## Author Profile

Helmut Werner \_\_\_\_\_ 8070

Electrochemistry of Functional Supramolecular Systems

Paola Ceroni, Alberto Credi, Margherita Venturi

## Books

reviewed by A. Harriman \_\_\_\_\_ 8073

**Sticky business:** Marine mussels (see picture) affix themselves to rocks with a system of threads and adhesive plaques. Emerging results are showing that iron–protein interactions help mussels stick by playing two roles: initiating material formation and enhancing mechanical performance.

## Highlights

### Biological Materials Chemistry

J. J. Wilker\* \_\_\_\_\_ 8076–8078

**The Iron-Fortified Adhesive System of Marine Mussels**

## Enantioselective Catalysis

M. North\* ————— 8079–8081

A Bimetallic Titanium Catalyst for the Enantioselective Cyanation of Aldehydes Based on Cooperative Catalysis

**Joined at the hip:** By linking two salen ligands together with a strap of appropriate size and shape, the effectiveness of a bimetallic titanium(salen) complex as a catalyst for asymmetric cyanohydrin synthesis can be increased by up to two orders of magnitude. The optimal catalyst is active at a catalyst loading as low as 0.0005 mol % and will accept both trimethylsilyl cyanide and sodium cyanide/ acetic anhydride as the cyanide source (see scheme).

## Minireviews

### Small Focused Libraries

T. W. J. Cooper, I. B. Campbell,  
S. J. F. Macdonald\* ————— 8082–8091

Factors Determining the Selection of Organic Reactions by Medicinal Chemists and the Use of These Reactions in Arrays (Small Focused Libraries)

**Helping chemists help chemists:** What reactions do medicinal chemists use in drug discovery? (The pie chart shows a snapshot from one unit at GlaxoSmith-Kline.) What criteria do they use to select synthetic methodology? Why are arrays (small focused libraries) so powerful in the lead-optimization process? These questions are considered in this Minireview, which also describes attempts to expand the number of robust reactions available to medicinal chemists.

## Reviews

### The Ozone Layer

M. Dameris\* ————— 8092–8102

Climate Change and Atmospheric Chemistry: How Will the Stratospheric Ozone Layer Develop?

Since the industrial revolution began about 150 years ago, the concentration of greenhouse gases such as CO<sub>2</sub> in the atmosphere has increased dramatically, with corresponding consequences for the climate. For over 25 years, destruction of the ozone layer (pink and green regions on the globe), which is caused by chlorofluorocarbons, has also been observed. The future development of the ozone layer and of the climate are closely related to each other.

ANGEWANDTE CHEMIE International Edition (ISSN 1433-7851) is published weekly by Wiley-VCH, PO Box 191161, 69451 Weinheim, Germany. Air freight and mailing in the USA by Publications Expediting Inc., 200 Meacham Ave., Elmont, NY 11003. Periodicals

postage paid at Jamaica, NY 11431. US POSTMASTER: send address changes to *Angewandte Chemie*, Journal Customer Services, John Wiley & Sons Inc., 350 Main St., Malden, MA 02148-5020. Annual subscription price for institutions: US\$ 9442/8583 (valid for print and electronic / print or electronic delivery); for

individuals who are personal members of a national chemical society prices are available on request. Postage and handling charges included. All prices are subject to local VAT/sales tax.

## Communications

**Light controls size:** A novel type of self-organized supramolecular nanoparticles can change their size upon irradiation with UV light (see picture). The doubly responsive system combines a light-triggered size with a pH-induced switching between nanoscale aggregates and molecular building blocks. The nano-objects form by a combination of ionic and  $\pi$ - $\pi$  interactions between macro-ions and dye ions.

