Books

reviewed by J. Altmann ————— 3864

Tag team: Not only hydrophilic carbohydrates but also hydrophobic compounds such as histone deacetylase inhibitors and biotin can be incorporated into fluorine-based small-molecule microarrays. A range of fluorine-tagged molecules can

be patterned and screened for bioactivity on a fluorine surface with hit rates comparable to those seen by solution-based and surface plasmon resonance-based bioassays.

Highlights

Microarrays

N. L. Pohl* ————— 3868 – 3870

Fluorous Tags Catching on Microarrays

Opening time: A method for the systematic and automatable design of DNA hybridization networks was recently introduced, which was based on the catalytic opening of metastable hairpin loops (see scheme). This technique has various applications in nanobiotechnology, such as the stepwise self-assembly of DNA scaffolds and the engineering of dynamic DNA devices.

How Is Oxygen Incorporated into Oxides? A Comprehensive Kinetic Study of a Simple Solid-State Reaction with SrTiO₃ as a Model Material

O, how does it go? Equilibration of an oxide with the surrounding oxygen partial pressure is one of the simplest gas–solid reactions. Nevertheless, it is a complex process comprising a (multistep) surface reaction, chemical bulk diffusion, and transport across or along grain boundaries. This Review gives a detailed phenomenological as well as mechanistic description of these processes for the model perovskite oxide SrTiO₃, emphasizing their relevance for electrochemical devices.

Oxygen Generation

Y. V. Geletii, B. Botar,* P. Kögerler, D. A. Hillesheim, D. G. Musaev, C. L. Hill* — 3896–3899

An All-Inorganic, Stable, and Highly Active Tetraruthenium Homogeneous Catalyst for Water Oxidation

Oxidation without organics: A tetraruthenium polyoxometalate (see picture; Ru blue, O red, Si yellow, W black) catalyzes the rapid oxidation of H₂O to O₂ in water at ambient temperature, and shows

considerable stability under turnover conditions. The complex was characterized by several methods, including X-ray crystallography and cyclic voltammetry.

Lab on a Chip

J. Pipper,* Y. Zhang, P. Neuzil, T.-M. Hsieh — 3900–3904

Clockwork PCR Including Sample Preparation

For whom the bell tolls: Surface-functionalized superparamagnetic particles emulsified in mineral oil turn a free-standing droplet into a flexible virtual laboratory with (sub)microliter volumes. By using magnetic forces, rare acute monocytic leukaemia cells are extracted from blood, preconcentrated, purified, lysed, and subjected to a real-time PCR in minutes. The PCR works like a clockwork by rotating the droplet over different temperature zones.

For the USA and Canada:

ANGEWANDTE CHEMIE International Edition (ISSN 1433-7851) is published weekly by Wiley-VCH, PO Box 191161, 69451 Weinheim, Germany. Air freight and mailing in the USA by Publications Expediting Inc., 200

Meacham Ave., Elmont, NY 11003. Periodicals postage paid at Jamaica, NY 11431. US POSTMASTER: send address changes to *Angewandte Chemie*, Wiley-VCH, 111 River Street, Hoboken, NJ 07030. Annual subscription price for institutions: US\$ 7225/6568 (valid for print and

electronic / print or electronic delivery); for individuals who are personal members of a national chemical society prices are available on request. Postage and handling charges included. All prices are subject to local VAT/sales tax.

A new spin on catalysis: A table-top centrifugal contact separator allows for fast continuous two-phase reactions to be performed by intimately mixing two immiscible phases and then separating them. Such a device has been used to produce biodiesel from sunflower oil and MeOH/NaOMe. A lipase-catalyzed esterification of oleic acid with *n*BuOH (see picture) also proceeds with high conversion and can be run for up to 13 h.

Process Intensification

G. N. Kraai, F. van Zwol, B. Schuur, H. J. Heeres,*
J. G. de Vries* ————— 3905–3908

Two-Phase (Bio)Catalytic Reactions in a Table-Top Centrifugal Contact Separator

Directed combination of $\{\text{Ni}_6\text{PW}_9\}$ building blocks with various rigid carboxylate linkers under hydrothermal conditions yields a series of unprecedented polyoxo-metalate-organic frameworks (POMOFs) with remarkable structural diversity including 1D, 2D, and 3D structures based on monomers, dimers, or infinite helical chains (see picture for 3D structure: WO_6 : red; NiO_6 : green; PO_4 : yellow; 1,2,4-benzenetricarboxylate: gold).

