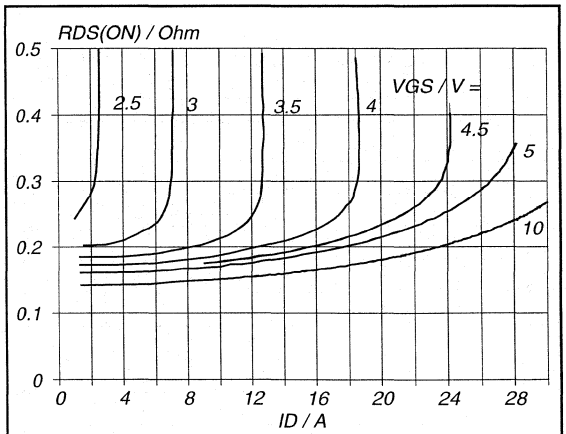

Fig.7 Typical on-state resistance, T_j = 25 °C.
$R_{DS(ON)} = f(I_D)$; parameter V_{GS}

The drain-source on-resistance is very important. It is specified at a gate-source voltage of 5 V for logic level FETs and 10 V for a standard device. The on-resistance for a standard MOSFET cannot be reduced significantly by increasing the gate source voltage above 10 V. Reducing the gate voltage will however increase the on-resistance. For the logic level FET, the on-resistance is given for a gate voltage of 5 V, a further reduction is

possible however at gate voltages up to 10 V, this is demonstrated by the output characteristics, Fig.6 and on-resistance characteristics, Fig.7 for a BUK553-100A.

The on-resistance is a temperature sensitive parameter, between 25 °C and 150 °C it approximately doubles in value. A plot of normalised $R_{DS(ON)}$ versus temperature (Fig.8) is included in each data sheet. Since the MOSFET will normally operate at a T_j higher than 25 °C, when making estimates of power dissipation in the MOSFET, it is important to take into account the higher $R_{DS(ON)}$.

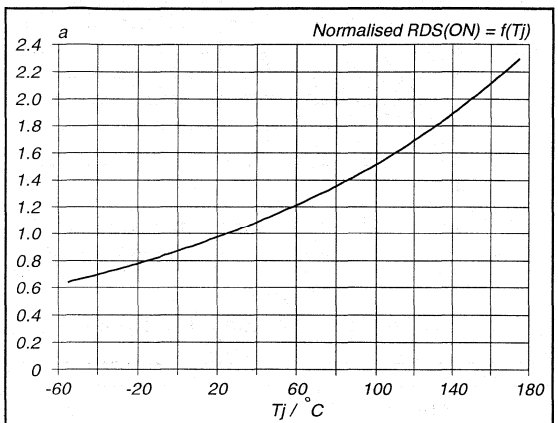

Fig.8 Normalised drain-source on-state resistance. $a = R_{DS(ON)}/R_{DS(ON)25\,°C} = f(T_j)$; I_D = 6.5 A; V_{GS} = 5 V

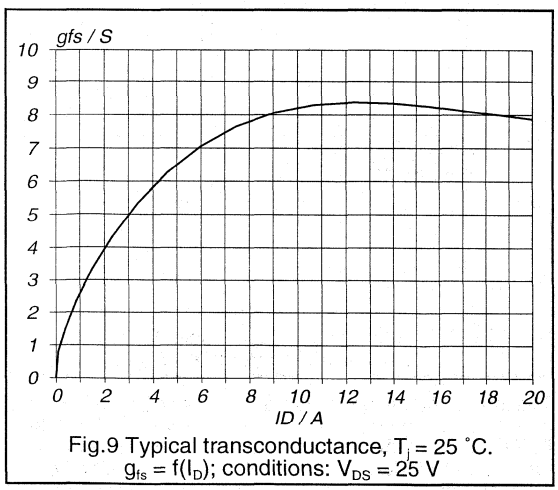

Fig.9 Typical transconductance, T_j = 25 °C. $g_{fs} = f(I_D)$; conditions: V_{DS} = 25 V

Dynamic Characteristics

These include transconductance, capacitance and switching times. Forward transconductance, g_{fs}, is essentially the gain parameter which indicates the change in drain current that will result from a fluctuation in gate voltage when the device is saturated. (NB saturation of a MOSFET refers to the flat portion of the output characteristics.) Fig.9 shows how g_{fs} varies as a function of the drain current for a BUK553-100A.

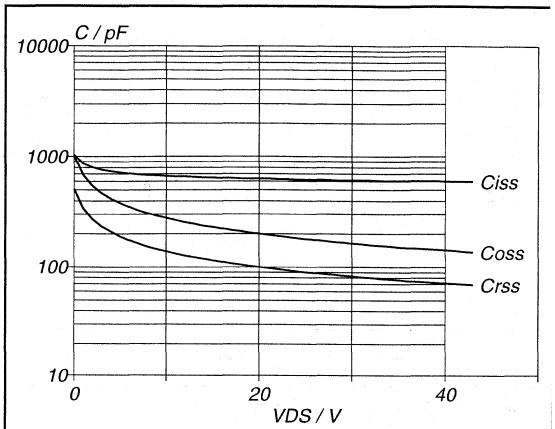

Fig.10 Typical capacitances, C_{iss}, C_{oss}, C_{rss}. $C = f(V_{DS})$; conditions: V_{GS} = 0 V; f = 1 MHz

Capacitances are specified by most manufacturers usually in terms of input, output and feedback capacitance. The values quoted are for a drain-source voltage of 25 V. However this is only part of the story as the MOSFET capacitances are strongly voltage dependent, increasing as drain-source voltage is reduced. Fig.10 shows how these capacitances vary with voltage. The usefulness of the capacitance figures is limited. The input capacitance value gives only a rough indication of the charging required by the drive circuit. Perhaps more useful is the gate charge information an example of which is shown in Fig.11. This plot shows how much charge has to be input to the gate to reach a particular gate-source voltage. Eg. to charge a BUK553-100A to V_{GS} = 5 V, starting from a drain-source voltage of 80 V, requires 12.4 nc. The speed at which this charge is to be applied will give the gate circuit current requirements. More information on MOSFET capacitance is given in chapter 1.2.2.

Resistive load switching times are also quoted by most manufacturers, however extreme care should be taken when making comparisons between different manufacturers data. The speed at which a power MOSFET can be switched is essentially limited only by circuit and package inductances. The actual speed in a circuit is determined by how fast the internal capacitances of the MOSFET are charged and discharged by the drive circuit. The switching times are therefore extremely dependent on the circuit conditions employed; a low gate drive resistance will provide for faster switching and vice-versa. The Philips data sheet presents the switching times for all PowerMOS with a resistor between gate and source of 50 Ω. The device is switched from a pulse

enerator with a source impedance also of 50 Ω. The verall impedance of the gate drive circuit is therefore 5 Ω.

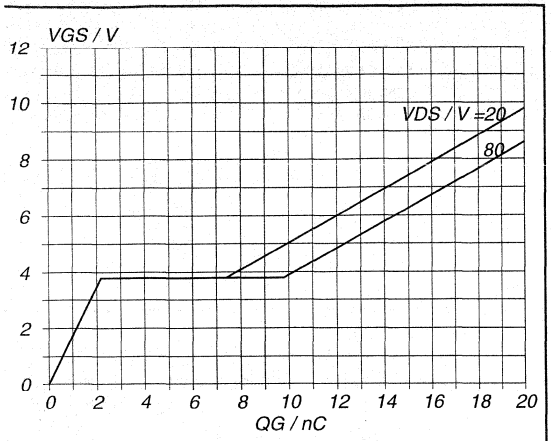

Fig.11 Typical turn-on gate-charge characteristics. V_{GS} = f(Q_G); conditions: I_D = 13 A; parameter V_{DS}

Also presented under dynamic characteristics are the ypical inductances of the package. These inductances ɔecome important when very high switching speeds are ɜmployed such that large dI/dt values exist in the circuit. Ξg. turning-on 30 A within 60 ns gives a dI/dt of 0.5 A/ns. The typical inductance of the source lead is 7.5 nH, from V = -L*dI/dt the potential drop from the source bond pad (point where the source bond wire connects to the chip nternally) to the bottom of the source lead would be 3.75 V. Normally a standard device will be driven with a gate-source voltage of 10 V applied across the gate and source terminals, the actual voltage gate to source on the semiconductor however would only be 6.25 V during the turn-on period! The switching speed is therefore ultimately limited by package inductance.

Reverse diode limiting values and characteristics

The reverse diode is inherent in the vertical structure of the power MOSFET. In some circuits this diode is required to perform a useful function. For this reason the characteristics of the diode are specified. The forward currents permissible in the diode are specified as 'continuous reverse drain current' and 'pulsed reverse drain current'. The forward voltage drop of the diode is also provided together with a plot of the diode characteristic, Fig.12. The switching capability of the diode is given in terms of the reverse recovery parameters, t_{rr} and Q_{rr}.

Because the diode operates as a bipolar device it is subject to charge storage effects. This charge must be removed for the diode to turn-off. The amount of charge stored is given by Q_{rr}, the reverse recovery charge, the

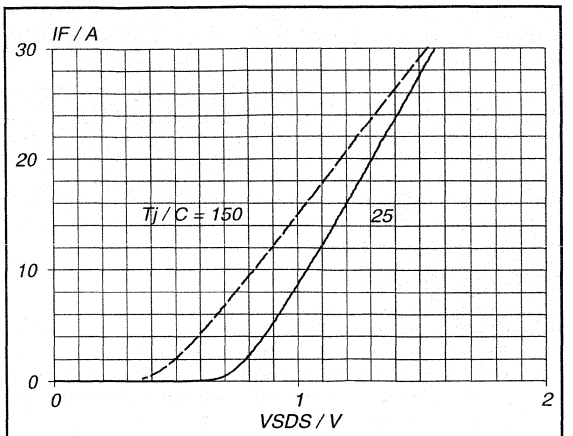

Fig.12 Typical reverse diode current. I_F = f(V_{SDS}); conditions: V_{GS} =) V; parameter T_j

time taken to extract the charge is given by t_{rr}, the reverse recovery time. NB. trr depends very much on the -dI_f/dt in the circuit, t_{rr} is specified in data at 100 A/μs.

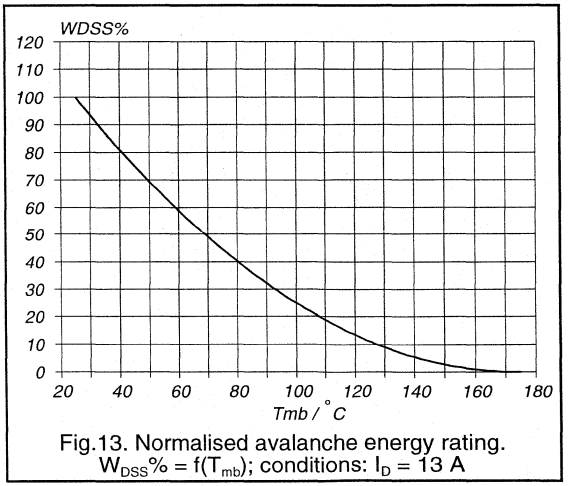

Fig.13. Normalised avalanche energy rating. W_{DSS}% = f(T_{mb}); conditions: I_D = 13 A

Avalanche limiting value

This parameter is an indication as to the ruggedness of the product in terms of its ability to handle a transient overvoltage, ie the voltage exceeds the drain-source voltage limiting value and causes the device to operate in an avalanche condition. The ruggedness is specified in terms of a drain-source non-repetitive unclamped inductive turn-off energy at a mounting base temperature of 25 °C. This energy level must be derated at higher mounting base temperatures as shown in Fig.13. NB. this rating is non-repetitive which means the circuit should not be designed to force the PowerMOS repeatedly into

avalanche. This rating is only to permit the device to survive if exceptional circuit conditions arise such that a transient overvoltage occurs.

The new generation of Philips Medium Voltage MOSFETs also feature a repetitive ruggedness rating. This rating is specified in terms of a drain-source repetitive unclamped inductive turn-off energy at a mounting base temperature of 25 °C, and indicates that the devices are able to withstand repeated momentary excursions into avalanche breakdown provided the maximum junction temperature is not exceeded.

Safe Operating Area

A plot of the safe operating area is presented for every PowerMOS type. Unlike bipolar transistors a PowerMOS exhibits no second breakdown mechanism. The safe operating area is therefore simply defined from the power dissipation that will cause the junction temperature to reach the maximum permitted value.

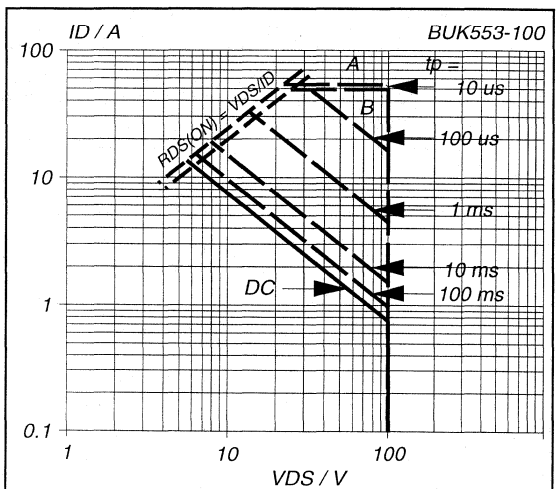

Fig.14 Safe operating area. T_{mb} = 25 °C
I_D & I_{DM} = f(V_{DS}); I_{DM} single pulse; parameter t_p

Fig.14 shows the SOA for a BUK553-100. The area is bounded by the limiting drain source voltage, limiting current values and a set of constant power curves for various pulse durations. The plots in data are all for a mounting base temperature of 25 °C. The constant power curves therefore represent the power that raises the junction temperature by an amount T_{jmax} - T_{mb}, ie. 150 °C for a device with a limiting T_j of 175 °C and 125 °C for a device with a limiting T_j of 150 °C. . Clearly in most applications the mounting base temperature will be higher than 25 °C, the SOA would therefore need to be reduced. The maximum power curves are calculated very simply. The dc curve is based upon the thermal resistance junction to mounting base (junction to heatsink in the case of isolated packages), which is substituted into equation 1. The curves for pulsed operation assume a single shot pulse and instead of thermal resistance, a value for transient thermal impedance is used. Transient thermal impedance is supplied as graphical data for each type, an example is shown in Fig.15. For calculation of the single shot power dissipation capability, a value at the required pulse width is read from the D = 0 curve and substituted in to equation 2. (A more detailed explanation of transient thermal impedance and how to use the curves can be found in chapter 7.)

$$P_{tot(dc)} = \frac{T_{jmax} - T_{mb}}{R_{thj-mb}} \quad 1$$

$$P_{tot(pulse)} = \frac{T_{jmax} - T_{mb}}{Z_{thj-mb}} \quad 2$$

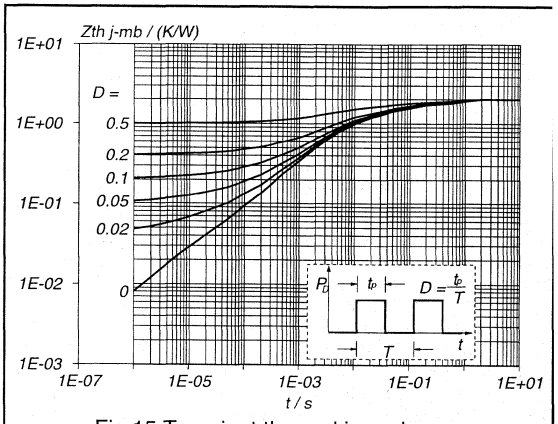

Fig.15 Transient thermal impedance.
Z_{thj-mb} = f(t); parameter D = t_p/T

Examples of how to calculate the maximum power dissipation for a 1 ms pulse are shown below. Example 1 calculates the maximum power assuming a T_j of 175 °C and T_{mb} of 25 °C. This power equates to the 1 ms curve on the SOA plot of Fig.14. Example 2 illustrates how the power capability is reduced if T_{mb} is greater than 25 °C.

Example 1: 1 ms pulse at 25 °C for a BUK553-100A

Z_{th} = 0.32 K/W, T_{jmax} = 175 °C, T_{mb} = 25 °C

$$P_{\max(1\,ms\,pulse)} = \frac{175 - 25}{0.32} = 469\,W$$

The 469 W line is observed on Fig.13, (4.69 A @ 100 V and 15.6 A @ 30 V etc)

Example 2: 1 ms pulse at 75 °C for a BUK553-100A

Z_{th} = 0.32 K/W, T_{jmax} = 175 °C, T_{mb} = 75 °C

$$P_{\max(1\,ms\,pulse)} = \frac{175 - 75}{0.32} = 312\,W$$

herefore with a mounting base temperature of 75 °C the ıaximum permissible power dissipation is reduced by ne third compared with the 25 °C value on the SOA plot.

:alculating Currents

'he current ratings quoted in the data sheet are derived irectly from the maximum power dissipation.

$$I_D(@T_{mb})^2 \cdot R_{DS(ON)}(@T_{jmax}) = P_{tot} \qquad 3$$

ubstituting for P_{tot} from equation 1

$$I_D(@T_{mb}) = \left\{ \frac{T_{jmax} - T_{mb}}{R_{thj-mb} \cdot R_{DS(ON)}(@T_{jmax})} \right\}^{\frac{1}{2}} \qquad 4$$

'o calculate a more realistic current it is necessary to eplace T_{jmax} in equation 4 with the desired operating ınction temperature and T_{mb} with a realistic working 'alue. It is generally recommended that devices are not ıperated continuously at T_{jmax}. For reasons of long term eliability, 125 °C is a more suitable junction operating emperature. A value of T_{mb} between 75 °C and 110 °C is ılso a more typical figure.

As an example a BUK553-100A is quoted as having a dc current rating of 13 A. Assuming a T_{mb} of 100 °C and operating T_j of 125 °C the device current is calculated as follows:

From Fig.8

$$R_{DS(ON)}(@\ 125^oC) = 1.75 \cdot R_{DS(ON)}(@\ 25^oC) = 1.75 \cdot 0.18 = 0.315\,\Omega$$

$R_{thj\text{-}mb}$ = 2 K/W, using equation 4

$$I_D = \left\{ \frac{25}{2 \cdot 0.315} \right\}^{\frac{1}{2}} = 6.3\,A$$

The device could therefore conduct 6.3 A under these conditions which equates to a 12.5 W power dissipation.

Conclusions

The most important information presented in the data sheet is the on-resistance and the maximum voltage drain-source. Current values and maximum power dissipation values should be viewed carefully since they are only achievable if the mounting base temperature is held to 25 °C. Switching times are applicable only for the specific conditions described in the data sheet, when making comparisons between devices from different manufacturers, particular attention should be paid to these conditions.

DEVICE DATA

N-channel enhancement mode vertical D-MOS transistor

BS107

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown.

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a TO-92 variant envelope. Intended for use as a line current interruptor in telephone sets and for applications in relay, high-speed and line transformer drivers.

PINNING - TO-92 variant

PIN	DESCRIPTION
1	source
2	gate
3	drain

QUICK REFERENCE DATA

N-channel enhancement mode MOS transistor

BSH101

FEATURES

- Very low threshold
- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL etc.

APPLICATIONS

- Power management
- DC to DC converters
- Battery powered applications
- 'Glue-logic'; interface between logic blocks and/or periphery
- General purpose switch.

DESCRIPTION

N-channel enhancement mode MOS transistor in a SOT23 SMD package.

PINNING - SOT23

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	s	source
3	d	drain

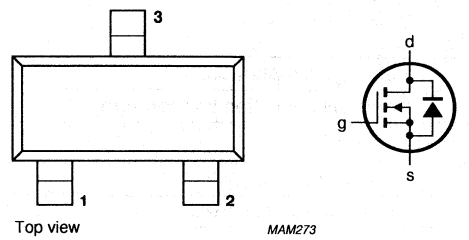

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETERS	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	60	V
V_{SD}	source-drain diode forward voltage	V_{GD} = 0; I_S = 0.5 A	–	1	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	1	–	V
I_D	drain current (DC)	T_s = 80 °C	–	0.7	A
R_{DSon}	drain-source on-state resistance	V_{GS} = 10 V; I_D = 0.35 A	–	0.6	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	0.5	W

CAUTION

This product is supplied in anti-static packing to prevent damage caused by electrostatic discharge during transport and handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

N-channel enhancement mode MOS transistor

BSH101

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	60	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	0.7	A
I_{DM}	peak drain current	note 2	–	2.8	A
P_{tot}	total power dissipation	T_s = 80 °C	–	0.5	W
		T_{amb} = 25 °C; note 3	–	0.75	W
		T_{amb} = 25 °C; note 4	–	0.54	W
T_{stg}	storage temperature		−55	+150	°C
T_j	operating junction temperature		−55	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 80 °C	–	0.5	A
I_{SM}	peak pulsed source current	note 2	–	2	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

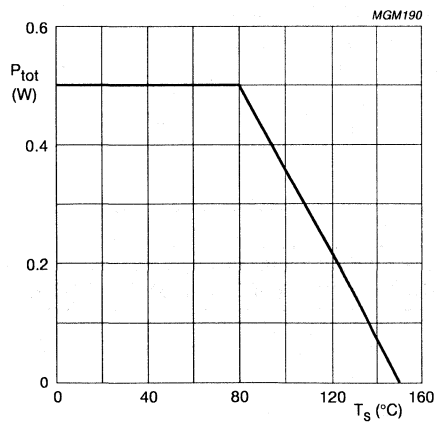

Fig.2 Power derating curve.

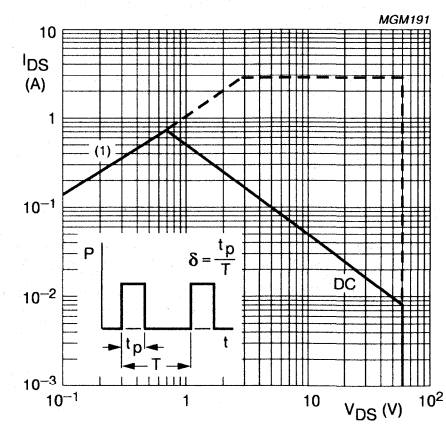

δ = 0.01; T_s = 80 °C.
(1) R_{DSon} limitation.

N-channel enhancement mode MOS transistor

BSH102

FEATURES

- Very low threshold
- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL etc.

APPLICATIONS

- Power management
- DC to DC converters
- Battery powered applications
- 'Glue-logic'; interface between logic blocks and/or periphery
- General purpose switch.

DESCRIPTION

N-channel enhancement mode MOS transistor in a SOT23 SMD package.

PINNING - SOT23

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	s	source
3	d	drain

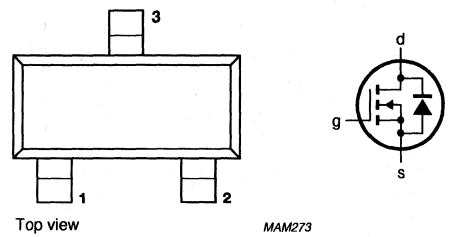

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{SD}	source-drain diode forward voltage	V_{GD} = 0; I_S = 0.5 A	–	1	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	1	–	V
I_D	drain current (DC)	T_s = 80 °C	–	0.85	A
R_{DSon}	drain-source on-state resistance	V_{GS} = 10 V; I_D = 0.5 A	–	0.4	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	0.5	W

CAUTION

This product is supplied in anti-static packing to prevent damage caused by electrostatic discharge during transport and handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	0.85	A

N-channel enhancement mode MOS transistor

BSH106

FEATURES

- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL, etc.
- Very low threshold.

APPLICATIONS

- Power management
- DC - DC converters
- 'Glue-logic': interface between logic blocks and/or periphery
- General purpose switch
- Battery powered applications.

DESCRIPTION

N-channel enhancement mode MOS transistor in a SOT363 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT363

PIN	SYMBOL	DESCRIPTION
1	d	drain
2	d	drain
3	g	gate

P-channel enhancement mode MOS transistor

BSH203

FEATURES

- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL, etc.

APPLICATIONS

- 'Glue-logic': interface between logic blocks and/or periphery
- Power management
- DC to DC converters
- General purpose switch
- Battery powered applications.

DESCRIPTION

P-channel enhancement mode MOS transistor in a SOT23 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	s	source
3	d	drain

Source-drain diode						
V_{SD}	source-drain diode forward voltage	V_{GD} = 0; I_S = −0.54 A	–	–	−1.3	V

P-channel enhancement mode MOS transistor

BSH207

FEATURES

- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL, etc.
- Very low threshold.

APPLICATIONS

- 'Glue-logic': interface between logic blocks and/or periphery
- Power management
- DC to DC converters
- General purpose switch
- Battery powered applications.

DESCRIPTION

P-channel enhancement mode MOS transistor in a SOT457 (TSOP6) SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING

PIN	SYMBOL	DESCRIPTION
1	d	drain
2	d	drain
3	g	gate
4	s	source
5	d	drain
6	d	drain

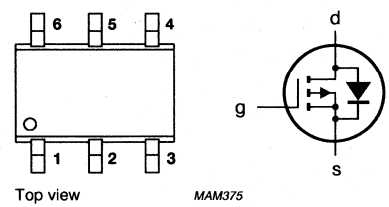

Fig.1 Simplified outline (SOT457) and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	–12	V
V_{SD}	source-drain diode forward voltage	V_{GD} = 0; I_S = –0.62 A	–	–1.3	V
V_{GS}	gate-source voltage (DC)		–	±8	V
V_{GSth}	gate-source threshold voltage	V_{DS} = V_{GS}; I_D = –1 mA	–0.4	–	V
I_D	drain current (DC)	T_s = 80 °C	–	–2	A
R_{DSon}	drain-source on-state resistance	V_{GS} = –2.5 V; I_D = –1 A	–	0.15	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	0.8	W

OBJECTIVE
See Philips Semiconductors for Design-in information

P-channel enhancement mode MOS transistor

BSH207

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	−12	V
V_{GS}	gate-source voltage (DC)		–	±8	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	−2	A
I_{DM}	peak drain current	note 2	–	−7.9	A
P_{tot}	total power dissipation	T_s = 80 °C; note 1	–	0.8	W
		T_{amb} = 25 °C; note 3	–	1.09	W
		T_{amb} = 25 °C; note 4	–	0.7	W
T_{stg}	storage temperature		−55	+150	°C
T_j	operating junction temperature		−55	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 80 °C; note 1	–	−0.62	A
I_{SM}	peak pulsed source current	note 2	–	−2.48	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j\text{-}s}$	thermal resistance from junction to soldering point	87.5	K/W

P-channel enhancement mode MOS transistor

BSH207

CHARACTERISTICS

T_j = 25 °C unless otherwise specified.

P-channel enhancement mode MOS transistor BSH299

FEATURES

- Low threshold voltage
- High-speed switching
- No secondary breakdown
- Direct interface to C-MOS, TTL, etc.

APPLICATIONS

- Power management
- Battery powered applications e.g. cellular phones
- General purpose switch.

DESCRIPTION

P-channel enhancement mode MOS transistor in a SOT363 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT363

PIN	SYMBOL	DESCRIPTION
1	d	drain
2	d	drain

N-channel enhancement mode vertical D-MOS transistor

BSN205; BSN205A

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a TO-92 variant envelope. Designed primarily as a line current interrupter in telephone sets, it can also be applied in other applications such as in relays, line and high speed transformer drivers etc.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown
- Low $R_{DS(on)}$

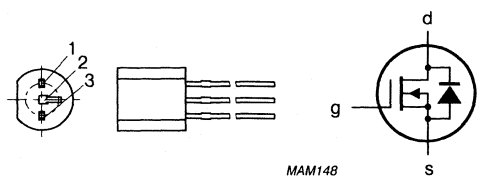
QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	200 V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20 V
Drain current (DC)	I_D	max.	300 mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1 W
Drain-source ON-resistance I_D = 400 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ. max.	4.5 Ω 6 Ω
Transfer admittance I_D = 400 mA; V_{DS} = 25 V	$\lvert Y_{fs} \rvert$	min. typ.	200 mS 350 mS

PINNING - TO-92 VARIANT

BSN205	BSN205A
1 = gate	1 = source
2 = drain	2 = gate
3 = source	3 = drain

PIN CONFIGURATION



Note: various pinout configurations available.

Fig.1 Simplified outline and symbol.

N-channel enhancement mode vertical D-MOS transistor

BSN205; BSN205A

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Drain-source voltage	V_{DS}	max.	200	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	I_D	max.	300	mA
Drain current (peak)	I_{DM}	max.	1.2	A
Total power dissipation up to T_{amb} = 25 °C (note 1)	P_{tot}	max.	1	W
Storage temperature range	T_{stg}	−65 to +	150	°C
Junction temperature	T_j	max.	150	°C

THERMAL RESISTANCE

From junction to ambient (note 1)	$R_{th\ j\text{-}a}$	=	125	K/W

Note

1. Transistor mounted on printed-circuit board, max. lead length 4 mm, mounting pad for drain lead min. 10 mm × 10 mm.

CHARACTERISTICS

T_j = 25 °C unless otherwise specified

Drain-source breakdown voltage I_D = 10 μA; V_{GS} = 0	$V_{(BR)\ DSS}$	min.	200	V
Drain-source leakage current V_{DS} = 160 V; V_{GS} = 0	I_{DSS}	max.	1	μA
Gate-source leakage current V_{GS} = 20 V; V_{DS} = 0	I_{GSS}	max.	100	nA
Gate threshold voltage I_D = 1 mA; V_{DS} = V_{GS}	$V_{GS(th)}$	min. max.	0.8 2.8	V V
Drain-source ON-resistance I_D = 400 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ. max.	4 6	Ω Ω
Transfer admittance I_D = 400 mA; V_{DS} = 25 V	$\lvert Y_{fs} \rvert$	min. typ.	200 350	mS mS
Input capacitance at f = 1 MHz V_{DS} = 25 V; V_{GS} = 0	C_{iss}	typ. max.	45 60	pF pF

Output capacitance at f = 1 MHz V_{DS} = 25 V; V_{GS} = 0	C_{oss}	typ. max.	15 pF 25 pF
Feedback capacitance at f = 1 MHz V_{DS} = 25 V; V_{GS} = 0	C_{rss}	typ. max.	3.5 pF 10 pF
Switching times (see Figs 2 and 3) I_D = 250 mA; V_{DD} = 50 V V_{GS} = 0 to 10 V	t_{on}	typ. max.	5 ns 10 ns
	t_{off}	typ. max.	15 ns 20 ns

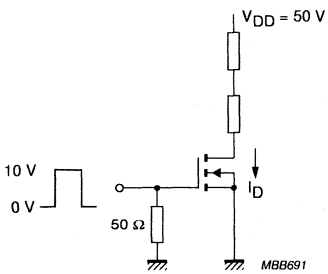


Fig.2 Switching time test circuit.

N-channel enhancement mode vertical D-MOS transistors

BSN254 BSN254A

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistors in TO-92 variant envelope and designed for use as line current interrupters in telephone sets and for application in relay, high-speed and line-transformer drivers.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No second breakdown
- Low $R_{DS\ (on)}$

QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	250	V
Drain current (DC)	I_D	max.	300	mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Drain-source on-resistance				
I_D = 300 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ.	5.0	Ω
		max.	7.0	Ω
Gate-source threshold voltage	$V_{GS(th)}$	max.	2	V

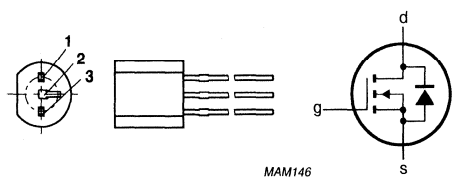
PINNING (BSN254)

1 = gate
2 = drain
3 = source

PINNING (BSN254A)

1 = source
2 = gate
3 = drain

PIN CONFIGURATION - TO-92 VARIANT



Note: Various pinnings are available on request.

N-channel enhancement mode vertical D-MOS transistor

BSN274; BSN274A

FEATURES

- Direct interface to C-MOS, TTL, etc., due to low threshold voltage
- High speed switching
- No secondary breakdown

DESCRIPTION

Silicon n-channel enhancement mode vertical D-MOS transistor in TO-92 variant envelope and intended for use as a line current interruptor in telephone sets and for applications in relay, high speed and line transformer drivers.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	drain-source voltage	270	V
I_D	drain current (DC)	250	mA
$R_{DS(on)}$	drain-source on-resistance	8	Ω
$V_{GS(th)}$	threshold voltage	2	V

N-channel enhancement mode vertical D-MOS transistor

BSP030

FEATURES

- High speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor and actuator drivers
- Power management
- Synchronized rectification.

