## Highlights

### Hydrogenases

K. Grubel, P. L. Holland\* — 3308–3310

New Iron–Sulfur Clusters Help  
Hydrogenases Tolerate Oxygen

**One S less:** Recent crystallographic studies have revealed a new, oxygen-tolerant kind of iron–sulfide cluster  $[4\text{Fe-3S}]$ , which contains only three rather than four sulfur atoms in its cage (see picture; yellow = S, red = Fe, blue = N, green = cysteine). It is proposed that the cluster's ability to transfer multiple electrons increases the oxygen tolerance by enabling the enzyme to reduce  $\text{O}_2$  rapidly, converting the dioxygen into harmless water before it can damage the protein.

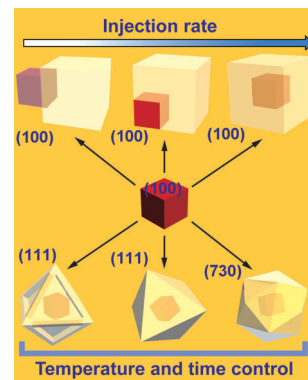

### Nanomaterials

X. Liu, X. Liu\* — 3311–3313

Bimetallic Nanoparticles: Kinetic Control  
Matters

**Morphologies à la carte:** A kinetic control strategy has been utilized to fabricate bimetallic nanoparticles. Using cubic Pd nanocrystals as seeds and a syringe pump that enables precise control over precursor injection rate, it is possible to synthesize Pd–Ag bimetallic nanoparticles with tailored shapes (see picture: dimers, eccentric hybrid bars, and core–shell structures) and tunable localized surface plasmon resonances.

## Reviews

### Cross-Coupling Catalysts

C. Valente, S. Çalimsiz, K. H. Hoi,  
D. Mallik, M. Sayah,  
M. G. Organ\* 3314–3332

The Development of Bulky Palladium  
NHC Complexes for the Most-Challenging  
Cross-Coupling Reactions

**Adding fizz to catalysis:** The Pd-PEPPSI series of catalysts (see scheme) is very active for the Suzuki–Miyaura, Negishi, Stille–Miyata, aryl amination, and aryl sulfonation reactions. The high reactivities of Pd-PEPPSI-IPr and Pd-PEPPSI-IPent

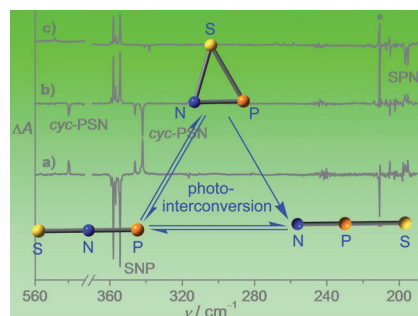

catalysts with N-heterocyclic carbene (NHC) ligands are compared with other state-of-the-art catalysts. Pd-PEPPSI-IPent is shown to be one of the most active and general catalysts for cross-coupling reactions.

## Communications

### Small-Ring Systems

X. Q. Zeng,\* H. Beckers, H. Willner,  
J. S. Francisco\* 3334–3339

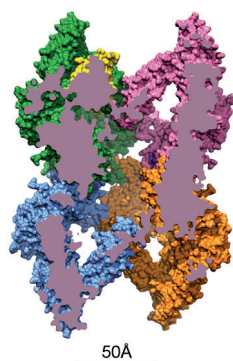

Experimental Observation of the  
16-Electron Molecules SPN, SNP, and  
Cyclic PSN

**16-Electron triatomic ring:** Novel thiazyli-dynephosphane (SNP) was produced by either flash vacuum pyrolysis (ca. 1000 °C) or laser photolysis (193 nm) of  $\text{SP}(\text{N}_3)_3$ . Its photointerconversion to cyclic thiazaphosphirine (cyc-PSN) and thiophosphoryl nitride (SPN) was found in Ar matrix at 16 K. Cyc-PSN is the first experimentally observed 16-electron cyclic triatomic molecule.

Frontispiece

**I'm your Venus:** The crystal structure of the human methylamine-induced form of  $\alpha_2$ -macroglobulin ( $\alpha_2\text{M}$ ) shows its large central cavity can accommodate two medium-sized proteinases (see structure, front part clipped off to better show central cavity). Twelve major entrances provide access for small substrates to the cavity and the still-active trapped “prey”. The structure unveils the molecular basis of the unique “venus flytrap” mechanism of  $\alpha_2\text{M}$ .

The Crystal Structure of Human  
 $\alpha_2$ -Macroglobulin Reveals a Unique  
Molecular Cage

Front Cover

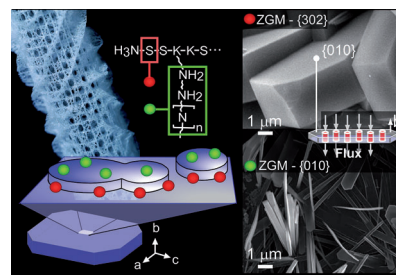

## Zeolite Crystallization

A. I. Lupulescu,  
J. D. Rimer\* — 3345 – 3349

Tailoring Silicalite-1 Crystal Morphology  
with Molecular Modifiers

**Modified point of view:** A bio-inspired approach was used to tailor silicalite-1 crystallization. Growth modifiers (ZGMs) with molecular recognition for binding to specific crystal faces produced drastic changes in zeolite crystal morphology. This facile approach offers an efficient method for tuning zeolite properties.

