**Tetrahedral nanoparticles
inhibit amyloid fibrillation.**

Amyloid peptide fibrillation ...

... causes many neurodegenerative disorders including Alzheimers disease. Some drugs can inhibit this process by binding to peptides in a 1:1 ratio. In their Communication on page 5110 ff., N. A. Kotov et al. describe the inhibition efficacy of nanoparticles (NPs), which bind to peptide oligomers. The mechanism of NP inhibition is similar to that of proteins responsible for preventing amyloid fibrillation in the human body.