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a 4-pin plastic SOT223 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT223

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	d	drain
3	s	source
4	d	drain

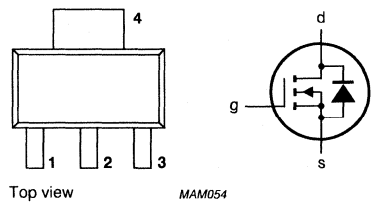

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{SD}	source-drain diode forward voltage	I_S = 1.25 A	–	1	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	I_D = 1 mA; V_{DS} = V_{GS}	1	2.8	V
I_D	drain current (DC)	T_s = 100 °C	–	10	A
R_{DSon}	drain-source on-state resistance	I_D = 5 A; V_{GS} = 10 V	–	0.03	Ω
P_{tot}	total power dissipation	T_s = 100 °C	–	5	W

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 100 °C; note 1	–	10	A
I_{DM}	peak drain current	note 2	–	40	A
P_{tot}	total power dissipation	T_s = 100 °C	–	5	W
		T_{amb} = 25 °C; note 3	–	3.3	W
		T_{amb} = 25 °C; note 4	–	1.25	W
T_{stg}	storage temperature		−65	+150	°C
T_j	operating junction temperature		−65	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 100 °C	–	5	A
I_{SM}	peak pulsed source current	note 2	–	20	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Value based on printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Value based on printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j\text{-}s}$	thermal resistance from junction to soldering point	10	K/W

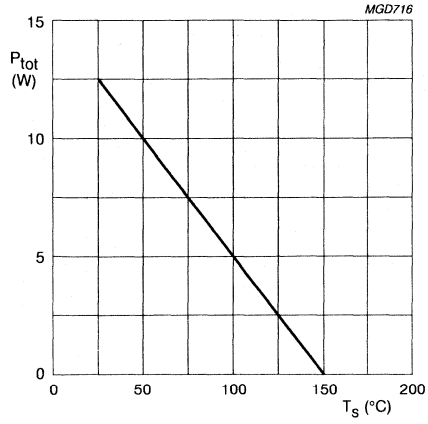

Fig.2 Power derating curve.

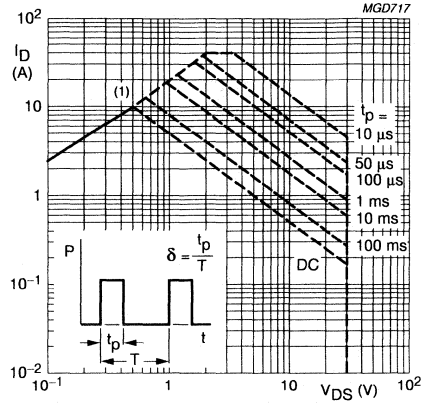

$\delta = 0.01$; $T_s = 100$ °C.
(1) R_{DSon} limitation.

P-channel enhancement mode vertical D-MOS transistor

BSP090

FEATURES

- High speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor and actuator drivers
- Power management
- Synchronized rectification.

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a 4-pin plastic SOT223 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT223

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	d	drain
3	s	source
4	d	drain

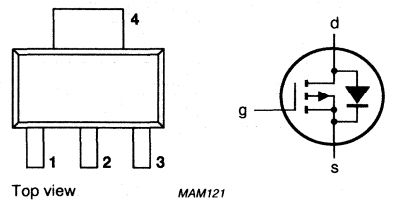

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	−30	V
V_{SD}	source-drain diode forward voltage	I_S = −1.25 A	–	−1.3	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	I_D = −1 mA; V_{DS} = V_{GS}	−1	−2.8	V
I_D	drain current (DC)	T_s = 100 °C	–	−5.7	A
R_{DSon}	drain-source on-state resistance	I_D = −2.8 A; V_{GS} = −10 V	–	0.09	Ω
P_{tot}	total power dissipation	T_s = 100 °C	–	5	W

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	–30	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 100 °C; note 1	–	–5.7	A
I_{DM}	peak drain current	note 2	–	–22	A
P_{tot}	total power dissipation	T_s = 100 °C	–	5	W
		T_{amb} = 25 °C; note 3	–	3.3	W
		T_{amb} = 25 °C; note 4	–	1.25	W
T_{stg}	storage temperature		–65	+150	°C
T_j	operating junction temperature		–65	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 100 °C	–	–3.8	A
I_{SM}	peak pulsed source current	note 2	–	–15	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j\text{-}s}$	thermal resistance from junction to soldering point	10	K/W

N-channel enhancement mode vertical D-MOS transistor

BSP108

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a miniature SOT223 envelope and intended for use in relay, high-speed and line-transformer drivers.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown

PINNING - SOT223

1 = gate
2 = drain
3 = source
4 = drain

Marking code

N-channel enhancement mode vertical D-MOS transistor

BSP126

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a miniature SOT223 envelope and designed for use as a line interrupter in telephone sets and for application in relay, high-speed and line-transformer drivers.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching.
- No secondary breakdown.

QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	250	V
Drain current (DC)	I_D	max.	350	mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1.5	W
Drain-source on-resistance				
I_D = 300 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ.	5.0	Ω
		max.	7.0	Ω
Gate-source threshold voltage	$V_{GS(th)}$	max.	2	V

PINNING - SOT223

1 = gate
2 = drain
3 = source
4 = drain

P-channel enhancement mode vertical D-MOS transistor

BSP205

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a miniature SOT223 envelope and intended for use in relay, high-speed and line-transformer drivers.

QUICK REFERENCE DATA

Drain-source voltage	$-V_{DS}$	max.	60	V
Drain current (DC)	$-I_D$	max.	275	mA
Drain-source ON-resistance				
$-I_D$ = 200 mA; $-V_{GS}$ = 10 V	$R_{DS(on)}$	max.	10	Ω
Gate threshold voltage	$-V_{GS(th)}$	max.	3.5	V

FEATURES

- Very low $R_{DS(on)}$
- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown

PINNING - SOT223

1 = gate
2 = drain
3 = source
4 = drain

P-channel enhancement mode vertical D-MOS transistor

BSP206

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a miniature SOT223 envelope and intended for use in relay, high-speed and line-transformer drivers.

QUICK REFERENCE DATA

Drain-source voltage	$-V_{DS}$	max.	60 V
Drain current (DC)	$-I_D$	max.	350 mA
Drain-source ON-resistance $-I_D$ = 200 mA; $-V_{GS}$ = 10 V	$R_{DS(on)}$	max.	6 Ω
Gate threshold voltage	$-V_{GS(th)}$	max.	3.5 V

FEATURES

- Very low $R_{DS(on)}$
- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown

PINNING - SOT223

1 = gate
2 = drain
3 = source
4 = drain

P-channel enhancement mode vertical D-MOS transistor

BSP206

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Drain-source voltage	$-V_{DS}$	max.	60 V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20 V
Drain current (DC)	$-I_D$	max.	350 mA
Drain current (peak)	$-I_{DM}$	max.	700 mA
Total power dissipation up to T_{amb} = 25 °C (note 1)	P_{tot}	max.	1.5 W
Storage temperature range	T_{stg}		−65 to + 150 °C
Junction temperature	T_j	max.	150 °C

THERMAL RESISTANCE

From junction to ambient (note 1)	$R_{th\ j\text{-}a}$	=	83.3 K/W

Note

1. Device mounted on an epoxy printed-circuit board 40 mm × 40 mm × 1.5 mm; mounting pad for the drain lead min. 6 cm^2.

CHARACTERISTICS

T_j = 25 °C unless otherwise specified

Drain-source breakdown voltage $-I_D$ = 10 μA; V_{GS} = 0	$-V_{(BR)DSS}$	min.	60 V
Drain-source leakage current $-V_{DS}$ = 48 V; V_{GS} = 0	$-I_{DSS}$	max.	1.0 μA
Gate-source leakage current $\pm V_{GS}$ = 20 V; V_{DS} = 0	$\pm I_{GSS}$	max.	100 nA
Gate threshold voltage $-I_D$ = 1 mA; V_{DS} = V_{GS}	$-V_{GS(th)}$	min. max.	1.5 V 3.5 V
Drain-source ON-resistance $-I_D$ = 200 mA; $-V_{GS}$ = 10 V	$R_{DS(on)}$	typ. max.	4.5 Ω 6 Ω
Transfer admittance $-I_D$ = 200 mA; $-V_{DS}$ = 15 V	$\lvert Y_{fs} \rvert$	min. typ.	100 mS 200 mS
Input capacitance at f = 1 MHz; $-V_{DS}$ = 10 V; V_{GS} = 0	C_{iss}	typ. max.	55 pF 70 pF
Output capacitance at f = 1 MHz; $-V_{DS}$ = 10 V; V_{GS} = 0	C_{oss}	typ. max.	30 pF 45 pF
Feedback capacitance at f = 1 MHz; $-V_{DS}$ = 10 V; V_{GS} = 0	C_{rss}	typ. max.	8 pF 12 pF
Switching times (see Figs 2 and 3) $-I_D$ = 200 mA; $-V_{DD}$ = 50 V; $-V_{GS}$ = 0 to 10 V	t_{on}	typ. max.	4 ns 8 ns
	t_{off}	typ. max.	15 ns 25 ns

P-channel enhancement mode vertical D-MOS transistor

BSP255

FEATURES

- Direct interface to C-MOS, TTL etc
- Low threshold voltage
- High speed switching
- No secondary breakdown.

APPLICATIONS

- Line current interrupter in telephone sets
- Relay, high speed and line transformer drivers.

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a 4-pin plastic SOT223 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT223

PIN	SYMBOL	DESCRIPTION
1	g	gate
2	d	drain
3	s	source
4	d	drain

N-channel enhancement mode vertical D-MOS transistor

BSP89

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown.

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a SOT223 envelope, intended for use as a surface-mounted device in line current interrupters in telephone sets and for application in relay, high speed and line transformer drivers.

PINNING - SOT223

PIN	DESCRIPTION
Code: BSP89	
1	gate
2	drain
3	source
4	drain

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	drain-source voltage	240	V
I_D	DC drain current	350	mA
$R_{DS(on)}$	drain-source on-resistance	6	Ω
$V_{GS(th)}$	gate-source threshold voltage	2	V

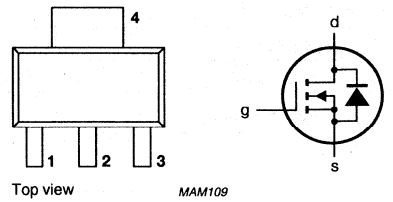

Fig.1 Simplified outline (SOT223) and symbol.

LIMITING VALUES

In accordance with the Absolute Maximum System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage		–	240	V
$\pm V_{GSO}$	gate-source voltage	open drain	–	20	V
I_D	DC drain current		–	350	mA
I_{DM}	peak drain current		–	1.4	A
P_{tot}	total power dissipation	up to T_{amb} = 25 °C (note 1)	–	1.5	W
T_{stg}	storage temperature range		−65	150	°C
T_j	junction temperature		–	150	°C

THERMAL RESISTANCE

SYMBOL	PARAMETER	THERMAL RESISTANCE
$R_{th\ j\text{-}a}$	from junction to ambient (note 1)	83.3 K/W

Note

1. Transistor mounted on an epoxy printed circuit board, 40 x 40 x 1.5 mm, mounting pad for the drain tab minimum 6 cm^2.

N-channel enhancement mode vertical D-MOS transistor

BSP89

CHARACTERISTICS

T_j = 25 °C unless otherwise specified.

$-I_D$	DC drain current	180	mA
$R_{DS(on)}$	drain-source on-resistance	20	Ω
$-V_{GS(th)}$	gate-source threshold voltage	1.8	V

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a SOT223 envelope, intended for use as a surface-mounted device in line current interruptor in telephone sets and for application in relay, high speed and line transformer drivers.

PINNING - SOT223

PIN	DESCRIPTION
1	gate
2	drain
3	source
4	drain

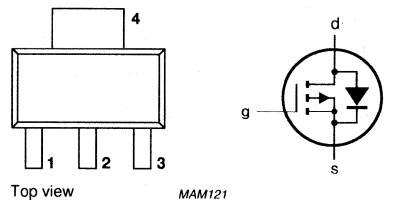

Fig.1 Simplified outline (SOT223) and symbol.

LIMITING VALUES

In accordance with the Absolute Maximum System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$-V_{DS}$	drain-source voltage		–	240	V
$\pm V_{GSO}$	gate-source voltage	open drain	–	20	V
$-I_D$	DC drain current		–	180	mA
$-I_{DM}$	peak drain current		–	720	mA
P_{tot}	total power dissipation	up to T_{amb} = 25 °C (note 1)	–	1.5	W
T_{stg}	storage temperature range		–65	150	°C
T_j	junction temperature		–	150	°C

THERMAL RESISTANCE

SYMBOL	PARAMETER	THERMAL RESISTANCE
$R_{th\ j\text{-}a}$	from junction to ambient (note 1)	83.3 K/W

Note

1. Transistor mounted on an epoxy printed circuit board, 40 x 40 x 1.5 mm, mounting pad for the drain tab minimum 6 cm^2.

P-channel enhancement mode vertical D-MOS transistor

BSP92

CHARACTERISTICS

T_j = 25 °C unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$-V_{(BR)DSS}$	drain-source breakdown voltage	$-I_D$ = 10 μA; V_{GS} = 0	240	–	–	V
$-I_{DSS}$	drain-source leakage current	$-V_{DS}$ = 200 V; V_{GS} = 0	–	–	1	μA
$\pm I_{GSS}$	gate-source leakage current	$\pm V_{GS}$ = 20 V; V_{DS} = 0	–	–	100	nA
$-V_{GS(th)}$	gate-source threshold voltage	$-I_D$ = 1 mA; V_{GS} = V_{DS}	0.8	–	2	V
$-V_{GS}$	gate-source voltage	$-I_D$ = 50 mA; $-V_{DS}$ = 5 V	0.8	–	2.8	V
$R_{DS(on)}$	drain-source on-resistance	$-I_D$ = 180 mA; $-V_{GS}$ = 10 V	–	10	20	Ω
		$-I_D$ = 100 mA; $-V_{GS}$ = 5 V	–	–	18	Ω
		$-I_D$ = 25 mA; $-V_{GS}$ = 2.8 V	–	–	20	Ω
$\lvert Y_{fs} \rvert$	transfer admittance	$-I_D$ = 180 mA; $-V_{DS}$ = 25 V	100	200	–	mS
C_{iss}	input capacitance	$-V_{DS}$ = 25 V; V_{GS} = 0; f = 1 MHz	–	65	90	pF
C_{oss}	output capacitance	$-V_{DS}$ = 25 V; V_{GS} = 0; f = 1 MHz	–	20	30	pF
C_{rss}	feedback capacitance	$-V_{DS}$ = 25 V; V_{GS} = 0; f = 1 MHz	–	6	15	pF
Switching times (see Figs 3 and 4)						
t_{on}	turn-on time	$-I_D$ = 250 mA; $-V_{DD}$ = 50 V; $-V_{GS}$ = 0 to 10 V	–	5	10	ns
t_{off}	turn-off time	$-I_D$ = 250 mA; $-V_{DD}$ = 50 V; $-V_{GS}$ = 0 to 10 V	–	20	30	ns

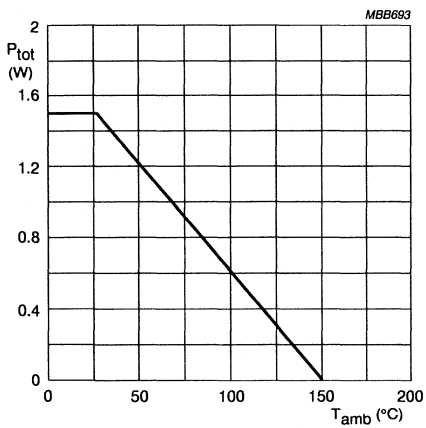

Fig.2 Power derating curve.

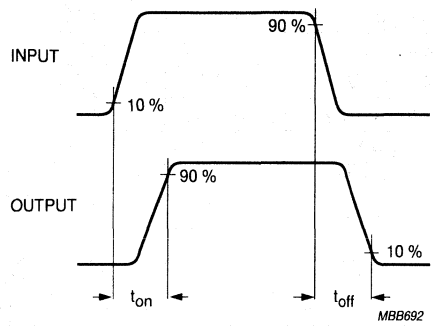

Fig.4 Input and output waveforms.

P-channel enhancement mode vertical D-MOS transistor

BSS84

FEATURES

- Low threshold voltage
- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown.

APPLICATIONS

- Line current interrupter in telephone sets
- Relay, high speed and line transformer drivers.

DESCRIPTION

P-channel enhancement mode vertical D-MOS transistor in a SOT23 SMD package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT23

PIN	SYMBOL	DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor

BSS87

DESCRIPTION

N-channel vertical D-MOS transistor in a SOT89 envelope. Designed primarily as a line current interrupter in telephone sets, it can also be applied in other applications such as in relays, line and high-speed transformer drivers etc.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown.
- Low $R_{DS(on)}$

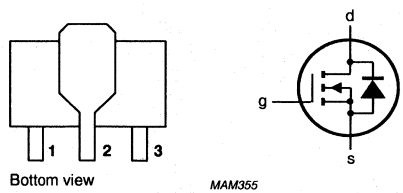
QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	200	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	I_D	max.	280	mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Drain-source on-resistance				
I_D = 400 mA; V_{GS} = 10 V	$R_{DS(on)}$	max.	6	Ω
		typ.	4.5	Ω
Transfer admittance				
I_D = 400 mA; V_{DS} = 25 V	$\lvert Y_{fs} \rvert$	typ.	350	mS
		min.	140	mS

PINNING - SOT89

1 = source
2 = drain
3 = gate

PIN CONFIGURATION



marking: KA

N-channel vertical D-MOS transistor BST70A

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in TO-92 variant envelope and intended for use in relay, high-speed and line-transformer drivers.

FEATURES:

- Very low $R_{DS(on)}$
- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No second breakdown

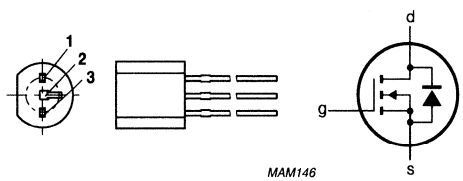
QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	80	V
Gate-source voltage (open drain)	V_{GSO}	max.	20	V
Drain current (DC)	I_D	max.	0.5	A
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Drain-source ON-resistance				
I_D = 500 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ.	2	Ω
		max.	4	Ω
Transfer admittance				
I_D = 500 mA; V_{DS} = 15 V	$\|Y_{fs}\|$	typ.	300	mS

PINNING - TO-92 VARIANT

1 = source
2 = gate
3 = drain

PIN CONFIGURATION



Note: Various pinout configurations available.

Fig.1 Simplified outline and symbol.

N-channel vertical D-MOS transistor BST70A

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Drain-source voltage	V_{DS}	max.	80	V
Gate-source voltage (open drain)	V_{GSO}	max.	20	V
Drain current (DC)	I_D	max.	0.5	A
Drain current (peak)	I_{DM}	max.	1.0	A
Total power dissipation up to T_{amb} = 25 °C (note 1)	P_{tot}	max.	1	W
Storage temperature range	T_{stg}	− 65 to +	150	°C
Junction temperature	T_j	max.	150	°C

THERMAL RESISTANCE

From junction to ambient (note 1)	$R_{th\ j\text{-}a}$	=	125	K/W

Note

1. Transistor mounted on printed circuit board, max. lead length 4 mm, mounting pad for drain lead min. 10 mm × 10 mm.

CHARACTERISTICS

T_j = 25 °C unless otherwise specified

N-channel enhancement mode vertical D-MOS transistor

BST82

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in SOT23 envelope and designed for use as Surface Mounted Device (SMD) in thin and thick-film circuits for telephone ringer and for application with relay, high-speed and line-transformer drivers.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No second breakdown
- Low $R_{DS(on)}$

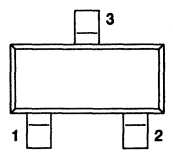
QUICK REFERENCE DATA

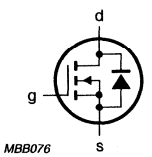
Drain-source voltage	V_{DS}	max.	80	V
Drain-source voltage (non-repetitive peak; $t_p \leq 2$ ms)	$V_{DS(SM)}$	max.	100	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	I_D	max.	175	mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	300	mW
Drain-source ON-resistance				
I_D = 150 mA; V_{GS} = 5 V	$R_{DS(on)}$	typ.	7	Ω
		max.	10	Ω
Transfer admittance				
I_D = 175 mA; V_{DS} = 5 V	$\lvert Y_{fs} \rvert$	typ.	150	mS

PINNING - SOT23

1 = gate
2 = source
3 = drain

PIN CONFIGURATION





Marking: 02p

P-channel enhancement mode vertical D-MOS transistor

BST100

DESCRIPTION

P-channel vertical D-MOS transistor TO-92 variant envelope and intended for use in relay, high-speed and line-transformer drivers.

FEATURES

- Very low $R_{DS(on)}$
- Direct interface to C-MOS
- High-speed switching
- No second breakdown

QUICK REFERENCE DATA

Drain-source voltage	$-V_{DS}$	max.	60	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	$-I_D$	max.	0.3	A
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Drain-source ON-resistance				
$-I_D$ = 200 mA; $-V_{GS}$ = 10 V	$R_{DS(on)}$	typ.	4,5	Ω
		max.	6	Ω
Transfer admittance				
$-I_D$ = 200 mA; $-V_{DS}$ = 15 V	$\lvert Y_{fs} \rvert$	typ.	200	mS

PINNING - TO-92 VARIANT

1 = source
2 = gate
3 = drain

PIN CONFIGURATION

P-channel enhancement mode vertical D-MOS transistor

BST122

DESCRIPTION

P-channel vertical D-MOS transistor in SOT89 envelope and intended for use in relay, high-speed and line-transformer drivers, using SMD-technology.

FEATURES

- Very low $R_{DS(on)}$
- Direct interface to C-MOS, TTL
- High-speed switching
- No second breakdown

QUICK REFERENCE DATA

Drain-source voltage	$-V_{DS}$	max.	60	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	$-I_D$	max.	0,25	A
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Drain-source ON-resistance				
$-I_D$ = 200 mA; $-V_{GS}$ = 10 V	$R_{DS(on)}$	max.	10	Ω
		typ.	7.5	Ω
Transfer admittance				
$-I_D$ = 200 mA; $-V_{DS}$ = 15 V	$\|Y_{fs}\|$	typ.	125	mS

PINNING - SOT89

BST122

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Drain-source voltage	$-V_{DS}$	max.	60	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	$-I_D$	max.	0.25	A
Drain current (peak)	$-I_{DM}$	max.	0.5	A
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	1	W
Storage temperature range	T_{stg}	−65 to +	150	°C
Junction temperature	T_j	max.	150	°C

THERMAL RESISTANCE

From junction to ambient (note 1)	$R_{th\ j\text{-}a}$	=	125	K/W

Note

1. Transistor mounted on a ceramic substrate: area = 2,5 cm^2; thickness = 0,7 mm.

P-channel enhancement mode vertical D-MOS transistor

PowerMOS transistor Logic level TOPFET

BUK100-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

QUICK REFERENCE DATA

SYMBOL	PARAMETER		MAX.	UNIT
V_{DS}	Continuous drain source voltage		50	V
I_D	Continuous drain current		13.5	A
P_D	Total power dissipation		40	W
T_j	Continuous junction temperature		150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		125	mΩ
I_{ISL}	Input supply current	V_{IS} = 5 V	650	µA

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

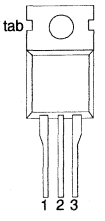
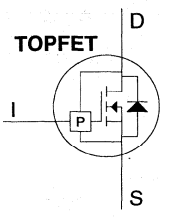
PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	13.5	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; $V_{IS} = 5$ V	-	8.5	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	54	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	40	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	24	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	0.6	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	15	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 15$ A; $V_{DD} \leq 20$ V; inductive load	-	200	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; $I_{DM} = 8$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	20	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2.5	3.1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 1 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 7.5 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	85	125	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.2	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	25	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	60	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 1$ A[5]	150	-	-	°C

TRANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 7.5 A $t_p \leq 300$ µs; $\delta \leq 0.01$	5	9	-	S

1 Continuous input voltage. The specified pulse width is for the drain current.

2 Refer to OVERLOAD PROTECTION LIMITING VALUES.

3 Continuous drain-source supply voltage. Pulsed input voltage.

4 Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

5 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω . Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	8	-	µs
t_r	Rise time	resistive load R_L = 4 Ω	-	40	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	40	-	µs
t_f	Fall time	resistive load R_L = 4 Ω	-	35	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	15	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 15 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

NVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

PowerMOS transistor Logic level TOPFET

BUK100-50GL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Low operating input current
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	0.5	1.2	2.0	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	-	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	4	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 7.5 A $t_p \leq$ 300 µs; $\delta \leq 0.01$	5	9	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	25	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	1.5	-	µs
t_r	Rise time	resistive load R_L = 4 Ω	-	8	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	6	-	µs
t_f	Fall time	resistive load R_L = 4 Ω	-	4.5	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	1.5	-	µs
t_r	Rise time	inductive load I_{DM} = 3 A	-	1	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	10	-	µs
t_f	Fall time	inductive load I_{DM} = 3 A	-	0.5	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq$ 25 °C; V_{IS} = 0 V	-	13.5	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

PowerMOS transistor Logic level TOPFET

BUK101-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER		MAX.	UNIT
V_{DS}	Continuous drain source voltage		50	V
I_D	Continuous drain current		26	A
P_D	Total power dissipation		75	W
T_j	Continuous junction temperature		150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		60	mΩ
I_{ISL}	Input supply current	V_{IS} = 5 V	650	µA

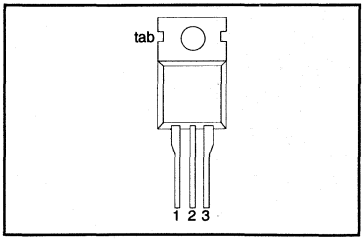
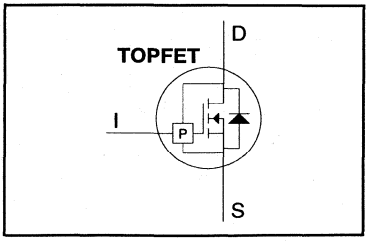
tab	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	26	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; $V_{IS} = 5$ V	-	16	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	100	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	75	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	20	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	1.3	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	26	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 26$ A; $V_{DD} \leq 20$ V; inductive load	-	625	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; $I_{DM} = 8$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	40	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.3	1.67	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 2 A; $t_p \le 300$ µs; $\delta \le 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 13 A; $t_p \le 300$ µs; $\delta \le 0.01$	-	45	60	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.4	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	45	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	105	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \ge 1$ A[5]	150	-	-	°C

TRANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 13 A $t_p \le 300$ µs; $\delta \le 0.01$	10	16	-	S

1 Continuous input voltage. The specified pulse width is for the drain current.

2 Refer to OVERLOAD PROTECTION LIMITING VALUES.

3 Continuous drain-source supply voltage. Pulsed input voltage.

4 Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

5 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	17	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	75	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	60	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	70	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	26	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 26 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	V_{IS} = 5 V; I_{DM} = 13 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	45	60	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	T_{mb} = 25 °C; L ≤ 10 µH				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.4	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 1$ A[2]	150	-	-	°C

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
I_{IS}	Input supply current	V_{IS} = 5 V; normal operation	-	0.2	0.35	mA
V_{ISR}	Protection reset voltage[3]		2.0	2.6	3.5	V
V_{ISR}	Protection reset voltage	T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	0.5	1.2	2.0	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	7	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	4	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 13 A $t_p \leq$ 300 µs; $\delta \leq 0.01$	10	16	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	40	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	2.5	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	15	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	10	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	7	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 10 V; V_{IS} = 5 V	-	2	-	µs
t_r	Rise time	inductive load I_{DM} = 6 A	-	4	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 10 V; V_{IS} = 0 V	-	15	-	µs
t_f	Fall time	inductive load I_{DM} = 6 A	-	1	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq$ 25 °C	-	26	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	I_S = 26 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

1 During overload before short circuit load protection operates.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor Logic level TOPFET

BUK102-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER		MAX.	UNIT
V_{DS}	Continuous drain source voltage		50	V
I_D	Continuous drain current		45	A
P_D	Total power dissipation		125	W
T_j	Continuous junction temperature		150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		35	mΩ
I_{ISL}	Input supply current	V_{IS} = 5 V	650	µA

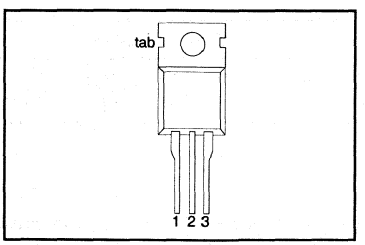
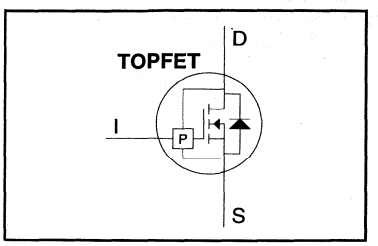
tab	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	45	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; $V_{IS} = 5$ V	-	28	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	180	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	125	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	16	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	2.1	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	45	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 25$ A; $V_{DD} \leq 20$ V; inductive load	-	1	J
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 85$ °C; $I_{DM} = 16$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 4 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 25 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	30	35	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	1.1	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	75	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	200	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 2$ A[5]	150	-	-	°C

TRANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 25 A $t_p \leq 300$ µs; $\delta \leq 0.01$	17	28	-	S

1 Continuous input voltage. The specified pulse width is for the drain current.

2 Refer to OVERLOAD PROTECTION LIMITING VALUES.

3 Continuous drain-source supply voltage. Pulsed input voltage.

4 Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

5 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	30	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	150	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	120	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	120	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	45	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 45 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

PowerMOS transistor Logic level TOPFET

BUK102-50GL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V input level
- Low threshold voltage also allows 5 V control
- Control of power MOSFET and supply of overload protection circuits derived from input
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	V_{IS} = 0 V	-	45	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; I_{DM} = 25 A; $V_{DD} \leq 25$ V; inductive load	-	1	J
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 85$ °C; I_{DM} = 16 A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1.0	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 2 A; $t_p \le 300$ µs; $\delta \le 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	I_{DM} = 25 A; V_{IS} = 5 V; $t_p \le 300$ µs; $\delta \le 0.01$	-	30	35	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	T_{mb} = 25 °C; L ≤ 10 µH				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	1.1	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \ge 2$ A[2]	150	-	-	°C

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
I_{IS}	Input supply current	V_{IS} = 5 V; normal operation	-	0.2	0.35	mA
V_{ISR}	Protection reset voltage[3]		2.0	2.6	3.5	V
V_{ISR}	Protection reset voltage	T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	2	3.8	10	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	-	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	1.5	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 25 A $t_p \leq$ 300 µs; $\delta \leq 0.01$	17	28	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	60	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	2	-	µs
t_r	Rise time	resistive load R_L = 1.1 Ω	-	8	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	8	-	µs
t_f	Fall time	resistive load R_L = 1.1 Ω	-	8	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	3.7	-	µs
t_r	Rise time	inductive load I_{DM} = 11 A	-	3.7	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	13	-	µs
t_f	Fall time	inductive load I_{DM} = 11 A	-	1.4	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq$ 25 °C; V_{IS} = 0 V	-	50	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	I_S = 50 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

1 During overload before short circuit load protection operates.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor
Logic level TOPFET

BUK104-50L/S
BUK104-50LP/SP

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 5 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V
I_D	Continuous drain current	15	A
P_{tot}	Total power dissipation	40	W
T_j	Continuous junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		
	V_{IS} = 5 V	125	mΩ
	V_{IS} = 7 V	100	mΩ
SYMBOL	**PARAMETER**	**NOM.**	**UNIT**
V_{PSN}	Protection supply voltage		
	BUK104-50L	5	V
	BUK104-50S	10	V

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Logic and protection supply from separate pin
- Low operating supply current
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by protection supply
- Protection circuit condition indicated by flag pin
- 5 V logic compatible input level
- Separate input pin for higher frequency drive
- ESD protection on input, flag and protection supply pins
- Over voltage clamping for turn off of inductive loads
- Both linear and switching operation are possible

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.		UNIT
	Voltages					
V_{DSS}	Continuous off-state drain source voltage[1]	V_{IS} = 0 V	-	50		V
V_{IS}	Continuous input voltage	-	0	11		V
V_{FS}	Continuous flag voltage	-	0	11		V
V_{PS}	Continuous supply voltage	-	0	11		V
	Currents	V_{IS} =	-	7	5	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C	-	15	13	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C	-	9.5	8.5	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C	-	60	54	A
	Thermal					
P_{tot}	Total power dissipation	T_{mb} = 25 °C	-	40		W
T_{stg}	Storage temperature	-	-55	150		°C
T_j	Junction temperature[2]	continuous	-	150		°C
T_{sold}	Lead temperature	during soldering	-	250		°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply connected, TOPFET can protect itself from two types of overload - over temperature and short circuit load.

