## A cooperative, reversible ...

... charge-transfer-induced spin transition that occurs upon cooling and heating of the well-isolated cyanide-bridged  $\text{Fe}^{\text{III}}_2\text{Co}^{\text{II}}$  double-zigzag chain  $\{[\text{Fe}(\text{pzTp})(\text{CN})_3]_2\text{Co}(4\text{-styrylpyridine})_2\} \cdot 2\text{H}_2\text{O} \cdot 2\text{CH}_3\text{OH}$  (pzTp = tetrakis(pyrazolyl)borate) is described in the Communication by T. Liu, O. Sato, C.-Y. Duan et al. on page 5119 ff. Irradiation of the chain with 532 nm light at 5 K results in a single-chain magnetic behavior with no antiferromagnetic ordering after the irradiation.