### Nanoparticles

I. Willerich, F. Gröhn\* — 8104–8108

Photoswitchable Nanoassemblies by Electrostatic Self-Assembly

**Adding 2Ns:** Palladium catalysis introduces two nitrogen groups in a new regio and chemoselective diamination of non-activated alkenes that proceeds under entirely intermolecular reaction control. This palladium-catalyzed reaction employs commercial nitrogen sources in combination with a hypervalent iodo(III) reagent as oxidant (see scheme; Tos = toluenesulfonyl).

### Synthetic Methods

Á. Iglesias, E. G. Pérez, K. Muñiz\* — 8109–8111

An Intermolecular Palladium-Catalyzed Diamination of Unactivated Alkenes

### Enzymatic C–H Activation

S. Scheller, M. Goenrich, S. Mayr, R. K. Thauer, B. Jaun\* — 8112–8115

Intermediates in the Catalytic Cycle of Methyl Coenzyme M Reductase: Isotope Exchange is Consistent with Formation of a  $\sigma$ -Alkane–Nickel Complex

**The key nickel enzyme** for methanogenesis (MCR) catalyzes the formation of  $\text{CH}_3\text{D}$  and  $\text{CH}_2\text{D}_2$  in a deuterated medium.  $\text{CH}_2\text{D}_2$  is formed by an exchange of deuterium into the S-methyl group of the substrate. Deuterium is incorporated at both carbon atoms of the S-ethyl group of

ethyl coenzyme M, and a  $^{13}\text{C}$  label is rapidly scrambled within the ethyl group (see scheme). Thus, at least one intermediate is formed and the isotope exchange pattern is consistent with formation of a  $\sigma$ -alkane–nickel complex.

**Breaking out:** Liposomes that are adsorbed onto porous  $\text{CaCO}_3$  particles and that contain the peroxidase substrate Amplex Red (AR) are disrupted by ultrasonic treatment. The substrate is released and diffuses into the inner part of the multicompartments where the peroxidase enzyme is found, and the enzymatic reaction is triggered. This approach may be useful for the simultaneous delivery of multiple molecules into cells.

### Enzyme Reactions in Microparticles

A. M. Yashchenok, M. Delcea, K. Videnova, E. A. Jares-Erijman, T. M. Jovin, M. Konrad, H. Möhwald, A. G. Skirtach\* — 8116–8120

Enzyme Reaction in the Pores of  $\text{CaCO}_3$  Particles upon Ultrasound Disruption of Attached Substrate-Filled Liposomes

## Iron Catalysis

S. Zhou, S. Fleischer, K. Junge, S. Das,  
D. Addis, M. Beller\* — 8121–8125

Enantioselective Synthesis of Amines:  
General, Efficient Iron-Catalyzed  
Asymmetric Transfer Hydrogenation of  
Imines

**In the iron age:** A readily accessible, active iron catalyst serves in the straightforward, catalytic transfer hydrogenation of imines (see scheme). A series of imines are

converted into chiral amines in high yields and very good enantioselectivities. This method should find broad application in the search for bioactive chiral amines.

## Amination

S. Imm, S. Bähn, L. Neubert,  
H. Neumann, M. Beller\* — 8126–8129

An Efficient and General Synthesis of  
Primary Amines by Ruthenium-Catalyzed  
Amination of Secondary Alcohols with  
Ammonia

**Atom efficiency and selectivity** are the key features of the first homogeneously catalyzed amination of secondary alcohols with ammonia to give the corresponding primary amines (see scheme). This novel

amination method relies on the commercially available catalyst  $[\text{Ru}_3(\text{CO})_{12}]$ /cata-CXium PCy and does not require any additional source of hydrogen.

## Amination

D. Pinggen, C. Müller,  
D. Vogt\* — 8130–8133

Direct Amination of Secondary Alcohols  
Using Ammonia

**Hydrogen shuttle:** For the first time secondary alcohols and ammonia can be directly converted into primary amines with a selectivity of up to 99% by using a simple ruthenium/phosphine catalyst (see scheme;  $\text{R}^1, \text{R}^2 = \text{alkyl, aryl, alkenyl}$ ;  $\text{M} = [\text{Ru}_3(\text{CO})_{12}]$ ; and  $\text{L} = \text{phosphine ligand}$ ).

