

INTERFERENCE ANALYSIS

Certification Training

Overview

RF interference is a high-impact problem that can compromise services anywhere at any time. Anritsu's expert instructors teach participants to identify, track down, and address RF interference sources. The comprehensive curriculum uses extensive labs and case studies to take the mystery out of interference hunting.

Who Should Take This Course?

- Cellular Technicians
- Wireless Carrier Performance Engineers
- Field Engineers
- Industrial Engineers
- Biomedical techs/engineers
- Government Agencies
- Military personnel
- Security personnel

Why?

Another industry-leading, Anritsu certification training, Interference Analysis (IA) is a rigorous instructor-led course that introduces participants to the fascinating detective work of tracking down interfering signals. Learn to make measurements, determine what they mean and adjust the parameters of testing to find interference.

Addressing interference often requires testing in structures occupied by those unaware of the problem. Effective communication is key to getting access. This course covers the do's and don'ts of gaining neighborly cooperation.

Course Details

The 3-day course covers theory, procedure, calculations, instrument use, measurement parameters, trace interpretation, case studies, and interpersonal communication strategies. Training culminates in a simulated interference hunt as the final practical exam.