POM–Organic Frameworks

S.-T. Zheng, J. Zhang,
G.-Y. Yang* ————— 3909–3913

Designed Synthesis of POM–Organic Frameworks from $\{\text{Ni}_6\text{PW}_9\}$ Building Blocks under Hydrothermal Conditions

Open the gate! A porous coordination polymer shows abrupt changes in its adsorption isotherm with guest-dependent gate-opening pressure (see picture). Kinetic analysis reveals that adsorption with structure transformation follows a

gate-opening model, in which adsorption proceeds through the formation of an intermediate by a gate-opening process. This process provides a significant difference in onset pressure between similar gas molecules.

Coordination Polymers

D. Tanaka, K. Nakagawa, M. Higuchi, S. Horike, Y. Kubota, T. C. Kobayashi, M. Takata, S. Kitagawa* — 3914–3918

Kinetic Gate-Opening Process in a Flexible Porous Coordination Polymer

Hot spot on amyloid-β? Atheronal-B-induced aggregation of amyloid-β ($\text{A}\beta$) involves a site-specific adduction of the aldehyde to the ϵ -amino group of Lys 16, suggesting that Lys 16 is a hot spot for

atheronal-induced fibrillization of $\text{A}\beta$ (see scheme). This process can be inhibited by molecules like cholesterol that compete for the central hydrophobic cluster binding domain.

Alzheimer's Disease

J. C. Scheinost, H. Wang, G. E. Boldt, J. Offer, P. Wentworth, Jr.* — 3919–3922

Cholesterol *seco*-Sterol-Induced Aggregation of Methylated Amyloid- β Peptides—Insights into Aldehyde-Initiated Fibrillization of Amyloid- β

Incredibly alert!

Angewandte Chemie International Edition keeps its readers up to date: RSS feeds act like Internet news tickers to notify them of brand-new articles, while E-Alerts send targeted news by e-mail of new issues or articles corresponding to pre-defined categories. In addition, the articles are available in “EarlyView” online several weeks before they appear in an issue – now even more use-friendly with the graphical/contents page characteristic of *Angewandte Chemie*.

GESELLSCHAFT
DEUTSCHER CHEMIKER

Switching from red to pink: It has been believed that only the amino acids near the retinal chromophore are responsible for the color tuning of rhodopsins. Herein is reported a color change of proteorhodopsin, an archaeal-type rhodopsin in marine bacteria, by mutation of Ala178 to Arg at the E-F loop. The red shift at a neutral pH value amounts to 20 nm (see graph).

Chromophores

M. Yoshitsugu, M. Shibata, D. Ikeda, Y. Furutani, H. Kandori* — 3923–3926

Color Change of Proteorhodopsin by a Single Amino Acid Replacement at a Distant Cytoplasmic Loop

Strand and deliver: Two different optical methods to analyze Hg^{2+} ions based on the formation of thymine- Hg^{2+} complexes are developed. These methods

include the analysis of Hg^{2+} ions by using aggregated gold nanoparticles and by using a DNA-based machine (see scheme).

Ion Sensors

D. Li, A. Wieckowska, I. Willner* — 3927–3931

Optical Analysis of Hg^{2+} Ions by Oligonucleotide–Gold-Nanoparticle Hybrids and DNA-Based Machines

A multitude of new binding modes: A $[\text{Bi}_{10}\text{Au}_2]^{6+}$ heteroicosahedron and two $(\text{SbBi}_3\text{Br}_9)^{3-}$ hemispheres form molecular cluster $[\text{Bi}_{10}\text{Au}_2](\text{SbBi}_3\text{Br}_9)_2$ (see picture: Bi blue, Au yellow, Sb green, Br dark red). The $[\text{Bi}_{10}\text{Au}_2]^{6+}$ polycation involves significant bismuth–gold interactions. The molecule also exhibits a rare interpnico-gen covalent bond between bismuth and antimony and a complex donor–acceptor bond between the anionic caps and the polycation.

Cluster Compounds

B. Wahl, L. Kloo, M. Ruck* — 3932–3935

The Molecular Cluster $[\text{Bi}_{10}\text{Au}_2](\text{SbBi}_3\text{Br}_9)_2$

A knockout result: Fluorine substituents give drugs beneficial properties. By using a rational combination of genetic engineering and precursor-directed biosynthesis, fluorosalinosporamide (see scheme) was generated in a fermentation-based approach. The anticancer lead compound and marine natural product salinosporamide A is chlorinated. A comparison of the biological activity of these proteasome inhibitors is presented.

