Supramolecular organization ...

... of appropriate building blocks is a well-established tool for creating tubular molecular structures. In their Communication on page 3030 ff., M. R. Hansen, S. Höger, and co-workers describe how dissipative forces can be utilized in the self-assembly of a molecular channel-forming system based on shape-persistent macrocycles that have an inner diameter greater than one nanometer in the liquid-crystalline phase.

 WILEY-VCH

Inside Cover

Martin Fritzsche, Anne Bohle, Dmytro Dudenko, Ute Baumeister, Daniel Sebastiani, Gabriele Richardt, Hans Wolfgang Spiess, Michael Ryan Hansen,* and Sigurd Höger*