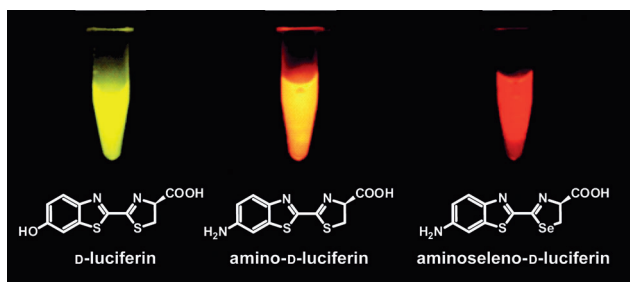

Back Cover

## Bioluminescence

N. R. Conley, A. Dragulescu-Andrasi,  
J. Rao, W. E. Moerner\* — 3350 – 3353

A Selenium Analogue of Firefly D-Luciferin  
with Red-Shifted Bioluminescence  
Emission

**A selenium analogue** of amino-d-luciferin, aminoseleno-d-luciferin, is synthesized and shown to be a competent substrate for the firefly luciferase enzyme. It has

a red-shifted bioluminescence emission maximum at 600 nm (see scheme) and is suitable for bioluminescence imaging studies in living subjects.

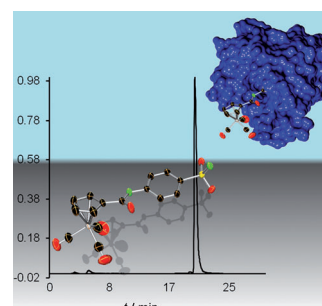

## Bio-organometallic Chemistry

D. Can, B. Spingler, P. Schmutz,  
F. Mendes, P. Raposo, C. Fernandes,  
F. Carta, A. Innocenti, I. Santos,  
C. T. Supuran, R. Alberto\* — 3354 – 3357

[(Cp-R)M(CO)<sub>3</sub>] (M = Re or <sup>99m</sup>Tc)  
Arylsulfonamide, Arylsulfamide, and  
Arylsulfamate Conjugates for Selective  
Targeting of Human Carbonic  
Anhydrase IX

**Enhanced receptor selectivity:** Carbonic anhydrase inhibitors are relevant for both cancer diagnosis and therapy. Combining non-radioactive Re compounds with their radioactive <sup>99m</sup>Tc homologs enables the use of identical molecules for therapy and imaging (theragnostic). The syntheses and in vitro evaluation of [(Cp-R)M(CO)<sub>3</sub>] (Cp = cyclopentadienyl, M = Re, <sup>99m</sup>Tc) with R being a highly potent carbonic-anhydrase-targeting vector is reported (see picture).

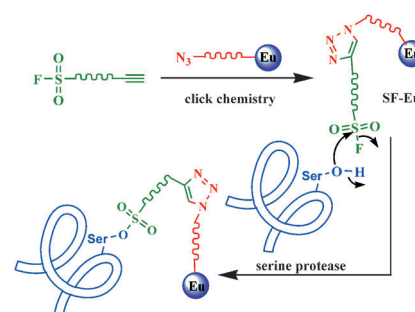

## Protein Quantification

X. W. Yan, Y. Luo, Z. Zhang, Z. Li, Q. Luo,  
L. M. Yang, B. Zhang, H. Chen, P. Bai,  
Q. Q. Wang\* — 3358 – 3363

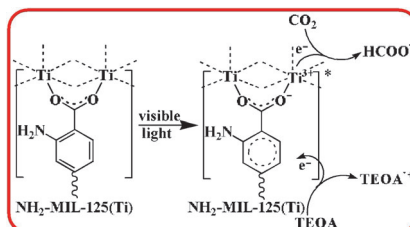

Europium-Labeled Activity-Based Probe  
through Click Chemistry: Absolute Serine  
Protease Quantification Using <sup>153</sup>Eu  
Isotope Dilution ICP/MS

**Click and analyze:** The titled probe was synthesized by conjugating a sulfonyl fluoride and azido unit using click chemistry to give SF-Eu, which can react specifically with serine (Ser) in the active site of serine protease (SP). Combination of the method with <sup>153</sup>Eu-isotope dilution ICP/MS enables absolute protein quantification of active SPs in biological samples using only one <sup>153</sup>Eu(NO<sub>3</sub>)<sub>3</sub> isotopic standard.