## Gold Catalysis

A. Negoj, S. Wuttke, E. Kemnitz,\*  
D. Macovei, V. I. Parvulescu,  
C. M. Teodorescu,  
S. M. Coman\* — 8134–8138

One-Pot Synthesis of Menthol Catalyzed  
by a Highly Diastereoselective  $\text{Au}/\text{MgF}_2$   
Catalyst

**No toxic compounds** such as KCN and no thermal activation is required for the preparation of  $\text{Au}/\text{MgF}_2$  complexes by a simple and facile “incipient wetness impregnation” method in which hydrogen tetrachloroaurate ( $\text{HAuCl}_4$ ) is the gold

precursor. One of the complexes prepared exhibits unique catalytic properties and serves as a heterogeneous catalyst for the highly diastereoselective one-pot synthesis of  $(\pm)$ -menthol from citronellal (see picture).

**An appealing couple:** The unprecedented insertion of the nitrosonium cation into a tetrahedral edge of white phosphorus forms the highly reactive  $[P_4NO]^+$  cation

(see picture). The synthesis, characterization, and applications are discussed, and  $NO_2[Al(OC(CF_3)_3)_4]$  is presented as an easily synthesized oxidant.

## P,N Compounds

T. Köchner, S. Riedel, A. J. Lehner, H. Scherer, I. Raabe, T. A. Engesser, F. W. Scholz, U. Gellrich, P. Eiden, R. A. Paz Schmidt, D. A. Plattner, I. Krossing\* — 8139–8143

The Reaction of White Phosphorus with  $NO^+/NO_2^+[Al(OR^f)_4]^-$ : The  $[P_4NO]^+$  Cluster Formed by an Unexpected Nitrosonium Insertion

**Asymmetric conjugate addition** of arylboroxines to borylalkenes proceed in the presence of a chiral bisphosphine/rho-

dium complex as a catalyst to give chiral  $\beta$ -arylalkylboranes with high enantioselectivities (see scheme).  $[O] = H_2O_2/NaOH$ .

## Rhodium Catalysis

K. Sasaki, T. Hayashi\* — 8145–8147

Rhodium-Catalyzed Asymmetric Conjugate Addition of Arylboroxines to Borylalkenes: Asymmetric Synthesis of  $\beta$ -Arylalkylboranes

**Tripping the light fantastic:** A fluorescently active cryptand containing an anthracene fragment catalyzes the photoinduced

reduction of  $Cu^{II}$  to  $Cu^I$  with simultaneous oxidation of water to oxygen (see scheme).

## Photoreduction

H.-G. Hao, X.-D. Zheng, T.-B. Lu\* — 8148–8151

Photoinduced Catalytic Reaction by a Fluorescent Active Cryptand Containing an Anthracene Fragment

**This way and that:** Triazolylbiferrocenyl dendrimers can be synthesized with up to 729 termini. Oxidation results in isolable mixed-valence dendrimers (see picture). In electrochemical studies, these species can recognize  $ATP^{2-}$  and  $Pd^{II}$ , and they can be used to stabilize Pd nanoparticle catalysts.

## Dendrimers

R. Djeda, A. Rapakousiou, L. Liang, N. Guidolin, J. Ruiz, D. Astruc\* — 8152–8156

Click Syntheses of 1,2,3-Triazolylbiferrocenyl Dendrimers and the Selective Roles of the Inner and Outer Ferrocenyl Groups in the Redox Recognition of  $ATP^{2-}$  and  $Pd^{2+}$

## Synthetic Methods

Y. Hasegawa, I. D. Gridnev,  
T. Ikariya\* ————— **8157–8160**

Enantioselective and *Z/E*-Selective  
Conjugate Addition of  $\alpha$ -Substituted  
Cynoacetates to Acetylenic Esters  
Catalyzed by Bifunctional Ruthenium and  
Iridium Complexes

**Metal-based catalysts:** The title reaction provided the chiral adducts in high yields, excellent enantiomeric excess, and high *Z/E* selectivity. A combined NMR/DFT study revealed a key intermediate for the stereoselective reaction and a possible reaction mechanism (see the optimized transition-state structure).