Halogenation

A. S. Eustáquio, B. S. Moore* — 3936–3938

Mutasynthesis of Fluorosalinosporamide, a Potent and Reversible Inhibitor of the Proteasome

(5+2) Cycloadditions

P. Liu, P. H.-Y. Cheong, Z.-X. Yu,
P. A. Wender, K. N. Houk* — 3939–3941

Substituent Effects, Reactant
Preorganization, and Ligand Exchange
Control the Reactivity in Rh^I-Catalyzed
(5+2) Cycloadditions between
Vinylcyclopropanes and Alkynes

Heteroatom and bulky alkyl substituents dramatically increase the rate of Rh^I-catalyzed (5+2) cycloadditions of **1**. This fact could be attributed to steric effects which ease the reactant preorganization, and to the stabilization of the allyl inter-

mediate by (hyper)conjugation with the substituents. The methoxy- and isopropyl-substituted **1** have an activation energy 5 and 7 kcal mol^{−1}, respectively, lower than the unsubstituted vinylcyclopropane.

Cluster Compounds

I. O. Koshevoy,* L. Koskinen, M. Haukka,
S. P. Tunik,* P. Y. Serdobintsev,
A. S. Melnikov,
T. A. Pakkanen* — 3942–3945

Self-Assembly of Supramolecular
Luminescent Au^I–Cu^I Complexes:
“Wrapping” an Au₆Cu₆ Cluster in a
[Au₃(diphosphine)₃]³⁺ “Belt”

Belt and suspenders: A supramolecular gold–copper cluster has been synthesized by Cu⁺-assisted self-assembly of [Au–(C₂Ph)₂]₂ rods and a gold–diphosphine belt, which is suspended from the Au₆Cu₆ core by Au–Au bonds (see picture). The

cluster displays strong orange luminescence on excitation at 308 nm which is more intense than that of either of its structural fragments, which were isolated and studied independently.
P–P = Ph₂PC₆H₄C₆H₄PPh₂.

Supramolecular Catalysis

T. Šmejkal, B. Breit* — 3946–3949

A Supramolecular Catalyst for the
Decarboxylative Hydroformylation of
α,β-Unsaturated Carboxylic Acids

Head 'em up, move 'em out, aldehyde!

A catalytic transformation of α,β-unsaturated carboxylic acids into aldehydes through a hydroformylation–decarboxylation process has been developed (see scheme; Do = donor ligand, FG1 and

FG2 = complementary functional groups). The reaction proceeds at mild conditions, tolerates many functional groups, and liberates CO₂ as the only stoichiometric by-product.

Polymer Architectures

U. Rauwald,
O. A. Scherman* — 3950–3953

Supramolecular Block Copolymers with
Cucurbit[8]uril in Water

Be my guest! A supramolecular amphiphilic diblock copolymer was prepared with a cucurbit[8]uril molecular “hand-cuff” (see picture). It subsequently

undergoes a hierarchical self-assembly process, resulting in the formation of a tertiary, compartmentalized nanostructure.

The persistence of resistance: In the zeolite silicalite-1, the influence of transport barrier on the surface and between crystal segments, are negligibly small in comparison to the transport resistance of the intracrystalline pore system. Diffusion experiments are conducted with these zeolite crystals and intracrystalline diffusion coefficients of guest molecules determined.

Diffusion in Zeolites

D. Tzoulaki, L. Heinke, W. Schmidt, U. Wilczok, J. Kärger* — 3954–3957

Exploring Crystal Morphology of Nanoporous Hosts from Time-Dependent Guest Profiles

The missing link between conventional $\text{S}_{\text{N}}1$ reactions and the chemistry of stable carbocations has been found. When water is added to the colorless solution of the covalent compound $\text{Ar}_2\text{CH-OAc}$

(Ar = morpholinophenyl) in acetone, the appearance and disappearance of the intermediate carbocation ArCH^+ can be observed with the naked eye!

Carbocations

H. F. Schaller, H. Mayr* — 3958–3961

“Carbocation Watching” in Solvolysis Reactions

Forever blowing bubbles: Hydrogen is generated from formic acid amine adducts at room temperature used directly in fuel cells (see picture for apparatus). Ruthenium phosphine systems act as catalysts in this transformation.

Hydrogen Storage

B. Loges, A. Boddien, H. Junge, M. Beller* — 3962–3965

Controlled Generation of Hydrogen from Formic Acid Amine Adducts at Room Temperature and Application in H_2/O_2 Fuel Cells

The use of formic acid as a hydrogen-storage material has become more feasible thanks to the development of a homogeneous catalytic system of ruthenium water-soluble complexes (Ru/TPPTS; TPPTS = *meta*-trisulfonated triphenylphosphine) that selectively decomposes HCOOH into H_2 and CO_2 . Continuous generation of H_2 of very high purity, over a wide range of pressures, and under mild conditions was achieved.