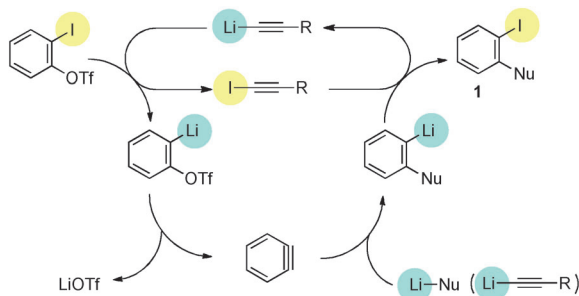

**Let your light shine:** The photocatalytic reduction of carbon dioxide to the formate anion under visible light irradiation is for the first time realized over a photoactive Ti-containing metal–organic framework, NH<sub>2</sub>-MIL-125(Ti), which is fabricated by a facile substitution of ligands in the UV-responsive MIL-125(Ti) material (see scheme; TEOA = triethanolamine).

### Photocatalysis

Y. Fu, D. Sun, Y. Chen, R. Huang, Z. Ding, X. Fu, Z. Li\* — 3364–3367

An Amine-Functionalized Titanium Metal–Organic Framework Photocatalyst with Visible-Light-Induced Activity for CO<sub>2</sub> Reduction

**A fair exchange:** In the title reaction, alkynyllithium serves as an initiator for benzyne generation through an iodine–lithium exchange (see scheme; Tf = trifluoromethanesulfonyl). When performed in the presence of stoichiometric amounts

of a nucleophile, the generated benzyne undergoes attack by lithio nucleophiles to generate aryllithium, which is then iodinated by iodoalkyne to give the iodoarenes **1**.

### Arynes

T. Hamura,\* Y. Chuda, Y. Nakatsuji, K. Suzuki\* — 3368–3372

Catalytic Generation of Arynes and Trapping by Nucleophilic Addition and Iodination

**Neoclassical architecture:** A new family of heteropolyoxometalates with “pagoda”-shaped building blocks  $[\text{Te}_n\text{W}_{6n+3}\text{O}_{21n+12}]^{(6+2n)-}$  ( $n = 1, 2, 3$ ) was discovered by adding  $\{\text{TeW}_6\text{O}_{21}\}$  layers on a classic  $\{\text{TeW}_9\text{O}_{33}\}$  fragment. Linking of the units allowed the generation of nanostructured clusters whose gross conformation is cation controlled. Studies of the redox behaviors of the multi-layered clusters indicate that the  $\text{Te}^{\text{IV}}$  template is redox-active.

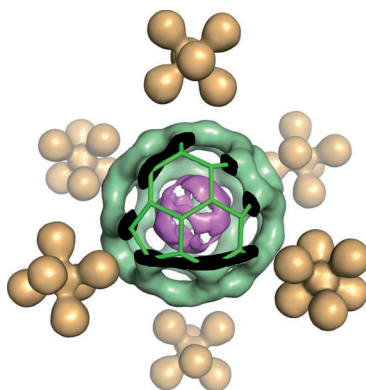

### Polyoxometalates

J. Gao, J. Yan, S. Beeg, D. L. Long,\* L. Cronin\* — 3373–3376

Assembly of Molecular “Layered” Heteropolyoxometalate Architectures

**Rock solid:** Fullerene-encapsulated Li<sup>+</sup> (Li<sup>+</sup>@C<sub>60</sub>) is an alkaline cation owing to the spherical shape and positive charge. Li<sup>+</sup>@C<sub>60</sub> crystallizes as a rock-salt-type crystal in the presence of PF<sub>6</sub><sup>−</sup>. The orientations of C<sub>60</sub> (green; see picture) and PF<sub>6</sub><sup>−</sup> (orange) are perfectly ordered below 370 K, and Li<sup>+</sup> (purple) hops within the cage. At temperatures below 100 K two Li<sup>+</sup> units are localized at two polar positions within each C<sub>60</sub>.

### Fullerenes

S. Aoyagi,\* Y. Sado, E. Nishibori, H. Sawa, H. Okada, H. Tobita, Y. Kasama, R. Kitaura, H. Shinohara — 3377–3381

Rock-Salt-Type Crystal of Thermally Contracted C<sub>60</sub> with Encapsulated Lithium Cation

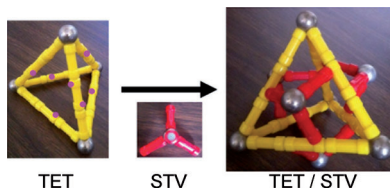

## DNA Nanostructures

C. Zhang, C. Tian, F. Guo, Z. Liu, W. Jiang,  
C. Mao\* ————— 3382–3385

DNA-Directed Three-Dimensional Protein  
Organization

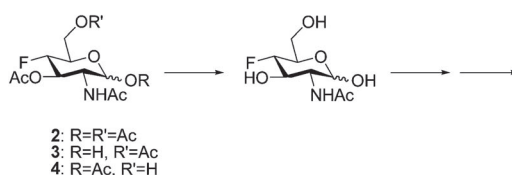

**All bound together:** Self-assembled symmetric DNA polyhedra were used to organize proteins in 3D space. Biotin moieties were incorporated into the self-assembled symmetric DNA polyhedra. Upon incubation with streptavidin (STV) protein, an STV protein became bound to each polyhedral face, thus resulting in well-structured DNA polyhedra/STV complexes (see picture, TET = tetrahedron). This strategy was also applied to different 3D DNA nanostructures and different proteins.