## Photosensitizers

W.-C. Chang, H.-S. Chen, T.-Y. Li,  
N.-M. Hsu, Y. S. Tingare, C.-Y. Li, Y.-C. Liu,  
C. Su,\* W.-R. Li\* ————— **8161–8164**

Highly Efficient N-Heterocyclic Carbene/  
Pyridine-Based Ruthenium Sensitizers:  
Complexes for Dye-Sensitized Solar Cells

**A new generation:** The incorporation of N-heterocyclic carbene/pyridine-based ruthenium sensitizers derived from benzimidazolium salts into dye-sensitized solar cells results in superior current densities, cell voltages, and photoelectric conversion efficiencies. The performance of a solar cell sensitized with CBTR (see picture) exceeded that of the traditional N719 cell.

## Nanostructures

Y. Dai, B. Lim, Y. Yang, C. M. Cobley, W. Li,  
E. C. Cho, B. Grayson, P. T. Fanson,  
C. T. Campbell, Y. Sun,  
Y. Xia\* ————— **8165–8168**

A Sinter-Resistant Catalytic System Based  
on Platinum Nanoparticles Supported on  
TiO<sub>2</sub> Nanofibers and Covered by Porous  
Silica

**Holey support:** The generation of a porous coating of SiO<sub>2</sub> on Pt-decorated TiO<sub>2</sub> nanofibers enables the preparation of a sinter-resistant catalytic system (see picture). The Pt nanoparticles could resist sintering at temperatures up to 750 °C in air, as the SiO<sub>2</sub> coating acts as a physical barrier that slows down surface migration, but the system remained catalytically active because of the porous nature of the coating.

## Asymmetric Catalysis

D. L. Usanov,  
H. Yamamoto\* ————— **8169–8172**

Asymmetric Nozaki–Hiyama  
Propargylation of Aldehydes:  
Enhancement of Enantioselectivity by  
Cobalt Co-Catalysis

**It takes two to tango!** A combination of partially reduced chiral H<sub>8</sub>-TBOx chromium catalyst **1** and achiral cobalt porphyrine co-catalyst **2** (Ar = *p*-anisyl) led to an enhancement in enantioselectivity by suppression of the background process that presumably proceeds through an organomanganese species.

**Captured and bound!** Kdo, a monosaccharide, and an immobilized capture molecule form a covalent adduct that can be detected by adduct-specific antibodies (see scheme). The recognition yields a

signal that is proportional to the amount of Kdo present in solution. This small-molecule sensor should be applicable for any small molecule that can react to give an immunogenic adduct.

## Molecular Recognition

K. Mannerstedt, A. M. Jansson, J. Weadge, O. Hindsgaul\* 8173–8176

Small-Molecule Sensing: A Direct Enzyme-Linked Immunosorbent Assay for the Monosaccharide Kdo

**The lead-inhibited** active site of a zinc-binding metalloenzyme in a thiol-rich coordination environment ( $\text{PbS}_3$ ) has been modeled by homoleptic three-strand coiled-coil peptides and characterized using natural-abundance  $^{207}\text{Pb}$  NMR spectroscopy (see picture:  $^{207}\text{Pb}$  NMR signals from two binding sites of the same protein).  $^{207}\text{Pb}$  NMR spectroscopy could thus be used to identify and characterize important human proteins associated with lead toxicity.

