## The selective conversion of furfural ...

... into  $\gamma$ -valerolactone (GVL) through a series of domino-like reactions catalyzed by zeolites with Lewis and Brønsted acid sites is described by Y. Román-Leshkov and co-workers in their Communication on page 8022 ff. Zr-Beta and Al-MFI nanosheets generated GVL in 78% yield without the use of high-pressure molecular hydrogen or precious metals.
