GR874® General-Purpose Coaxial Components

Over 24 years of design refinement General Radio entered the coaxial component field over 24 years ago with the introduction of the GR874® connector. This connector offered not only excellent electrical performance but a major convenience feature — any two, although identical, could be mated. The hermaphrodite, quick-connect GR874 connector was soon joined by a family of circuit elements and adaptors using it. GR874-equipped instruments were added to solve the special measurement problems of vhf and uhf and the availability of these precise measuring instruments in turn made possible a continuous refinement of the basic connector.

A universal choice The GR874 connector has gained wide popularity; highly respected instrument manufacturers have put the electrical and physical advantages of these connectors to good use on their products.

Based on the GR874 connector is a full line of coaxial components and instruments so that a user of the GR874-equipped laboratory need seldom turn to other connector types for a needed element. If he does, there are GR874 adaptors to fit most other common types of connector.

Locking connectors The GR874 connector is available in both the common nonlocking version and a high-performance locking version. The locking version has a threaded coupling nut that permits the two connectors to be mechanically locked together in a stable, semi-permanent union for better electrical repeatability, lower leakage, and less chance of accidental disconnection. The quick-connect/disconnect feature is retained if the coupling nut is not engaged.

Electrical characteristics The GR874 connector has truly outstanding reflection characteristics among standard, general-purpose coaxial connectors in the dc-to-9 GHz frequency range. Its SWR performance is typically superior to that of the type N connector, for example. Its low level of reflections at high frequencies makes the connector of particular value in pulse applications and in time-domain reflectometry. GR874 cable connectors, in fact, offer SWR performance superior to that of any cable with which they can be used and therefore add no significant reflections when used in cabled measurement set-ups. They also provide very low contact resistance, an important requirement to minimize intermodulation in multichannel communications systems.

Cutaway view of GR874 basic connector mated with GR874 cable connector.

Mechanical characteristics The elements of a GR874 connector include an inner conductor, an outer conductor, a supporting polystyrene bead, a phosphor-bronze retaining ring, and a threaded coupling nut. All metal parts are machined and formed to very close tolerances; all are made of hard-drawn brass, except for the center conductor which is heat-treated beryllium copper to ensure good gripping capability and long wear. A bright-alloy finish on all surfaces produces good conductivity for low loss and gives long-lasting protection against tarnish.

Inner and outer conductors are similar in principle; each is a tube with four longitudinal slots in one end, with two opposite quadrants displaced inward. When two connectors are joined, the undisplaced quadrants of one overlap the displaced quadrants of the other.

Cable Connectors

For use with more than 40 different RG types of coaxial cable. Each cable connector consists of a basic connector, plus inner and outer transition pieces, a soft copper ferrule, a heat disk, and a flexible cable guard. The transition pieces maintain the 50-ohm characteristic impedance of the connector throughout the reduction to the cable diameter. The cable inner conductor is soldered to the inner transition piece; the cable braid and jacket are crimped to the outer transition by the specially perforated ferrule. Braid and jacket are thus securely fastened, to minimize reflections and leakage. A neoprene cable guard serves as a protective handle. Sized to grip the cable securely without compressing it, the cable guard adds to the quick-connect/disconnect convenience of the connector.

GR874® 50-Ohm Adaptors

Conversion These adaptors provide easy conversion from the GR874® connector to most popular military and industrial coaxial connectors. Many of the adaptors are available with locking GR874 connectors to allow semi-permanent attachment of the adaptor while ensuring stable electrical performance.

Without degradation GR874 adaptors extend the usefulness of GR874 connectors without sacrificing electrical performance. The SWR of the combination of GR874 connector and GR874 adaptor is actually comparable to that of the "other series" connector alone.

Excellent for OEM applications Original-equipment manufacturers recognize the possibilities of these adaptors

in combination with the GR874 recessed panel connector. An instrument originally equipped with these connectors can be quickly converted by means of appropriate GR874 adaptors to almost any coaxial connector series; the resulting panel connector protrudes less than an inch in front of the panel.

Replace countless adaptors Because any two GR874 adaptors mate, a few of them can perform a cross-connection task that would otherwise involve a costly collection of direct adaptors. For example, interconnection of types BNC, C, Microdot, N, TNC, and UHF plugs and jacks would require 72 direct adaptors, whereas only 12 GR874 adaptors are needed to do the same job.

50-Ohm Adaptor Kit

- fifteen adaptors in one neat package provide the answer to the connector dilemma

Tame the connector menagerie Your device is fitted with type N connectors, your test equipment with UHF, and your patch cords with BNC — is that what plagues you? Or have you just wasted ten minutes trying to force one SMA plug onto another? Frustrating as these experiences may be, they're inevitable because of the multitude of connector types available to manufacturers. There is a bright side, however, and it comes in the form of a small gray box from General Radio. The box contains 15 different adaptor types that allow you to connect to any of 9 popular commercial and military connector types — conveniently and with a minimum of the usual fumbling.