An n-MOS transistor turns on between the input and source to quickly discharge the power MOSFET gate capacitance.

For internal overload protection to remain latched while the control circuit is high, external series input resistance must be provided. Refer to INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.		MAX.	UNIT
		V_{IS} =	7	5	-	V
V_{PSP}	Protection supply voltage[3]	for valid protection				
		BUK104-50L	4.4	4	-	V
		BUK104-50S	5.4	5	-	V
	Over temperature protection	$V_{PS} = V_{PSN}$				
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-		50	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-		50	V
	Short circuit load protection	$V_{PS} = V_{PSN}$; L ≤ 10 µH				
$V_{DDP(P)}$	Protected drain source supply voltage[4]	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-		25	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-		45	V
P_{DSM}	Instantaneous overload dissipation		-		0.8	kW

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The minimum supply voltage required for correct operation of the overload protection circuits.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DRRM}	Repetitive peak clamping drain current	$R_{IS} \geq 100\ \Omega$[1]	-	15	A
E_{DSM}	Non-repetitive inductive turn-off energy[2]	$I_{DM} = 15$ A; $R_{IS} \geq 100\ \Omega$	-	200	mJ
E_{DRM}	Repetitive inductive turn-off energy	$R_{IS} \geq 100\ \Omega$; $T_{mb} \leq 95$ °C; $I_{DM} = 4$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	20	mJ
I_{DIRM}	Repetitive peak drain to input current[3]	$R_{IS} = 0\ \Omega$; $t_p \leq 1$ ms	-	50	mA

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} = 25$ °C; $V_{IS} = V_{PS} = V_{FS} = 0$ V	-	15	A

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2.5	3.1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_D = 10$ mA		50	-	65	V
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_{DM} = 1$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$		50	-	70	V
I_{DSS}	Zero input voltage drain current	$V_{DS} = 12$ V; $V_{IS} = 0$ V		-	0.5	10	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 50$ V; $R_{IS} = 100\ \Omega$;		-	1	20	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 40$ V; $R_{IS} = 100\ \Omega$; $T_j = 125$ °C		-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	$I_{DM} = 7.5$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$	$V_{IS} = 7$ V	-	75	100	mΩ
			$V_{IS} = 5$ V	-	95	125	mΩ

1 The input pin must be connected to the source pin by a specified external resistance to allow the power MOSFET gate source voltage to become sufficiently positive for active clamping. Refer to INPUT CHARACTERISTICS.

2 While the protection supply voltage is connected, during overvoltage clamping it is possible that the overload protection may operate at energies close to the limiting value. Refer to OVERLOAD PROTECTION CHARACTERISTICS.

3 Shorting the input to source with low resistance inhibits the internal overvoltage protection by preventing the power MOSFET gate source voltage becoming positive.

OVERLOAD PROTECTION CHARACTERISTICS

With adequate protection supply voltage TOPFET detects when one of the overload thresholds is exceeded.

Provided there is adequate input series resistance it switches off and remains latched off until reset by the protection supply pin.

Refer also to OVERLOAD PROTECTION LIMITING VALUES and INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	$V_{PS} = V_{PSN}$[2]; $T_{mb} = 25$ °C; $L \leq 10$ µH; $R_I \geq 2$ kΩ				
$E_{DS(TO)}$	Overload threshold energy	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	150	-	mJ
$t_{d\,sc}$	Response time	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	375	-	µs
	Over temperature protection	$V_{PS} = V_{PSN}$; $R_I \geq 2$ kΩ				
$T_{j(TO)}$	Threshold junction temperature	from $I_D \geq 0.65$ A[3]	150	-	-	°C

TRANSFER CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	$V_{DS} = 10$ V; $I_{DM} = 7.5$ A $t_p \leq 300$ µs; $\delta \leq 0.01$	5	9	-	S
I_D	Drain current[4]	$V_{DS} = 13$ V; $V_{IS} = 5$ V	-	25	-	A
		$V_{IS} = 10$ V		40	-	A

PROTECTION SUPPLY CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Protection supply					
I_{PS}, I_{PSL}	Protection supply current	normal operation or protection latched				
		BUK104-50L $V_{PS} = 5$ V	-	0.2	0.35	mA
		BUK104-50S $V_{PS} = 10$ V	-	0.4	1.0	mA
V_{PSR}	Protection reset voltage[5]		1.5	2.5	3.5	V
		$T_j = 150$ °C	1.0	-	-	V
$V_{(CL)PS}$	Protection clamp voltage	$I_P = 1.35$ mA	11	13	-	V

REVERSE DIODE CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	$I_S = 15$ A; $V_{IS} = V_{PS} = V_{FS} = 0$ V; $t_p = 300$ µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[6]	-	-	-	-

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum.

2 At the appropriate nominal protection supply voltage for each type. Refer to QUICK REFERENCE DATA.

3 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

4 During overload condition. Refer also to OVERLOAD PROTECTION LIMITING VALUES and CHARACTERISTICS.

5 The supply voltage below which the overload protection circuits will be reset.

6 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
	Normal operation						
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
			T_{mb} = 150 °C	0.5	-	-	V
I_{IS}	Input current	V_{IS} = 10 V		-	10	100	nA
$V_{(CL)IS}$	Input clamp voltage	I_I = 1 mA		11	13	-	V
	Overload protection latched						
R_{ISL}	Input resistance[1]	V_{PS} = 5 V	I_I = 5 mA;	-	55	-	Ω
			T_{mb} = 150 °C	-	95	-	Ω
		V_{PS} = 10 V	I_I = 5 mA;	-	35	-	Ω
			T_{mb} = 150 °C	-	60	-	Ω
	Application information						
	External input resistances for	(see figure 29)					
R_{IS}	internal overvoltage clamping[2]	R_I = ∞ Ω;	V_{DS} > 30 V	100	-	-	Ω
R_I	internal overload protection[3]	R_{IS} = ∞ Ω;	V_{II} = 5 V	1	-	-	kΩ
			V_{II} = 10 V	2	-	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C; R_I = 50 Ω; R_{IS} = 50 Ω (see figure 29); resistive load R_L = 10 Ω. For waveforms see figure 28.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 15 V; V_{IS}: 0 V ⇒ 10 V	-	8	-	ns
t_r	Rise time		-	13	-	ns
$t_{d\,off}$	Turn-off delay time	V_{DD} = 15 V; V_{IS}: 10 V ⇒ 0 V	-	100	-	ns
t_f	Fall time		-	45	-	ns

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{iss}	Input capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	415	600	pF
C_{oss}	Output capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	275	400	pF
C_{rss}	Reverse transfer capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	55	80	pF
C_{pso}	Protection supply pin capacitance	V_{PS} = 10 V	-	30	-	pF
C_{fso}	Flag pin capacitance	V_{FS} = 10 V; V_{PS} = 0 V	-	20	-	pF

1 The resistance of the internal transistor which discharges the power MOSFET gate capacitance when overload protection operates.
The external drive circuit should be such that the input voltage does not exceed $V_{IS(TO)}$ minimum when the overload protection has operated. Refer also to figure for latched input characteristics.

2 Applications using a lower value for R_{IS} would require external overvoltage protection.

3 For applications requiring a lower value for R_I, an external overload protection strategy is possible using the flag pin to 'tell' the control circuit to switch off the input.

FLAG DESCRIPTION

The flag pin provides a means to detect the presence of the protection supply and indicate the state of the overload detectors. The flag is the open drain of an n-MOS transistor and requires an external pull-up resistor[1]. It is suitable for both 5 V and 10 V logic. Flag may be used to implement an external protection strategy[2] for applications which require low input drive impedance.

TRUTH TABLE

CONDITION	DESCRIPTION	FLAG
NORMAL	Normal operation and adequate protection supply voltage	LOGIC LOW
OVER TEMP.	Over temperature detected	LOGIC HIGH
SHORT CIRCUIT	Overload condition detected	LOGIC HIGH
SUPPLY FAULT	Inadequate protection supply voltage	LOGIC HIGH

FLAG CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Flag 'low'	normal operation				
V_{FS}	Flag voltage	I_F = 1.6 mA	-	0.15	0.4	V

PowerMOS transistor
Logic level TOPFET

BUK106-50L/S
BUK106-50LP/SP

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 5 pin plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V
I_D	Continuous drain current	50	A
P_{tot}	Total power dissipation	125	W
T_j	Continuous junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		
	V_{IS} = 5 V	35	mΩ
	V_{IS} = 8 V	28	mΩ
SYMBOL	**PARAMETER**	**NOM.**	**UNIT**
V_{PSN}	Protection supply voltage		
	BUK106-50L	5	V
	BUK106-50S	10	V

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Logic and protection supply from separate pin
- Low operating supply current
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by protection supply
- Protection circuit condition indicated by flag pin
- 5 V logic compatible input level
- Separate input pin for higher frequency drive
- ESD protection on input, flag and protection supply pins
- Over voltage clamping for turn off of inductive loads
- Both linear and switching operation are possible

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.		UNIT
	Voltages					
V_{DSS}	Continuous off-state drain source voltage[1]	V_{IS} = 0 V	-	50		V
V_{IS}	Continuous input voltage	-	0	11		V
V_{FS}	Continuous flag voltage	-	0	11		V
V_{PS}	Continuous supply voltage	-	0	11		V
	Currents	V_{IS} =	-	8	5	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C	-	50	45	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C	-	31	28	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C	-	200	180	A
	Thermal					
P_{tot}	Total power dissipation	T_{mb} = 25 °C	-	125		W
T_{stg}	Storage temperature	-	-55	150		°C
T_j	Junction temperature[2]	continuous	-	150		°C
T_{sold}	Lead temperature	during soldering	-	250		°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply connected, TOPFET can protect itself from two types of overload - over temperature and short circuit load.

An n-MOS transistor turns on between the input and source to quickly discharge the power MOSFET gate capacitance.

For internal overload protection to remain latched while the control circuit is high, external series input resistance must be provided. Refer to INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.		MAX.	UNIT
		V_{IS} =	8	5	-	V
V_{PSP}	Protection supply voltage[3]	for valid protection				
		BUK106-50L	4.4	4	-	V
		BUK106-50S	5.4	5	-	V
	Over temperature protection	$V_{PS} = V_{PSN}$				
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-		50	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-		50	V
	Short circuit load protection	$V_{PS} = V_{PSN}$; L ≤ 10 µH				
$V_{DDP(P)}$	Protected drain source supply voltage[4]	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-		24	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-		45	V
P_{DSM}	Instantaneous overload dissipation		-		4	kW

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The minimum supply voltage required for correct operation of the overload protection circuits.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DRRM}	Repetitive peak clamping drain current	$R_{IS} \geq 100\ \Omega$[1]	-	50	A
E_{DSM}	Non-repetitive inductive turn-off energy[2]	$I_{DM} = 27$ A; $R_{IS} \geq 100\ \Omega$	-	1	J
E_{DRM}	Repetitive inductive turn-off energy	$R_{IS} \geq 100\ \Omega$; $T_{mb} \leq 85$ °C; $I_{DM} = 16$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ
I_{DIRM}	Repetitive peak drain to input current[3]	$R_{IS} = 0\ \Omega$; $t_p \leq 1$ ms	-	50	mA

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} = 25$ °C; $V_{IS} = V_{PS} = V_{FS} = 0$ V	-	50	A

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1.0	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	-	K/W

STATIC CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_D = 10$ mA		50	-	65	V
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_{DM} = 1$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$		50	-	70	V
I_{DSS}	Zero input voltage drain current	$V_{DS} = 12$ V; $V_{IS} = 0$ V		-	0.5	10	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 50$ V; $R_{IS} = 100\ \Omega$;		-	1	20	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 40$ V; $R_{IS} = 100\ \Omega$; $T_j = 125$ °C		-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	$I_{DM} = 25$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$	$V_{IS} = 8$ V	-	22	28	mΩ
			$V_{IS} = 5$ V	-	28	35	mΩ

1 The input pin must be connected to the source pin by a specified external resistance to allow the power MOSFET gate source voltage to become sufficiently positive for active clamping. Refer to INPUT CHARACTERISTICS.

2 While the protection supply voltage is connected, during overvoltage clamping it is possible that the overload protection may operate at energies close to the limiting value. Refer to OVERLOAD PROTECTION CHARACTERISTICS.

3 Shorting the input to source with low resistance inhibits the internal overvoltage protection by preventing the power MOSFET gate source voltage becoming positive.

OVERLOAD PROTECTION CHARACTERISTICS

With adequate protection supply voltage TOPFET detects when one of the overload thresholds is exceeded.

Provided there is adequate input series resistance it switches off and remains latched off until reset by the protection supply pin.

Refer also to OVERLOAD PROTECTION LIMITING VALUES and INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	$V_{PS} = V_{PSN}$[2]; $T_{mb} = 25$ °C; $L \leq 10$ µH				
$E_{DS(TO)}$	Overload threshold energy	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	550	-	mJ
$t_{d\,sc}$	Response time	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	0.4	-	ms
	Over temperature protection	$V_{PS} = V_{PSN}$				
$T_{j(TO)}$	Threshold junction temperature	from $I_D \geq 2.5$ A[3]	150	-	-	°C

TRANSFER CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	$V_{DS} = 12$ V; $I_{DM} = 25$ A $t_p \leq 300$ µs; $\delta \leq 0.01$	17	28	-	S
I_D	Drain current[4]	$V_{DS} = 13$ V; $V_{IS} = 5$ V	-	80	-	A
		$V_{IS} = 10$ V		160	-	A

PROTECTION SUPPLY CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Protection supply					
I_{PS}, I_{PSL}	Protection supply current	normal operation or protection latched				
		BUK106-50L $V_{PS} = 5$ V	-	0.2	0.35	mA
		BUK106-50S $V_{PS} = 10$ V	-	0.4	1.0	mA
V_{PSR}	Protection reset voltage[5]		1.5	2.5	3.5	V
		$T_j = 150$ °C	1.0	-	-	V
$V_{(CL)PS}$	Protection clamp voltage	$I_P = 1.35$ mA	11	13	-	V

REVERSE DIODE CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	$I_S = 20$ A; $V_{IS} = V_{PS} = V_{FS} = 0$ V; $t_p = 300$ µs	-	0.9	1.2	V
t_{rr}	Reverse recovery time	not applicable[6]	-	-	-	-

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum.

2 At the appropriate nominal protection supply voltage for each type. Refer to QUICK REFERENCE DATA.

3 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

4 During overload condition. Refer also to OVERLOAD PROTECTION LIMITING VALUES and CHARACTERISTICS.

5 The supply voltage below which the overload protection circuits will be reset.

6 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
	Normal operation						
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
			T_{mb} = 150 °C	0.5	-	-	V

			T_{mb} = 150 °C	-	95	-	Ω
		V_{PS} = 10 V	I_I = 5 mA;	-	35	-	Ω
			T_{mb} = 150 °C	-	60	-	Ω
	Application information						
	External input resistances for	(see figure 29)					
R_{IS}	internal overvoltage clamping[2]	R_I = ∞ Ω;	V_{DS} > 30 V	100	-	-	Ω
R_I	internal overload protection[3]	R_{IS} = ∞ Ω;	V_{II} = 5 V	1	-	-	kΩ
			V_{II} = 10 V	2	-	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C; R_I = 50 Ω; R_{IS} = 50 Ω (see figure 29); resistive load R_L = 10 Ω. For waveforms see figure 28.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 15 V; V_{IS}: 0 V ⇒ 10 V	-	10	-	ns
t_r	Rise time		-	35	-	ns
$t_{d\,off}$	Turn-off delay time	V_{DD} = 15 V; V_{IS}: 10 V ⇒ 0 V	-	280	-	ns
t_f	Fall time		-	120	-	ns

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{iss}	Input capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	1250	1800	pF
C_{oss}	Output capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	650	1000	pF
C_{rss}	Reverse transfer capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	150	250	pF
C_{pso}	Protection supply pin capacitance	V_{PS} = 10 V	-	30	-	pF
C_{fso}	Flag pin capacitance	V_{FS} = 10 V; V_{PS} = 0 V	-	20	-	pF

1 The resistance of the internal transistor which discharges the power MOSFET gate capacitance when overload protection operates.
The external drive circuit should be such that the input voltage does not exceed $V_{IS(TO)}$ minimum when the overload protection has operated. Refer also to figure for latched input characteristics.

2 Applications using a lower value for R_{IS} would require external overvoltage protection.

3 For applications requiring a lower value for R_I, an external overload protection strategy is possible using the flag pin to 'tell' the control circuit to switch off the input.

FLAG DESCRIPTION

The flag pin provides a means to detect the presence of the protection supply and indicate the state of the overload detectors. The flag is the open drain of an n-MOS transistor and requires an external pull-up resistor[1]. It is suitable for both 5 V and 10 V logic. Flag may be used to implement an external protection strategy[2] for applications which require low input drive impedance.

TRUTH TABLE

CONDITION	DESCRIPTION	FLAG
NORMAL	Normal operation and adequate protection supply voltage	LOGIC LOW
OVER TEMP.	Over temperature detected	LOGIC HIGH
SHORT CIRCUIT	Overload condition detected	LOGIC HIGH
SUPPLY FAULT	Inadequate protection supply voltage	LOGIC HIGH

PowerMOS transistor Logic level TOPFET

BUK107-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic overload protected logic level power MOSFET in a surface mount plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- small motors
- solenoids

FEATURES

- Vertical power DMOS output stage
- Overload protected up to 85˚C ambient
- Overload protection by current limiting and overtemperature sensing
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Low operating input current permits direct drive by micro-controller
- ESD protection on all pins
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V
I_D	Continuous drain current	0.7	A
P_D	Total power dissipation	1.8	W
T_j	Continuous junction temperature	150	˚C
$R_{DS(ON)}$	Drain-source on-state resistance	200	mΩ

FUNCTIONAL BLOCK DIAGRAM

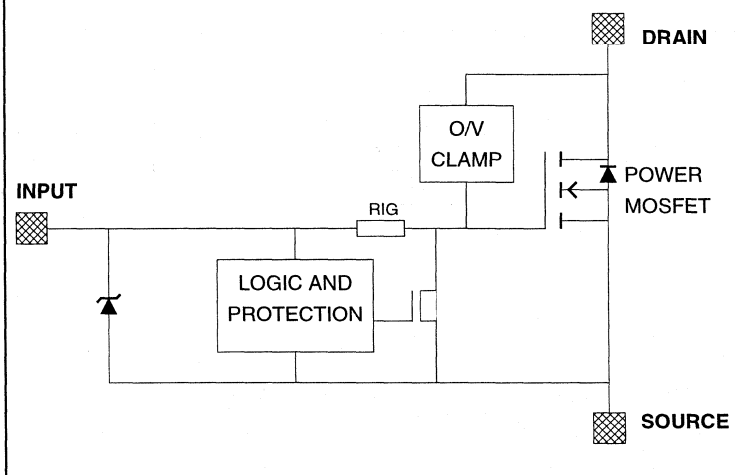

Fig.1. Elements of the TOPFET.

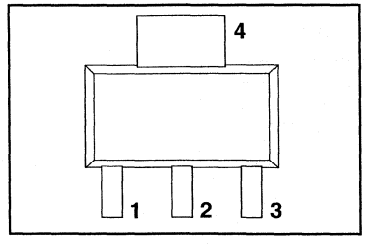
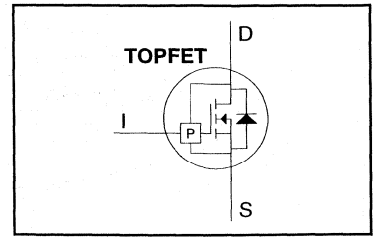
PINNING - SOT223

PIN	DESCRIPTION
1	input
2	drain
3	source
4	drain (tab)

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
I_D	Continuous drain current[2]	-	-	self limiting	A
I_I	Continuous input current	clamping	-	3	mA
I_{IRM}	Non-repetitive peak input current	$t_p \leq 1$ ms	-	10	mA
P_D	Total power dissipation	$T_{amb} = 25$ °C	-	1.8	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature	normal operation[3]	-	150	°C

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
E_{DSM}	Non-repetitive clamping energy	$T_b \leq 25$ °C; $I_{DM} < I_{D(lim)}$; inductive load	-	100	mJ
E_{DRM}	Repetitive clamping energy	$T_b \leq 75$ °C; $I_{DM} = 50$ mA; f = 250 Hz	-	4	mJ

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from short circuit loads.
Overload protection operates by means of drain current limiting and activating the overtemperature protection.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DDP}	Protected drain source supply voltage	$V_{IS} = 5$ V	-	35	V
		$V_{IS} = 4$ V	-	16	V

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off to protect itself when there is an overload fault condition.
It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Overload protection					
$I_{D(lim)}$	Drain current limiting	$V_{IS} = 5$ V	0.7	1.1	1.5	A
	Overtemperature protection	only in drain current limiting				
$T_{j(TO)}$	Threshold junction temperature	$V_{IS} = 5$ V	100	130	160	°C

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 Refer to OVERLOAD PROTECTION CHARACTERISTICS.

3 **Not** in an overload condition with drain current limiting.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}sp}$	Junction to solder point		-	12	18	K/W
$R_{th\ j\text{-}b}$	Junction to board[1]	Mounted on any PCB	-	40	-	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	Mounted on PCB of fig. 19	-	-	70	K/W

STATIC CHARACTERISTICS

T_b = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	55	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 200 mA; $t_p \le 300\ \mu s$; $\delta \le 0.01$	-	56	70	V
I_{DSS}	Off-state drain current	V_{DS} = 45 V; V_{IS} = 0 V	-	0.5	2	µA
I_{DSS}	Off-state drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Off-state drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 100 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[2]	V_{IS} = 5 V; I_{DM} = 100 mA; $t_p \le 300\ \mu s$; $\delta \le 0.01$	-	150	200	mΩ

INPUT CHARACTERISTICS

T_b = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.7	2.2	2.7	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	-	330	450	µA
			V_{IS} = 4 V	-	170	270	µA
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	500	650	µA
			V_{IS} = 3.5 V	-	250	400	µA
V_{ISR}	Protection latch reset voltage[3]			1	2.2	3.5	V
$V_{(CL)IS}$	Input clamping voltage	I_I = 1.5 mA		6	7.5	-	V
R_{IG}	Input series resistance	to gate of power MOSFET		-	33	-	kΩ

SWITCHING CHARACTERISTICS

T_{amb} = 25 °C; resistive load R_L = 50 Ω; adjust V_{DD} to obtain I_D = 250 mA; refer to test circuit and waveforms

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\ on}$	Turn-on delay time	V_{IS} = 0 V to V_{IS} = 5 V	-	8	-	µs
t_r	Rise time		-	30	-	µs
$t_{d\ off}$	Turn-off delay time	V_{IS} = 5 V to V_{IS} = 0 V	-	3	-	µs
t_f	Fall time		-	6	-	µs

1 Temperature measured 1.3 mm from tab.

2 Continuous input voltage. The specified pulse width is for the drain current.

3 The input voltage below which the overload protection circuits will be reset.

PowerMOS transistor Logic level TOPFET

BUK108-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic surface mount envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

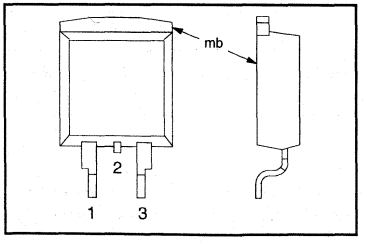
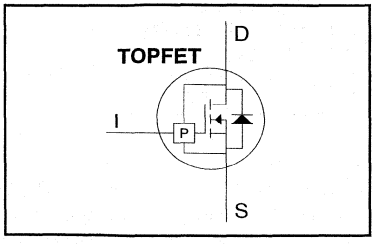
PINNING - SOT404

PIN	DESCRIPTION
1	input
2	drain
3	source
mb	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	13.5	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; $V_{IS} = 5$ V	-	8.5	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	54	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	40	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	24	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	0.6	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	15	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 15$ A; $V_{DD} \leq 20$ V; inductive load	-	200	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; $I_{DM} = 8$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	20	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2.5	3.1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB (see fig. 23)	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 1 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 7.5 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	85	125	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.2	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	25	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	60	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 0.5$ A[5]	150	-	-	°C

TRANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 7.5 A $t_p \leq 300$ µs; $\delta \leq 0.01$	5	9	-	S

1 Continuous input voltage. The specified pulse width is for the drain current.

2 Refer to OVERLOAD PROTECTION LIMITING VALUES.

3 Continuous drain-source supply voltage. Pulsed input voltage.

4 Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

5 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	8	-	µs
t_r	Rise time	resistive load R_L = 4 Ω	-	40	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	40	-	µs
t_f	Fall time	resistive load R_L = 4 Ω	-	35	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq$ 25 °C; V_{IS} = 0 V	-	15	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 15 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor Logic level TOPFET

BUK108-50GL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic surface mount envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Low operating input current
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V
I_D	Continuous drain current	13.5	A
P_D	Total power dissipation	40	W
T_j	Continuous junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance V_{IS} = 5 V	125	mΩ

FUNCTIONAL BLOCK DIAGRAM

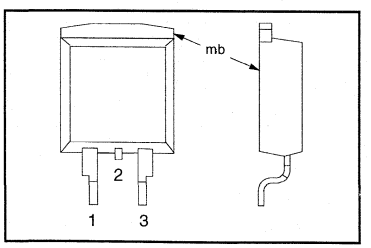
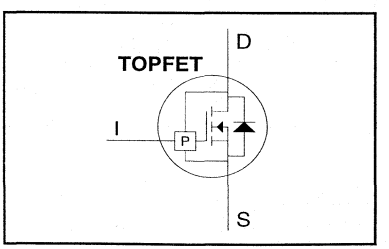
PINNING - SOT404

PIN	DESCRIPTION
1	input
2	drain
3	source
mb	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DSS}	Continuous off-state drain source voltage[1]	V_{IS} = 0 V	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	13.5	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; V_{IS} = 5 V	-	8.5	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	54	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	40	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 5 V	-	50	V
	Short circuit load protection				
$V_{DDP(P)}$	Protected drain source supply voltage[4]	V_{IS} = 5 V	-	35	V
P_{DSM}	Instantaneous overload dissipation	T_{mb} = 25 °C	-	0.6	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	V_{IS} = 0 V	-	15	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; I_{DM} = 15 A; $V_{DD} \leq 20$ V; inductive load	-	200	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; I_{DM} = 4 A; $V_{DD} \leq 20$ V; f = 250 Hz	-	20	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2.5	3.1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB (see fig. 32)	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 1 A; $t_p \leq 300\ \mu s$; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	V_{IS} = 5 V; I_{DM} = 7.5 A; $t_p \leq 300\ \mu s$; $\delta \leq 0.01$	-	85	125	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	T_{mb} = 25 °C; L ≤ 10 µH				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.2	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 0.5$ A[2]	150	-	-	°C

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
I_{IS}	Input supply current	V_{IS} = 5 V; normal operation	-	0.2	0.35	mA
V_{ISR}	Protection reset voltage[3]		2.0	2.6	3.5	V
V_{ISR}	Protection reset voltage	T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	0.5	1.2	2.0	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	-	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	4	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 7.5 A $t_p \leq 300$ µs; $\delta \leq 0.01$	5	9	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	25	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_i = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	1.5	-	µs
t_r	Rise time	resistive load R_L = 4 Ω	-	8	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	6	-	µs
t_f	Fall time	resistive load R_L = 4 Ω	-	4.5	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	1.5	-	µs
t_r	Rise time	inductive load I_{DM} = 3 A	-	1	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	10	-	µs
t_f	Fall time	inductive load I_{DM} = 3 A	-	0.5	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	13.5	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	I_S = 15 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 During overload before short circuit load protection operates.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor Logic level TOPFET

BUK109-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic surface mount envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	20	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	1.3	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	26	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 26$ A; $V_{DD} \leq 20$ V; inductive load	-	625	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; $I_{DM} = 8$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	40	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.3	1.67	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB (see fig. 23)	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 2 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 13 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	45	60	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.4	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	45	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	105	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 1$ A[5]	150	-	-	°C

TRANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 13 A $t_p \leq 300$ µs; $\delta \leq 0.01$	10	16	-	S

1 Continuous input voltage. The specified pulse width is for the drain current.

2 Refer to OVERLOAD PROTECTION LIMITING VALUES.

3 Continuous drain-source supply voltage. Pulsed input voltage.

4 Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

5 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	17	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	75	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	60	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	70	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	26	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 26 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor Logic level TOPFET

BUK109-50GL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic surface mount envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Low operating input current
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V
I_D	Continuous drain current	26	A
P_D	Total power dissipation	75	W
T_j	Continuous junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance V_{IS} = 5 V	60	mΩ

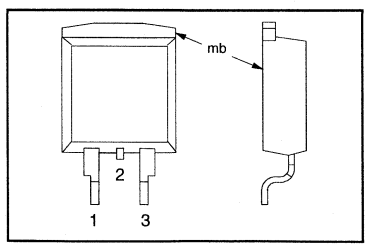
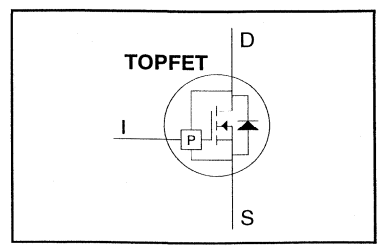
PINNING - SOT404

PIN	DESCRIPTION
1	input
2	drain
3	source
mb	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DSS}	Continuous off-state drain source voltage	V_{IS} = 0 V	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	26	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; V_{IS} = 5 V	-	16	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	100	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	75	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[1]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[2]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 5 V	-	50	V
	Short circuit load protection				
$V_{DDP(P)}$	Protected drain source supply voltage[3]	V_{IS} = 5 V	-	35	V
P_{DSM}	Instantaneous overload dissipation	T_{mb} = 25 °C	-	1.3	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	V_{IS} = 0 V	-	26	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; I_{DM} = 26 A; $V_{DD} \leq 20$ V; inductive load	-	625	mJ
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 95$ °C; I_{DM} = 8 A; $V_{DD} \leq 20$ V; f = 250 Hz	-	40	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

2 The input voltage for which the overload protection circuits are functional.

3 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.3	1.67	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB (see fig. 32)	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 2 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	V_{IS} = 5 V; I_{DM} = 13 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	45	60	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	T_{mb} = 25 °C; L ≤ 10 µH				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	0.4	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 1$ A[2]	150	-	-	°C

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
I_{IS}	Input supply current	V_{IS} = 5 V; normal operation	-	0.2	0.35	mA
V_{ISR}	Protection reset voltage[3]		2.0	2.6	3.5	V
V_{ISR}	Protection reset voltage	T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	0.5	1.2	2.0	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	7	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	4	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 13 A $t_p \leq 300$ µs; $\delta \leq 0.01$	10	16	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	40	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	2.5	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	15	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	10	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	7	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 10 V; V_{IS} = 5 V	-	2	-	µs
t_r	Rise time	inductive load I_{DM} = 6 A	-	4	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 10 V; V_{IS} = 0 V	-	15	-	µs
t_f	Fall time	inductive load I_{DM} = 6 A	-	1	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C	-	26	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	I_S = 26 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 During overload before short circuit load protection operates.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

PowerMOS transistor Logic level TOPFET

BUK110-50DL

For maintenance only. Do not use for design-in.