## $^{207}\text{Pb}$ NMR Spectroscopy

Probing a Homoleptic  $\text{PbS}_3$  Coordination Environment in a Designed Peptide Using  $^{207}\text{Pb}$  NMR Spectroscopy: Implications for Understanding the Molecular Basis of Lead Toxicity

**On a Rh-oll:** Rhodium(I)-catalyzed C-H activations of ketimines and subsequent carboration of an allene led to an allyl metal species, which then allylated the

imine directing group to give highly functionalized methylene dihydroindene derivatives (see scheme) with excellent regio- and diastereoselectivity.

## C-H Activation

D. N. Tran, N. Cramer\* 8181–8184

*syn*-Selective Rhodium(I)-Catalyzed Allylations of Ketimines Proceeding through a Directed C-H Activation/Allene Addition Sequence

**Back to basics:** Coupled with MALDI-TOF MS, laser-assisted proteolysis (see schematic illustration) enabled rapid protein digestion and peptide mapping without the need for enzyme immobilization to

increase the efficiency of tryptic digestion. Protein solutions containing trypsin were digested in less than a minute upon irradiation at 808 nm with a laser.

## Fast Proteolysis

G. Yao, C. Deng,\* X. Zhang, P. Yang 8185–8189

Efficient Tryptic Proteolysis Accelerated by Laser Radiation for Peptide Mapping in Proteome Analysis

## Enzyme Models

S. C. Sawant, X. Wu, J. Cho, K.-B. Cho,  
S. H. Kim, M. S. Seo, Y.-M. Lee, M. Kubo,  
T. Ogura, S. Shaik, W. Nam\* **8190–8194**

Water as an Oxygen Source: Synthesis,  
Characterization, and Reactivity Studies of  
a Mononuclear Nonheme Manganese(IV)  
Oxo Complex

**The source of the problem:** Experiments with isotopically labeled water can be used to unambiguously assign the source of oxygen in a nonheme manganese(IV) oxo complex. The complex, which was generated using water as an oxygen source and

cerium(IV) as an oxidant (see picture), shows reactivities in the activation of C–H bonds of alkyl-functionalized aromatic molecules and the oxidation of aromatic substrates (sub) and benzyl alcohol.

## Glycan Imaging

K. Tanaka,\* E. R. O. Siwu, K. Minami,  
K. Hasegawa, S. Nozaki, Y. Kanayama,  
K. Koyama, W. C. Chen, J. C. Paulson,

Noninvasive Imaging of Dendrimer-Type  
N-Glycan Clusters: In Vivo Dynamics  
Dependence on Oligosaccharide  
Structure

**Body image:** Self-activating Huisgen 1,3-dipolar cycloaddition and  $6\pi$  azaelectrocyclization of lysine-based dendrimers (see picture) enable the in vivo dynamics and organ-specific accumulation of

N-glycans to be visualized. The sugar structure and glycosyl bond linkages of N-glycans control the whole-body trafficking of the clusters in nude mice and a cancer model.

## Mesoporous Materials

B. Alonso,\* E. Belamie\* **8201–8204**

Chitin–Silica Nanocomposites by Self-  
Assembly

**A new family** of chitin–silica nanocomposites has been synthesized by using a versatile colloid-based combination of self-assembly and sol–gel chemistry (see picture). Various textures and morpholo-

gies can be obtained by adjusting the evaporation-based processes or by applying external fields. After calcination, textures and birefringence are preserved in the resulting mesoporous silicas.

## Cyclophanes

A. Ito,\* Y. Yokoyama, R. Aihara, K. Fukui,  
S. Eguchi, K. Shizu, T. Sato,  
K. Tanaka\* **8205–8208**

Preparation and Characterization of  
N-Anisyl-Substituted  
Hexaaza[1<sub>6</sub>]paracyclophane

**Localized or delocalized?** For the first time, a cyclic oligoaniline, hexaaza[1<sub>6</sub>]paracyclophane, has been prepared (see picture; carbon: gray; nitrogen: blue; hydrogen: light gray). The macrocycle exhibits a high electron-donating ability, and furthermore, the spin of the corresponding radical cation was delocalized over the macrocyclic molecular backbone.

