Highlights

Nanominerals

M. Epple* _____ 4960 – 4961

From Metal Complexes to Nanominerals:
The Formation of Inorganic Nanoparticles
on Fibrils of Transferrin

Upon drying of the iron transport protein transferrin (hTf), the originally individually coordinated Fe forms crystalline deposits of FeO(OH) (“rust”), which are periodically arranged on fibrils of the protein. This is also true for Mn and Bi minerals (the picture shows mineralization on hTf fibrils; holo/apo-hTf: hTf with/without Fe). A mineralization of this kind on fibrils could play a role in neurodegenerative diseases such as Alzheimer’s.

Divalent Lanthanides

G. Meyer* _____ 4962 – 4964

Superbulky Ligands and Trapped
Electrons: New Perspectives in Divalent
Lanthanide Chemistry

Spectacular developments in recent years, especially the discovery of an anionic complex of divalent lanthanum, in which the electron is trapped in a localized 5d¹ SOMO (see structure of the anion of [K([2.2.2]crypt)][LaCp[−]]₃] (Cp[−] = 1,3-(SiMe₃)₂C₅H₃); La red, C gray, Si black), have brought new impetus to the solution chemistry of divalent lanthanides.

Reviews

Gas Storage Materials

R. E. Morris,*
P. S. Wheatley _____ 4966 – 4981

Gas Storage in Nanoporous Materials

Gas tanks for all: Gas storage technologies are developing in many areas and the use of nanoporous materials as storage media for gases as varied as hydrogen, carbon dioxide, and nitric oxide is the focus of significant research effort. Different applications require different properties from the materials to be used, and how we can improve on currently available materials is a significant challenge for chemists.

Communications

Biomaterials

A. Kawska, O. Hochrein, J. Brickmann,
R. Kniep,* D. Zahn* — 4982–4985

The Nucleation Mechanism of
Fluorapatite–Collagen Composites: Ion
Association and Motif Control by Collagen
Proteins

Apatite for the structure: Nucleation mechanisms of apatite–collagen composites at the atomistic level of detail have been investigated. Peculiar motifs of the apatite crystal structure were identified in which formation is promoted by ion association to the biomolecule. Apart from acting as a nucleation seed for ionic ordering, collagen triple helices (see picture; red bands) also induce orientation control in these motifs.

Photomechanics

M. Yamada, M. Kondo, J. Mamiya, Y. Yu,
M. Kinoshita, C. J. Barrett,
T. Ikeda* — 4986–4988

Photomobile Polymer Materials: Towards
Light-Driven Plastic Motors

Can light drive a motor? Azobenzene-containing liquid-crystalline elastomers (LCEs) and their composite materials have the potential to show three-dimensional movement by light irradiation. With

the LCE laminated films, a first light-driven plastic motor has been developed, which can convert light energy directly into a continuous rotation without the aid of batteries, electric wires, or gears.

Multicomponent Reactions

T. Arai,* N. Yokoyama — 4989–4992

Tandem Catalytic Asymmetric Friedel–
Crafts/Henry Reaction: Control of Three
Contiguous Acyclic Stereocenters

Good things come in threes: Highly functionalized indole derivatives with three contiguous stereocenters were formed in the title reaction of an indole, a nitroalkene, and an aldehyde with the imidazoline–aminophenol catalyst **1**–

CuOTf in the presence of 1,1,1,3,3,3-hexafluoro-2-propanol (HFIP). The major isomers of the adducts were obtained with up to 99% *ee*. Tf = trifluoromethanesulfonyl, Ts = *p*-toluenesulfonyl; R = H, Me; R', R'' = alkyl, aryl.

For the USA and Canada:

ANGEWANDTE CHEMIE International Edition (ISSN 1433-7851) is published weekly by Wiley-VCH, PO Box 191161, 69451 Weinheim, Germany. Air freight and mailing in the USA by Publications Expediting Inc., 200

Meacham Ave., Elmont, NY 11003. Periodicals postage paid at Jamaica, NY 11431. US POSTMASTER: send address changes to *Angewandte Chemie*, Wiley-VCH, 111 River Street, Hoboken, NJ 07030. Annual subscription price for institutions: US\$ 7225/6568 (valid for print and

electronic / print or electronic delivery); for individuals who are personal members of a national chemical society prices are available on request. Postage and handling charges included. All prices are subject to local VAT/sales tax.