DESCRIPTION

lonolithic temperature and verload protected logic level power IOSFET in a 3 pin plastic surface ount envelope, intended as a eneral purpose switch for utomotive systems and other pplications.

APPLICATIONS

eneral controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V logic compatible input level
- Control of power MOSFET and supply of overload protection circuits derived from input
- Lower operating input current permits direct drive by micro-controller
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER		MAX.	UNIT
V_{DS}	Continuous drain source voltage		50	V
I_D	Continuous drain current		45	A
P_D	Total power dissipation		125	W
T_j	Continuous junction temperature		150	°C
$R_{DS(ON)}$	Drain-source on-state resistance		35	mΩ
I_{ISL}	Input supply current	V_{IS} = 5 V	650	μA

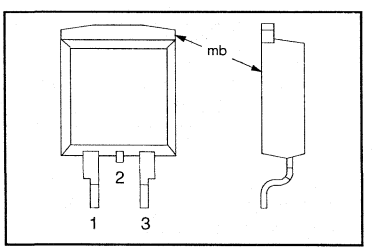
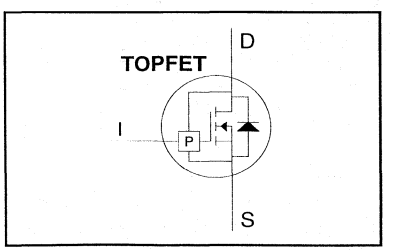
PINNING - SOT404

PIN	DESCRIPTION
1	input
2	drain
3	source
mb	drain

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Continuous drain source voltage[1]	-	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	45	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; $V_{IS} = 5$ V	-	28	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; $V_{IS} = 5$ V	-	180	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	125	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	$V_{IS} = 5$ V	-	50	V
	Short circuit load protection[4]				
$V_{DDP(P)}$	Protected drain source supply voltage[5]	$V_{IS} = 5$ V	-	16	V
P_{DSM}	Instantaneous overload dissipation	$T_{mb} = 25$ °C	-	2.1	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	$V_{IS} = 0$ V	-	45	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; $I_{DM} = 25$ A; $V_{DD} \leq 20$ V; inductive load	-	1	J
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 85$ °C; $I_{DM} = 16$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

5 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than $V_{DDP(P)}$ maximum.

HERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB	-	50	-	K/W

TATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 4 A; $t_p \leq 300\ \mu s$; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance[1]	V_{IS} = 5 V; I_{DM} = 25 A; $t_p \leq 300\ \mu s$; $\delta \leq 0.01$	-	30	35	mΩ

VERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[2]	T_{mb} = 25 °C; L ≤ 10 µH; R_L = 10 mΩ				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	1.1	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
$I_{D(SC)}$	Drain current[3]	V_{DD} = 13 V; V_{IS} = 5 V	-	75	-	A
$I_{DM(SC)}$	Peak drain current[4]	V_{IS} = 5 V; V_{DD} = 13 V	-	200	-	A
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 2$ A[5]	150	-	-	°C

RANSFER CHARACTERISTIC

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 25 A $t_p \leq 300\ \mu s$; $\delta \leq 0.01$	17	28	-	S

Continuous input voltage. The specified pulse width is for the drain current.

: Refer to OVERLOAD PROTECTION LIMITING VALUES.

Continuous drain-source supply voltage. Pulsed input voltage.

Continuous input voltage. Momentary short circuit load connection. (The higher peak current is due to the effect of capacitance Cgd).

The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
I_{IS}	Input supply current	normal operation;	V_{IS} = 5 V	100	200	350	µA
			V_{IS} = 4 V	-	160	270	µA
V_{ISR}	Protection reset voltage[1]		T_j = 25 °C	2.0	2.6	3.5	V
			T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	protection latched;	V_{IS} = 5 V	-	330	650	µA
			V_{IS} = 3.5 V	-	240	430	µA
$V_{(BR)IS}$	Input breakdown voltage	I_I = 10 mA		6	-	-	V
R_{IG}	Input series resistance		T_j = 25 °C	-	33	-	kΩ
	to gate of power MOSFET		T_j = 150 °C	-	50	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figure and test circuit.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	30	-	µs
t_r	Rise time	resistive load R_L = 2.1 Ω	-	150	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	120	-	µs
t_f	Fall time	resistive load R_L = 2.1 Ω	-	120	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq 25$ °C; V_{IS} = 0 V	-	45	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDO}	Forward voltage	I_S = 45 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 The input voltage below which the overload protection circuits will be reset.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

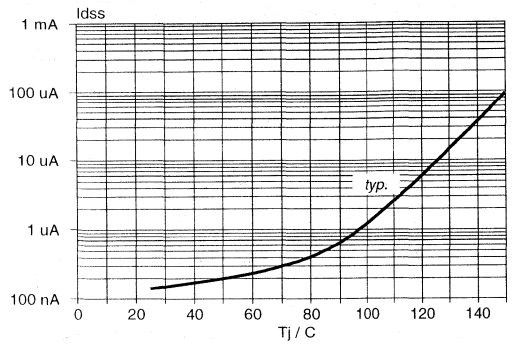

Fig.20. Typical off-state leakage current. $I_{DSS} = f(T_j)$; Conditions: V_{DS} = 40 V; I_S = 0 V.

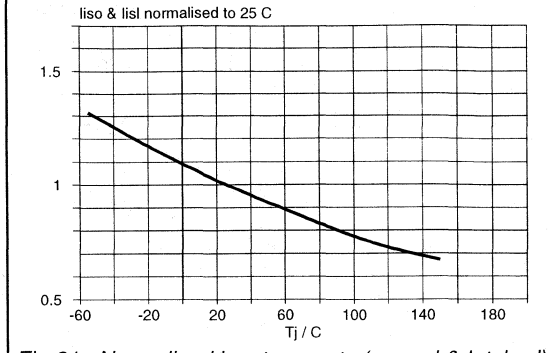

Fig.21. Normalised input currents (normal & latched). $I_{ISO}/I_{ISO}25^{\circ}C$ & $I_{ISL}/I_{ISL}25^{\circ}C = f(T_j)$; V_{IS} = 5 V

PowerMOS transistor Logic level TOPFET

BUK110-50GL

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 3 pin plastic surface mount envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by input
- 5 V input level
- Low threshold voltage also allows 5 V control
- Control of power MOSFET and supply of overload protection circuits derived from input
- ESD protection on input pin
- Overvoltage clamping for turn off of inductive loads

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Continuous drain source voltage	50	V

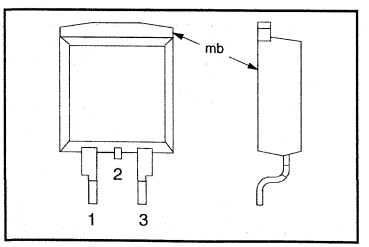
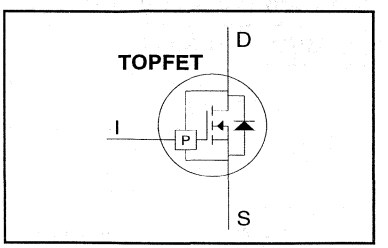
PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DSS}	Continuous off-state drain source voltage[1]	V_{IS} = 0 V	-	50	V
V_{IS}	Continuous input voltage	-	0	6	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	45	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C; V_{IS} = 5 V	-	28	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C; V_{IS} = 5 V	-	180	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	125	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Continuous junction temperature[2]	normal operation	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply provided via the input pin, TOPFET can protect itself from two types of overload.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{ISP}	Protection supply voltage[3]	for valid protection	4	-	V
	Over temperature protection				
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 5 V	-	50	V
	Short circuit load protection				
$V_{DDP(P)}$	Protected drain source supply voltage[4]	V_{IS} = 5 V	-	24	V
P_{DSM}	Instantaneous overload dissipation	T_{mb} = 25 °C	-	2.1	kW

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DROM}	Repetitive peak clamping current	V_{IS} = 0 V	-	45	A
E_{DSM}	Non-repetitive clamping energy	$T_{mb} \leq 25$ °C; I_{DM} = 25 A; $V_{DD} \leq 25$ V; inductive load	-	1	J
E_{DRM}	Repetitive clamping energy	$T_{mb} \leq 85$ °C; I_{DM} = 16 A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The input voltage for which the overload protection circuits are functional.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1.0	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	minimum footprint FR4 PCB	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_D = 10 mA	50	-	-	V
$V_{(CL)DSS}$	Drain-source clamping voltage	V_{IS} = 0 V; I_{DM} = 4 A; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	-	70	V
I_{DSS}	Zero input voltage drain current	V_{DS} = 12 V; V_{IS} = 0 V	-	0.5	10	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 50 V; V_{IS} = 0 V	-	1	20	µA
I_{DSS}	Zero input voltage drain current	V_{DS} = 40 V; V_{IS} = 0 V; T_j = 125 °C	-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	I_{DM} = 25 A; V_{IS} = 5 V; $t_p \leq 300$ µs; $\delta \leq 0.01$	-	30	35	mΩ

OVERLOAD PROTECTION CHARACTERISTICS

TOPFET switches off when one of the overload thresholds is reached. It remains latched off until reset by the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	T_{mb} = 25 °C; L ≤ 10 µH				
$E_{DS(TO)}$	Overload threshold energy	V_{DD} = 13 V; V_{IS} = 5 V	-	1.1	-	J
$t_{d\ sc}$	Response time	V_{DD} = 13 V; V_{IS} = 5 V	-	0.8	-	ms
	Over temperature protection					
$T_{j(TO)}$	Threshold junction temperature	V_{IS} = 5 V; from $I_D \geq 2$ A[2]	150	-	-	°C

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified. The supply for the logic and overload protection is taken from the input.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
I_{IS}	Input supply current	V_{IS} = 5 V; normal operation	-	0.2	0.35	mA
V_{ISR}	Protection reset voltage[3]		2.0	2.6	3.5	V
V_{ISR}	Protection reset voltage	T_j = 150 °C	1.0	-	-	
I_{ISL}	Input supply current	V_{IS} = 5 V; protection latched	2	3.8	10	mA
$V_{(BR)IS}$	Input clamp voltage	I_I = 10 mA	6	-	-	V
R_{IG}	Input series resistance	to gate of power MOSFET	-	1.5	-	kΩ

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum. Refer to OVERLOAD PROTECTION LIMITING VALUES.

2 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

3 The input voltage below which the overload protection circuits will be reset.

TRANSFER CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 10 V; I_{DM} = 25 A $t_p \leq$ 300 µs; $\delta \leq 0.01$	17	28	-	S
$I_{D(SC)}$	Drain current[1]	V_{DS} = 13 V; V_{IS} = 5 V	-	60	-	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C. R_I = 50 Ω. Refer to waveform figures and test circuits.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	2	-	µs
t_r	Rise time	resistive load R_L = 1.1 Ω	-	8	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	8	-	µs
t_f	Fall time	resistive load R_L = 1.1 Ω	-	8	-	µs
$t_{d\,on}$	Turn-on delay time	V_{DD} = 13 V; V_{IS} = 5 V	-	3.7	-	µs
t_r	Rise time	inductive load I_{DM} = 11 A	-	3.7	-	µs
$t_{d\,off}$	Turn-off delay time	V_{DD} = 13 V; V_{IS} = 0 V	-	13	-	µs
t_f	Fall time	inductive load I_{DM} = 11 A	-	1.4	-	µs

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} \leq$ 25 °C; V_{IS} = 0 V	-	50	A

REVERSE DIODE CHARACTERISTICS

T_{mb} = 25 °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	I_S = 50 A; V_{IS} = 0 V; t_p = 300 µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[2]	-	-	-	-

ENVELOPE CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
L_d	Internal drain inductance	Measured from upper edge of tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

1 During overload before short circuit load protection operates.

2 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

Logic level TOPFET
SMD version of BUK104-50L/S

BUK114-50L/S

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected logic level power MOSFET in a 5 pin surface mounting plastic envelope, intended as a general purpose switch for automotive systems and other applications.

APPLICATIONS

General controller for driving
- lamps
- motors
- solenoids
- heaters

FEATURES

- Vertical power DMOS output stage
- Low on-state resistance
- Logic and protection supply from separate pin
- Low operating supply current
- Overload protection against over temperature
- Overload protection against short circuit load
- Latched overload protection reset by protection supply
- Protection circuit condition indicated by flag pin
- 5 V logic compatible input level
- Separate input pin for higher frequency drive
- ESD protection on input, flag and protection supply pins
- Over voltage clamping for turn off of inductive loads
- Both linear and switching operation are possible

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Voltages				
V_{DSS}	Continuous off-state drain source voltage[1]	V_{IS} = 0 V	-	50	V
V_{IS}	Continuous input voltage	-	0	11	V
V_{FS}	Continuous flag voltage	-	0	11	V
V_{PS}	Continuous supply voltage	-	0	11	V
	Currents	V_{IS} =	-	7 | 5	V
I_D	Continuous drain current	$T_{mb} \leq 25$ °C	-	15 | 13	A
I_D	Continuous drain current	$T_{mb} \leq 100$ °C	-	9.5 | 8.5	A
I_{DRM}	Repetitive peak on-state drain current	$T_{mb} \leq 25$ °C	-	60 | 54	A
	Thermal				
P_{tot}	Total power dissipation	T_{mb} = 25 °C	-	40	W
T_{stg}	Storage temperature	-	-55	150	°C
T_j	Junction temperature[2]	continuous	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C

OVERLOAD PROTECTION LIMITING VALUES

With the protection supply connected, TOPFET can protect itself from two types of overload - over temperature and short circuit load.

An n-MOS transistor turns on between the input and source to quickly discharge the power MOSFET gate capacitance.

For internal overload protection to remain latched while the control circuit is high, external series input resistance must be provided. Refer to INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
		V_{IS} =	7 | 5	-	V
V_{PSP}	Protection supply voltage[3]	for valid protection			
		BUK114-50L	4.4 | 4	-	V
		BUK114-50S	5.4 | 5	-	V
	Over temperature protection	$V_{PS} = V_{PSN}$			
$V_{DDP(T)}$	Protected drain source supply voltage	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-	50	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-	50	V
	Short circuit load protection	$V_{PS} = V_{PSN}$; L ≤ 10 µH			
$V_{DDP(P)}$	Protected drain source supply voltage[4]	V_{IS} = 10 V; $R_I \geq 2$ kΩ	-	25	V
		V_{IS} = 5 V; $R_I \geq 1$ kΩ	-	45	V
P_{DSM}	Instantaneous overload dissipation		-	0.8	kW

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The minimum supply voltage required for correct operation of the overload protection circuits.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DRRM}	Repetitive peak clamping drain current	$R_{IS} \geq 100\ \Omega$[1]	-	15	A
E_{DSM}	Non-repetitive inductive turn-off energy[2]	$I_{DM} = 15$ A; $R_{IS} \geq 100\ \Omega$	-	200	mJ
E_{DRM}	Repetitive inductive turn-off energy	$R_{IS} \geq 100\ \Omega$; $T_{mb} \leq 95$ °C; $I_{DM} = 4$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	20	mJ
I_{DIRM}	Repetitive peak drain to input current[3]	$R_{IS} = 0\ \Omega$; $t_p \leq 1$ ms	-	50	mA

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} = 25$ °C; $V_{IS} = V_{PS} = V_{FS} = 0$ V	-	15	A

THERMAL CHARACTERISTIC

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2.5	3.1	K/W

STATIC CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_D = 10$ mA		50	-	65	V
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_{DM} = 1$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$		50	-	70	V
I_{DSS}	Zero input voltage drain current	$V_{DS} = 12$ V; $V_{IS} = 0$ V		-	0.5	10	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 50$ V; $R_{IS} = 100\ \Omega$;		-	1	20	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 40$ V; $R_{IS} = 100\ \Omega$; $T_j = 125$ °C		-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	$I_{DM} = 7.5$ A; $t_p \leq 300\ \mu$s; $\delta \leq 0.01$	$V_{IS} = 7$ V	-	75	100	mΩ
			$V_{IS} = 5$ V	-	95	125	mΩ

1 The input pin must be connected to the source pin by a specified external resistance to allow the power MOSFET gate source voltage to become sufficiently positive for active clamping. Refer to INPUT CHARACTERISTICS.

2 While the protection supply voltage is connected, during overvoltage clamping it is possible that the overload protection may operate at energies close to the limiting value. Refer to OVERLOAD PROTECTION CHARACTERISTICS.

3 Shorting the input to source with low resistance inhibits the internal overvoltage protection by preventing the power MOSFET gate source voltage becoming positive.

OVERLOAD PROTECTION CHARACTERISTICS

With adequate protection supply voltage TOPFET detects when one of the overload thresholds is exceeded.

Provided there is adequate input series resistance it switches off and remains latched off until reset by the protection supply pin.

Refer also to OVERLOAD PROTECTION LIMITING VALUES and INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	$V_{PS} = V_{PSN}$[2]; $T_{mb} = 25$ °C; $L \leq 10$ µH; $R_I \geq 2$ kΩ				
$E_{DS(TO)}$	Overload threshold energy	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	150	-	mJ
$t_{d\,sc}$	Response time	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	375	-	µs
	Over temperature protection	$V_{PS} = V_{PSN}$; $R_I \geq 2$ kΩ				
$T_{j(TO)}$	Threshold junction temperature	from $I_D \geq 0.65$ A[3]	150	-	-	°C

TRANSFER CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	$V_{DS} = 10$ V; $I_{DM} = 7.5$ A $t_p \leq 300$ µs; $\delta \leq 0.01$	5	9	-	S
I_D	Drain current[4]	$V_{DS} = 13$ V; $V_{IS} = 5$ V	-	25	-	A
		$V_{IS} = 10$ V		40	-	A

PROTECTION SUPPLY CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Protection supply					
I_{PS}, I_{PSL}	Protection supply current	normal operation or protection latched				
		BUK114-50L $V_{PS} = 5$ V	-	0.2	0.35	mA
		BUK114-50S $V_{PS} = 10$ V	-	0.4	1.0	mA
V_{PSR}	Protection reset voltage[5]		1.5	2.5	3.5	V
		$T_j = 150$ °C	1.0	-	-	V
$V_{(CL)PS}$	Protection clamp voltage	$I_P = 1.35$ mA	11	13	-	V

REVERSE DIODE CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	$I_S = 15$ A; $V_{IS} = V_{PS} = V_{FS} = 0$ V; $t_p = 300$ µs	-	1.0	1.5	V
t_{rr}	Reverse recovery time	not applicable[6]	-	-	-	-

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum.

2 At the appropriate nominal protection supply voltage for each type. Refer to QUICK REFERENCE DATA.

3 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

4 During overload condition. Refer also to OVERLOAD PROTECTION LIMITING VALUES and CHARACTERISTICS.

5 The supply voltage below which the overload protection circuits will be reset.

6 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
	Normal operation						
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA		1.0	1.5	2.0	V
			T_{mb} = 150 °C	0.5	-	-	V
I_{IS}	Input current	V_{IS} = 10 V		-	10	100	nA
$V_{(CL)IS}$	Input clamp voltage	I_I = 1 mA		11	13	-	V
	Overload protection latched						
R_{ISL}	Input resistance[1]	V_{PS} = 5 V	I_I = 5 mA;	-	55	-	Ω
			T_{mb} = 150 °C	-	95	-	Ω
		V_{PS} = 10 V	I_I = 5 mA;	-	35	-	Ω
			T_{mb} = 150 °C	-	60	-	Ω
	Application information						
	External input resistances for	(see figure 29)					
R_{IS}	internal overvoltage clamping[2]	R_I = ∞ Ω;	V_{DS} > 30 V	100	-	-	Ω
R_I	internal overload protection[3]	R_{IS} = ∞ Ω;	V_{II} = 5 V	1	-	-	kΩ
			V_{II} = 10 V	2	-	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C; R_I = 50 Ω; R_{IS} = 50 Ω (see figure 29); resistive load R_L = 10 Ω. For waveforms see figure 28.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 15 V; V_{IS}: 0 V ⇒ 10 V	-	8	-	ns
t_r	Rise time		-	13	-	ns
$t_{d\,off}$	Turn-off delay time	V_{DD} = 15 V; V_{IS}: 10 V ⇒ 0 V	-	100	-	ns
t_f	Fall time		-	45	-	ns

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{iss}	Input capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	415	600	pF
C_{oss}	Output capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	275	400	pF
C_{rss}	Reverse transfer capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	55	80	pF
C_{pso}	Protection supply pin capacitance	V_{PS} = 10 V	-	30	-	pF
C_{fso}	Flag pin capacitance	V_{FS} = 10 V; V_{PS} = 0 V	-	20	-	pF

1 The resistance of the internal transistor which discharges the power MOSFET gate capacitance when overload protection operates.
The external drive circuit should be such that the input voltage does not exceed $V_{IS(TO)}$ minimum when the overload protection has operated. Refer also to figure for latched input characteristics.

2 Applications using a lower value for R_{IS} would require external overvoltage protection.

3 For applications requiring a lower value for R_I, an external overload protection strategy is possible using the flag pin to 'tell' the control circuit to switch off the input.

FLAG DESCRIPTION

The flag pin provides a means to detect the presence of the protection supply and indicate the state of the overload detectors. The flag is the open drain of an n-MOS transistor and requires an external pull-up resistor[1]. It is suitable for both 5 V and 10 V logic. Flag may be used to implement an external protection strategy[2] for applications which require low input drive impedance.

TRUTH TABLE

CONDITION	DESCRIPTION	FLAG
NORMAL	Normal operation and adequate protection supply voltage	LOGIC LOW
OVER TEMP.	Over temperature detected	LOGIC HIGH
SHORT CIRCUIT	Overload condition detected	LOGIC HIGH
SUPPLY FAULT	Inadequate protection supply voltage	LOGIC HIGH

FLAG CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Flag 'low'	normal operation				
V_{FS}	Flag voltage	I_F = 1.6 mA	-	0.15	0.4	V
I_{FSS}	Flag saturation current	V_{FS} = 10 V	-	15	-	mA
	Flag 'high'	overload or fault				
I_{FS}	Flag leakage current	V_{FS} = 10 V	-	-	10	µA
V_{PSF}	Protection supply threshold voltage	V_{FF} = 5 V; R_F = 3 kΩ;				
		BUK114-50L	2.5	3.3	4	V
		BUK114-50S	3.3	4.2	5	V
$V_{(CL)FS}$	Flag clamping voltage	I_F = 1 mA; V_{PS} = 0 V	11	13	-	V
	Application information					
R_F	Suitable external pull-up resistance	V_{FF} =5 V	1	10	50	kΩ
		V_{FF} =10 V	2	20	100	kΩ

Even if the flag pin is not used, it is recommended that it is connected to the protection supply via a pull-up resistor. It should not be left floating.

Low pass filtering of the flag signal may be advisable to prevent false tripping.

P_{DSM}	Instantaneous overload dissipation		-		4	kW

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

1 Prior to the onset of overvoltage clamping. For voltages above this value, safe operation is limited by the overvoltage clamping energy.

2 A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 The minimum supply voltage required for correct operation of the overload protection circuits.

4 The device is able to self-protect against a short circuit load providing the drain-source supply voltage does not exceed $V_{DDP(P)}$ maximum. For further information, refer to OVERLOAD PROTECTION CHARACTERISTICS.

OVERVOLTAGE CLAMPING LIMITING VALUES

At a drain source voltage above 50 V the power MOSFET is actively turned on to clamp overvoltage transients.

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_{DRRM}	Repetitive peak clamping drain current	$R_{IS} \geq 100\ \Omega$[1]	-	50	A
E_{DSM}	Non-repetitive inductive turn-off energy[2]	$I_{DM} = 27$ A; $R_{IS} \geq 100\ \Omega$	-	1	J
E_{DRM}	Repetitive inductive turn-off energy	$R_{IS} \geq 100\ \Omega$; $T_{mb} \leq 85$ °C; $I_{DM} = 16$ A; $V_{DD} \leq 20$ V; f = 250 Hz	-	80	mJ
I_{DIRM}	Repetitive peak drain to input current[3]	$R_{IS} = 0\ \Omega$; $t_p \leq 1$ ms	-	50	mA

REVERSE DIODE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
I_S	Continuous forward current	$T_{mb} = 25$ °C; $V_{IS} = V_{PS} = V_{FS} = 0$ V	-	50	A

THERMAL CHARACTERISTIC

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1.0	K/W

STATIC CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS		MIN.	TYP.	MAX.	UNIT
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_D = 10$ mA		50	-	65	V
$V_{(CL)DSR}$	Drain-source clamping voltage	$R_{IS} = 100\ \Omega$; $I_{DM} = 1$ A; $t_p \leq 300$ µs; $\delta \leq 0.01$		50	-	70	V
I_{DSS}	Zero input voltage drain current	$V_{DS} = 12$ V; $V_{IS} = 0$ V		-	0.5	10	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 50$ V; $R_{IS} = 100\ \Omega$;		-	1	20	µA
I_{DSR}	Drain source leakage current	$V_{DS} = 40$ V; $R_{IS} = 100\ \Omega$; $T_j = 125$ °C		-	10	100	µA
$R_{DS(ON)}$	Drain-source on-state resistance	$I_{DM} = 25$ A; $t_p \leq 300$ µs; $\delta \leq 0.01$	$V_{IS} = 8$ V	-	22	28	mΩ
			$V_{IS} = 5$ V	-	28	35	mΩ

1 The input pin must be connected to the source pin by a specified external resistance to allow the power MOSFET gate source voltage to become sufficiently positive for active clamping. Refer to INPUT CHARACTERISTICS.

2 While the protection supply voltage is connected, during overvoltage clamping it is possible that the overload protection may operate at energies close to the limiting value. Refer to OVERLOAD PROTECTION CHARACTERISTICS.

3 Shorting the input to source with low resistance inhibits the internal overvoltage protection by preventing the power MOSFET gate source voltage becoming positive.

OVERLOAD PROTECTION CHARACTERISTICS

With adequate protection supply voltage TOPFET detects when one of the overload thresholds is exceeded.

Provided there is adequate input series resistance it switches off and remains latched off until reset by the protection supply pin.

Refer also to OVERLOAD PROTECTION LIMITING VALUES and INPUT CHARACTERISTICS.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Short circuit load protection[1]	$V_{PS} = V_{PSN}$[2]; $T_{mb} = 25$ °C; $L \leq 10$ µH				
$E_{DS(TO)}$	Overload threshold energy	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	550	-	mJ
$t_{d\,sc}$	Response time	$V_{DD} = 13$ V; $V_{IS} = 10$ V	-	0.4	-	ms
	Over temperature protection	$V_{PS} = V_{PSN}$				
$T_{j(TO)}$	Threshold junction temperature	from $I_D \geq 2.5$ A[3]	150	-	-	°C

TRANSFER CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	$V_{DS} = 12$ V; $I_{DM} = 25$ A $t_p \leq 300$ µs; $\delta \leq 0.01$	17	28	-	S
I_D	Drain current[4]	$V_{DS} = 13$ V; $V_{IS} = 5$ V	-	80	-	A
		$V_{IS} = 10$ V		160	-	A

PROTECTION SUPPLY CHARACTERISTICS

$T_{mb} = 25$ °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Protection supply					
I_{PS}, I_{PSL}	Protection supply current	normal operation or protection latched				
		BUK116-50L $V_{PS} = 5$ V	-	0.2	0.35	mA
		BUK116-50S $V_{PS} = 10$ V	-	0.4	1.0	mA
V_{PSR}	Protection reset voltage[5]		1.5	2.5	3.5	V
		$T_j = 150$ °C	1.0	-	-	V
$V_{(CL)PS}$	Protection clamp voltage	$I_P = 1.35$ mA	11	13	-	V

REVERSE DIODE CHARACTERISTICS

$T_{mb} = 25$ °C

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SDS}	Forward voltage	$I_S = 20$ A; $V_{IS} = V_{PS} = V_{FS} = 0$ V; $t_p = 300$ µs	-	0.9	1.2	V
t_{rr}	Reverse recovery time	not applicable[6]	-	-	-	-

1 The short circuit load protection is able to save the device providing the instantaneous on-state dissipation is less than the limiting value for P_{DSM}, which is always the case when V_{DS} is less than V_{DSP} maximum.

2 At the appropriate nominal protection supply voltage for each type. Refer to QUICK REFERENCE DATA.

3 The over temperature protection feature requires a minimum on-state drain source voltage for correct operation. The specified minimum I_D ensures this condition.

4 During overload condition. Refer also to OVERLOAD PROTECTION LIMITING VALUES and CHARACTERISTICS.

5 The supply voltage below which the overload protection circuits will be reset.

6 The reverse diode of this type is not intended for applications requiring fast reverse recovery.

INPUT CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Normal operation					
$V_{IS(TO)}$	Input threshold voltage	V_{DS} = 5 V; I_D = 1 mA	1.0	1.5	2.0	V
		T_{mb} = 150 °C	0.5	-	-	V
I_{IS}	Input current	V_{IS} = 10 V	-	10	100	nA
$V_{(CL)IS}$	Input clamp voltage	I_I = 1 mA	11	13	-	V
	Overload protection latched					
R_{ISL}	Input resistance[1]	V_{PS} = 5 V; I_I = 5 mA	-	55	-	Ω
		T_{mb} = 150 °C	-	95	-	Ω
		V_{PS} = 10 V; I_I = 5 mA	-	35	-	Ω
		T_{mb} = 150 °C	-	60	-	Ω
	Application information					
	External input resistances for	(see figure 29)				
R_{IS}	internal overvoltage clamping[2]	R_I = ∞ Ω; V_{DS} > 30 V	100	-	-	Ω
R_I	internal overload protection[3]	R_{IS} = ∞ Ω; V_{II} = 5 V	1	-	-	kΩ
		V_{II} = 10 V	2	-	-	kΩ

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C; R_I = 50 Ω; R_{IS} = 50 Ω (see figure 29); resistive load R_L = 10 Ω. For waveforms see figure 28.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$t_{d\,on}$	Turn-on delay time	V_{DD} = 15 V; V_{IS}: 0 V ⇒ 10 V	-	10	-	ns
t_r	Rise time		-	35	-	ns
$t_{d\,off}$	Turn-off delay time	V_{DD} = 15 V; V_{IS}: 10 V ⇒ 0 V	-	280	-	ns
t_f	Fall time		-	120	-	ns

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{iss}	Input capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	1250	1800	pF
C_{oss}	Output capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	650	1000	pF
C_{rss}	Reverse transfer capacitance	V_{DS} = 25 V; V_{IS} = 0 V	-	150	250	pF
C_{pso}	Protection supply pin capacitance	V_{PS} = 10 V	-	30	-	pF
C_{fso}	Flag pin capacitance	V_{FS} = 10 V; V_{PS} = 0 V	-	20	-	pF

1 The resistance of the internal transistor which discharges the power MOSFET gate capacitance when overload protection operates.
The external drive circuit should be such that the input voltage does not exceed $V_{IS(TO)}$ minimum when the overload protection has operated. Refer also to figure for latched input characteristics.

2 Applications using a lower value for R_{IS} would require external overvoltage protection.

3 For applications requiring a lower value for R_I, an external overload protection strategy is possible using the flag pin to 'tell' the control circuit to switch off the input.

FLAG DESCRIPTION

The flag pin provides a means to detect the presence of the protection supply and indicate the state of the overload detectors. The flag is the open drain of an n-MOS transistor and requires an external pull-up resistor[1]. It is suitable for both 5 V and 10 V logic. Flag may be used to implement an external protection strategy[2] for applications which require low input drive impedance.