## Sugar Derivatives

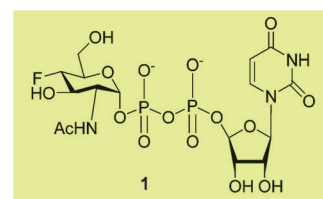

S.-I. Nishimura,\* M. Hato, S. Hyugaji,  
F. Feng, M. Amano ————— 3386–3390

Glycomics for Drug Discovery: Metabolic  
Perturbation in Androgen-Independent  
Prostate Cancer Cells Induced by  
Unnatural Hexosamine Mimics

**Inhibited:** N-acetylglucosamine (GlcNAc) derivatives with a fluorine atom at the C4 position (**2–4**) were synthesized, and their ability to inhibit cancer-cell growth was investigated. The administration of these 4F-GlcNAc derivatives to cells led to the

unnatural sugar nucleotide **1**. Furthermore, N-glycan profiles of cells were determined by using a glycoblotting-based enrichment analysis, which is suitable for high-throughput screenings for drug discovery.

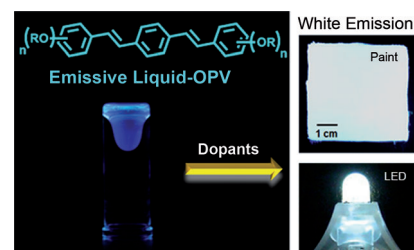

## Luminescent Liquids

S. Santhosh Babu, J. Aimi, H. Ozawa,  
N. Shirahata, A. Saeki, S. Seki,  
A. Ajayaghosh, H. Möhwald,  
T. Nakanishi\* ————— 3391–3395

Solvent-Free Luminescent Organic  
Liquids

**Illuminating!** Isolation of a  $\pi$ -core by covalently attached flexible hydrocarbon chains has been employed to synthesize blue-emitting oligo(*p*-phenylenevinylene) (OPV) liquids with tunable viscosity and optical properties. A solvent-free, stable, white-light emitting ink/paint, which can be applied onto various surfaces and even onto LEDs, was made by blending of liquid OPVs with emissive solid dopants.

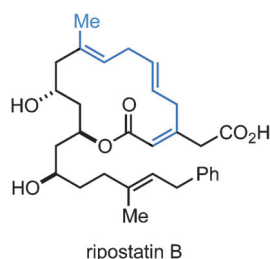

## Ripostatin B (1)

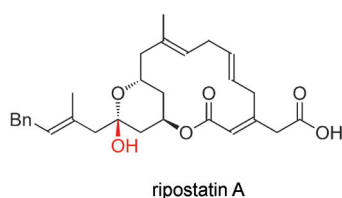

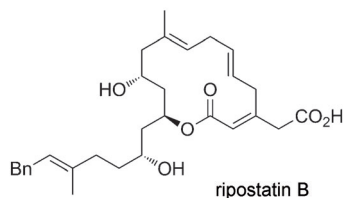

P. Winter, W. Hiller,  
M. Christmann\* ————— 3396–3400

Access to Skipped Polyene Macrolides  
through Ring-Closing Metathesis: Total  
Synthesis of the RNA Polymerase  
Inhibitor Ripostatin B

**Rip-Roaring!** A convergent total synthesis of antibiotic ripostatin B was developed. A key step in the synthesis is a metathesis reaction allowing for a ring closure to the labile doubly skipped triene macrolide.

**Keep me skipped:** A highly convergent total synthesis of ripostatin B, an inhibitor of the bacterial RNA polymerase, is described. The key steps to construct and avoid isomerization of the skipped triene are a double Stille cross-coupling reaction

and a ring-closing metathesis. Furthermore, 15-deoxyripostatin A, a stable and conformationally locked analogue of ripostatin A (see scheme, 15-OH group red), was prepared and tested in vivo.

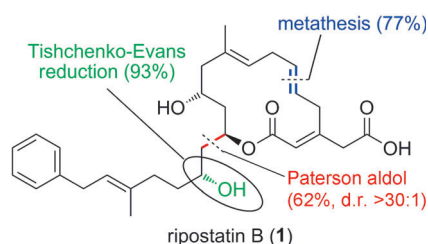

### Ripostatin B (2)

W. Tang, E. V. Prusov\* — 3401–3404

Total Synthesis of RNA-Polymerase Inhibitor Ripostatin B and 15-Deoxyripostatin A

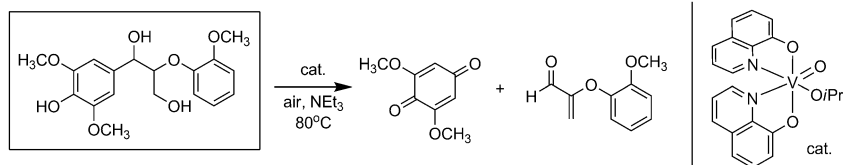

**A modular and highly stereoselective synthesis** of the title compound was developed. Key steps in the assembly of the carbon framework of ripostatin B (1; see scheme) were a stereoselective Paterson aldol reaction and a high-yielding ring-closing metathesis mediated by Grubbs first generation catalyst. The C15 hydroxy group was established through Tishchenko–Evans reduction in excellent yield and selectivity.

