Coordination clusters comprising three linked M_4O_4 cubanes are prepared. The resulting isostructural $\{Ni_{12}\}$ (see picture) and $\{Co_{12}\}$ cations, as well as mixed-metal structures, are characterized by ferro- and antiferromagnetic coupling. The composition of the cluster complexes was confirmed by low-temperature electrospray mass spectrometry. For more information on these species, see the Communication by P. Kögerler, L. Cronin, and co-workers on page 1340 ff.