Strong cycle: The cyclic hexamer-templatate complex **3** obtained through template-directed trimerization of a porphyrin dimer **2**, using a hexapyridyl template **1**, is extremely stable ($K_f = 7 \times 10^{38} \text{ M}^{-1}$), but the

free macrocycle **4** can be liberated using amine ligands. Spectroscopic data and DFT calculations show that the cyclic hexamer is more conjugated than its linear analogue.

Strained Molecular Wires

M. Hoffmann, J. Kärrbratt, M.-H. Chang, L. M. Herz, B. Albinsson, H. L. Anderson* 4993 – 4996

Enhanced π Conjugation around a Porphyrin[6] Nanoring

One hand mapping: By means of scanning tunneling microscopy, solvent-induced homochirality is shown to emerge in self-assembled monolayers of achiral molecules at the liquid–solid interface (see picture). The chirality of the solvent directs the macroscopic chirality of the monolayer. The dynamics of the monolayer structure as it evolves towards homochirality are probed by time-dependent measurements.

Surface Chirality

N. Katsonis,* H. Xu, R. M. Haak, T. Kudernac, Ž. Tomović, S. George, M. Van der Auweraer, A. P. H. J. Schenning,* E. W. Meijer,* B. L. Feringa,* S. De Feyter* 4997 – 5001

Emerging Solvent-Induced Homochirality by the Confinement of Achiral Molecules Against a Solid Surface

Pass the parcel: Activity experiments show that LaCl_3 supported on carbon nanofibers is a highly active, selective, and stable catalyst for the H–Cl exchange reaction between CCl_4 and CH_2Cl_2 to form CHCl_3 (see scheme) in the absence of either lattice or gas-phase oxygen. Density functional calculations suggest that the reaction proceeds through the formation of weakly adsorbed Cl and H species which can be exchanged between the reactants.

Oxygen-Free H–Cl Exchange

A. W. A. M. van der Heijden, S. G. Podkolzin, M. E. Jones, J. H. Bitter, B. M. Weckhuysen* 5002 – 5004

Catalytic Hydrogen-Chlorine Exchange between Chlorinated Hydrocarbons under Oxygen-Free Conditions

Edges and steps have been identified as the locations of surface (O2) and subsurface oxygen atoms (O1) on silver particles by means of DFT calculations and aberration-corrected transmission electron microscopy. The experimental technique allows surface features, such as terraces, steps, and edges, to be clearly imaged (see picture) by eliminating the Fresnel fringes.

Surface Chemistry

D. S. Su,* T. Jacob, T. W. Hansen, D. Wang, R. Schlögl, B. Freitag, S. Kujawa 5005 – 5008

Surface Chemistry of Ag Particles: Identification of Oxide Species by Aberration-Corrected TEM and by DFT Calculations

Incredibly versatile!

Theme variety on the one hand: Many articles in *Angewandte Chemie* cover the classical themes such as organic synthesis or coordination chemistry. Besides these, current topics like (bio)nanotechnology, chemical biology, and green chemistry are well represented. And then there are the „must-see articles“, such as those on the detection of anthrax spores*, or the characteristic scent of iron,** or the artificial lily-of-the-valley flavor.***

Section variety on the other: Communications, Reviews, Highlights, Essays, Obituaries, Meeting Reviews, as well as Website and Book Reviews are regularly found in *Angewandte*.

GESELLSCHAFT
DEUTSCHER CHEMIKER

The Da Vinci Code: Monolayer-barcoded nanoparticles have been successfully prepared by simultaneous incorporation of probe elements and organic molecules. The organic species serve as mass-tagging surrogates for MS readout and allow on-chip DNA hybridization assay by laser desorption/ionization time-of-flight MS. The strategy could readily be extended to the identification of a vast range of biomolecular binding events.