**We are family:** Triazacoronene derivatives have been synthesized in four steps from veratrole by using a threefold Pictet–Spengler reaction as the key step (see picture).

They have good photophysical and electronic properties, thermal stability, and solubility, thus rendering them promising candidates as electron-transport materials.

## Heteroarenes

J. Wei,\* B. Han, Q. Guo, X. Shi, W. Wang, N. Wei — 8209–8213

1,5,9-Triazacoronenes: A Family of Polycyclic Heteroarenes Synthesized by a Threefold Pictet–Spengler Reaction

**Cut here to cure:** Doxorubicin attached to pH-sensitive mesoporous silica nanoparticles (MSN-hydrazone-Dox) shows potential in the chemotherapeutic treatment of liver cancer. Hydrolysis of the pH-sensitive hydrazone bond in the acidic environment of endosomes/lysosomes (see picture) releases Dox intracellularly from the MSN nanochannels, resulting in highly efficient apoptotic cell death.

## Drug Delivery

C.-H. Lee, S.-H. Cheng, I.-P. Huang, J. S. Souris, C.-S. Yang, C.-Y. Mou, L.-W. Lo\* — 8214–8219

Intracellular pH-Responsive Mesoporous Silica Nanoparticles for the Controlled Release of Anticancer Chemotherapeutics

**Getting in shape:** Stable pointed-oval-shaped micelles of uniform size and shape (see TEM image) were prepared by extending the crystallization-driven living self-assembly method to crystalline core-forming polyferrocenylsilane diblock copolymers with corona-forming coblocks of poly(2-vinylpyridine) and polyphosphazene. The pointed-oval-shaped micelles were subsequently used as precursors to hierarchical micelle architectures.

## Micelles

A. Presa Soto, J. B. Gilroy, M. A. Winnik,\* I. Manners\* — 8220–8223

Pointed-Oval-Shaped Micelles from Crystalline-Coil Block Copolymers by Crystallization-Driven Living Self-Assembly

**All for one and one for all:** Molecules with multiple conjugated photochromic boryl units undergo photoisomerization on a single boryl unit only. This single boryl switching causes fluorescence quenching of the entire molecule, which is greatly amplified with increasing numbers of switchable boryl units in the molecule.

## Photoisomerization

O. Rath, F. Gueritte, C. Guillou,  
F. Kozielski\* ————— **8228–8231**

Relocation of Aurora B and Survivin from Centromeres to the Central Spindle Impaired by a Kinesin-Specific MKLP-2 Inhibitor

**Relocation, relocation:** Inactivation of the mitotic kinesin MKLP-2 by a specific small-molecule inhibitor (**1**) leads to failure in the recruitment of the chromosome

passenger protein (survivin, red) to the central spindle (microtubules, green) during anaphase chromosome segregation (DNA, blue).

## Self-Assembly

S. Kwon, A. Jeon, S. H. Yoo, I. S. Chung,  
H.-S. Lee\* ————— **8232–8236**

Unprecedented Molecular Architectures by the Controlled Self-Assembly of a  $\beta$ -Peptide Foldamer

**Fighting against windmills:** Highly homogeneous, well-defined, and finite “windmill”- and square-rod-shaped supramolecular architectures were formed by the self-assembly of a short helical  $\beta$  peptide in aqueous solution (see picture). The reproducible formation of the unprecedented 3D shapes could be controlled by the use of a surfactant of different concentrations.

## Surface Analysis

S. Clair,\* M. Abel,\* L. Porte **8237–8239**

Mesoscopic Arrays from Supramolecular Self-Assembly

**Well-ordered superarrays** of exceptionally large period (22 nm) and involving a substantial number of hexahydroxytriphenylene molecules ( $20 \times 20$  superlattice) form on a Ag(111) surface. The superstructure (see picture; triangular pattern) is an intrinsic property of the system and, remarkably, it does not depend on global surface coverage (lower right: partial structure).