With a double approach All adaptors in the kit have one connector type in common, the GR874. These connectors are hermaphroditic; i.e., any two, although identical, can be plugged together — no more worrying about whether you need a jack or a plug or whatever.

One approach to the problem is simply to connect the appropriate adaptor to each end of a GR874® patch cord and then connect it from one device to the other.

Equally simple is a second approach. Connect one adaptor to another, with the second adaptor appropriate to whatever type of patch cord you have available.

Supplied: In addition to the adaptors listed below, the kit also includes one 874-T tee connector to connect stubs and other elements in shunt with a coaxial line, one 874-EL 90° ell right-angle line section, and one 874-R33 three-foot 50-Ω cable terminated on one end with a GR874 connector and on the other with banana plugs.

GR874® Terminations and Attenuators for 50-Ohm Systems

Short-Circuit Terminations

Short-circuit terminations are useful in establishing initial coaxial line-length conditions for impedance measurements. Each termination consists of a fixed short-circuit mounted in a GR874 connector. Each of three versions has a counterpart open-circuit termination.

Plane Position: Short-circuit plane is effectively 0 to 0.07 cm toward load from the generator face of bead, except in -WN3 where it is 3.2 cm (see drawing). (3.2 cm correspond to the bead-to-reference-plane distance in 874-ML Component Mount and 874-UBL Balun).

Mechanical: WEIGHT: 0.2 lb (0.1 kg) net, 1 lb (0.5 kg) shipping.

Adjustable Attenuator

A waveguide-below-cutoff type, useful as a calibrated attenuator or as a sampling device. Calibrated in decibels, on a micrometer-type scale. Absolute attenuation is the sum of insertion loss and scale reading. Phase shift is essentially constant as the attenuation is varied. The main line is a short coaxial section with locking GR874 connectors, one end for source, the other for load. It introduces minimal discontinuity when inserted in a 50-ohm line. The loop output is brought out through 3 feet of 50-ohm cable with a locking GR874 connector. If a source is connected to this output port, signals with relative phases of 0° and 180° are produced at the main line connectors.

Frequency: 100 MHz to 4 GHz.

Relative Attenuation: RANGE: 120 dB, with main line terminated in 50 Ω ; 129 dB, with main line terminated in adjustable stub, set to minimize electric field at the coupling point. MICROMETER SCALE: -9 to 120 dB. ACCURACY: For 50- Ω terminated input, $\pm$ (0.015 x difference in scale readings + 0.2) dB, when corrected; correction chart is supplied. For stub-terminated input, $\pm$ (0.01 x difference in scale readings + 0.2) dB, direct reading.

Insertion Loss from input connector to end of output cable at 1 GHz, when signal source impedance is 50 Ω : For 50- Ω terminated main line, 30.4 $\pm$ 2 dB with scale set at 0 dB; 17 $\pm$ 2 dB with scale set at -9 dB (settings below 0 dB not accurate). For stub-terminated unit (that extends range over which calibration is accurate to the -9 dB scale setting), 19 $\pm$ 2 dB min. Insertion loss is approx proportional to 1/f, up to 1 GHz. Insertion loss directly through main line is negligible.

SWR: MAIN LINE: < 1.03 at 1 GHz, < 1.12 from 1 to 4 GHz. OUTPUT: < 4 at 1 GHz, < 5 from 1 to 4 GHz.

Electrical: INPUT POWER, max: 300 W at 1 GHz; proportional 1/ $\sqrt{f}$. OUTPUT, max: 0.5 W.

Mechanical: WEIGHT: 1.3 lb (0.6 kg) net.

- all solid-state — no relays
- 10 kHz to 500 MHz
- 0 to 80 dB in 1-dB steps
- high accuracy
- fast switching, < 500 μ s
- precision metal-film resistors ensure long-term stability

80-dB, no waiting The 1452 provides any attenuation from 0 to 80 dB for any signal from 10 kHz to 500 MHz in less than half a millisecond! Signals up to a half watt are accommodated at most frequencies; insertion loss and SWR are minimal.

Reliable and adaptable There are no life-limited relays in the 1452; all switching is accomplished by solid-state devices. The accuracy is achieved by precision metal-film resistors with long-term stability, and careful design of the attenuator networks preserves their 50-ohm characteristic impedance.

Two models are offered. One allows manual, as well as remote, control of the attenuator. It includes a cabinet for bench use which can also be adapted for installation in a standard rack. The other saves money and space in systems applications by excluding manual control and instrument cabinet.

Low-Pass Filters

Recommended for use in immittance- or voltage-measuring systems to reduce harmonics, and especially in systems that contain nonlinear elements or sections that might resonate at a harmonic. Also useful in slotted-line measurements. Uses Chebyshev-type filters that produce a very steep cutoff characteristic at the expense of passband flatness. Spurious responses in the stopband are very small.

Electrical: IMPEDANCE: 50 Ω , nominal. INPUT VOLTAGE: Up to 200 V pk. POWER, average into 50- Ω load; Up to 0.8 kW, dc to 20 MHz, decreasing as $1/\sqrt{f}$ to 0.1 kW at 1 GHz.