DNA Detection

F. Qiu, D. Jiang, Y. Ding, J. Zhu,*
L. L. Huang — 5009 – 5012

Monolayer-Barcoded Nanoparticles for On-Chip DNA Hybridization Assay

Plasmonic crystal optics: Highly uniform, fully 3D plasmonic crystals exhibiting exceptional analytical sensitivity at visible wavelengths can image surface binding events with high spatial resolution and can distinguish adsorbates with masses that differ by only 25 amu. The picture shows a transmitted white-light plasmonic image of microcontact-printed lines (ca. 8 μm wide) of 1-octadecanethiol on the Au surface of a 3D plasmonic crystal.

Analytical Methods

Seeing Molecules by Eye: Surface Plasmon Resonance Imaging at Visible Wavelengths with High Spatial Resolution and Submonolayer Sensitivity

Sensing in reverse: Reversible detection of as few as 10^9 molecules (1700 am) of dimethyl methylphosphonate, a nerve agent simulant, is demonstrated at the end of a micro GC column (see picture). Such arrays form the basis of rapidly transducing molecular sensors with micrometer-sized footprints. The separation capability of the column eliminates the need for selectivity on the sensor, as long as analyte binding is reversible and rapid.

Nanotube GC Sensor

C. Y. Lee, R. Sharma, A. D. Radadia,
R. I. Masel, M. S. Strano* — 5018 – 5021

On-Chip Micro Gas Chromatograph Enabled by a Noncovalently Functionalized Single-Walled Carbon Nanotube Sensor Array

Protective coatings: Glycodendrimers can function as homogeneous bioactive coatings that mitigate the cytotoxicity of single-walled carbon nanotubes (SWNTs). The bifunctional glycodendrimers (see picture) have peripheral carbohydrate units and a pyrene tail capable of binding SWNT surfaces through π - π interaction. Cells cultured with glycodendrimer-coated SWNTs proliferate at the same rate as untreated cells.

Biocompatible Nanotubes

A. Zettl, C. R. Bertozzi* — 5022 – 5025

Biocompatible Carbon Nanotubes Generated by Functionalization with Glycodendrimers

Tandem Synthesis

T. A. Mitchell, C. Zhao,
D. Romo* — 5026–5029

Highly Diastereoselective, Tandem, Three-Component Synthesis of Tetrahydrofurans from Ketoaldehydes via Silylated β -Lactone Intermediates

Like falling dominoes! A novel tandem, three-component reaction is described that generates up to two C–C bonds, one C–O bond, and three additional stereocenters leading to substituted tetrahydrofuran units. This process involves a

tandem Mukaiyama aldol-lactonization/reductive cyclization and proceeds via a silylated β -lactone intermediate. The method was applied to prepare the tetrahydrofuran fragment of colopsinol B. Py = 2-pyridyl.

Gold Catalysis

A. Fürstner,* L. Morency — 5030–5033

On the Nature of the Reactive Intermediates in Gold-Catalyzed Cycloisomerization Reactions

A gold rush: The Stork–Eschenmoser postulate explaining the course and stereoselectivity of cationic polyene cyclization reactions also holds true for cycloisomerization reactions catalyzed by gold. This result suggests that the

pertinent intermediates (see scheme) are more adequately described as gold-stabilized carbocations rather than as gold carbenes. E = COOMe, L = neutral ligand.

Photoswitches

V. Lemieux, M. D. Spantulescu,
K. K. Baldrige,
N. R. Branda* — 5034–5037

Modulating the Lewis Acidity of Boron Using a Photoswitch

Light turns the Lewis acid on: The Lewis acidity of a boron atom integrated into a cyclic dithienylethene photoswitch is modulated by light: **1a** has low Lewis acidity since the p orbital of the boron

center is partially occupied by delocalized π electrons, whereas the rearrangement of the π electrons in **1b** reduces the electron density at the boron center and turns the Lewis acid “on”.