Hydrogen Storage

C. Fellay, P. J. Dyson, G. Laurenczy* — 3966–3968

A Viable Hydrogen-Storage System Based On Selective Formic Acid Decomposition with a Ruthenium Catalyst

Crystal Engineering

M. Jaya Prakash, P. Raghavaiah,
Y. S. R. Krishna,
T. P. Radhakrishnan* — 3969–3972

Growing Molecular Crystals on Inorganic Crystals: Polar Structure Induced by Noncentrosymmetric Templates

Like promotes like: The templating effect of inorganic crystals is exploited to promote the growth of the polar structure of a molecular crystal of a dipolar zinc(II) complex (see picture). It is likely that the

polar nature of the noncentrosymmetric template crystal lattice, and its associated electrostatic field, facilitates the oriented assembly of the dipolar molecules.

Janus Colloids

B. Liu, W. Wei, X. Qu,
Z. Yang* — 3973–3975

Janus Colloids Formed by Biphasic Grafting at a Pickering Emulsion Interface

A two-faced synthesis: Biphasic grafting at a Pickering emulsion interface leads to the formation of Janus colloids (see scheme; ATRP: atom transfer radical polymerization), which form Janus composite colloids by the preferential growth of desired materials in specific regions of the original colloids. This approach is general and can be extended to the synthesis of a huge family of such colloids.

Heterotrimetallic Butoxides

X.-H. Wei,* Q.-C. Dong, H.-B. Tong,
J.-B. Chao, D.-S. Liu,*
M. F. Lappert* — 3976–3978

Heterotrimetallic Salts: Synthesis, Structures, and Superbase Reactivity of Crystalline *tert*-Butoxides $[\text{Li}_4\text{Na}_2\text{K}_2(\text{O}t\text{Bu})_8(\mu\text{-L})]_n$

Line them up! Crystalline, polymeric arrays of heterotrimetallic $(\text{Li}_4\text{Na}_2\text{K}_2)$ *tert*-butoxides of definite composition have been obtained by mixing the individual Li, Na, and K alkoxides. In the crystal, $[\text{Li}_4\text{Na}_2\text{K}_2(\mu_3\text{-O}t\text{Bu})_6(\mu_4\text{-O}t\text{Bu})_2]$ units (see picture: Li blue, Na green, K purple, C white, O red) are joined through their terminal K ions by $\eta^6\text{:}\eta^6\text{-C}_6\text{H}_6$ or *N,N'*-tetramethylethylenediamine bridges.

β -Amino Acids

C. M. Byrne, T. L. Church, J. W. Kramer,
G. W. Coates* — 3979–3983

Catalytic Synthesis of β^3 -Amino Acid Derivatives from α -Amino Acids

α goes to β ! The catalytic ring-expansive carbonylation of oxazolines, easily derived from α -amino acids, to yield β -amino acid derivatives is described. The catalyst is $[\text{HCo}(\text{CO})_4]$; high yields are observed for

most substrates, and enantiopure oxazolines are carbonylated with predictable stereochemistry to the corresponding enantiopure oxazinones.

An electrostatic tuner: Long-range isotropic electrostatic repulsion between identically charged nanoparticles can become anisotropic in the presence of short-range anisotropic dipolar interactions, thus endorsing anisotropic self-assembly of the nanoparticles into chains. The length of these particle chains can be tuned by controlling the interparticle electrostatic repulsion (see image).

Nanoparticle Self-Assembly

H. Zhang, D. Wang* — 3984–3987

Controlling the Growth of Charged-Nanoparticle Chains through Interparticle Electrostatic Repulsion

A spin quintet: The electronic and molecular structure of the metacyclophane-based spin-quintet tetraradical **1** with a sterically controlled rigid structure and small fine-structure parameters is characterized. Pulse-ESR based 2D electron spin nutation spectroscopy allows the spin multiplicity of **1** to be unequivocally identified, providing its fine-structure parameters and *g*-values.

Macrocyclic High-Spin Molecule

T. Sawai, K. Sato,* T. Ise, D. Shiomi, K. Toyota, Y. Morita, T. Takui* — 3988–3990

Macrocyclic High-Spin ($S=2$) Molecule: Spin Identification of a Sterically Rigid Metacyclophane-Based Nitroxide Tetraradical by Two-Dimensional Electron Spin Nutation Spectroscopy

Fullerene antioxidants: A direct correlation between the redox and structural properties of water-soluble fullerenes (see picture) and their reactivity towards superoxide is demonstrated. Some of the C_{60} monoadducts examined act as superoxide dismutase mimetics. The findings establish a guide for designing fullerene derivatives to catalytically decompose the superoxide radical anion.