TRUTH TABLE

CONDITION	DESCRIPTION	FLAG
NORMAL	Normal operation and adequate protection supply voltage	LOGIC LOW
OVER TEMP.	Over temperature detected	LOGIC HIGH
SHORT CIRCUIT	Overload condition detected	LOGIC HIGH
SUPPLY FAULT	Inadequate protection supply voltage	LOGIC HIGH

FLAG CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Flag 'low'	normal operation				
V_{FS}	Flag voltage	I_F = 1.6 mA	-	0.15	0.4	V
I_{FSS}	Flag saturation current	V_{FS} = 10 V	-	15	-	mA
	Flag 'high'	overload or fault				
I_{FS}	Flag leakage current	V_{FS} = 10 V	-	-	10	µA
V_{PSF}	Protection supply threshold voltage	V_{FF} = 5 V; R_F = 3 kΩ;				
		BUK116-50L	2.5	3.3	4	V
		BUK116-50S	3.3	4.2	5	V
$V_{(CL)FS}$	Flag clamping voltage	I_F = 1 mA; V_{PS} = 0 V	11	13	-	V
	Application information					
R_F	Suitable external pull-up resistance	V_{FF} =5 V	1	10	50	kΩ
		V_{FF} =10 V	2	20	100	kΩ

1 Even if the flag pin is not used, it is recommended that it is connected to the protection supply via a pull-up resistor. It should not be left floating.

2 Low pass filtering of the flag signal may be advisable to prevent false tripping.

PowerMOS transistor TOPFET high side switch

BUK200-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	3.5	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	10	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	100	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7\ k\Omega$, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7\ k\Omega$	-	16	V
I_L	Continuous load current	$T_{mb} \leq 115\ ^\circ C$	-	10	A
P_D	Total power dissipation	$T_{mb} \leq 25\ ^\circ C$	-	62.5	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150\ ^\circ C$ prior to turn-off	-	1.2	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.5	2	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	75	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	3.5	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 5 A; t_p = 300 µs	-	77	100	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 1 A; t_p = 300 µs	-	116	150	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the battery with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	50	200	350	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	8.5	10.3	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 80 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 5 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq 10$ mΩ				
$t_{d\,sc}$	Response time		-	90	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	35	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 8.5 V; t_p = 300 µs	23	33	43	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1	2.5	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	30	-	µs

t_{off}	Total switching time	to 10% V_L	-	50	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	$V_{BL} = V_{BG}$ = 13 V	-	330	460	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

PowerMOS transistor TOPFET high side switch

BUK201-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	6	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	15	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	60	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7$ kΩ, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7$ kΩ	-	16	V
I_L	Continuous load current	$T_{mb} \leq 115$ °C	-	15	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	83.3	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150$ °C prior to turn-off	-	1.2	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.2	1.5	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	75	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	6	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 7.5 A; t_p = 300 µs	-	45	60	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 1.5 A; t_p = 300 µs	-	70	90	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the battery with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	100	350	600	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 140 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 7.5 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq 10$ mΩ				
$t_{d\,sc}$	Response time		-	90	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	42	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	28	40	52	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1	2.5	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	30	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	1.2	2.5	V/µs
t_{off}	Total switching time	to 10% V_L	-	50	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	$V_{BL} = V_{BG}$ = 13 V	-	415	580	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150$ °C prior to turn-off	-	1.7	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	75	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	9	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 10 A; t_p = 300 µs	-	28	38	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 2 A; t_p = 300 µs	-	36	48	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the supply when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the supply with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	150	450	750	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 230 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.5 V.

6 Overvoltage sensor causes the device to switch off. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 10 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq$ 10 mΩ				
$t_{d\,sc}$	Response time		-	75	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	50	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	34	45	64	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	0.7	2	V/µs
t_{on}	Total switching time	to 90% V_L	-	140	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	40	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	0.7	2	V/µs
t_{off}	Total switching time	to 10% V_L	-	70	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	V_{BL} = V_{BG} = 13 V	-	500	700	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

PowerMOS transistor TOPFET high side switch

BUK203-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	1.6	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	4	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	220	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7\ k\Omega$, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7\ k\Omega$	-	16	V
I_L	Continuous load current	$T_{mb} \leq 110\ ^\circ C$	-	4	A
P_D	Total power dissipation	$T_{mb} \leq 25\ ^\circ C$	-	50	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150\ ^\circ C$ prior to turn-off	-	1.4	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2	2.5	K/W
$R_{th\ j\text{-}a}$	Junction to ambient	in free air	-	60	75	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	1.6	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 2 A; t_p = 300 µs	-	160	220	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 0.5 A; t_p = 300 µs	-	225	320	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the battery with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	30	90	150	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 25 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 2 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq 10$ mΩ				
$t_{d\,sc}$	Response time		-	75	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	17	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	12	15	22	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1.3	3	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	20	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	1.6	3	V/µs
t_{off}	Total switching time	to 10% V_L	-	35	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	$V_{BL} = V_{BG}$ = 13 V	-	120	170	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

TOPFET high side switch SMD version of BUK200-50Y

BUK204-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic surface mount envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	3.5	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	10	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	100	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7\ k\Omega$, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7\ k\Omega$	-	16	V
I_L	Continuous load current	$T_{mb} \leq 115$ °C	-	10	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	62.5	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150$ °C prior to turn-off	-	1.2	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTIC

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	1.5	2	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	3.5	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 5 A; t_p = 300 µs	-	77	100	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 1 A; t_p = 300 µs	-	116	150	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the battery with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	50	200	350	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	8.5	10.3	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 80 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 5 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq$ 10 mΩ				
$t_{d\,sc}$	Response time		-	90	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	35	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 8.5 V; t_p = 300 µs	23	33	43	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1	2.5	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	30	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	1.2	2.5	V/µs
t_{off}	Total switching time	to 10% V_L	-	50	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	V_{BL} = V_{BG} = 13 V	-	330	460	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

TOPFET high side switch SMD version of BUK201-50Y

BUK205-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic surface mount envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	6	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	15	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	60	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 7.5 A; t_p = 300 µs	-	45	60	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 1.5 A; t_p = 300 µs	-	70	90	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.
2 Defined as in ISO 10483-1.
3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.
4 This is the continuous current drawn from the battery with no load connected, but with the input high.
5 The measured current is in the load pin only.
6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	100	350	600	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 140 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 7.5 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq$ 10 mΩ				
$t_{d\,sc}$	Response time		-	90	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	42	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	28	40	52	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1	2.5	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	30	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	1.2	2.5	V/µs
t_{off}	Total switching time	to 10% V_L	-	50	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	$V_{BL} = V_{BG}$ = 13 V	-	415	580	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

TOPFET high side switch SMD version of BUK202-50Y

BUK206-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic surface mount envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

QUICK REFERENCE DATA

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7\ k\Omega$, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7\ k\Omega$	-	16	V
I_L	Continuous load current	$T_{mb} \leq 110\ ^\circ C$	-	20	A
P_D	Total power dissipation	$T_{mb} \leq 25\ ^\circ C$	-	125	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150\ ^\circ C$ prior to turn-off	-	1.7	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTIC

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	0.8	1	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	9	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 10 A; t_p = 300 µs	-	28	38	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 2 A; t_p = 300 µs	-	36	48	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the supply when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the supply with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	150	450	750	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

[1] In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 230 mA. The thresholds are specified for supply voltage within the normal working range.
[2] After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.
[3] If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.
[4] After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.
[5] Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.5 V.
[6] Overvoltage sensor causes the device to switch off. Typical hysteresis equals 1.3 V.
[7] In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.
[8] The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 10 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq$ 10 mΩ				
$t_{d\,sc}$	Response time		-	75	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	50	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	34	45	64	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	0.7	2	V/µs
t_{on}	Total switching time	to 90% V_L	-	140	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	40	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	0.7	2	V/µs
t_{off}	Total switching time	to 10% V_L	-	70	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	V_{BL} = V_{BG} = 13 V	-	500	700	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

1 For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

2 The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

3 If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

TOPFET high side switch SMD version of BUK203-50Y

BUK207-50Y

For maintenance only. Do not use for design-in.

DESCRIPTION

Monolithic temperature and overload protected power switch based on MOSFET technology in a 5 pin plastic surface mount envelope, configured as a single high side switch.

APPLICATIONS

General controller for driving lamps, motors, solenoids, heaters.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	UNIT
I_L	Nominal load current (ISO)	1.6	A
SYMBOL	**PARAMETER**	**MAX.**	**UNIT**
V_{BG}	Continuous off-state supply voltage	50	V
I_L	Continuous load current	4	A
T_j	Continuous junction temperature	150	°C
R_{ON}	On-state resistance	220	mΩ

FEATURES

- Vertical power DMOS switch
- Low on-state resistance
- 5 V logic compatible input
- Overtemperature protection - self resets with hysteresis
- Overload protection against short circuit load with output current limiting; latched - reset by input
- High supply voltage load protection
- Supply undervoltage lock out
- Status indication for overload protection activated
- Diagnostic status indication of open circuit load
- Very low quiescent current
- Voltage clamping for turn off of inductive loads
- ESD protection on all pins
- Reverse battery and overvoltage protection

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
	Battery voltages				
V_{BG}	Continuous off-state supply voltage	-	0	50	V
	Reverse battery voltages[1]	External resistors:			
$-V_{BG}$	Repetitive peak supply voltage	$R_I = R_S \geq 4.7\ k\Omega$, $\delta \leq 0.1$	-	32	V
$-V_{BG}$	Continuous reverse supply voltage	$R_I = R_S \geq 4.7\ k\Omega$	-	16	V
I_L	Continuous load current	$T_{mb} \leq 110$ °C	-	4	A
P_D	Total power dissipation	$T_{mb} \leq 25$ °C	-	50	W
T_{stg}	Storage temperature	-	-55	175	°C
T_j	Continuous junction temperature[2]	-	-	150	°C
T_{sold}	Lead temperature	during soldering	-	250	°C
	Input and status				
I_I	Continuous input current	-	-5	5	mA
I_S	Continuous status current	-	-5	5	mA
I_I	Repetitive peak input current	$\delta \leq 0.1$	-20	20	mA
I_S	Repetitive peak status current	$\delta \leq 0.1$	-20	20	mA
	Inductive load clamping				
E_{BL}	Non-repetitive clamping energy	$T_{mb} = 150$ °C prior to turn-off	-	1.4	J

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model; C = 250 pF; R = 1.5 kΩ	-	2	kV

THERMAL CHARACTERISTIC

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Thermal resistance[3]					
$R_{th\ j\text{-}mb}$	Junction to mounting base	-	-	2	2.5	K/W

1 Reverse battery voltage is allowed only with external input and status resistors to limit the currents to a safe value.

2 For normal continuous operation. A higher T_j is allowed as an overload condition but at the threshold $T_{j(TO)}$ the over temperature trip operates to protect the switch.

3 Of the output Power MOS transistor.

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise stated

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Clamping voltages					
V_{BG}	Battery to ground	I_G = 1 mA	50	55	65	V
V_{BL}	Battery to load	$I_L = I_G$ = 1 mA	50	55	65	V
$-V_{LG}$	Negative load to ground	I_L = 1 mA	12	17	21	V
	Supply voltage	battery to ground				
V_{BG}	Operating range[1]	-	5	-	40	V
	Currents	V_{BG} = 13 V				
I_L	Nominal load current[2]	V_{BL} = 0.5 V; T_{mb} = 85 °C	1.6	-	-	A
I_B	Quiescent current[3]	V_{IG} = 0 V; V_{LG} = 0 V	-	0.1	2	µA
I_G	Operating current[4]	V_{IG} = 5 V; I_L = 0 A	1.5	2.2	4	mA
I_L	Off-state load current[5]	V_{BL} = 13 V; V_{IG} = 0 V	-	0.1	1	µA
	Resistances					
R_{ON}	On-state resistance[6]	V_{BG} = 13 V; I_L = 2 A; t_p = 300 µs	-	160	220	mΩ
R_{ON}	On-state resistance	V_{BG} = 5 V; I_L = 0.5 A; t_p = 300 µs	-	225	320	mΩ
R_G	Internal ground resistance	I_G = 10 mA	-	150	-	Ω

INPUT CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_I	Input current	V_{IG} = 5 V	35	60	100	µA
V_{IG}	Input clamping voltage	I_I = 200 µA	6	7.5	8.5	V
$V_{IG(ON)}$	Input turn-on threshold voltage		-	2.1	2.7	V
$V_{IG(OFF)}$	Input turn-off threshold voltage		1.5	2	-	V

1 On-state resistance is increased if the supply voltage is less than 9 V. Refer to figure 8.

2 Defined as in ISO 10483-1.

3 This is the continuous current drawn from the battery when the input is low and includes leakage current to the load.

4 This is the continuous current drawn from the battery with no load connected, but with the input high.

5 The measured current is in the load pin only.

6 The supply and input voltage for the R_{ON} tests are continuous. The specified pulse duration t_p refers only to the applied load current.

PROTECTION FUNCTIONS AND STATUS INDICATIONS

Truth table for normal, open-circuit load and overload conditions and abnormal supply voltages.

FUNCTIONS		TRUTH TABLE			THRESHOLD			
SYMBOL	CONDITION	INPUT	STATUS	OUTPUT	MIN.	TYP.	MAX.	UNIT
	Normal on-state	1	1	1				
	Normal off-state	0	1	0				
$I_{L(OC)}$	Open circuit load[1]	1	0	1	30	90	150	mA
	Open circuit load	0	1	0				
$T_{j(TO)}$	Over temperature[2]	1	0	0	150	175	-	°C
	Over temperature[3]	0	0	0				
$V_{BL(TO)}$	Short circuit load[4]	1	0	0	9	10.5	12	V
	Short circuit load	0	1	0				
$V_{BG(TO)}$	Low supply voltage[5]	X	1	0	3	4	5	V
$V_{BG(LP)}$	High supply voltage[6]	X	1	0	40	45	50	V

For input '0' equals low, '1' equals high, 'X' equals don't care.
For status '0' equals low, '1' equals open or high.
For output switch '0' equals off, '1' equals on.

STATUS CHARACTERISTICS

T_{mb} = 25 °C.
The status output is an open drain transistor, and requires an external pull-up circuit to indicate a logic high.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{SG}	Status clamping voltage	I_S = 100 µA; V_{IG} = 0 V	6	7	8	V
V_{SG}	Status low voltage	I_S = 50 µA; V_{BG} = 13 V; V_{IG} = 5 V	-	0.7	0.8	V
I_S	Status leakage current	V_{SG} = 5 V	-	0.1	1	µA
I_S	Status saturation current[7]	V_{SS} = 5 V; R_S = 0 Ω; V_{BG} = 13 V	-	5	-	mA
	Application information					
R_S	External pull-up resistor[8]	V_{SS} = 5 V	-	100	-	kΩ

1 In the on-state, the switch detects whether the load current is less than the quoted open load threshold current. This is for status indication only. Typical hysteresis equals 25 mA. The thresholds are specified for supply voltage within the normal working range.

2 After cooling below the reset temperature the switch will resume normal operation. The reset temperature is lower than the trip temperature by typically 10 °C.

3 If the overtemperature protection has operated, status remains low to indicate the overtemperature condition even if the input is taken low, providing the device has not cooled below the reset temperature.

4 After short circuit protection has operated, the input voltage must be toggled low for the switch to resume normal operation.

5 Undervoltage sensor causes the device to switch off. Typical hysteresis equals 0.7 V.

6 Overvoltage sensor causes the device to switch off to protect the load. Typical hysteresis equals 1.3 V.

7 In a fault condition with the pull-up resistor short circuited while the status transistor is conducting.

8 The pull-up resistor also protects the status pin during reverse battery conditions.

DYNAMIC CHARACTERISTICS

T_{mb} = 25 °C; V_{BG} = 13 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	Inductive load turn-off					
$-V_{LG}$	Negative load voltage[1]	V_{IG} = 0 V; I_L = 2 A; t_p = 300 µs	15	20	25	V
	Short circuit load protection[2]	V_{IG} = 5 V; $R_L \leq$ 10 mΩ				
$t_{d\,sc}$	Response time		-	75	-	µs
I_L	Load current prior to turn-off	$t < t_{d\,sc}$	-	17	-	A
	Overload protection[3]					
$I_{L(lim)}$	Load current limiting	V_{BL} = 9 V; t_p = 300 µs	12	15	22	A

SWITCHING CHARACTERISTICS

T_{mb} = 25 °C, V_{BG} = 13 V, for resistive load R_L = 13 Ω.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
	During turn-on	to V_{IG} = 5 V				
$t_{d\,on}$	Delay time	to 10% V_L	-	16	-	µs
dV/dt_{on}	Rate of rise of load voltage		-	1.3	3	V/µs
t_{on}	Total switching time	to 90% V_L	-	40	-	µs
	During turn-off	to V_{IG} = 0 V				
$t_{d\,off}$	Delay time	to 90% V_L	-	20	-	µs
dV/dt_{off}	Rate of fall of load voltage		-	1.6	3	V/µs
t_{off}	Total switching time	to 10% V_L	-	35	-	µs

CAPACITANCES

T_{mb} = 25 °C; f = 1 MHz; V_{IG} = 0 V

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
C_{ig}	Input capacitance	V_{BG} = 13 V	-	15	20	pF
C_{bl}	Output capacitance	V_{BL} = V_{BG} = 13 V	-	120	170	pF
C_{sg}	Status capacitance	V_{SG} = 5 V	-	11	15	pF

[1] For a high side switch, the load pin voltage goes negative with respect to ground during the turn-off of an inductive load. This negative voltage is clamped by the device.

[2] The load current is self-limited during the response time for short circuit load protection. Response time is measured from when input goes high.

[3] If the load resistance is low, but not a complete short circuit, such that the on-state voltage remains less than $V_{BL(TO)}$, the device remains in current limiting until the overtemperature protection operates.

PowerMOS transistor — BUK436W-200A/B

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	MAX.	UNIT
	BUK436	-200A	-200B

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic full-pack envelope.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic full-pack envelope.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Drain-source voltage	1000	V
I_D	Drain current (DC)	1.5	A
P_{tot}	Total power dissipation	30	W
$R_{DS(ON)}$	Drain-source on-state resistance	5	Ω

PINNING - SOT186

PIN	DESCRIPTION
1	gate

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

PowerMOS transistor — BUK465-100A

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope suitable for surface mount applications.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Drain-source voltage	100	V
I_D	Drain current (DC)	26	A
P_{tot}	Total power dissipation	125	W
T_j	Junction temperature	175	°C
$R_{DS(ON)}$	Drain-source on-state resistance	0.08	Ω

PINNING - SOT404

PIN	DESCRIPTION
1	gate
2	drain
3	source

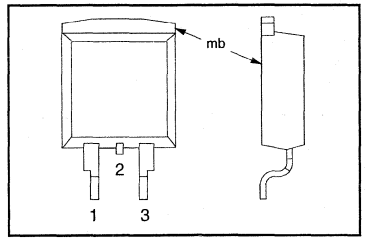
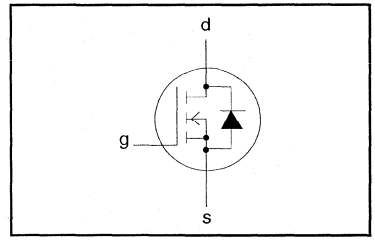
PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Drain-source voltage	-	-	200	V
V_{DGR}	Drain-gate voltage	R_{GS} = 20 kΩ	-	200	V
$\pm V_{GS}$	Gate-source voltage	-	-	30	V
I_D	Drain current (DC)	T_{mb} = 25 °C	-	19	A
I_D	Drain current (DC)	T_{mb} = 100 °C	-	13	A
I_{DM}	Drain current (pulse peak value)	T_{mb} = 25 °C	-	76	A
P_{tot}	Total power dissipation	T_{mb} = 25 °C	-	150	W
T_{stg}	Storage temperature	-	- 55	175	°C
T_j	Junction temperature	-	-	175	°C

THERMAL RESISTANCES

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$R_{th\ j\text{-}mb}$	Thermal resistance junction to mounting base		-	-	1.0	K/W
$R_{th\ j\text{-}a}$	Thermal resistance junction to ambient	minimum footprint, FR4 board (see Fig. 18).	-	50	-	K/W

STATIC CHARACTERISTICS

T_{mb} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(BR)DSS}$	Drain-source breakdown voltage	V_{GS} = 0 V; I_D = 0.25 mA	200	-	-	V
$V_{GS(TO)}$	Gate threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	2.1	3.0	4.0	V
I_{DSS}	Zero gate voltage drain current	V_{DS} = 200 V; V_{GS} = 0 V; T_j = 25 °C	-	1	10	µA
I_{DSS}	Zero gate voltage drain current	V_{DS} = 200 V; V_{GS} = 0 V; T_j =125 °C	-	0.1	1.0	mA
I_{GSS}	Gate source leakage current	V_{GS} = ±30 V; V_{DS} = 0 V	-	10	100	nA
$R_{DS(ON)}$	Drain-source on-state resistance	V_{GS} = 10 V; I_D = 10 A	-	0.15	0.16	Ω

DYNAMIC CHARACTERISTICS

Tmb = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 25 V; I_D = 10 A	8.5	16	-	S
C_{iss}	Input capacitance	V_{GS} = 0 V; V_{DS} = 25 V; f = 1 MHz	-	1500	2000	pF
C_{oss}	Output capacitance		-	300	400	pF
C_{rss}	Feedback capacitance		-	60	100	pF
$t_{d\,on}$	Turn-on delay time	V_{DD} = 30 V; I_D = 3 A;	-	20	30	ns
t_r	Turn-on rise time	V_{GS} = 10 V;	-	40	60	ns
$t_{d\,off}$	Turn-off delay time	R_{gen} = 50 Ω;	-	145	185	ns
t_f	Turn-off fall time	R_{GS} = 50 Ω	-	50	70	ns
L_d	Internal drain inductance	Measured from upper edge of drain tab to centre of die	-	2.5	-	nH
L_s	Internal source inductance	Measured from source lead soldering point to source bond pad	-	7.5	-	nH

REVERSE DIODE LIMITING VALUES AND CHARACTERISTICS

Tmb = 25 °C unless otherwise specified

PowerMOS transistor
Isolated version of BUK452-100A/B

BUK472-100A/B

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic full-pack envelope. The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	MAX.	UNIT

PowerMOS transistor
Isolated version of BUK455-200A/B

BUK475-200A/B

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic full-pack envelope. The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	MAX.	UNIT
	BUK475	-200A	-200B

PCB: FR4 epoxy glass (1.6 mm thick), copper laminate (35 μm thick).

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope suitable for surface mounting featuring high avalanche energy capability, stable blocking voltage, fast switching and high thermal cycling performance. Intended for use in Switched Mode Power Supplies (SMPS) and general purpose switching applications.

PowerMOS transistor Logic level FET

BUK545-200A/B

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic full-pack envelope.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in automotive and general purpose switching applications.

QUICK REFERENCE DATA

PowerMOS transistor Logic level FET

BUK553-100A/B

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope. The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in automotive and general purpose switching applications.

PowerMOS transistor Logic level FET

BUK562-100A

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mount applications.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in automotive and general purpose switching applications.

QUICK REFERENCE DATA

PowerMOS transistor Logic level FET

BUK565-100A

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mount applications.
The device is intended for use in Switched Mode Power Supplies (SMPS), motor control, welding, DC/DC and AC/DC converters, and in automotive and general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Drain-source voltage	100	V
I_D	Drain current (DC)	25	A
P_{tot}	Total power dissipation	125	W
T_j	Junction temperature	175	°C
$R_{DS(ON)}$	Drain-source on-state resistance; $V_{GS} = 5$ V	0.085	Ω

PINNING - SOT404

PIN	DESCRIPTION
1	gate

PowerMOS transistor Logic level FET

BUK582-100A

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mount applications.
The device is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Drain-source voltage	100	V
I_D	Drain current (DC)	1.7	A
P_{tot}	Total power dissipation	1.8	W
T_j	Junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance; V_{GS} = 5 V	0.31	Ω

Insulated Gate Bipolar Transistor Protected Logic-Level IGBT

BUK856-400 IZ

GENERAL DESCRIPTION

Protected N-channel logic-level insulated gate bipolar power transistor in a plastic envelope, intended for automotive ignition applications. The device has built-in zener diodes providing active collector voltage clamping and ESD protection up to 2 kV.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
$V_{(CL)CER}$	Collector-emitter clamp voltage	350	400	500	V
V_{CEsat}	Collector-emitter on-state voltage			2.2	V
I_C	Collector current (DC)			20	A
P_{tot}	Total power dissipation			100	W
E_{CERS}	Clamped energy dissipation			300	mJ

GENERAL DESCRIPTION

Fast-switching N-channel insulated gate bipolar power transistor in a plastic envelope.
The device is intended for use in motor control, DC/DC and AC/DC converters, and in general purpose high frequency switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{CE}	Collector-emitter voltage	800	V
I_C	Collector current (DC)	24	A
P_{tot}	Total power dissipation	125	W
V_{CEsat}	Collector-emitter on-state voltage	3.5	V
E_{off}	Turn-off energy Loss	1.0	mJ

PINNING - TO220AB

Insulated Gate Bipolar Transistor Protected Logic-Level IGBT

BUK866-400 IZ

GENERAL DESCRIPTION

Protected N-channel logic-level insulated gate bipolar power transistor in a plastic envelope suitable for surface mount applications. It is intended for automotive ignition applications, and has integral zener diodes providing active collector voltage clamping and ESD protection up to 2 kV.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MIN.	TYP.	MAX.	UNIT
$V_{(CL)CER}$	Collector-emitter clamp voltage	350	400	500	V
V_{CEsat}	Collector-emitter on-state voltage			2.2	V
I_C	Collector current (DC)			20	A
P_{tot}	Total power dissipation			100	W
E_{CERS}	Clamped energy dissipation			300	mJ

PINNING - SOT404

TrenchMOS™ transistor Standard level FET

BUK7510-30

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor
Standard level FET

BUK7518-30

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor
Standard level FET

BUK7524-55

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

TrenchMOS™ transistor Standard level FET

BUK7575-55

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor
Standard level FET

BUK7610-30

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope suitable for surface mounting using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor
Standard level FET

BUK7618-30

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope suitable for surface mounting using **'trench'** technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor Standard level FET

BUK7624-5

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope suitable for surface mounting. Using '**trench**' technology the device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

TrenchMOS™ transistor Standard level FET

BUK7675-55

GENERAL DESCRIPTION

N-channel enhancement mode standard level field-effect power transistor in a plastic envelope suitable for surface mounting. Using '**trench**' technology the device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

ENERAL DESCRIPTION

-channel enhancement mode logic vel field-effect power transistor in a astic envelope suitable for surface ounting. Using **'trench'** technolgy e device features very low on-state sistance and has integral zener odes giving ESD protection. It is tended for use in automotive and eneral purpose switching pplications.

QUICK REFERENCE DATA

PowerMOS transistor
Voltage clamped logic level FET
with temperature sensing diodes

BUK9120-48TC

GENERAL DESCRIPTION

Protected N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. Using **'trench'** technology the device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV and active drain voltage clamping. Temperature sensitive diodes are incorporated for monitoring chip temperature.
The device is intended for use in automotive and general purpose switching applications.

rrenchMOS™ transistor
ogic level FET

BUK9508-55

ENERAL DESCRIPTION

-channel enhancement mode logic vel field-effect power transistor in a lastic envelope using **'trench'** chnology. The device features very w on-state resistance and has ntegral zener diodes giving ESD rotection up to 2kV. It is intended for se in automotive and general urpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT

TrenchMOS™ transistor Logic level FET

BUK9514-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Drain-source voltage	-	-	55	V
V_{DGR}	Drain-gate voltage	R_{GS} = 20 kΩ	-	55	V
$\pm V_{GS}$	Gate-source voltage	-	-	10	V
I_D	Drain current (DC)	T_{mb} = 25 °C	-	52	A
I_D	Drain current (DC)	T_{mb} = 100 °C	-	37	A
I_{DM}	Drain current (pulse peak value)	T_{mb} = 25 °C	-	208	A
P_{tot}	Total power dissipation	T_{mb} = 25 °C	-	116	W
T_{stg}, T_j	Storage & operating temperature	-	- 55	175	°C

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage, all pins	Human body model (100 pF, 1.5 kΩ)	-	2	kV

THERMAL RESISTANCES

SYMBOL	PARAMETER	CONDITIONS	TYP.	MAX.	UNIT
$R_{th\ j\text{-}mb}$	Thermal resistance junction to mounting base	-	-	1.29	K/W
$R_{th\ j\text{-}a}$	Thermal resistance junction to ambient	in free air	60	-	K/W

STATIC CHARACTERISTICS

T_j= 25˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(BR)DSS}$	Drain-source breakdown voltage	V_{GS} = 0 V; I_D = 0.25 mA;	55	-	-	V
		T_j = -55˚C	50	-	-	V
$V_{GS(TO)}$	Gate threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	1	1.5	2	V
		T_j = 175˚C	0.5	-	-	V
		T_j = -55˚C	-	-	2.3	
I_{DSS}	Zero gate voltage drain current	V_{DS} = 55 V; V_{GS} = 0 V;	-	0.05	10	µA
		T_j = 175˚C	-	-	500	µA
I_{GSS}	Gate source leakage current	V_{GS} = ±5 V; V_{DS} = 0 V	-	0.02	1	µA
		T_j = 175˚C	-		10	µA
$\pm V_{(BR)GSS}$	Gate-source breakdown voltage	I_G = ±1 mA;	10	-	-	V
$R_{DS(ON)}$	Drain-source on-state resistance	V_{GS} = 5 V; I_D = 25 A	-	15	20	mΩ
		T_j = 175˚C	-	-	42	mΩ

DYNAMIC CHARACTERISTICS

T_{mb} = 25˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 25 V; I_D = 25 A	20	-	-	S
C_{iss}	Input capacitance	V_{GS} = 0 V; V_{DS} = 25 V; f = 1 MHz	-	1800	2400	pF
C_{oss}	Output capacitance		-	350	420	pF
C_{rss}	Feedback capacitance		-	170	235	pF
$t_{d\,on}$	Turn-on delay time	V_{DD} = 30 V; I_D = 25 A;	-	28	40	ns
t_r	Turn-on rise time	V_{GS} = 5 V; R_G = 10 Ω	-	110	160	ns
$t_{d\,off}$	Turn-off delay time	Resistive load	-	95	135	ns
t_f	Turn-off fall time		-	70	90	ns
L_d	Internal drain inductance	Measured from contact screw on tab to centre of die	-	3.5	-	nH
L_d	Internal drain inductance	Measured from drain lead 6 mm from package to centre of die	-	4.5	-	nH
L_s	Internal source inductance	Measured from source lead 6 mm from package to source bond pad	-	7.5	-	nH

REVERSE DIODE LIMITING VALUES AND CHARACTERISTICS

T_j = 25˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

TrenchMOS™ transistor Logic level FET

BUK9524-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT

TrenchMOS™ transistor
Logic level FET

BUK9575-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

TrenchMOS™ transistor
Logic level FET

BUK9610-30

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor Logic level FET

BUK9618-30

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting using '**trench**' technology. The device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

TrenchMOS™ transistor Logic level FET

BUK9624-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. Using '**trench**' technology the device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor Logic level FET

BUK9675-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. Using '**trench**' technology the device features very low on-state resistance and has integral zener diodes giving ESD protection up to 2kV. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor Logic level FET

BUK9840-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. The device features very low on-state resistance and has integral zener diodes giving ESD protection. It is intended for use in automotive and general purpose switching applications.