### Ripostatin B (3)

F. Glaus, K.-H. Altmann\* — 3405–3409

Total Synthesis of the Bacterial RNA Polymerase Inhibitor Ripostatin B

**The aerobic oxidation** of a phenolic lignin model compound with a vanadium catalyst results in the oxidative cleavage of the C–C bond between the aryl ring and the adjacent hydroxy-substituted carbon atom (see scheme). Labeling experiments indi-

cate key mechanistic differences to a previously reported related C–O bond cleavage reaction. The selectivity in C–C versus C–O bond cleavage depends on the choice of the vanadium catalyst.

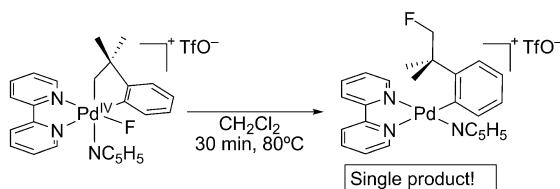

### Oxidative Cleavage

S. K. Hanson,\* R. Wu,  
L. A. “Pete” Silks\* — 3410–3413

C–C or C–O Bond Cleavage in a Phenolic Lignin Model Compound: Selectivity Depends on Vanadium Catalyst

Inside Cover

**Pd<sup>IV</sup>–fluoride complexes**, some of which are remarkably insensitive to water, have been synthesized and used in the title reaction, which proceeds with high selectivity to give the product of the C(sp<sup>3</sup>)–F

coupling (see scheme, TfO = trifluoromethanesulfonate). Preliminary mechanistic studies implicate a pathway involving dissociation of pyridine followed by direct C–F coupling at the Pd center.

### Fluorination

J. M. Racowski, J. B. Gary,  
M. S. Sanford\* — 3414–3417

Carbon(sp<sup>3</sup>)–Fluorine Bond-Forming Reductive Elimination from Palladium(IV) Complexes

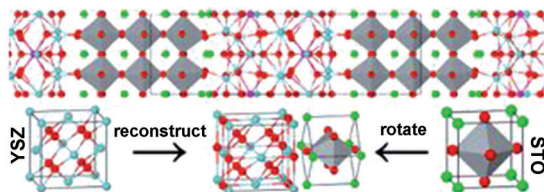

## Solid-State Chemistry

M. S. Dyer, G. R. Darling, J. B. Claridge,  
M. J. Rosseinsky\* 3418–3422

Chemical Bonding and Atomic Structure  
in  $\text{Y}_2\text{O}_3\text{:ZrO}_2\text{-SrTiO}_3$  Layered  
Heterostructures

**Repeating boundaries:** The buried interfaces in artificial heterostructures produced by sequential deposition of nano-sized units are critical to their properties. With density functional theory it was

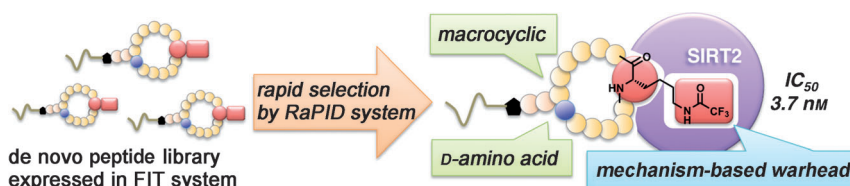

shown that in  $\text{Y}_2\text{O}_3\text{:ZrO}_2$  (YSZ) and  $\text{SrTiO}_3$  (STO) heterostructures reconstruction of the interfaces between the component units is required to access the most favorable structure (see picture).

## Inhibitors

J. Morimoto, Y. Hayashi,  
H. Suga\* 3423–3427

Discovery of Macrocyclic Peptides Armed  
with a Mechanism-Based Warhead:  
Isoform-Selective Inhibition of Human  
Deacetylase SIRT2

**Designed to inhibit:** By using the random nonstandard peptide integrated discovery (RaPID) system, highly potent isoform-selective inhibitors can be identified from a library of nonstandard macrocyclic pep-

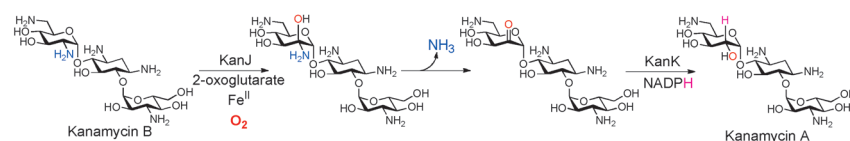

tides (see picture). These inhibitors, which contain a mechanism-based warhead residue, are active against the human deacetylase SIRT2, with  $\text{IC}_{50}$  values in the low nanomolar region.