Not-So-Weak Hydrogen Bonds

D.-W. Yoon, D. E. Gross, V. M. Lynch,
J. L. Sessler,* B. P. Hay,*
C.-H. Lee* — 5038–5042

Benzene-, Pyrrole-, and Furan-Containing Diametrically Strapped Calix[4]pyrroles—An Experimental and Theoretical Study of Hydrogen-Bonding Effects in Chloride Anion Recognition

Weak but important: The chloride anion binding properties of diametrically strapped calixpyrroles bearing benzene (see structure), pyrrole, and furan moieties in the solid state, in solution, and through theoretical analyses. The results obtained provide support for the notion that C–H...Cl[−] hydrogen bonds are significant and contribute substantially to the Cl[−] binding energetics.

A copper-rich cereal: Superhydrophobic copper particles show a very large Cheerios effect and rapidly self-assemble into robust sheets on the surface of water. These sheets can support objects (including water drops, see photo) placed on them, even though the irregular geometry of the particles means that they contain macroscopic holes.

Particle Interactions

S. E. J. Bell* 5043–5045

Sheets of Large Superhydrophobic Metal Particles Self Assembled on Water by the Cheerios Effect

Out in the cold: Amyloid fibrils formed by the protein α -synuclein, one of the key players in Parkinson's disease, are rapidly dissociated in supercooled water at -15°C (see TEM images), conditions in which many globular proteins remain folded. NMR studies indicate that the weakening of hydrophobic and electrostatic interactions contribute to the cold-induced destabilization of the amyloid fibrils.

Fibril Dissociation

A. H. Payne 5060–5062

Stereoselective Dearomatizing Addition
of Nucleophiles to Uncomplexed Benzene
Rings: A Route to Carbocyclic Sugar
Analogues

Versatile synthetic intermediates were formed by the dearomatization of 2-aryl 4,5-diphenyloxazolines with secondary alkyl lithium reagents in the presence of *N,N'*-dimethylpropyleneurea (DMPU; see

scheme). The resulting cyclohexadiene derivatives were converted into carbocyclic analogues of mannose and altrose in a short sequence without the use of protecting groups.

Synthetic Methods

S. Bhunia, K.-C. Wang,
R.-S. Liu* 5063–5066

Pt^{II}-Catalyzed Synthesis of 9-Oxabicyclo-
[3.3.1]nona-2,6-dienes from 2-Alkynyl-1-carbo-
nylbenzenes and Allylsilanes by an
Allylation/Annulation Cascade

Platinum is key: A new catalytic synthesis of 9-oxabicyclo[3.3.1]nona-2,6-dienes from readily available 2-alkynyl-1-carbonylbenzenes, allylsilanes, and water is reported (see scheme). This reaction

sequence is proposed to proceed through a series of three reactions, including allylation of the carbonyl group, hydroalkoxylation of the alkyne, and a new eno-oxonium annulation.

Mechanistic Studies

A. M. Dyke, D. M. Gill, J. N. Harvey,

M. P. Muñoz,
I. R. Shepperson 5067–5070

Decoupling Deprotonation from
Metalation: Thia-Fries Rearrangement

Label-enabled: Studies with ²H-, ¹⁸O-, and ³⁴S-labeled aryl triflates show that lithium diisopropylamide-mediated thia-Fries rearrangement proceeds through an irreversible *ortho* deprotonation (see

scheme; DIPA = diisopropylamine, LDA = lithium diisopropylamide). In contrast, *ortho* metalation results exclusively in the generation of a benzyne.

A simple additive approach based on the empirical formula has been developed to calculate the enthalpy of vaporization of an ionic liquid, which is separated into a main contribution from the constituent

elements (regardless of their position in the cation or anion) and an auxiliary contribution (correction) due to structural peculiarities, such as the presence of CF_3 groups or a cyclic structure.

Ionic Liquids

S. P. Verevkin* _____ 5071 – 5074

Predicting Enthalpy of Vaporization of Ionic Liquids: A Simple Rule for a Complex Property

Long sought structural data on an f-element tuck-in complex have been obtained for the title compound **1** that

contains the first example of both tuck-in and tuck-over bonding in a ligand derived from C_5Me_5^- by metalation (see scheme).

Diuranium Complexes