TrenchMOS™ transistor
Logic level FET

BUK98150-55

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. The device features very low on-state resistance and has integral zener diodes giving ESD protection. It is intended for use in automotive and general purpose switching applications.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	MAX.	UNIT
V_{DS}	Drain-source voltage	55	V
I_D	Drain current	5.5	A
P_{tot}	Total power dissipation	1.8	W
T_j	Junction temperature	150	°C
$R_{DS(ON)}$	Drain-source on-state resistance V_{GS} = 5 V	150	mΩ

PINNING - SOT223

PIN	DESCRIPTION
1	gate
2	drain

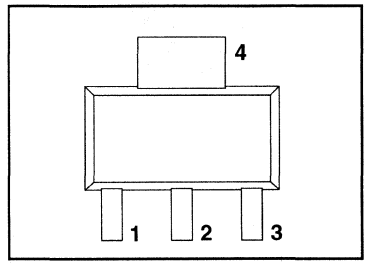
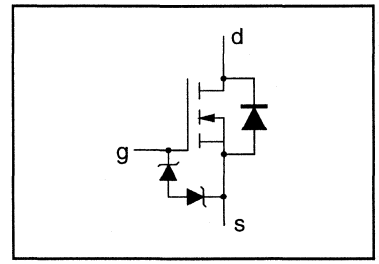
4	drain (tab)

PIN CONFIGURATION



SYMBOL



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	Drain-source voltage	-	-	55	V
V_{DGR}	Drain-gate voltage	R_{GS} = 20 kΩ	-	55	V
$\pm V_{GS}$	Gate-source voltage	-	-	10	V
I_D	Drain current (DC)	T_{sp} = 25 °C	-	5.5	A
I_D	Drain current (DC)	On PCB in Fig.19 T_{amb} = 25 °C	-	2.6	A
I_D	Drain current (DC)	On PCB in Fig.19 T_{amb} = 100 °C	-	1.6	A
I_{DM}	Drain current (pulse peak value)	T_{sp} = 25 °C	-	30	A
P_{tot}	Total power dissipation	T_{sp} = 25 °C	-	8.3	W
P_{tot}	Total power dissipation	On PCB in Fig.19 T_{amb} = 25 °C	-	1.8	W
T_{stg}, T_j	Storage & operating temperature	-	- 55	150	°C

ESD LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_C	Electrostatic discharge capacitor voltage	Human body model (100 pF, 1.5 kΩ)	-	2	kV

THERMAL RESISTANCES

SYMBOL	PARAMETER	CONDITIONS	TYP.	MAX.	UNIT
$R_{th\ j\text{-}sp}$	From junction to solder point	Mounted on any PCB	12	15	K/W
$R_{th\ j\text{-}amb}$	From junction to ambient	Mounted on PCB of Fig.18	-	70	K/W

STATIC CHARACTERISTICS

T_j= 25˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(BR)DSS}$	Drain-source breakdown voltage	V_{GS} = 0 V; I_D = 0.25 mA	55	-	-	V
		T_j = -55˚C	50	-	-	V
$V_{GS(TO)}$	Gate threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	1.0	1.5	2.0	V
		T_j = 150˚C	0.6	-	-	V
		T_j = -55˚C	-	-	2.3	V
I_{DSS}	Zero gate voltage drain current	V_{DS} = 55 V; V_{GS} = 0 V;	-	0.05	10	µA
		T_j = 150˚C	-	-	100	µA
I_{GSS}	Gate source leakage current	V_{GS} = ±5 V	-	0.02	1	µA
		T_j = 150˚C	-	-	5	µA
$\pm V_{(BR)GSS}$	Gate source breakdown voltage	V_{GS} = ±1 mA	10	-	-	V
$R_{DS(ON)}$	Drain-source on-state resistance	V_{GS} = 5 V; I_D = 5 A	-	120	150	mΩ
		T_j = 150˚C	-	-	277	mΩ

DYNAMIC CHARACTERISTICS

T_{mb} = 25˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
g_{fs}	Forward transconductance	V_{DS} = 25 V; I_D = 5 A; T_j = 25˚C	3	5	-	S
C_{iss}	Input capacitance	V_{GS} = 0 V; V_{DS} = 25 V; f = 1 MHz	-	250	330	pF
C_{oss}	Output capacitance		-	65	80	pF
C_{rss}	Feedback capacitance		-	35	50	pF
$t_{d\ on}$	Turn-on delay time	V_{DD} = 30 V; I_D = 5 A;	-	11	17	ns
t_r	Turn-on rise time	V_{GS} = 5 V; R_G = 10 Ω;	-	38	60	ns
$t_{d\ off}$	Turn-off delay time		-	25	38	ns
t_f	Turn-off fall time	T_j = 25˚C	-	20	38	ns

REVERSE DIODE LIMITING VALUES AND CHARACTERISTICS

T_j = -55 to 175˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
I_{DR}	Continuous reverse drain current	T_{sp} = 25˚C	-	-	5.5	A
I_{DRM}	Pulsed reverse drain current	T_{sp} = 25˚C	-	-	30	A
V_{SD}	Diode forward voltage	I_F = 2 A; V_{GS} = 0 V	-	0.85	1.1	V
t_{rr}	Reverse recovery time	I_F = 2 A; -dI_F/dt = 100 A/µs;	-	43	-	ns
Q_{rr}	Reverse recovery charge	V_{GS} = -10 V; V_R = 30 V	-	0.16	-	µC

AVALANCHE LIMITING VALUE

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
W_{DSS}	Drain-source non-repetitive unclamped inductive turn-off energy	I_D = 1.9 A; $V_{DD} \leq$ 25 V; V_{GS} = 5 V; R_{GS} = 50 Ω; T_{sp} = 25 °C	-	-	15	mJ

Complementary enhancement mode MOS transistors

PHC2300

FEATURES

- High-speed switching
- No secondary breakdown.

APPLICATIONS

- Universal line interface in telephone sets
- Relay, high-speed and line transformer drivers.

DESCRIPTION

One N-channel and one P-channel enhancement mode MOS transistor in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per FET					
V_{DS}	drain-source voltage (DC)				
	N-channel		–	300	V
	P-channel		–	–300	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage				V
	N-channel	$V_{DS} = V_{GS}$; I_D = 1 mA	0.8	2	V
	P-channel	$V_{DS} = V_{GS}$; I_D = –1 mA	–0.8	–2	V
I_D	drain current (DC)	T_s = 80 °C			
	N-channel		–	340	mA
	P-channel		–	–235	mA
R_{DSon}	drain-source on-state resistance				
	N-channel	V_{GS} = 10 V; I_D = 170 mA	–	8	Ω
	P-channel	V_{GS} = –10 V; I_D = –115 mA	–	17	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	1.6	W

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per FET					
V_{DS}	drain-source voltage (DC)				
	N-channel		–	300	V
	P-channel		–	–300	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 80 °C; note 1			
	N-channel		–	340	mA
	P-channel		–	–235	mA
I_{DM}	peak drain current	note 2			
	N-channel		–	1.4	A
	P-channel		–	–0.9	A
P_{tot}	total power dissipation	T_s = 80 °C; note 3	–	1.6	W
		T_{amb} = 25 °C; note 4	–	1.8	W
		T_{amb} = 25 °C; note 5	–	0.9	W
		T_{amb} = 25 °C; note 6	–	1.2	W
T_{stg}	storage temperature		–55	+150	°C
T_j	operating junction temperature		–55	+150	°C

Notes

1. T_s is the temperature at the soldering point of the drain leads.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Maximum permissible dissipation per MOS transistor. (So both devices may be loaded up to 1.6 W at the same time).
4. Maximum permissible dissipation per MOS transistor. Value based on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
5. Maximum permissible dissipation per MOS transistor. Value based on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
6. Maximum permissible dissipation if only one MOS transistor dissipates. Value based on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

Complementary enhancement mode MOS transistor

PHC20306

OBJECTIVE
Philips Semiconductors for Design-in Information
See Philips Semiconductors

FEATURES

- Very low on-state resistance
- High-speed switching
- No secondary breakdown.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

One N-channel and one P-channel enhancement mode MOS transistor in an 8-pin SOT96-1 (SO8) plastic package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Maximum permissible dissipation per MOS transistor. Both devices may be loaded up to 3.5 W at the same time.
4. Maximum permissible dissipation per MOS transistor. Device mounted on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
5. Maximum permissible dissipation per MOS transistor. Device mounted on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
6. Maximum permissible dissipation if only one MOS transistor dissipates. Device mounted a on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

Complementary enhancement mode MOS transistors

PHC20512

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

One N-channel and one P-channel enhancement mode MOS transistor in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

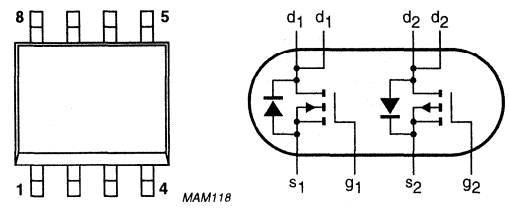

Fig.1 Simplified outline and symbol.

	P-channel		–	–5	A

Notes

1. Pulse width and duty cycle limited by maximum junction temperature.
2. Maximum permissible dissipation per MOS transistor. Both devices may be loaded up to 2 W at the same time.
3. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
5. Maximum permissible dissipation if only one MOS transistor dissipates. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

PowerMOS transistor | PHD3N20E

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope suitable for surface mounting featuring high avalanche energy capability, stable blocking voltage, fast switching and high thermal cycling performance with low thermal resistance. Intended for use in Switched Mode Power Supplies (SMPS), motor control circuits and general purpose switching applications.

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope suitable for surface mounting featuring high avalanche energy capability, stable blocking voltage, fast switching and high thermal cycling performance with low thermal resistance. Intended for use in Switched Mode Power Supplies (SMPS), motor control circuits and general purpose switching applications.

QUICK REFERENCE DATA

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope suitable for surface mounting featuring high avalanche energy capability, stable blocking voltage, fast switching and high thermal cycling performance with low thermal resistance. Intended for use in Switched Mode Power Supplies (SMPS), motor control circuits and general purpose switching applications.

N-channel enhancement mode MOS transistor

PHN103

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

N-channel enhancement mode MOS transistor in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	n.c	not connected
2	s	source
3	s	source
4	g	gate
5	d	drain
6	d	drain
7	d	drain

		T_{amb} = 25 °C; note 3	–	2.7	W
		T_{amb} = 25 °C; note 4	–	1.15	W
T_{stg}	storage temperature		–65	+150	°C
T_j	operating junction temperature		–65	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 80 °C	–	5	A
I_{SM}	peak pulsed source current	note 2	–	20	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT

N-channel enhancement mode MOS transistor

PHN110

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	n.c	not connected
2	s	source
3	s	source
4	g	gate
5	d	drain
6	d	drain
7	d	drain
8	d	drain

DESCRIPTION

N-channel enhancement mode MOS transistor in an 8-pin plastic SOT96-1 (SO8) package.

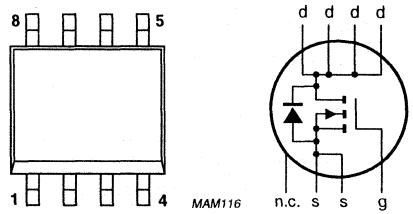

Fig.1 Simplified outline and symbol.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{SD}	source-drain diode forward voltage	I_S = 1.25 A	–	1.2	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	I_D = 1 mA; V_{DS} = V_{GS}	1	2.8	V
I_D	drain current (DC)	T_s = 80 °C	–	4	A
R_{DSon}	drain-source on-state resistance	I_D = 2.2 A; V_{GS} = 10 V	–	0.1	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	2.8	W

N-channel enhancement mode MOS transistor

PHN110

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	30	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	4	A

Dual N-channel enhancement mode MOS transistor

PHN203

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

Two N-channel enhancement mode MOS transistors in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

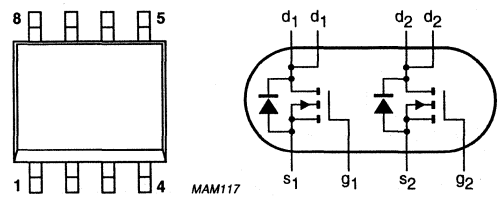

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per N-channel					
V_{DS}	drain-source voltage (DC)		–	30	V
V_{SD}	source-drain diode forward voltage	V_{GD} = 0; I_S = 1.25 A	–	1	V
V_{GS}	gate-source voltage (DC)		–	±20	V
V_{GSth}	gate-source threshold voltage	V_{DS} = V_{GS}; I_D = 1 mA	1	–	V
I_D	drain current (DC)	T_s = 80 °C	–	8.2	A
R_{DSon}	drain-source on-state resistance	V_{GS} = 10 V; I_D = 4 A	–	30	mΩ
P_{tot}	total power dissipation	T_s = 80 °C	–	3.5	W

OBJECTIVE
See Philips Semiconductors for Design-in information

Dual N-channel enhancement mode MOS transistor

PHN203

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per N-channel					
V_{DS}	drain-source voltage (DC)		–	30	V
V_{GS}	gate-source voltage (DC)		–	±20	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	8.2	A

Dual N-channel enhancement mode MOS transistor

PHN210

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

Two N-channel enhancement mode MOS transistors in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

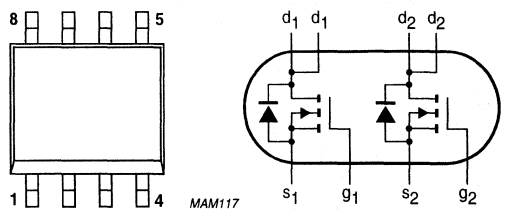

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per N-channel					
V_{DS}	drain-source voltage (DC)		–	30	V
V_{SD}	source-drain diode forward voltage	I_S = 1.25 A	–	1.2	V
V_{GSO}	gate-source voltage (DC)	open drain	–	±20	V
V_{GSth}	gate-source threshold voltage	I_D = 1 mA; $V_{DS} = V_{GS}$	1	2.8	V
I_D	drain current (DC)		–	3.5	A
R_{DSon}	drain-source on-state resistance	I_D = 2.2 A; V_{GS} = 10 V	–	0.1	Ω
P_{tot}	total power dissipation	T_s = 80 °C	–	2	W

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per N-channel					
V_{DS}	drain-source voltage (DC)		–	30	V
V_{GSO}	gate-source voltage (DC)	open drain	–	±20	V
I_D	drain current (DC)	$T_s \leq 80°$ C	–	3.5	A
I_{DM}	peak drain current	note 1	–	14	A
P_{tot}	total power dissipation	T_s = 80 °C; note 2	–	2	W
		T_{amb} = 25 °C; note 3	–	2	W
		T_{amb} = 25 °C; note 4	–	1	W
		T_{amb} = 25 °C; note 5	–	1.3	W
T_{stg}	storage temperature		–65	+150	°C
T_j	operating junction temperature		–	150	°C
Source-drain diode					
I_S	source current (DC)	$T_s \leq 80$ °C	–	1.5	A
I_{SM}	peak pulsed source current	note 1	–	6	A

Notes

1. Pulse width and duty cycle limited by maximum junction temperature.
2. Maximum permissible dissipation per MOS transistor. Both devices may be loaded up to 2 W at the same time.
3. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
5. Maximum permissible dissipation if only one MOS transistor dissipates. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

4 N-channel 60 mΩ FET array enhancement mode MOS transistors

PHN405

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance
- Current monitoring.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

Four enhancement mode MOS transistors in a 16-pin plastic SOT338-1 (SSOP16) package. Two transistors feature current monitoring (sense FETs).

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT338-1 (SSOP16)

PIN	SYMBOL	DESCRIPTION
1 and 4	d_1	drain 1
2	s_1	source 1
3	g_1	gate 1
5 and 8	d_2	drain 2
6	s_2	source 2
7	g_2	gate 2
9	g_3	gate 3
10	s_3	source 3
11 and 15	d_3	drain 3
12	m_3	current monitor 3
13	g_4	gate 4
14	s_4	source 4
16	m_4	current monitor 4

6 N-channel 30 mΩ FET/Schottky barrier diode array

PHN603S

FEATURES

- 30 mΩ on-state resistance
- On board Schottky diodes for back-emf clamping.

APPLICATIONS

- Driving high performance three phase brushless DC motors.

DESCRIPTION

Six enhancement mode MOS transistors and six Schottky barrier diodes in a 24-pin SOT137-1 (SO24) plastic package, in three half-bridge configuration.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

PINNING - SOT137-1 (SO24)

PIN	SYMBOL	DESCRIPTION
1 and 4	d_1	drain 1
2	s_1	source 1
3	g_1	gate 1
5 and 8	d_2	drain 2
6	s_2	source 2
7	g_2	gate 2

7 N-channel 80 mΩ FET array enhancement mode MOS transistors

PHN708

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Driving high performance three phase brushless DC motors.

DESCRIPTION

Seven enhancement mode MOS transistors in a 24-pin plastic SOT340-1 (SSOP24) package. Six of the transistors are in three half-bridge configurations.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT340-1 (SSOP24)

PIN	SYMBOL	DESCRIPTION
1 and 4	d_1	drain 1
2	s_1	source 1
3	g_1	gate 1
5 and 8	d_2	drain 2
6	s_2	source 2
7	g_2	gate 2
9 and 12	d_3	drain 3
10	s_3	source 3
11	g_3	gate 3
13	g_4	gate 4
14	s_4	source 4

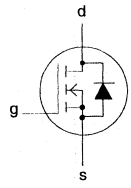
TrenchMOS™ transistor Logic level FET

PHN1011

FEATURES

- 'Trench' technology
- Low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low-profile surface mount package
- Logic level gate drive

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 25 V

I_D = 11 A

$R_{DS(ON)} \leq$ 11 mΩ

GENERAL DESCRIPTION

N-channel, enhancement mode, logic level, field-effect power transistor, using **'trench'** technology to achieve very low on-resistance in a low-profile, surface mount package. This device is intended for use in computer motherboard d.c. to d.c. converters and general purpose switching applications.

The PHN1011 is supplied in the SOT96 (SO8) 8-leaded, low profile, surface mounting package.

PINNING

PIN	DESCRIPTION

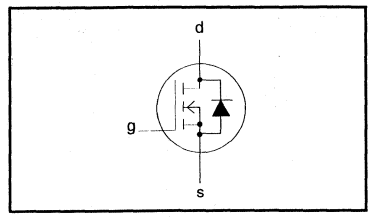
TrenchMOS™ transistor Logic level FET

PHN1015

FEATURES

- 'Trench' technology
- Low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low-profile surface mount package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 25 V

I_D = 9 A

$R_{DS(ON)} \leq 18\ m\Omega$

$R_{DS(ON)} \leq 14\ m\Omega$

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The combination of very low on-state resistance and low switching losses make this device the optimum choice in high speed computer motherboard d.c. to d.c. converters.

The PHN1015 is supplied in the SOT96 (SO8) 8-leaded, low profile, surface mounting package.

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP2N50E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB2N50E is supplied in the SOT404 surface mounting package.
The PHD2N50E is supplied in the SOT428 surface mounting package.

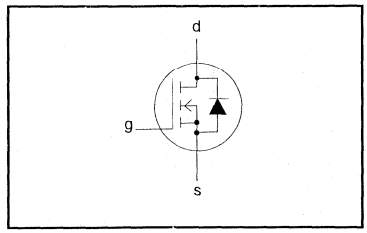
PowerMOS transistors Avalanche energy rated

PHP2N60E, PHB2N60E, PHD2N60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 1.9 A

$R_{DS(ON)} \leq 6\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP2N60E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB2N60E is supplied in the SOT404 surface mounting package.
The PHD2N60E is supplied in the SOT428 surface mounting package.

LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DSS}	Drain-source voltage	T_j = 25 °C to 150°C	-	600	V
V_{DGR}	Drain-gate voltage	T_j = 25 °C to 150°C; R_{GS} = 20 kΩ	-	600	V
V_{GS}	Gate-source voltage		-	± 30	V
I_D	Continuous drain current	T_{mb} = 25 °C; V_{GS} = 10 V	-	1.9	A
		T_{mb} = 100 °C; V_{GS} = 10 V	-	1.2	A
I_{DM}	Pulsed drain current	T_{mb} = 25 °C	-	7.6	A
P_D	Total dissipation	T_{mb} = 25 °C	-	50	W
T_j, T_{stg}	Operating junction and storage temperature range		- 55	150	°C

1 It is not possible to make connection to pin 2 of the SOT428 or SOT404 packages.

AVALANCHE ENERGY LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
E_{AS}	Non-repetitive avalanche energy	Unclamped inductive load, I_D = 1.9 A; $V_{DD} \leq 50$ V; starting T_j = 25˚C; R_{GS} = 50 Ω; V_{GS} = 10 V	-	144	mJ
E_{AR}	Repetitive avalanche energy[2]		-	3.6	mJ
I_{AS}, I_{AR}	Repetitive and non-repetitive avalanche current		-	1.9	A

THERMAL RESISTANCES

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$R_{th\ j\text{-}mb}$	Thermal resistance junction to mounting base		-	-	2.5	K/W
$R_{th\ j\text{-}a$	Thermal resistance junction to ambient	SOT78 package, in free air	-	60	-	K/W
		SOT404 and SOT428 packages, pcb mounted, minimum footprint	-	50	-	K/W

ELECTRICAL CHARACTERISTICS

T_j = 25 ˚C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(BR)DSS}$	Drain-source breakdown voltage	V_{GS} = 0 V; I_D = 0.25 mA	600	-	-	V

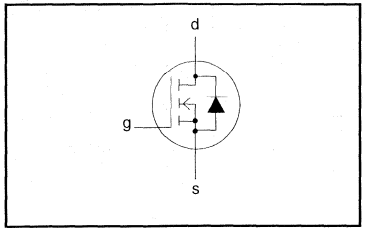
PowerMOS transistors Avalanche energy rated

PHP3N40E, PHB3N40E, PHD3N40E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 400 V

I_D = 2.5 A

$R_{DS(ON)} \leq 3.5\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP3N40E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB3N40E is supplied in the SOT404 surface mounting package.
The PHD3N40E is supplied in the SOT428 surface mounting package.

PowerMOS transistors Avalanche energy rated

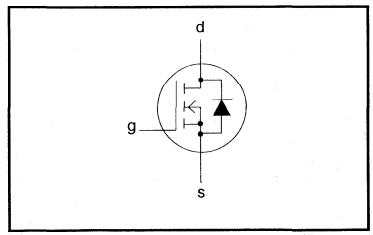
PHP4N40E, PHB4N40E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 400 V

I_D = 4.4 A

$R_{DS(ON)} \leq 1.8\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP4N40E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB4N40E is supplied in the SOT404 surface mounting package.

PowerMOS transistor — PHP5N20E

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope featuring high avalanche energy capability, stable blocking voltage, fast switching and high thermal cycling performance with low thermal resistance. Intended for use in Switched Mode Power Supplies (SMPS), motor control circuits and general purpose switching applications.

QUICK REFERENCE DATA

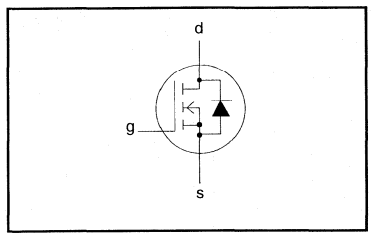
PowerMOS transistors Avalanche energy rated

PHP6N50E, PHB6N50E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 500 V

I_D = 5.9 A

$R_{DS(ON)} \leq 1.5\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP6N50E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB6N50E is supplied in the SOT404 surface mounting package.

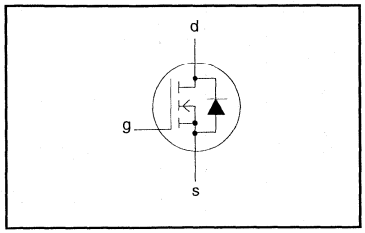
PowerMOS transistors FREDFET, Avalanche energy rated

PHP6ND50E, PHB6ND50E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance
- Fast reverse recovery diode

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 500 V

I_D = 5.9 A

$R_{DS(ON)} \leq 1.5\ \Omega$

t_{rr} = 180 ns

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, incorporating a **F**ast **R**ecovery **E**pitaxial **D**iode (FRED). This gives improved switching performance in half bridge and full bridge converters making this device particularly suitable for inverters, lighting ballasts and motor control circuits.

The PHP6ND50E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB6ND50E is supplied in the SOT404 surface mounting package.

PowerMOS transistors Avalanche energy rated

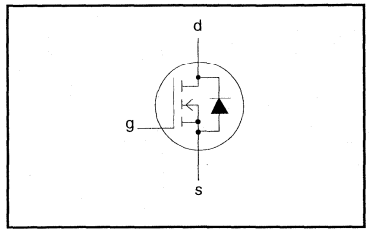
PHP7N60E, PHB7N60E, PHW7N60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 7 A

$R_{DS(ON)} \leq 1.2\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP7N60E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHW7N60E is supplied in the SOT429 (TO247) conventional leaded package.
The PHB7N60E is supplied in the SOT404 surface mounting package.

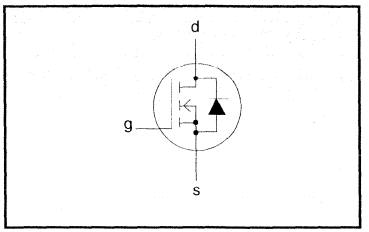
PowerMOS transistors FREDFET, Avalanche energy rated

PHP8ND50E, PHB8ND50E, PHW8ND50E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance
- Fast reverse recovery diode

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 500 V

I_D = 8.5 A

$R_{DS(ON)} \leq 0.85\ \Omega$

t_{rr} = 180 ns

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, incorporating a **F**ast **R**ecovery **E**pitaxial **D**iode (FRED). This gives improved switching performance in half bridge and full bridge converters making this device particularly suitable for inverters, lighting ballasts and motor control circuits.

The PHP8ND50E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHW8ND50E is supplied in the SOT429 (TO247) conventional leaded package.
The PHB8ND50E is supplied in the SOT404 surface mounting package.

PowerMOS transistors Avalanche energy rated

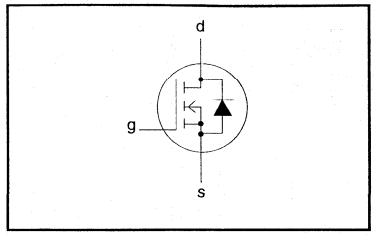
PHP10N40E, PHB10N40E, PHW10N40E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 400 V

I_D = 10.6 A

$R_{DS(ON)} \leq 0.55\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP10N40E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHW10N40E is supplied in the SOT429 (TO247) conventional leaded package.
The PHB10N40E is supplied in the SOT404 surface mounting package.

Philips Semiconductors for Design-in information
Philips Semiconductors

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHP13N40E is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHW13N40E is supplied in the SOT429 (TO247) conventional leaded package.
The PHB13N40E is supplied in the SOT404 surface mounting package.

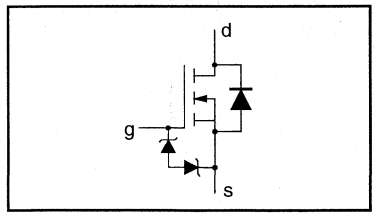
TrenchMOS™ transistor Logic level FET

PHP21N06LT, PHB21N06LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 55 V

I_D = 21 A

$R_{DS(ON)} \leq 75\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 70\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode, logic level, field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP21N06LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB21N06LT is supplied in the SOT404 surface mounting package.

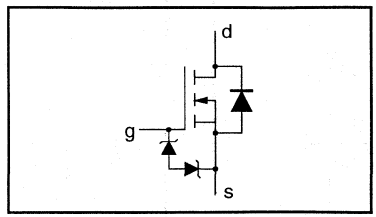
TrenchMOS™ transistor Logic level FET

PHP24N03LT, PHB24N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 30 V

I_D = 24 A

$R_{DS(ON)} \leq 56\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 50\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP24N03LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB24N03LT is supplied in the SOT404 surface mounting package.

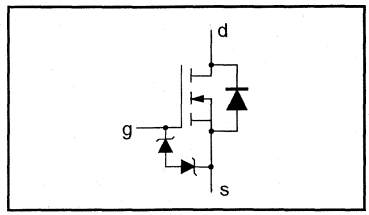
TrenchMOS™ transistor Logic level FET

PHP37N06LT, PHB37N06LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 55 V

I_D = 37 A

$R_{DS(ON)} \leq 35\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 32\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode, logic level, field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP37N06LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB37N06LT is supplied in the SOT404 surface mounting package.

TrenchMOS™ transistor Logic level FET

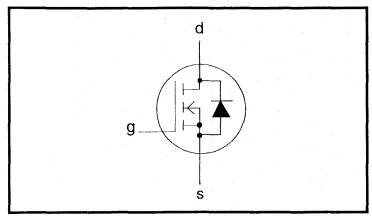
PHP45N03LT, PHB45N03LT, PHD45N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 30 V

I_D = 45 A

$R_{DS(ON)} \leq 24\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 21\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP45N03LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB45N03LT is supplied in the SOT404 surface mounting package.
The PHD45N03LT is supplied in the SOT428 surface mounting package.

TrenchMOS™ transistor Logic level FET

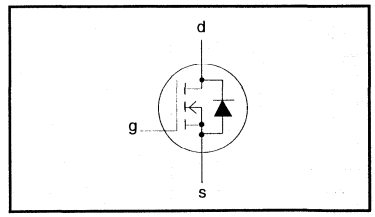
PHP55N03LT, PHB55N03LT, PHD55N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 25 V

I_D = 55 A

$R_{DS(ON)} \leq 18\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 14\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The combination of very low on-state resistance and low switching losses make this device the optimum choice in high speed computer motherboard d.c. to d.c. converters.

The PHP55N03LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB55N03LT is supplied in the SOT404 surface mounting package.
The PHD55N03LT is supplied in the SOT428 surface mounting package.

TrenchMOS™ transistor Logic level FET

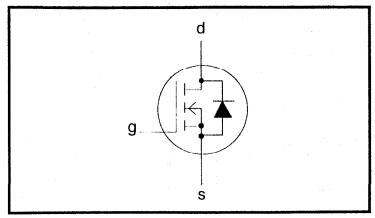
PHP69N03LT, PHB69N03LT, PHD69N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 25 V

I_D = 69 A

$R_{DS(ON)} \leq 14\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 12\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The combination of very low on-state resistance and low switching losses make this device the optimum choice in high speed computer motherboard d.c. to d.c. converters.

The PHP69N03LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB69N03LT is supplied in the SOT404 surface mounting package.
The PHD69N03LT is supplied in the SOT428 surface mounting package.

P-channel enhancement mode MOS transistor

PHP109

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-resistance.

APPLICATIONS

- Motor and actuator driver
- Power management
- Synchronized rectification.

DESCRIPTION

P-channel enhancement mode MOS transistor in an 8-pin plastic SO8 (SOT96-1) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SO8 (SOT96-1)

PIN	SYMBOL	DESCRIPTION
1	n.c.	not connected
2	s	source
3	s	source

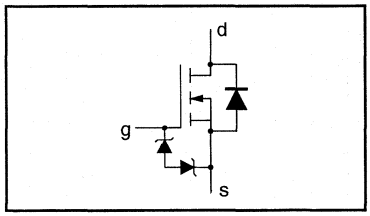
TrenchMOS™ transistor Logic level FET

PHP125N06LT, PHB125N06LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 55 V

I_D = 75 A

$R_{DS(ON)} \leq 8\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 6\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode, logic level, field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP125N06LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB125N06LT is supplied in the SOT404 surface mounting package.

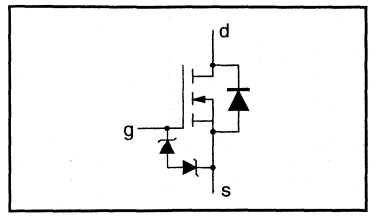
TrenchMOS™ transistor Logic level FET

PHP130N03LT, PHB130N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 30 V

I_D = 75 A

$R_{DS(ON)} \leq 6\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 5\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHP130N03LT is supplied in the SOT78 (TO220AB) conventional leaded package.
The PHB130N03LT is supplied in the SOT404 surface mounting package.

Dual P-channel enhancement mode MOS transistor

PHP206

FEATURES

- High-speed switching
- No secondary breakdown
- Very low on-state resistance.

APPLICATIONS

- Motor driver
- Power management
- DC-DC converters
- General purpose switching.

DESCRIPTION

Two P-channel enhancement mode MOS transistors in an 8-pin plastic SOT96-1 (SO8) package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

Source-drain diode					
I_S	source current (DC)	T_s = 80 °C	–	–2.7	A
I_{SM}	peak pulsed source current	note 2	–	–10.8	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Maximum permissible dissipation per MOS transistor. Both devices may be loaded up to 3.5 Watt at the same time.
4. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
5. Maximum permissible dissipation per MOS transistor. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
6. Maximum permissible dissipation if only one MOS transistor dissipates. Device mounted on printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

Dual P-channel enhancement mode MOS transistor

PHP222

FEATURES

- Very low on-state resistance
- High-speed switching
- No secondary breakdown
- Low threshold.

APPLICATIONS

- Power management
- DC-DC converters
- General purpose switch.

DESCRIPTION

Two P-channel enhancement mode MOS transistors in an 8-pin SOT96-1 (SO8) SMD plastic package.

CAUTION
The device is supplied in an antistatic package. The gate-source input must be protected against static discharge during transport or handling.