## Enzymes

H. Sucipto, F. Kudo,  
T. Eguchi\* 3428–3431

The Last Step of Kanamycin Biosynthesis:  
Unique Deamination Reaction Catalyzed  
by the  $\alpha$ -Ketoglutarate-Dependent  
Nonheme Iron Dioxygenase KanJ and the  
NADPH-Dependent Reductase KanK

**Mystery solved:** Using heterologous expression, the activities of two enzymes exclusively belonging to the kanamycin biosynthetic pathway have been identified in vitro. A distinctive reaction mechanism

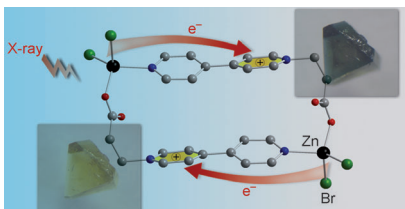

(see scheme) to produce kanamycin is proposed and the previously unknown catalytic deamination activity of KanJ dioxygenase is uncovered.

## Photochromism

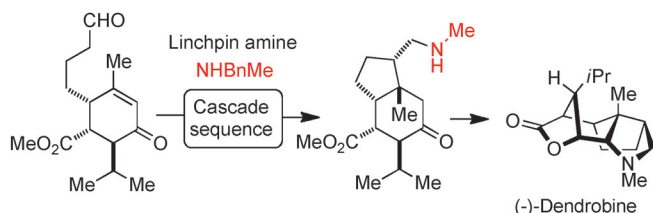

M.-S. Wang, C. Yang, G.-E. Wang, G. Xu,  
X.-Y. Lv, Z.-N. Xu, R.-G. Lin, L. Z. Cai,  
G.-C. Guo\* 3432–3435

A Room-Temperature X-ray-Induced  
Photochromic Material for X-ray Detection

**A color change:** X-ray-induced photochromic species are rare and can be used for detection of X-rays. A highly robust X-ray-sensitive material with the discrete structure of a metal–organic complex has been found to show both soft and hard X-ray-induced photochromism at room temperature (see picture). A new ligand-to-ligand electron-transfer mechanism was proposed to elucidate this photochromic phenomenon.

**Cascading to alkaloids:** An 18-step total synthesis of (–)-dendrobine is based on a reaction cascade with a key amine group (see scheme, Bn = benzyl). The amine is the initiator of the cascade and provides

an efficient method for installing the stereocenters at C11 and C3. The overall transformation occurs stereoselectively only when the conversion is carried out without the isolation of intermediates.

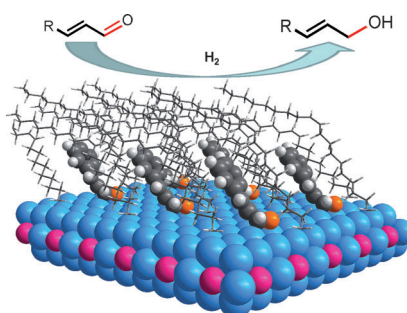

## Total Synthesis

L. M. Kreis, E. M. Carreira\* - 3436–3439

Total Synthesis of (–)-Dendrobine

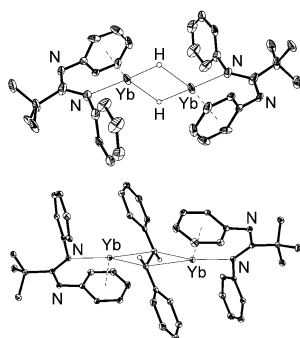

**More Greasy, More Selective:** Amine-capped Pt<sub>3</sub>Co nanocatalysts were synthesized and used for the hydrogenation of cinnamaldehyde (CAL). Capping the catalysts with amines that contain long carbon chains results in an ordered surface “array” (see scheme), in which high selectivity towards C=O hydrogenation can be achieved because the C=C bond in CAL does not interact with the surface. The longer the carbon chains in the amine, the higher the selectivity.