Fullerene Dendrimers

G.-F. Liu, M. Filipović, I. Ivanović-Burmazović,* F. Beuerle, P. Witte, A. Hirsch* — 3991–3994

High Catalytic Activity of Dendritic C_{60} Monoadducts in Metal-Free Superoxide Dismutation

A natural benzopyren: The title compound **1** was discovered by chemical metabolite profiling of a large-scale fermentation of *Streptomyces lavendulae*. Biological evaluation of the *peri*-fused pentacyclic compound revealed antitumor activity against several cell lines. The co-occurrence of an angucyclic polyketide with an identical ring-substitution pattern suggests that **1** is biosynthesized from an angular decaketide and a C_3 building block.

Natural Products

X. Huang, J. He, X. Niu, K.-D. Menzel, H.-M. Dahse, S. Grabley, H.-P. Fiedler, I. Sattler,* C. Hertweck* — 3995–3998

Benzopyrenomycin, a Cytotoxic Bacterial Polyketide Metabolite with a Benzo[*a*]pyrene-Type Carbocyclic Ring System

Intermetallic Compounds

S. Ponou, T. F. Fässler,*
L. Kienle ————— 3999 – 4004

Structural Complexity in Intermetallic Alloys: Long-Periodic Order beyond 10 nm in the System BaSn₃/BaBi₃

Nanosized long-periodic stacking

sequences are formed by polytypic transformations that are initiated by partially substituting Bi for Sn in the close-packed structure of BaSn₃. Single-crystal X-ray diffraction and TEM investigations show that temperature-dependent interlayer-ordering processes lead to repeat units beyond 10 nm (see TEM image).

Natural Product Synthesis

J. K. Belardi,
G. C. Micalizio* ————— 4005 – 4008

Total Synthesis of Macbecin I

Beyond the bounds of biosynthesis: In a step towards the goal of developing a synthetic pathway for the production of collections of complex molecules related to the benzoquinone ansamycin antibiotics, a natural member of this class was synthesized in a convergent manner through the mild titanium alkoxide mediated coupling of the highly functionalized aniline-containing alkyne **1** with the sensitive polyunsaturated aldehyde **2**.

Natural Products

C. H. Kim, K. P. Jang, S. Y. Choi,
Y. K. Chung, E. Lee* ————— 4009 – 4011

A Carbonyl Ylide Cycloaddition Approach to Platensimycin

Short and to the point: A formal synthesis of platensimycin has been accomplished by employing a carbonyl ylide [3+2] cycloaddition reaction (see scheme). This

short and facile enantioselective synthesis of the pivotal tetracyclic precursor requires 11 steps and proceeds in 20% overall yield from isopropyl cyanoacetate.

Organocatalysis

Y. Hayashi,* H. Gotoh, R. Masui,
H. Ishikawa ————— 4012 – 4015

Diphenylprolinol Silyl Ether as a Catalyst in an Enantioselective, Catalytic, Formal Aza [3+3] Cycloaddition Reaction for the Formation of Enantioenriched Piperidines

Aza-ene reaction: Diphenylprolinol silyl ether was found to be an effective organocatalyst for the formal aza [3+3] cycloaddition reaction of α,β -unsaturated aldehydes and enecarbamates (see

scheme). The reaction proceeds through an asymmetric catalytic ene reaction, isomerization, hydrolysis, and cyclization to afford piperidine derivatives in good yields and excellent enantioselectivities.

Crafty catalysts: Friedel–Crafts alkylation of indoles with nitroalkenes proceeded in the presence of phosphoric acid **1** and 3 Å

molecular sieves to give Friedel–Crafts adducts with excellent enantioselectivities (see scheme).

Organocatalysis

J. Itoh, K. Fuchibe,
T. Akiyama* _____ **4016–4018**

Chiral Phosphoric Acid Catalyzed
Enantioselective Friedel–Crafts Alkylation
of Indoles with Nitroalkenes: Cooperative
Effect of 3 Å Molecular Sieves

Bright light rings: The direct coupling of phenylazoles with an internal alkyne proceeds efficiently in the presence of a rhodium catalyst and a copper oxidant to selectively give either the 1-naphthyl- or 1-

anthrylazole derivatives through the cleavage of multiple C–H bonds (see scheme; 1-naphthylazole derivative not shown). Some of the products exhibit intense fluorescence in the solid state.

Direct Coupling

N. Umeda, H. Tsurugi, T. Satoh,*
M. Miura* _____ **4019–4022**

Fluorescent Naphthyl- and Anthrylazoles
from the Catalytic Coupling of
Phenylazoles with Internal Alkynes
through the Cleavage of Multiple C–H
Bonds