PINNING - SOT96-1 (SO8)

PIN	SYMBOL	DESCRIPTION
1	s_1	source 1
2	g_1	gate 1
3	s_2	source 2
4	g_2	gate 2
5	d_2	drain 2
6	d_2	drain 2
7	d_1	drain 1
8	d_1	drain 1

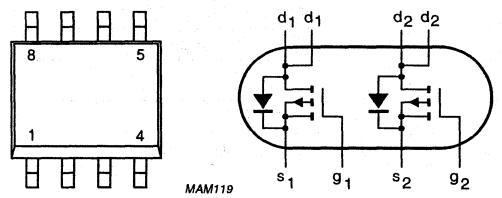

Fig.1 Simplified outline and symbol.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DS}	drain-source voltage (DC)		–	–30	V
V_{SD}	source-drain diode forward voltage	$I_S = -1.25$ A; $V_{GD} = 0$	–	–1.3	V
V_{GSO}	gate-source voltage (DC)	open drain	–	±8	V
V_{GSth}	gate-source threshold voltage	$I_D = -1$ mA; $V_{DS} = V_{GS}$	–0.4	–	V
I_D	drain current (DC)	$T_s = 80$ °C	–	–3.2	A
R_{DSon}	drain-source on-state resistance	$I_D = -1.6$ A; $V_{GS} = -2.5$ V	–	220	mΩ
P_{tot}	total power dissipation	$T_s = 80$ °C	–	3.5	W

PRELIMINARY
See Philips Semiconductors for Design-in information

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
Per P-channel					
V_{DS}	drain-source voltage (DC)		–	–30	V
V_{GSO}	gate-source voltage (DC)	open drain	–	±8	V
I_D	drain current (DC)	T_s = 80 °C; note 1	–	–3.2	A
I_{DM}	peak drain current	note 2	–	–12.8	A
P_{tot}	total power dissipation	T_s = 80 °C; note 3	–	3.5	W
		T_{amb} = 25 °C; note 4	–	2.63	W
		T_{amb} = 25 °C; note 5	–	1.14	W
		T_{amb} = 25 °C; note 6	–	1.56	W
T_{stg}	storage temperature		–55	+150	°C
T_j	operating junction temperature		–55	+150	°C
Source-drain diode					
I_S	source current (DC)	T_s = 80 °C	–	–2.7	A
I_{SM}	peak pulsed source current	note 2	–	–10.8	A

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Maximum permissible dissipation per MOS transistor. Both devices may be loaded up to 3.5 W at the same time.
4. Maximum permissible dissipation per MOS transistor. Device mounted on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
5. Maximum permissible dissipation per MOS transistor. Device mounted on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.
6. Maximum permissible dissipation if only one MOS transistor dissipates. Device mounted on a printed-circuit board with an $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

Notes

1. T_s is the temperature at the soldering point of the drain lead.
2. Pulse width and duty cycle limited by maximum junction temperature.
3. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 27.5 K/W.
4. Device mounted on a printed-circuit board with a $R_{th\ a\text{-}tp}$ (ambient to tie-point) of 90 K/W.

THERMAL CHARACTERISTICS

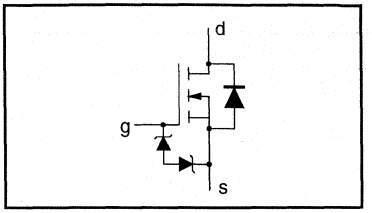
TrenchMOS™ transistor Logic level FET

PHT6N03LT

FEATURES

- **'Trench'** technology
- Very low on-state resistance
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Surface mounting package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 30 V

I_D = 5.9 A

$R_{DS(ON)} \leq 30\ m\Omega$ (V_{GS} = 5 V)

$R_{DS(ON)} \leq 28\ m\Omega$ (V_{GS} = 10 V)

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor using **'trench'** technology. The device has very low on-state resistance. It is intended for use in dc to dc converters and general purpose switching applications.

The PHT6N03LT is supplied in the SOT223 surface mounting package.

TrenchMOS™ transistor
Logic level FET

PHT6N06LT

GENERAL DESCRIPTION

N-channel enhancement mode logic level field-effect power transistor in a plastic envelope suitable for surface mounting. The device features very low on-state resistance and has integral zener diodes giving ESD protection. It is intended for use in DC-DC converters and general purpose switching applications.

PowerMOS transistor PHW7N60

GENERAL DESCRIPTION

N-channel enhancement mode field-effect power transistor in a plastic envelope featuring high avalanche energy capability, stable off-state characteristics, fast switching and high thermal cycling performance with low thermal resistance. Intended for use in Switched Mode Power Supplies (SMPS), motor control circuits and general purpose switching applications.

PowerMOS transistors Avalanche energy rated

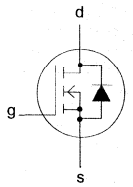
PHX2N60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Isolated package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 1.3 A

$R_{DS(ON)} \leq 6\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHX2N60E is supplied in the SOT186A full pack, isolated package.

PowerMOS transistors Avalanche energy rated

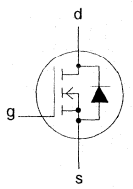
PHX3N60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Isolated package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 1.7 A

$R_{DS(ON)} \leq 4.4\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHX3N60E is supplied in the SOT186A full pack, isolated package.

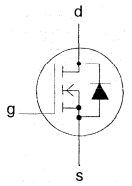
PowerMOS transistors FREDFET, Avalanche energy rated

PHX4ND40E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Isolated package
- Fast reverse recovery diode

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 400 V

I_D = 2.7 A

$R_{DS(ON)} \leq 1.8\ \Omega$

t_{rr} = 180 ns

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, incorporating a **F**ast **R**ecovery **E**pitaxial **D**iode (FRED). This gives improved switching performance in half bridge and full bridge converters making this device particularly suitable for inverters, lighting ballasts and motor control circuits.

The PHX4ND40E is supplied in the SOT186A full pack isolated package.

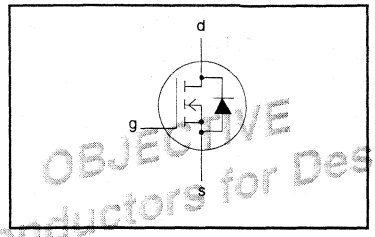
PowerMOS transistors
Low capacitance
Avalanche energy rated

PHX6NA60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Low feedback capacitance
- Stable off-state characteristics
- High thermal cycling performance
- Low thermal resistance

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 3.9 A

$R_{DS(ON)} \leq 1.2\ \Omega$

OBJECTIVE
Philips Semiconductors for Design-in information

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHX6NA60E is supplied in the SOT186A full pack, isolated package.

t_{rr} = 180 ns

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, incorporating a **F**ast **R**ecovery **E**pitaxial **D**iode (FRED). This gives improved switching performance in half bridge and full bridge converters making this device particularly suitable for inverters, lighting ballasts and motor control circuits.

The PHX6ND50E is supplied in the SOT186A full pack, isolated package.

PowerMOS transistors Avalanche energy rated

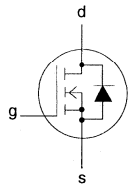
PHX7N60E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Isolated package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 600 V

I_D = 3.6 A

$R_{DS(ON)} \leq 1.2\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHX7N60E is supplied in the SOT186A full pack, isolated package.

PowerMOS transistors Avalanche energy rated

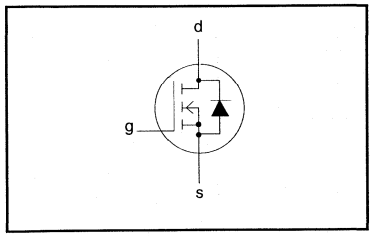
PHX10N40E

FEATURES

- Repetitive Avalanche Rated
- Fast switching
- Stable off-state characteristics
- High thermal cycling performance
- Isolated package

SYMBOL



QUICK REFERENCE DATA

V_{DSS} = 400 V

I_D = 5.3 A

$R_{DS(ON)} \leq 0.55\ \Omega$

GENERAL DESCRIPTION

N-channel, enhancement mode field-effect power transistor, intended for use in off-line switched mode power supplies, T.V. and computer monitor power supplies, d.c. to d.c. converters, motor control circuits and general purpose switching applications.

The PHX10N40E is supplied in the SOT186A full pack, isolated package.

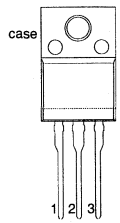
SOT186A



LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{DSS}	Drain-source voltage	T_j = 25 °C to 150°C	-	400	V
V_{DGR}	Drain-gate voltage	T_j = 25 °C to 150°C; R_{GS} = 20 kΩ	-	400	V
V_{GS}	Gate-source voltage		-	± 30	V
I_D	Continuous drain current	T_{hs} = 25 °C; V_{GS} = 10 V	-	5.3	A
		T_{hs} = 100 °C; V_{GS} = 10 V	-	3.4	A
I_{DM}	Pulsed drain current	T_{hs} = 25 °C	-	42	A
P_D	Total dissipation	T_{hs} = 25 °C	-	37	W
T_j, T_{stg}	Operating junction and storage temperature range		- 55	150	°C

AVALANCHE ENERGY LIMITING VALUES

Limiting values in accordance with the Absolute Maximum System (IEC 134)

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
E_{AS}	Non-repetitive avalanche energy	Unclamped inductive load, I_D = 10 A; $V_{DD} \leq$ 50 V; starting T_j = 25°C; R_{GS} = 50 Ω; V_{GS} = 10 V	-	520	mJ
E_{AR}	Repetitive avalanche energy[1]		-	13	mJ
I_{AS}, I_{AR}	Repetitive and non-repetitive avalanche current		-	10	A

1 pulse width and repetition rate limited by T_j max.

ISOLATION LIMITING VALUE & CHARACTERISTIC

T_{hs} = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{isol}	R.M.S. isolation voltage from all three terminals to external heatsink	f = 50-60 Hz; sinusoidal waveform; R.H. ≤ 65% ; clean and dustfree	-		2500	V
C_{isol}	Capacitance from T2 to external heatsink	f = 1 MHz	-	10	-	pF

THERMAL RESISTANCES

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$R_{th\ j\text{-}hs}$	Thermal resistance junction to heatsink	with heatsink compound	-	-	3.4	K/W
$R_{th\ j\text{-}a}$	Thermal resistance junction to ambient		-	55	-	K/W

ELECTRICAL CHARACTERISTICS

T_j = 25 °C unless otherwise specified

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{(BR)DSS}$	Drain-source breakdown voltage	V_{GS} = 0 V; I_D = 0.25 mA	400	-	-	V
$\Delta V_{(BR)DSS}$ / ΔT_j	Drain-source breakdown voltage temperature coefficient	V_{DS} = V_{GS}; I_D = 0.25 mA	-	0.1	-	%/K
$R_{DS(ON)}$	Drain-source on resistance	V_{GS} = 10 V; I_D = 5.3 A	-	0.42	0.55	Ω
$V_{GS(TO)}$	Gate threshold voltage	V_{DS} = V_{GS}; I_D = 0.25 mA	2.0	3.0	4.0	V
g_{fs}	Forward transconductance	V_{DS} = 30 V; I_D = 5.3 A	3.5	6	-	S
I_{DSS}	Drain-source leakage current	V_{DS} = 400 V; V_{GS} = 0 V	-	1	25	μA
		V_{DS} = 320 V; V_{GS} = 0 V; T_j = 125 °C	-	30	250	μA

N-channel enhancement mode vertical D-MOS transistor

PMBF107

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown.

APPLICATIONS

- Relay, high-speed and line transformer drivers.

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a SOT23 package, intended for use as a line current interruptor in telephone sets.

CAUTION
This product is supplied in anti-static packing to prevent damage caused by electrostatic discharge during transport and handling. For further information, refer to Philips specs.: SNW-EQ-608, SNW-FQ-302A and SNW-FQ-302B.

PINNING - SOT23

PIN	SYMBOL	DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor

PMBF170

DESCRIPTION

N-channel enhancement mode vertical D-MOS transistor in a SOT23 envelope. Designed for use as a Surface Mounted Device (SMD) in thin and thick-film circuits with applications in relay, high-speed and line transformer drivers.

FEATURES

- Direct interface to C-MOS, TTL, etc.
- High-speed switching
- No secondary breakdown

QUICK REFERENCE DATA

Drain-source voltage	V_{DS}	max.	60	V
Gate-source voltage (open drain)	$\pm V_{GSO}$	max.	20	V
Drain current (DC)	I_D	max.	250	mA
Total power dissipation up to T_{amb} = 25 °C	P_{tot}	max.	300	mW
Drain-source on-resistance I_D = 200 mA; V_{GS} = 10 V	$R_{DS(on)}$	typ.	2.5	Ω
		max.	5.0	Ω

INTRODUCTION

There are two basic forms of electronic component construction, those with leads for through-hole mounting and (micro)miniature types for surface mounting. Through-hole mounting gives a very rugged construction and uses well established soldering methods. Surface mounting has the advantages of high packing density plus high-speed automated assembly.

LEADED DEVICES

The following general rules are for the save handling and soldering of leaded devices. Special rules for particular types may apply and, for these, instructions are given in the individual data sheets. With all components, excessive forces or heat can cause serious damage and should always be avoided.

Handling

- Avoid perpendicular forces on the body of the device
- Avoid sudden forces on the leads or body. These forces are often much greater than allowed
- Avoid high acceleration as a result of any shock, e.g. dropping the device on a hard surface
- During bending, support the leads between body or stud and the bending point
- During the bending process, axial forces on the body must not exceed 20 N
- Bending the leads through 90° is allowed at any distance from the body when it is possible to support the leads during bending without contacting the body or weldings
- Bending close to the body or stud without supporting the leads is only allowed if the bend radius is greater than 0.5 mm
- Twisting the leads is allowed at any distance from the body or stud only if the lead is properly clamped between body or stud and the twisting point
- Without clamping, twisting the leads is allowed only at a distance of greater than 3 mm from the body; the torque angle must not exceed 30°
- Straightening bent leads is allowed only if the applied pulling force in the axial direction does not exceed 20 N and the total pull duration is not longer than 5 s.

Soldering

- Avoid any force on the body or leads during or immediately after soldering
- Do not correct the position of an already soldered device by pushing, pulling or twisting the body
- Avoid fast cooling after soldering.

The maximum allowable soldering time is determined by:

- Package type
- Mounting environment
- Soldering method
- Soldering temperature
- Distance between the point of soldering and the seal of the device's body.

GENERAL DATA AND INSTRUCTIONS FOR THE SOT186A; SOT263; TO 220AB

General rules

1. Fasten the device to the heatsink before soldering the leads.
2. Avoid stress to the leads.
3. Keep mounting tool (e.g. screwdriver) clear of the plastic body.
4. The rectangular washer may only touch the plastic part of the body; it should not exert any force on that part (screw mounting).

Mounting methods

CLIP MOUNTING

Mounting with a spring clip gives:

1. A good thermal contact under the crystal area, and slightly lower thermal resistance than screw mounting.
2. Safe insulation for mains operation.

Minimum force for good heat transfer is 10 N.

Maximum force to avoid damaging the device is 80 N.

M3 SCREW MOUNTING

It is recommended that the rectangular spacing washer is inserted between screw head and mounting tab.

Do not use self-tapping screws.

Mounting torque for screw mounting:

For thread-forming screws these are final values.

Minimum torque for good heat transfer is 0.55 Nm.

Maximum torque to avoid damaging the device is 0.80 Nm.

When a nut or screw is driven directly against the tab, the torques are as follows:

Minimum torque for good heat transfer is 0.40 Nm.

Maximum torque to avoid damaging the device is 0.60 Nm.

RIVET MOUNTING NON-INSULATED

The device should not be pop-rivetted to the heatsink. It is permissible to press-rivet the metal tab providing that eyelet rivets of soft material are used, and the press forces are slowly and carefully controlled.

This method is not permitted for full-pack envelopes because it will damage the plastic encapsulation.

Heatsink requirements

Flatness in the mounting area: 0.02 mm maximum per 10 mm.
Mounting holes must be deburred, for further information see clip and screw mounting instructions.

Heatsink compound

The thermal resistance from mounting base to heatsink ($R_{th\ mb\text{-}h}$) can be reduces by applying a metallic oxide compound between the contact surfaces. Values given are of thermal resistance using this type of compound. Dow Corning 340 Heat sink compound is recommended. For insulated mounting, the compound should be applied to the bottom of both device and insulator.

Thermal data for heatsink mounting methods (TO220 only)

Typical figures, for exact figures see data for each device type.

$R_{th\ mb\text{-}h}$	Thermal resistance from mounting base to heatsink	K/W	
	Mounting method	**Clip**	**Screw**
direct with heatsink compound		0.3	0.5
direct without heatsink compound		1.4	1.4
with heatsink compound and 0.1 mm maximum mica insulator		2.2	–
with heatsink compound and 0.25 mm maximum alumina insulator		0.8	–
with heatsink compound and 0.05 mm mica insulator			
	insulated up to 500 V	–	1.4
	insulated up to 800 V/1 000 V	–	1.6
without heatsink compound and 0.05 mm mica insulator			
	insulated up to 500 V	–	3.0
	insulated up to 800 V/1 000 V	–	4.5

Additional insulators are generally not required when mounting the full-pack outlines.

Soldering

Recommendation for devices with a maximum junction temperature rating <175 °C:

DIP OR WAVE SOLDERING

Maximum permissible solder temperature is 260 °C at a distance from the body of >5 mm and for a total contact time with soldering bath or waves of <7 s.

HAND SOLDERING

Maximum permissible solder temperature is 275 °C at a distance from the body of >3 mm and for a total contact time with the soldering iron of <5 s.

The body of the device must not touch anything with a temperature >200 °C.

It is not permitted to solder the metal tab of the device to a heatsink, otherwise the junction temperature rating will be exceeded.

Avoid any force on body and leads during or after soldering; do not correct the position of the device or of its leads after soldering.

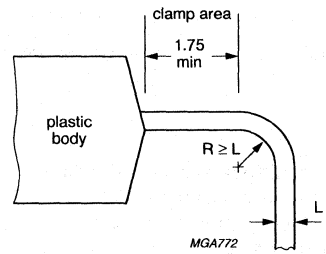
Lead bending

Maximum permissible tensile force on the body for 5 seconds is 20 N. The leads can be bent, twisted or straightened.

To keep forces within the above mentioned limits the leads should always be clamped rigidly near the body during bending. This is also to prevent damage to the seal of the leads within the plastic body.

Leads can be bent as near to the body as required, but adequate length should always be allowed for clamping. This is a minimum of 1.75 mm from the body to the start of a bend radius.

The internal radius of bend should never be less than the thickness of the lead. A minimum radius of at least 1.5 × lead thickness is preferred. See Fig.1. Surface cracks in the dip tin coating on the lead are common when a radius less than 1.5 × lead thickness is used. Although exposing the copper material, these cracks do not affect the mechanical strength of the lead. Lead forming by Philips is available as an option on all products supplied in these outlines.



Dimensions in mm.

Fig.1 Minimum lead bend radius.

Additional guide-lines

It is recommended that where a device is rigidly secured to a heatsink which is in turn rigidly secured to a PCB, that a bend is put in the leads to act as an expansion loop. This will prevent differential expansion of the mounting parts transferring stress to the soldering joint, as shown in Fig.2. This is only necessary where the device is mounted so rigidly that expansion forces are transmitted through the assembly.

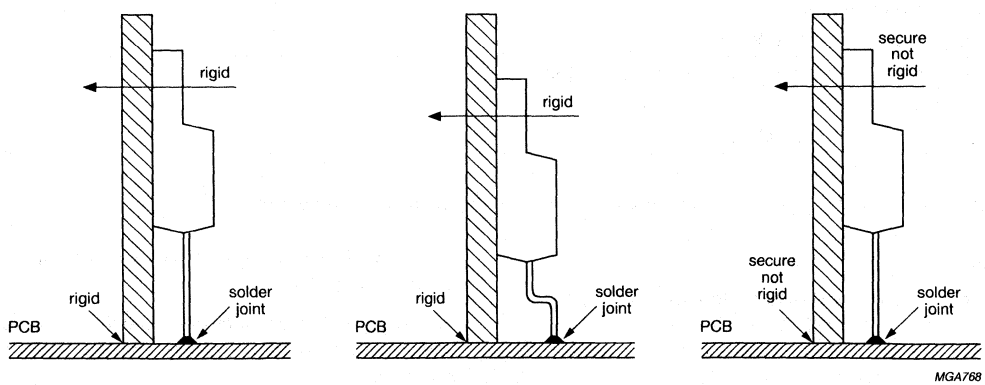


Fig.2 Printed circuit board and heatsink mounting.

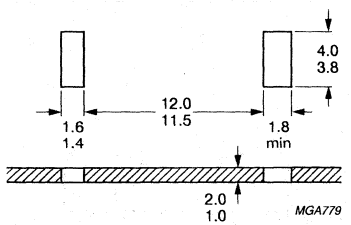
INSTRUCTIONS FOR CLIP MOUNTING

Direct mounting with clip

1. Apply heatsink compound to the mounting base, then place the device on the heatsink.
2. Push the short end of the clip into the narrow slot in the heatsink with the clip at an angle of 10° to 30° to the vertical. See Figs.3 and 4.
3. Push down the clip over the device until the long end of the clip snaps into the wide slot in the heatsink. The clip should bear on the plastic body, not on the tab. See Fig.5.



Dimensions in mm.

Fig.3 Heatsink requirements.

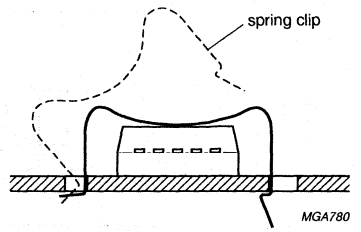


Fig.4 Mounting.

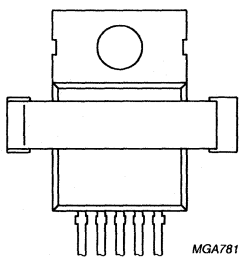

Fig.5 Position of device (top view).

Insulated mounting with clip

With the insulators up to 2 kV insulation is obtained.

1. Apply heatsink compound to the bottom of both device and insulator, then place the device with the insulator on the heatsink.
2. Push the short end of the clip into the narrow slot in the heatsink with the clip at an angle of 10° to 30° to the vertical. See Figs 6, 7 and 8.
3. Push down the clip over the device until the long end of the clip snaps into the wide slot in the heatsink. The clip should bear on the plastic body, not on the tab. Ensure that the device is centred on the mica insulator to prevent unwanted movement.

SURFACE-MOUNT DEVICES

Since the introduction of Surface Mount Devices (SMDs), component design and manufacturing techniques have changed almost beyond recognition. Smaller pitch, minimum footprint area and reduced component volume all contribute to a more compact circuit assembly. As a consequence, when designing printed circuit boards (PCBs), the dimensions of the footprints are perhaps more crucial than ever before.

One of the first steps in this design process is to consider which soldering method, either wave or reflow, will be used during production. This determines not only the solder footprint dimensions, but also the minimum spacing between components, the available area underneath the component where tracks may be laid, and possibly the required component orientation during soldering.

Although reflow soldering is recommended for SMDs, many manufacturers use, and will continue to use for some time to come, a mixture of surface-mount and through-hole components on one substrate (a mixed print).

The mix of components affects the soldering methods that can be applied. A substrate having SMDs mounted on one or both sides but no through-hole components is likely to be suitable for reflow or wave soldering. A double sided mixed print that has through-hole components and some SMDs on one side and densely packed SMDs on the other normally undergoes a sequential combination of reflow and wave soldering. When the mixed print has only through-hole components on one side and all SMDs on the other, wave soldering is usually applied.

To help with your circuit board design, this guideline gives an overview of both reflow and wave soldering methods, and is followed by some useful hints on hand soldering for repair purposes, and the recommended footprints for our SMD discrete semiconductor packages.

Reflow soldering process

There are three basic process steps for single-sided PCB reflow soldering, these are:

1. Applying solder paste to the PCB
2. Component placement
3. Reflow soldering.

APPLYING SOLDER PASTE TO THE PCB

Solder paste can be applied to the PCBs solder lands by one of either three methods: dispensing, screen or stencil printing.

Dispensing is flexible but is slow, and only suitable for pitches of 0.65 mm and above.

With screen printing, a fine-mesh screen is placed over the PCB and the solder paste is forced through the mesh onto the solder lands of the PCB. However, because of mesh aperture limitations (emulsion resolution), this method is only suitable for solder paste deposits of 300 μm and wider.

Stencil printing is similar to screen printing, except that a metal stencil is used instead of a fine-mesh screen. The stencil is usually made of stainless steel or bronze and should be 150 to 200 μm thick. A squeegee is passed across the stencil to force solder paste through the apertures in the stencil and onto the solder lands on the PCB (see Fig.19). It does not suffer from the same limitations as the other two printing methods and so is the preferred method currently available.

It is recommended that for solder paste printing, the equipment is located in a controlled environment maintained at a temperature of 23 ±2 °C, and a relative humidity between 45% and 75%.

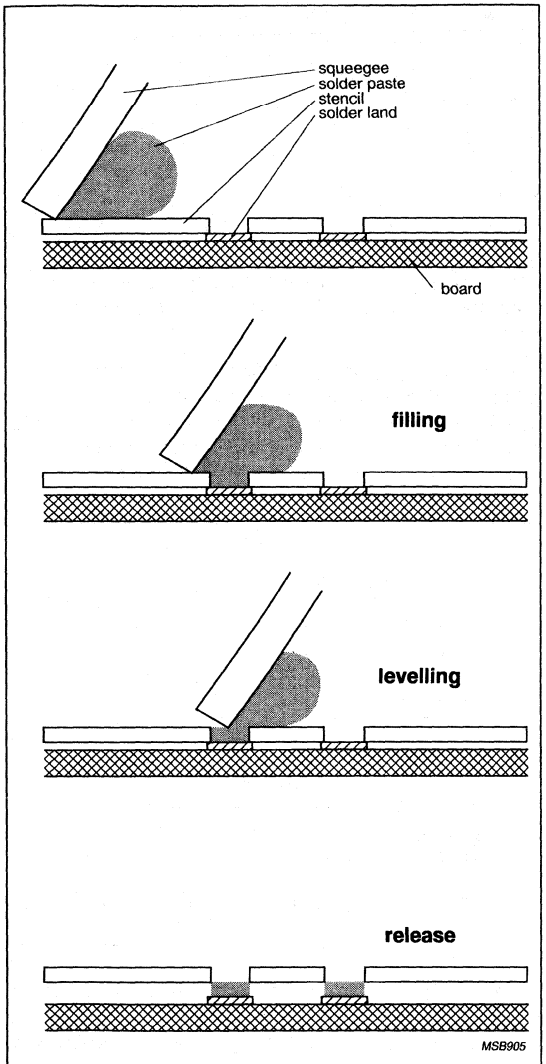

Fig.19 Applying solder paste by stencilling.

Stencil printing

The printing process must be able to apply the solder paste deposits to the PCB:

- In the correct amounts
- At the correct position on the lands
- With an acceptable height and shape.

The amount of solder paste used must be sufficient to give reliable soldered joints. This amount is controlled by the stencil thickness, aperture dimensions, process settings, and the volume of paste pressed through the apertures by the squeegee.

The downward force of the squeegee is counteracted by the hydrodynamic pressure of the paste, and so the machine should be set to ensure that the stencil is just 'cleaned' by the squeegee.

Suitable aperture dimensions depend on the stencil thickness. The solder paste deposits must have a flat part on the top (Fig.20, examples 4 and 5), which can be achieved by correct process settings. The footprints given in this book were designed for these correct deposit types. Stencil apertures that are too small result in irregular dots on the lands (Fig.20, examples 1 to 3). If the apertures are too large, solder paste can be scooped out, particularly if a rubber squeegee is used (Fig.20, example 6).

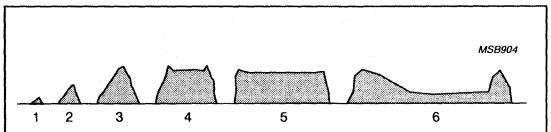

Fig.20 Shapes of solder deposits for increasing stencil apertures (left to right).

Ideally, the deposited solder paste should sit entirely on the solder land. The tolerated misplacement of solder paste with respect to the solder land is determined by the most critical component. The solder paste deposit must be deposited within 100 µm with respect to the solder land.

Furthermore, the tackiness (tack strength) of the solder paste must be sufficient to hold surface-mount devices on the PCB during assembly and during transport to the reflow oven. Tack strength depends on factors such as paste composition, drying conditions, placement pressure, dwell time and contact area. As a general rule, component placement should be within four hours after the paste printing process.

Squeegee

The squeegee can be either metal or rubber. A metal squeegee gives better overall results and so is recommended, however with step stencils, a rubber squeegee has to be used. The footprints given in this chapter were designed for application by both types of squeegee.

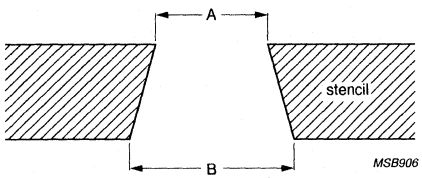
Stencil apertures

Stencil apertures can be made by either:

- Etching
- Laser cutting
- Electroforming.

Of the three methods, etching is less accurate as the deviation in aperture dimensions with respect to the target is relatively large (target is +50 μm at squeegee side and 0 μm at PCB side).

Laser-cut and electroformed stencils have smaller deviations in dimensions and are therefore more suitable for small and fine-pitch components (see Fig.21).



A = B +0/–30 (μm); B= X 30 (μm); X = nominal apertures size.

Fig.21 Specifications of laser-cut stencil apertures for discrete and passive components.

A useful method of controlling the stencil printing process during production is by monitoring the weight of solder paste on the board which may vary between 80% and 110% of the theoretical amount according to the target (designed) apertures. Smearing and clogging of a small aperture cannot be detected with this method.

Solder paste

Reflow soldering uses a paste consisting of small nodules of solder and a flux with binder, solvents and additives to control rheological properties. The flux in the solder paste can be rosin mildly activated or rosin activated.

The requirements of the solder paste are:

- Good rolling behaviour
- No slump during heat-up
- Low viscosity during printing
- High viscosity after printing
- Sufficient tackiness to hold the components
- Removal of oxides during reflow soldering.

Suitable solder paste types have the following compositions:

- Sn62Pb36Ag2
- Sn63Pb37
- Sn60Pb40.

COMPONENT PLACEMENT

The position of the component with respect to the solder lands is an important factor in the final result of the assembly process. A misaligned component can lead to unreliable joints, open circuits and/or bridges between leads.

The placement accuracy is defined as the maximum permissible deviation of the component outline or component leads, with respect to the actual position of the solder land pattern belonging to that component or component leads on the circuit board (see Fig.22).

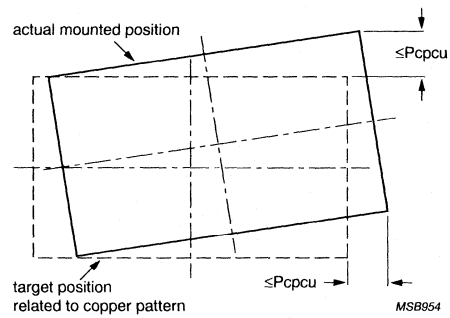


Fig.22 Component placement tolerances.

A maximum placement deviation (P) of 0.25 mm is used in these guidelines, which relates to the accuracy of a low-end placement machine. A higher placement accuracy is required for components with a fine pitch. This is given in the footprint description for the components concerned.

Besides the position in x- and y-directions, the z-position with respect to the solder paste, which is determined by the placement force, is also important. If the placement force is too high, solder paste will be squeezed out and solder balls or bridges will be formed. If the force is too low, physical contact will be insufficient, leads will not be soldered properly and the component may shift.

REFLOW SOLDERING

There are several methods available to provide the heat to reflow the solder paste, such as convection, hot belt, hot gas, vapour phase and resistance soldering. The preferred method is, however, convection reflow.

Convection reflow

With this method, the PCBs passes through an oven where it is preheated, reflow soldered and cooled (see Fig.23). If the heating rate of the board and components are similar, however, preheating is not necessary.