## Heterogeneous Catalysis

B. H. Wu, H. Q. Huang, J. Yang, N. F. Zheng,\* G. Fu\* — 3440–3443

Selective Hydrogenation of  $\alpha,\beta$ -Unsaturated Aldehydes Catalyzed by Amine-Capped Platinum-Cobalt Nanocrystals

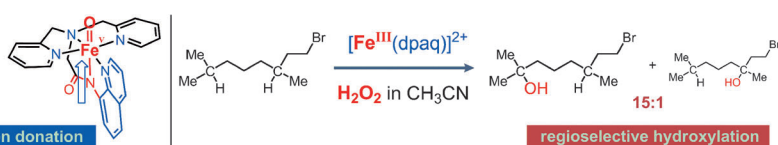

**Addition of two Ln–H bonds of an Yb<sup>II</sup> hydrido complex supported by bulky amidinate ligand to a C≡C bond lead to the formation of 1,2-dianionic bibenzyl fragment (see picture). Both Yb<sup>II</sup> and hydrido centers are oxidized under the reaction conditions. The resulting Yb<sup>III</sup>– $\eta^6$ -arene interaction is surprisingly robust: the arene cannot be replaced from the metal coordination sphere when treated with Lewis bases.**

## Hydrides of Lanthanides

I. V. Basalov, D. M. Lyubov, G. K. Fukin, A. S. Shavyrin, A. A. Trifonov\* — 3444–3447

A Double Addition of Ln–H to a Carbon–Carbon Triple Bond and Competitive Oxidation of Ytterbium(II) and Hydrido Centers

**Selective oxidation:** The success of the title reaction (see scheme) is caused by the strong electron donation from the amidate moiety of the dpaq ligand to the iron center (dpaq = 2-[bis(pyridin-2-ylmethyl)]amino-*N*-quinolin-8-yl-acetamidate).

This process facilitates the O–O bond heterolysis of the intermediate Fe<sup>III</sup>OOH species to generate a selective oxidant without forming highly reactive hydroxyl radicals.

## Hydroxylation

Y. Hitomi,\* K. Arakawa, T. Funabiki, M. Kodera — 3448–3452

An Iron(III)–Monoamidate Complex Catalyst for Selective Hydroxylation of Alkane C–H Bonds with Hydrogen Peroxide

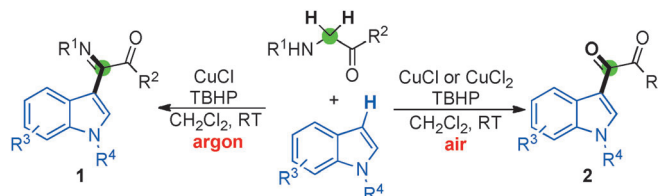

## Synthetic Methods

J.-C. Wu, R.-J. Song, Z.-Q. Wang,  
X.-C. Huang, Y.-X. Xie,  
J.-H. Li\* 3453–3457

Copper-Catalyzed C–H Oxidation/  
Cross-Coupling of  $\alpha$ -Amino Carbonyl  
Compounds

**Keeping options open:** The new and mild title reaction involving indoles selectively furnishes **1** and **2** with the aid of *tert*-butyl hydroperoxide (TBHP). The method represents the first example of a copper-

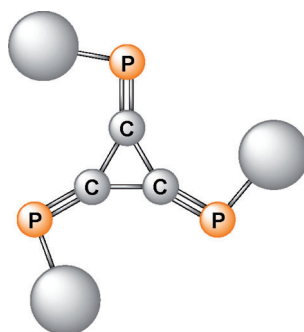

catalyzed  $\alpha$  arylation of  $\alpha$ -amino carbonyl substrates leading to  $\alpha$ -aryl  $\alpha$ -imino and  $\alpha$ -aryl  $\alpha$ -oxo carbonyl compounds using a C–H oxidation strategy.

## Radialene Chemistry

H. Miyake, T. Sasamori,\*  
N. Tokito\* 3458–3461

Synthesis and Properties of  
4,5,6-Triphospha[3]radialene

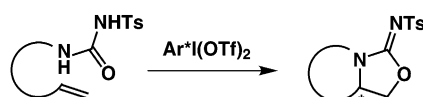

**[3]Radialenes:** 4,5,6-Tris(2,4,6-tri-*tert*-butylphenyl)phospha[3]radialene has been synthesized (see picture). The compound can be easily handled in air under ambient conditions, despite the [3]radialene moiety containing P=C bonds, and exhibits red-shifted absorption as well as high electron-accepting ability. The unique electronic properties are brought about by the synergistic effect of the [3]radialene framework and the phosphorus substitution.

## Stereoselective Synthesis

U. Farid, T. Wirth\* 3462–3465

Highly Stereoselective Metal-Free  
Oxyaminations Using Chiral Hypervalent  
Iodine Reagents

**The ring and I:** Hypervalent iodine compounds avoid the issues of toxicity or complicated ligands of many transition-metal-based systems. A highly enantioselective oxyamination of alkenes with

*N*-sulfonyl ureas employing chiral, lactic acid-based hypervalent iodine reagents gives a facile synthesis of enantiomerically pure 2-arylproline derivatives (see scheme) for the first time.

