Transparent polymer-nanofiber substrates ...

... combined with a laser microdissection technique, produced a new single-cell isolation technology, as shown by M. A. Garcia, A. Ribas, R. S. Lo, H.-R. Tseng, et al. in their Communication on page 3379 ff. Using this new technique, single circulating melanoma cells (CMCs) were isolated from patients' blood for subsequent single-cell genotyping to identify a mutation in a proto-oncogene *BRAF*.