During the reflow soldering process, all parts of the board must be subjected to an accurate temperature/ time profile. Figure 23 shows a suitable profile framework for single-sided reflow soldering and the first side of double-sided print boards. It's important to note that this profile is for discrete semiconductor packages. The actual framework for the entire PCB could be smaller than the one shown, as other components on the board may have different process requirements.

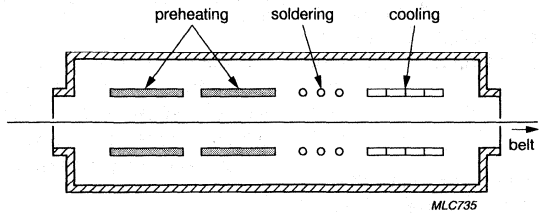
Reflow soldering can be done in either air or a nitrogen atmosphere. If soldering in air, the temperature (T_p) must not exceed 240 °C on the first side of a double-sided print board with organic coated solder lands. This is because peak temperatures greater than 240 °C reduce the solderability of the lands on the second side to be soldered. This peak temperature can rise to 280 °C when soldering the second side with organic coated solder lands in air.

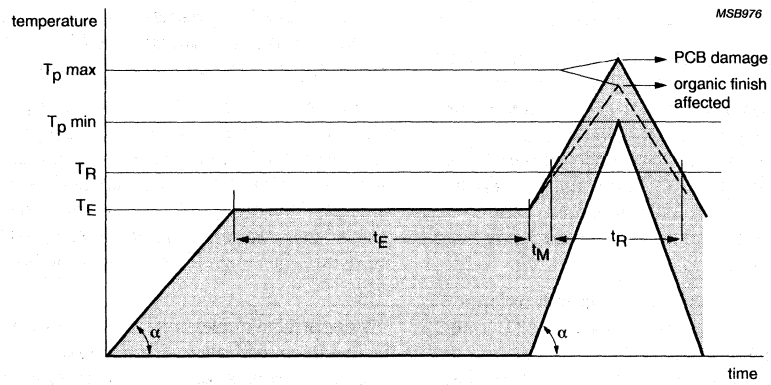
If soldering in a nitrogen atmosphere, a peak temperature of 280 °C is allowed for double-sided print boards or single-sided reflow soldering. Soldering in a nitrogen atmosphere results in smoother joint meniscus, smaller contact angles, and better wetting of the copper solder lands.

The profile can be achieved by correct combinations of conveyor speed and heater temperature. To check whether the profile is within specification, the coldest and hottest spots on the board have to be located.

To do this, you should dispense solder paste deposits regularly over the surface of a test board and on the component leads. Set the oven to a moderate temperature with maximum conveyor velocity and pass the test board through. If too many solder paste dots melt, lower the oven's temperature. Continue passing test boards through the oven, while lowering the speed of the belt in small steps.

The deposit that melts first indicates the warmest location, the one that melts last indicates the coldest location. Paste dots not reflowed after two runs must be replaced by fresh dots. Thermocouples have to be mounted at the coldest and warmest location and temperature profiles measured.





α	≤ 10 °C/s.	t_E	≤ 1 min, if possible (else ≤ 5 min).
T_E	≤ 160 °C.	t_M	= 2 to 30 s.
T_R	= 180 °C.	t_R	≤ 70 s.
$T_P$min	= 205 °C.		
$T_P$max	= 240 °C	for soldering the first side of a double-sided board with organic finish.	
$T_P$max	= 280 °C	for all other cases.	

Fig.23 Convection reflow soldering method (top), process requirements for reflow soldering (bottom).

Double-wave soldering process

There are four basic process steps for double-wave soldering, these are:

1. Applying adhesive
2. Component placement
3. Curing adhesive
4. Wave soldering process.

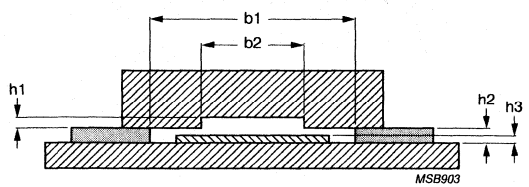
APPLYING ADHESIVE

To hold SMDs on the board during wave soldering, it is necessary to bond the component to the PCB with one or more adhesive dots. This is done either by dispensing, stencilling or pin transfer. Dispensing is currently the most popular technique. It is flexible and allows a controlled amount of adhesive to be applied at each position. Stencil printing and pin transfer are less flexible and are mainly used for mass production. The component-specific requirements for an adhesive dot are:

- Shape (volume) of the adhesive dot
- Number of dots per component
- Position of the dots.

Volume of adhesive

There must be enough adhesive to keep components in their correct positions while being transported to the curing oven. This means that the deposited adhesive must be higher than the gap between the component and the board surface. Nevertheless, there should not be too much deposit as it may smear onto the solder lands, where it can affect their solderability. The gap between a component and printed board depends on the geometry of the board and component (see Fig.24).



h1 = component stand-off height.
h2 = solder resist (and track) height on PCB.
h3 = copper height on PCB.
b1 = gap between solder lands on the PCB.
b2 = gap between metallization of the component.

Fig.24 Available space for adhesive between component and PCB (unmarked area).

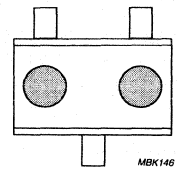
Table 1 gives guidelines for volumes of adhesive dots per package. The spreading in volumes should be within ±15%.

Table 1 Guidelines for volumes of adhesive dots

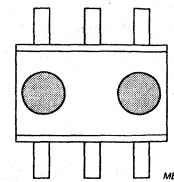
COMPONENT	NUMBER OF DOTS	VOLUME PER DOT (mm^3)
SC-70 (SOT323)	2	0.045
SC-88 (SOT363)	2	0.045
SOT23	2	0.06
SOT89	2	0.3
SOT223	2	0.70

Number, position and volume of dots per component

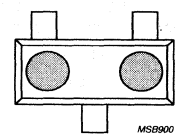
Figure 25 shows the recommended positions and numbers of adhesive dots for a variety of packages. SOT89 and SOT223 packages require much larger adhesive dots compared with those for other components.



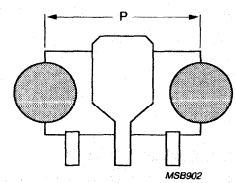
a. SC-70 (SOT323).



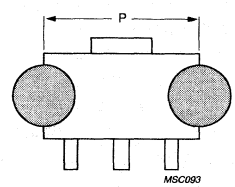
b. SC-88 (SOT363).



c. SOT23.



d. SOT89 (P = 4.4 mm).



e. SOT223 (P = 6.0 mm).

For optimum power dissipation, the SOT89 requires a good thermal contact (i.e. good solder joint) between the package and the solder land. During wave-soldering, however, flux may not always reach the total soldering area beneath the component body, which in turn can lead to an incomplete solder joint. If the SOT89 is double-wave soldered, therefore, power derating must be applied.

Fig.25 Position of adhesive dots. Pitch between two small dots is 1.0 mm.

Nozzle outlet diameter

Depending on adhesive type and component size, the nozzle outlet diameter of the dispenser can vary between 0.6 and 0.7 mm for the larger dots, and between 0.3 and 0.5 mm for the smaller dots.

As the rheology of the adhesive is temperature dependent, the temperature in the nozzle must be carefully controlled before dispensing. The required temperature depends on the adhesive type, but is usually between 26 °C and 32 °C to maintain the adhesive's rheology within specification during dispensing. Thermally curing epoxy adhesives are normally used.

Adhesives

Beside the nozzle diameters, different adhesive types are also used for different component sizes.
Small components can be secured during assembly and wave soldering with a thin (low green strength) adhesive, which can be dispensed at high speeds. For larger components (such as QFP and SO packages), a higher green strength adhesive is required.

COMPONENT PLACEMENT

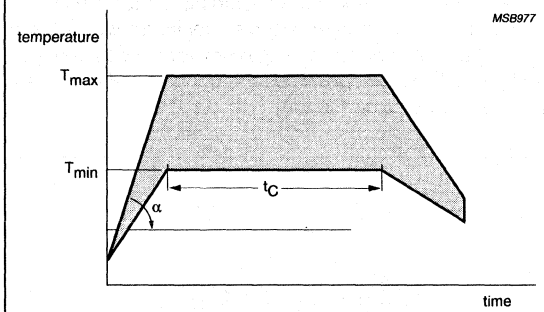
Positioning components on the PCB is similar in practice to that of reflow soldering. To prevent component shift and smearing of the adhesive, board support is important while placing components.

CURING THE ADHESIVE

To provide sufficient bonding strength between component and board, the adhesive must be properly cured. Figure 26 gives general process requirements for curing most thermosetting epoxy adhesives with latent hardeners. The temperature profile of all adhesive dots on the PCB must be within this framework. It's important to note that this profile is for discrete semiconductor packages. The actual framework for the entire PCB could be smaller than the one shown, as other components on the board may have different process requirements.

To check whether the profile is within specification, the temperature of coldest and hottest spots must be measured. The coldest spot is usually under the largest package: the hottest spot is usually under the smallest package.

The adhesive can be cured either by infrared or hot-air convection.



$T_{max} \leq 160$ °C.
$T_{min} \geq 110$ °C.
$t_C \geq 3$ minutes.
$\alpha \leq 100$ °C/min (some adhesives allow higher heating rates).
If $T_{min} > 125$ °C, t_C may be <3 min, depending on adhesive specification.

Fig.26 Process requirements for curing thermosetting adhesives.

Bonding strength

The bonding strength of glued components on the board can be checked by measuring the torque force. For small components the requirements are given in Table 2.
No values are specified for larger packages.

Table 2 Bonding strength requirements

COMPONENT	MINIMUM BONDING STRENGTH (cNcm)	TARGET BONDING STRENGTH (cNcm)
SC-70 (SOT323) SC-88 (SOT363)	110	250
SOT23	150	250

WAVE SOLDERING PROCESS

After applying adhesive, placing the component on the PCB and curing, the PCB can be wave soldered. The wave soldering process is basically built up from three sub-processes. These are:

1. Fluxing
2. Preheating
3. (Double) wave soldering.

Although listed here as sub-process they are in practice combined in one machine. All are served by one transport mechanism, which guides the PCBs at an incline through the soldering machine. It's important to note that the PCB must be loaded into the machine so that the SMDs on the board come into direct contact with the solder wave (see Fig.27).

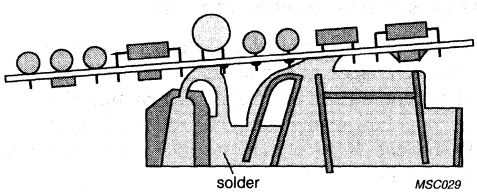


Fig.27 Double-wave soldering.

In principle, two different systems of PCB transports are available for wave soldering:

- Carrier transport

  PCBs are mounted on a soldering carrier, which moves through the soldering machine, taking it from one sub-process to the next. The advantage of carrier mounting is that the board is fixed and warpage during soldering is reduced.

- Carrierless transport

  PCBs are guided through the soldering machine by a chain with grips. This method is more convenient for mass production.

Fluxing

Fluxing is necessary to promote wetting both of the PCB and the mounted components. This ensures a good and even solder joint.

During the fluxing process, the solder side of the PCB (including the components) are covered with a thin layer of solder flux, which can be applied to the PCB either by spraying or as a foam. Although several types of solder flux are available for this purpose, they can be categorized into three main groups:

- Non-activated flux (e.g. rosin-based fluxes)
- Mildly activated flux (e.g. rosin-based or synthetic fluxes)
- Highly activated flux (e.g. water-soluble fluxes).

The choice for a particular flux type depends mainly on the products to be soldered.

Although there is always some flux residue left on the PCB after soldering, it's not always necessary to wash the boards to remove it. Whether to clean the board can depend on:

- The type of flux used (highly activated fluxes are corrosive and so should always be removed).
- The required appearance of the board after soldering.
- Customer requirements.

Preheating

After the flux is applied, the PCB needs to be preheated. This serves several purposes: it evaporates the flux solvents, it accelerates the activity of the flux and it heats the PCB and components to reduce thermal shock.

The required pre-heat temperature depends on the type of flux used. For example, the more common low-residue fluxes require a pre-heat temperature of 120 °C (measured on the wave solder side of the PCB).

(Double) wave soldering

The PCB first passes over a highly intensive (jet) solder wave with a carefully controlled constant height. This ensures good contact with the PCB, the edges of SMDs and the leads of components near to high non-wetted bodies. The greater the board's immersion depth into this first wave, the fewer joints will be missed.

If the PCB is carrier mounted, the first wave's height, and thus the board's immersion depth, can be greater. Carrierless soldering is more convenient for mass production, but the height of the wave must be lower to avoid solder overflowing to the top side of the board. The height of the jet wave is given in Table 3 along with an indication of soldering process window. This information is based on a 1.6 mm thick PCB.

Table 3 Process ranges for carrierless and carrier double wave soldering

	CARRIERLESS	CARRIER
Preheat temperature of board at wave solder side (°C)	120 ±10	
Heating rate preheating (°C/s)	$\Delta T/\Delta t \leq 3$	
First (jet) wave:		
wave height with respect to bottom side of board (mm)	1.6 +0.5/–0	3.0 +0.5/–0
Second (laminar) wave (double sided overflow):		
height with respect to underside of the board (mm)	0.8 +0.5/–0	
relative stream velocity with respect to the board	0	
Solder temperature (°C)	250 ±3	
Contact times (s):		
first (jet) wave	0.5 +0.5/–0	
second (laminar) wave	2.0 ±0.2 (plain holes); 2.5 ±0.2 (plated holes)	
PCB transport angle (°)	7 ±0.5	
Solder alloys	Sn60Pb40; Sn60Pb38Bi2	

The second, smoother laminar solder wave completes formation of the solder fillet, giving an optimal soldered connection between component and PCB. It also reduces the possibility of solder bridging by taking up excessive solder.

To reduce lead/tin oxides and possibly other solder imperfection forming during soldering, the complete wave configuration can be encapsulated by an inert atmosphere such as nitrogen.

Hand soldering microminiature components

It is possible to solder microminiature components with a light-weight hand-held soldering iron, but this method has obvious drawbacks and should be restricted to laboratory use and/or incidental repairs on production circuits:

- Hand-soldering is time-consuming and therefore expensive
- The component cannot be positioned accurately and the connecting tags may come into contact with the substrate and damage it
- There is a risk of breaking the substrate and internal connections in the component could be damaged
- The component package could be damaged by the iron.

Assessment of soldered joint quality

The quality of a soldered joint is assessed by inspecting the shape and appearance of the joint. This inspection is normally done with either a low-powered magnifier or microscope, however where ultra-high reliability is required, video, X-ray or laser inspection equipment may be considered.

Both sides of the PCB should be carefully examined: there should be no misaligned, missing or damaged components, soldered joints should be clean and have a similar appearance, there should be no solder bridging or residue, and the PCB should be assessed for general cleanliness.

Unlike leaded component joints where the lead also provides added mechanical strength, the SMD relies on the quality of the soldering for both electrical and mechanical integrity. It is therefore necessary that the inspector is trained to make a visual assessment with regard to long-term reliability.

Criteria used to assess the quality of an SMD solder joint include:

- Correct position of the component on the solder lands
- Good wetting of the surfaces
- Correct amount of solder
- A sound, smooth joint surface.

POSITIONING

If a lead projects over the solder land too far an unreliable joint is obtained. Figures 28 to 30 show the maximum shift allowed for various components. The dimensions of these solder lands guarantee that, in the statistically extreme situation, a reliable soldered joint can be made.

GOOD WETTING

This produces an even flow of solder over the surface land and component lead, and thinning towards the edges of the joint. The metallic interaction that takes place during soldering should give a smooth, unbroken, adherent layer of solder on the joint.

CORRECT AMOUNT OF SOLDER

A good soldered joint should have neither too much nor too little solder: there should be enough solder to ensure electrical and mechanical integrity, but not so much that it causes solder bridging.

SOUND, SMOOTH JOINT SURFACE

The surface of the solder should be smooth and continuous. Small irregularities on the solder surface are acceptable, but cracks are unacceptable.

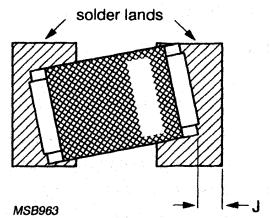

Fig.28 $J \geq 0.3$ mm.

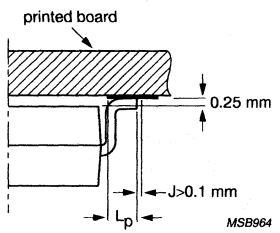

Fig.29 $J \geq 0.1$ mm; solder land > L_p.

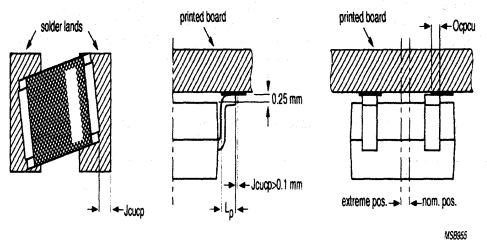

Fig.30 Oc > half lead width.

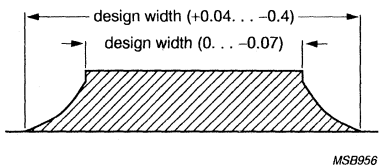
Footprint definitions

A typical SMD footprint, is composed of:

- Solder lands (conductive pattern)
- Solder resist pattern
- Occupied area of the component
- Solder paste pattern (for reflow soldering only)
- Area underneath the SMD available for tracks
- Component orientation during wave soldering.

SOLDER LANDS (CONDUCTIVE PATTERN)

The dimensions of the solder lands given in these guidelines are the actual dimensions of the conductive pattern on the printed board (see Fig.31). These dimensions are more crucial for fine-pitch components.



solder land width

The solder land dimensions are designed to give optimum soldering results. They do not take into account the copper area for optimum power dissipation. If an extra area is required to improve power dissipation, it should be coated with solder resist. This is especially important for power packages such as SOT89 and SOT223.

Fig.31 Requirements of solder land dimensions.

SOLDER RESIST PATTERN

The solder resist on the circuit board prevents short circuits during soldering, increases the insulation resistance between adjacent circuit details and stops solder flowing away from solder lands during reflow soldering.

In contrast to the tracks, which must be entirely covered, solder lands must be free of solder resist. Because of this, the cut-outs in the solder resist pattern should be at least 0.15 mm or 0.3 mm larger than the relevant solder lands (for a photo-defined and screen printed solder resist pattern respectively). The solder resist cut-outs given with the footprints in these guidelines are sketched and their dimensions can be calculated by using the above rule. Consult your printed board supplier for agreement with these solder resist cut-outs.

OCCUPIED AREA OF THE COMPONENT

A minimum spacing between components is necessary to avoid component placement problems, short circuits during wave or reflow soldering and dry solder joints during wave soldering caused by non-wettable component bodies. These problems can be avoided by placing the components so the occupied areas do not overlap (see Fig.32).

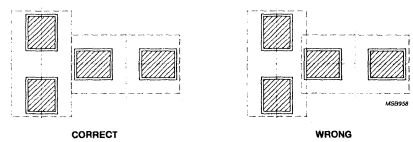


Fig.32 Minimum spacing required (bottom) between components.

SOLDER PASTE PATTERN

It is important to use a solder paste printer which is optical aligned with the PCBs copper pattern for the reflow footprints presented here. This is because, for these footprints, the solder paste deposit must be within a 0.1 mm tolerance with respect to the copper pattern.

To ensure the right amount of solder for each solder joint, the stencil apertures must be equal to the solder paste areas given by the footprints.

AREA AVAILABLE FOR TRACKS (CONDUCTIVE PATTERN)

Tracks underneath leadless SMDs must be covered with solder resist. However, as solder resist can sometimes be thin or have pin holes at the edges of tracks (especially when applied by screen printing), an additional clearance for tracks with respect to the actual metallization position of the mounted component should be taken into account (see Fig.33).

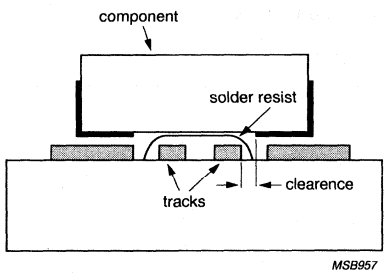

Fig.33 Clearance required underneath component between metallization and tracks.

For components that need the additional clearance, the footprints on the following pages give the maximum space for tracks not connected to the solder lands (clearance ≥ 0.1 mm), for low-voltage applications. The number of tracks in this space is determined by the specified line resolution of the printed board.

COMPONENT ORIENTATION DURING WAVE SOLDERING

Where applicable, footprints for wave soldering are given with the transport direction of the PCB. This is given as either a 'preferred transport direction during soldering' or 'transport direction during soldering'.

Components with small terminals and non-wettable bodies, have a smaller risk of dry joints, especially when using carrierless soldering as the components are placed according to the 'preferred orientation'.

Components have no orientation preference for reflow soldering.

Recommended footprints

The recommended footprints for our discrete semiconductor packages are given on the following pages. For their dimensional outline drawings, see the 'Package outlines' section in this book.

SURFACE-MOUNT DEVICES

Tape and reel packing for surface-mount devices meets the feed requirements for automatic pick and place equipment (packing conforms to IEC publication 286-3). Tape is an ideal shipping container making handling easy and providing secure blister cavities in which the devices are sealed with peel-off cover tape.

Tape specification

Tape dimensions are specified in Tables 2, 3 and 4 and in Figures 1 through 5 for 8, 12, 16 and 24 mm tape.

Table 2 Carrier tape widths

8 mm	12 mm	16 mm	24 mm
SC-70 (SOT323)	SOT89	SSOP16 (SOT338-1)	SOT404
SC-88 (SOT363)	SOT223	SSOP24 (SOT340-1)	SOT426
SOT23	SO8 (SOT96-1)		SO24 (SOT137-1)
TSOP6 (SOT457)

	500	127	20 tubes in a box

LEADED DEVICES

Tape and reel packing of TO-92 devices

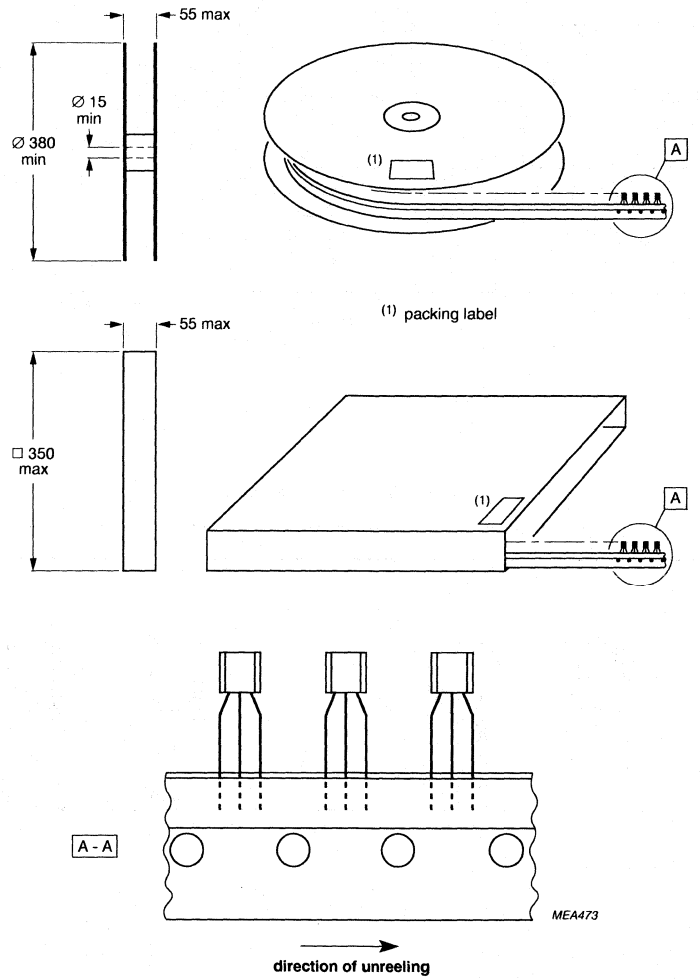
Tape and reel packing meets the feed requirements of automatic pick and place equipment (packing conforms to IEC publication 286-2 and 286-3). Additionally, the tape is an ideal shipping container.
The transistors are supplied on tape in boxes (ammopack) or on reels. The number per reel and per ammopack is 2000. The ammopack has 80 layers of 25 transistors each. Each layer contains 25 transistors, plus one empty position in order to fold the layer correctly.The ammopack is accessible from both sides, enabling the user to choose between 'normal' (see Fig.8) and 'reverse' tape. 'Normal' is indicated by a plus sign (+) on the ammopack and 'reverse' by a minus sign (–). In the European version, the leading pin is the source.

DROPOUTS

A maximum of 0.5% of the specified number of transistors in each packing may be missing. Up to 3 consecutive components may be missing provided the gap is followed by 6 consecutive components.

TAPE SPLICING

Splice the carrier tape on the back and/or front so that the feed hole pitch (P_0) is maintained (see Figs 9 and 10).



Dimensions in mm.

Fig.8 Dimensions of reel and box.

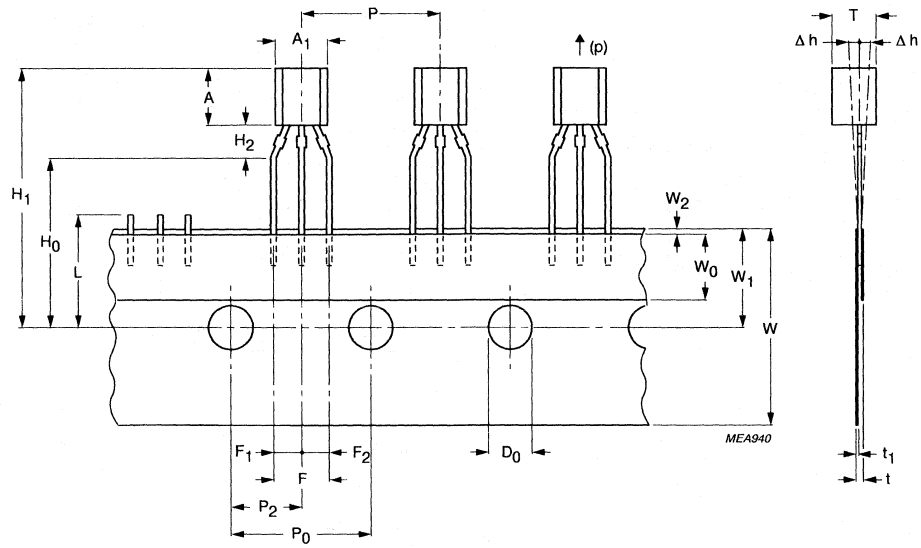


Fig.9 TO-92 transistors on tape.

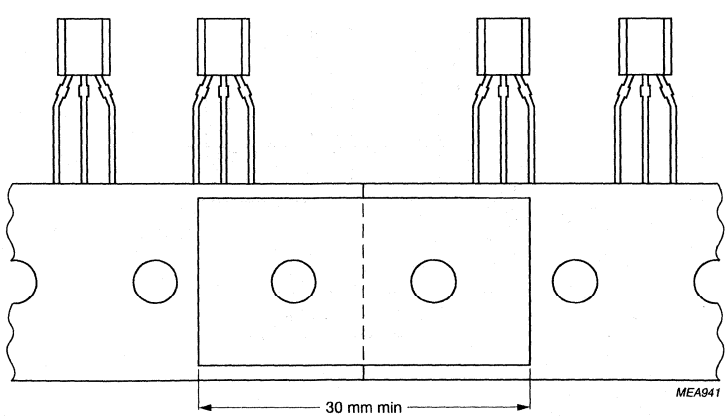

Fig.10 Joining tape with splicing patch.

Table 8 Tape specification (TO-92 leaded types)

SYMBOL	DIMENSION	SPECIFICATIONS					REMARKS
		MIN.	NOM.	MAX.	TOL.	UNIT	
A_1	body width	4	–	4.8	–	mm	
A	body height	4.8	–	5.2	–	mm	
T	body thickness	3.5	–	3.9	–	mm	
P	pitch of component	–	12.7	–	±1	mm	
P_0	feed hole pitch	–	12.7	–	±0.3	mm	
	cumulative pitch error	–	–	–	±0.1		note 1
P_2	feed hole centre to component centre	–	6.35	–	±0.4	mm	to be measured at bottom of clinch
F	distance between outer leads	–	5.08	–	+0.6/–0.2	mm	
Δh	component alignment	–	0	1	–	mm	at top of body
W	tape width	–	18	–	±0.5	mm	
W_0	hold-down tape width	–	6	–	±0.2	mm	
W_1	hole position	–	9	–	+0.7/–0.5	mm	
W_2	hold-down tape position	–	0.5	–	±0.2	mm	
H_0	lead wire clinch height	–	16.5	–	±0.5	mm	
H_1	component height	–	–	23.25	–	mm	
L	length of snipped leads	–	–	11	–	mm	
D_0	feed hole diameter	–	4	–	±0.2	mm	
t	total tape thickness	–	–	1.2	–	mm	t_1 = 0.3 to 0.6
F_1, F_2	lead-to-lead distance	–	–	–	+0.4/–0.2	mm	
H_2	clinch height	–	–	–	–	mm	
(p)	pull-out force	6	–	–	–	N	

Note

1. Measured over 20 devices.

Bulk packing of TO-92 devices

In addition to TO-92 on tape, TO-92 can also be delivered in bulk. Products are packed in boxes and plastic bags with 1000 pieces to a bag and 5 bags to a box.

As well as the standard TO-92 with straight leads, leads with delta pinning are available in bulk on request (see package outline chapter).

DATA HANDBOOK SYSTEM

Data handbook system

DATA HANDBOOK SYSTEM

Philips Semiconductors data handbooks contain all pertinent data available at the time of publication and each is revised and reissued regularly.

Loose data sheets are sent to subscribers to keep them up-to-date on additions or alterations made during the lifetime of a data handbook.

Catalogues are available for selected product ranges (some catalogues are also on floppy discs).

Our data handbook titles are listed here.

Integrated circuits

Book	*Title*
IC01	Semiconductors for Radio, Audio and CD/DVD Systems
IC02	Semiconductors for Television and Video Systems
IC03	Semiconductors for Wired Telecom Systems
IC04	HE4000B Logic Family CMOS
IC05	Advanced Low-power Schottky (ALS) Logic
IC06	High-speed CMOS Logic Family
IC11	General-purpose/Linear ICs
IC12	I^2C Peripherals
IC13	Programmable Logic Devices (PLD)
IC14	8048-based 8-bit Microcontrollers
IC15	FAST TTL Logic Series
IC16	CMOS ICs for Clocks, Watches and Real Time Clocks
IC17	Semiconductors for Wireless Communications
IC18	Semiconductors for In-Car Electronics
IC19	ICs for Data Communications
IC20	80C51-based 8-bit Microcontrollers
IC22	Multimedia ICs
IC23	BiCMOS Bus Interface Logic
IC24	Low Voltage CMOS & BiCMOS Logic
IC25	16-bit 80C51XA Microcontrollers (eXtended Architecture)
IC26	Integrated Circuit Packages
IC27	Complex Programmable Logic Devices

Discrete semiconductors

Book	*Title*

OVERVIEW OF PHILIPS COMPONENTS DATA HANDBOOKS

Our sister product division, Philips Components, also has a comprehensive data handbook system to support their products. Their data handbook titles are listed here.

Display components

Book	*Title*
DC01	Colour Television Tubes
DC02	Monochrome Monitor Tubes and Deflection Units
DC03	Television Tuners, Coaxial Aerial Input Assemblies
DC04	Colour Monitor and Multimedia Tubes
DC05	Wire Wound Components

Magnetic products

MA01	Soft Ferrites
MA03	Piezoelectric Ceramics Specialty Ferrites
MA04	Dry-reed Switches

Passive components

PA01	Electrolytic Capacitors
PA02	Varistors, Thermistors and Sensors
PA03	Potentiometers
PA04	Variable Capacitors
PA05	Film Capacitors
PA06	Ceramic Capacitors
PA06a	Surface Mounted Ceramic Multilayer Capacitors
PA06b	Leaded Ceramic Capacitors
PA08	Fixed Resistors
PA10	Quartz Crystals
PA11	Quartz Oscillators