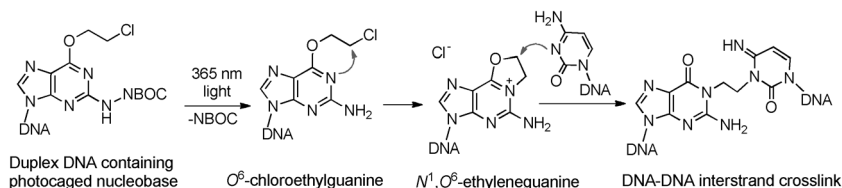

## Inside Back Cover

## Linking DNA

S. Hentschel, J. Alzeer, T. Angelov,  
O. D. Schärer,  
N. W. Luedtke\* 3466–3469

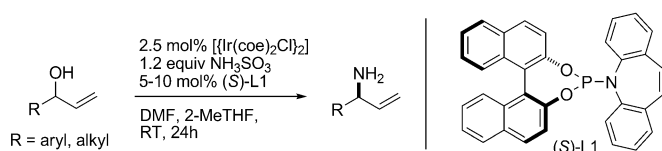

Synthesis of DNA Interstrand Cross-Links  
Using a Photocaged Nucleobase

**The missing linking:** BCNU is a chemotherapy drug that generates an ethylene bridge between N<sup>1</sup> of deoxyguanosine and N<sup>3</sup> of deoxycytidine. No synthesis of a DNA containing this moiety has been reported until now. A new strategy uses

a photocaged nucleobase that, when released, generates a highly reactive intermediate which cross-links the opposing DNA strand in a manner analogous to BCNU (see scheme, NBoc = *ortho*-nitrobenzyloxycarbonyl).

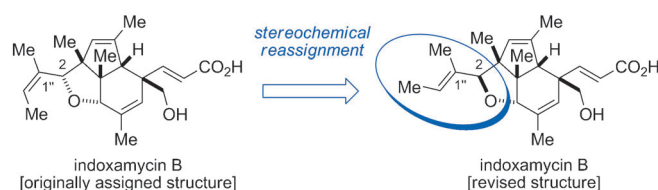

**The direct route:** Iridium-catalyzed direct conversion of branched allylic alcohols into enantioenriched branched primary

allylic amines is highly regio- and enantioselective (see scheme; coe = cyclo-octene).

### Enantioselective Allylic Amination

M. Lafrance, M. Roggen,  
E. M. Carreira\* — 3470–3473

Direct, Enantioselective Iridium-Catalyzed Allylic Amination of Racemic Allylic Alcohols

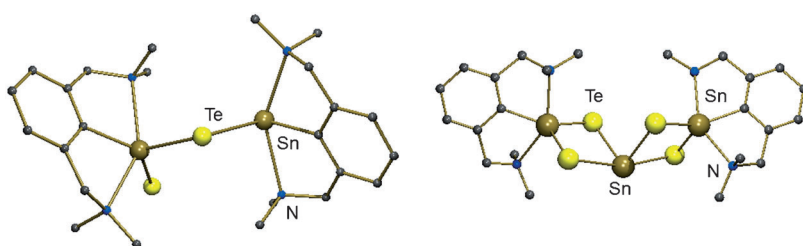

**Revised version:** The first total synthesis of indoxamycin B leads to a stereochemical reassignment of the natural product (see picture). The synthetic route features an efficient carboannulation sequence to

rapidly access the dihydroindenone system. Moreover, a series of  $\text{Au}^{\text{I}}$ -catalyzed transformations served in the construction of the sterically congested core framework.

### Natural Product Synthesis

O. F. Jeker, E. M. Carreira\* — 3474–3477

Total Synthesis and Stereochemical Reassignment of  $(\pm)$ -Indoxamycin B

**The step-wise oxidation** of an organotin(II) compound with elemental tellurium gave a variety of unprecedented organotin

tellurides containing tin atoms in the oxidation states +II and +IV (see examples).

### Organotin Compounds

M. Bouška, L. Dostál, Z. Padělková,  
A. Lyčka, S. Herres-Pawlis,\* K. Jurkschat,\*  
R. Jambor\* — 3478–3482

Intramolecularly Coordinated Organotin Tellurides: Stable or Unstable?

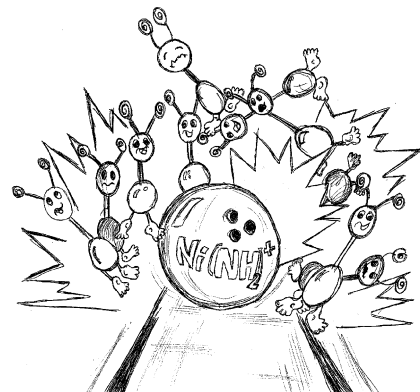

## Gas-Phase Reactions

R. Kretschmer, M. Schlangen,  
H. Schwarz\* 3483 – 3488

C–N and C–C Bond Formations in the Thermal Reactions of “Bare”  $\text{Ni}(\text{NH}_2)^+$  with  $\text{C}_2\text{H}_4$ : Mechanistic Insight on the Metal-Mediated Hydroamination of an Unactivated Olefin

**Strike!** While pure ammonia is out of luck,  $\text{Ni}(\text{NH}_2)^+$  gets one strike after another at the “ethylene bowling championship”. In fact,  $\text{Ni}(\text{NH}_2)^+$  is so effective that no pin, not even at the neighboring lane, is safe from it.