GR874® 75-Ohm Components

New

New versatility A new series of GR874 general-purpose coaxial components extends the versatility of the line to the field of 75-ohm transmission-line measurements. The series includes matching pads and adaptors to permit direct conversion of existing 50-ohm systems to the 75-ohm capability.

The GR874 75-ohm components use a connector similar to their 50-ohm counterparts except a new inner conductor and insulating bead are used to achieve the 75-ohm characteristic impedance. Although the GR874 50-

ohm and 75-ohm connectors will mate with one another, the combination is not recommended because the inner conductors do not join snugly. A black outer ring is used on the 75- Ω connectors; bright metal, on the 50- Ω ones, ensures distinction.

Frequency response for the new series is specified from dc to 2 GHz although the units are often satisfactory at higher frequencies. Locking connectors are standard in the series; nonlocking 75- Ω connectors are available in OEM quantities.

50-Ohm Transistor and Component Mounts

These mounts permit three-terminal measurements of a variety of devices with instruments such as the 1710 RF Network Analyser. Using the recommended short- and open-circuit terminations, you can precisely establish a phase reference plane at the transistor socket or other appropriate surface. By this means, the effects of coaxial line lengths and of the mount itself between unknown and instrument are eliminated.

In each transistor mount, the leads are inserted into hollow contact tubes that are the center conductors of small coaxial lines. Thus, all but about 1/32 inch of the leads at the header are completely shielded; small bends, various lengths, or other irregularities of the leads have no effect and the discontinuity at the transistor-to-mount connection is minimized. Additional advantages include complete accessibility to the socket, provisions for bolting a heat sink to the mount, and a fourth lead in the mount socket that is dc ground.

Frequency: Dc to 5 GHz.

Electrical: IMPEDANCE: 50 Ω , nominal. LEADS: 4. Each mount includes 2 damper resistors (10 and 50 Ω) to control oscillators in the measurement of wide-band, high-gain transistors.

Stand

A solid, stable support for components of coaxial systems. Consists of a heavy cast-iron base with rubber feet, 22-inch and 8-inch stainless-steel rods, and three universal clamps. The vertical rod can be used to hold long tuning stubs. The horizontal rod can be moved longitudinally or can be clamped to two bases to support a long horizontal run of coaxial parts. Clamps fit a range of diameters. Base can be bolted to bench top.

Mechanical: DIMENSIONS: Base, 3.5x4.44 in. (89x113 mm); rods, 8 and 22 in. (203 and 559 mm). WEIGHT: 5.5 lb (2.5 kg) net.

Tools

These tools ensure quick assembly, neat, uniform appearance, and best electrical and mechanical performance of GR874 connectors (50 and 75 Ω).

The **874-TOK Tool Kit** consists of an inner-conductor wrench to install the insulating bead and hold the inner conductor, an outer-conductor wrench to install the outer conductor, and a third wrench to tighten the coupling nut. The other tools are useful for installation of retaining rings.

The **874-T058 or -T08 Crimping Tool** assures a neat, fast crimp of the ferrule that clamps the shield braid and outer jacket of the cable to a cable connector.

Crimping Dimensions, across flats of hexagonal crimp: For -T08, 0.389 and 0.411 in. (9.88, 10.45 mm); for -T058, 0.215, 0.250, and 0.375 in. (5.46, 6.35, 9.53 mm).

Smith Charts

Measurements made with slotted lines are facilitated by the use of Smith Charts; you can use them to determine the impedance that corresponds to any SWR and to convert from impedance to admittance and vice versa. Charts with normalized coordinates are for use with lines of any impedance. Charts with 50- Ω characteristic impedance (20-m Ω characteristic admittance) are directly applicable to all GR 50- Ω coaxial equipment.

RF Bridges

- broad range — 400 kHz to 500 MHz
- high directivity — 40 dB
- low-cost 50-ohm or 75-ohm models

New

These bridges combine small size and low price with high performance. They are excellent for use in general-purpose or specialized SWR- or reflection-measurement systems in research, calibration, standards, and maintenance applications.

Both the standard and unknown ports of these bridges are accessible. Normally, the standard port is terminated in an 874-W50 50-ohm or an 874-W75 (75 Ω) termination so that no degradation in directivity is encountered. For applications where structural return loss is important, a variable termination can be connected to the standard port. All ports are GR874® connectors and accept a wide variety of GR components to adapt the bridges to specific uses or measurement applications.

Frequency: 400 kHz to 500 MHz.

Directivity: 40 dB from 1 MHz to 500 MHz; 45 dB, 3 MHz to 450 MHz.

Electrical: IMPEDANCE: 50 or 75 Ω . INSERTION LOSS: 6 dB from load port (standard or unknown) to detector port, 6 to 10 dB from source port to load port.

Mechanical: DIMENSIONS: 3.75x6.25x1 in. (95x159x25 mm). WEIGHT: 0.8 lb (0.4 kg) net, 2 lb (1 kg) shipping.