## Cell-Penetrating Compounds

D. Paramelle, G. Subra,\* L. L. Vezekov,  
M. Maynadier, C. André, C. Enjalbal,  
M. Calmès, M. Garcia, J. Martinez,  
M. Amblard\* ————— **8240–8243**

A Straightforward Approach for Cellular Uptake Quantification

**Putting a number on it:** MALDI-TOF MS enabled direct quantification of the cellular uptake of cell-penetrating peptides (CPPs) by MDA-MB-231 breast cancer cells. This sensitive general strategy (see schematic representation), which requires

no purification or separation steps, relies on the enhancement and discrimination of the MS signals of an  $\alpha$ -cyano-4-hydroxycinnamic acid tag in a neutral  $\alpha$ -cyano-4-hydroxycinnamic methyl ester matrix.

**Support framework:** Post-synthesis modification of an interpenetrating Zn-based chiral metal–organic framework with  $\text{Ti}(\text{O}i\text{Pr})_4$  results in a Lewis acidic catalyst (see picture; gray C, white H, red O, green Ti) with modest enantioselectivity in the asymmetric addition of diethylzinc to aldehydes. The  $\text{Ti}(\text{O}i\text{Pr})_4$ -treated framework contains single-crystal to single-crystal cross-linking of the two interpenetrating networks.

### Metal–Organic Frameworks

L. Ma, C.-D. Wu, M. M. Wanderley, W. Lin\* — 8244–8248

Single-Crystal to Single-Crystal Cross-Linking of an Interpenetrating Chiral Metal–Organic Framework and Implications in Asymmetric Catalysis

**Not so far away from me:** Reductive cleavage of a disulfide ligand with  $\text{Cu}^{\text{I}}$  leads to the formation of a new mixed-valent  $\text{Cu}^{\text{II}}\text{Cu}^{\text{I}}$  complex (see picture). Combined X-ray and theoretical investigations highlight the presence of a striking  $\text{Cu}_2\text{S}$  core containing a Cu–Cu bond, and solution studies also indicate a high degree of delocalization.

### Bioinorganic Chemistry

**“Hot Papers”** are chosen by the Editors for their importance in a rapidly evolving field of high current interest. A preview with the graphical abstracts of these articles can be found on the *Angewandte Chemie* homepage in Wiley InterScience at [www.angewandte.org](http://www.angewandte.org).

All articles in *Angewandte Chemie* are published online several weeks ahead of print. They are found under the “EarlyView” link on the journal’s homepage in Wiley InterScience.

GEORG-AUGUST-UNIVERSITÄT  
GÖTTINGEN

The Faculty of Chemistry wishes to appoint a

### W3-Professor for "Organic Chemistry"

to commence on the 1<sup>st</sup> of April 2012.

The professor is expected to perform research and teaching in organic chemistry and strengthen the research interests of the Institute of Organic and Biomolecular Chemistry. Applicants should have excellent qualifications in the field of organic synthesis. Participation in existing or planned research initiatives of the faculty in "molecular catalysis" and "functional biomolecular chemistry" is expected.

The requirements for an appointment as a professor are specified by § 25 of the Niedersächsischen Hochschulgesetzes of February 26<sup>th</sup>, 2007 (Nds. GVBl. 2007 S. 69). The Stiftungsuniversität Göttingen has the right to make this appointment. Further details are available on request.

Applications from scientists working abroad are particularly welcome. A part time appointment is in principle possible. Appropriately qualified severely handicapped applicants will be given preference. The University would like to increase the percentage of women in areas in which they are under-represented and thus encourages suitably qualified women to apply.

Online applications with CV, publications list and details of teaching and research experience should be received not later than **December 5<sup>th</sup>, 2010**. Applications by regular mail are accepted.
