

... comprises energy transduction machineries that operate by a series of redox-active components such as flavin molecules to store energy. In their Communication on page 8322 ff., C. B. Park, K. Kang, et al. present a biomimetic approach based on the analogy between energy-storage phenomena of mitochondria and rechargeable lithium batteries to design high-performance energy devices.

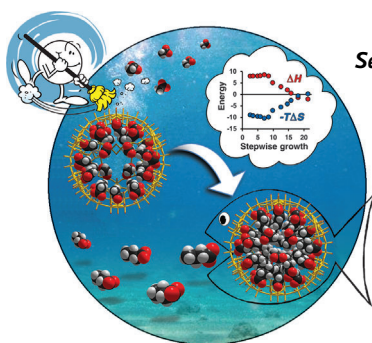

Self-Assembling Fibers

In their Communication on page 8266 ff., P. Perlmutter, A. I. Mechler, M.-I. Aguilar, and co-workers describe helical *N*-acetyl- β^3 -peptides that spontaneously self-assemble to form nano- to macro-scale fibers.

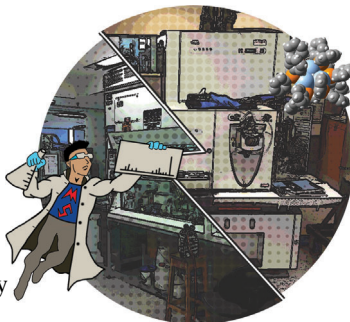

Self-Assembly Processes

In their Communication on page 8358 ff., A. Grego, A. Müller, and I. A. Weinstock describe a method that allows the study of the stepwise growth of structurally defined organic aggregates within a water-soluble porous metal-oxide nanocapsule.

Silver Hydrides

In their Communication on page 8391 ff., G. N. Khairallah, P. S. Donnelly, R. A. J. O'Hair et al. describe the synthesis, isolation, and characterization of $[\text{Ag}_3\{(\text{Ph}_2\text{P})_2\text{CH}_2\}_3(\mu_3\text{-H})(\mu_3\text{-Cl})]\text{BF}_4 \cdot 0.5\text{CHCl}_3$, in which mass spectrometry plays a key role.

Quantum Mechanics (1)

A. Fernández-Ramos* — 8204–8205

Correct Interpretation of How Tunneling Proceeds at Low Temperatures in the Proton Transfer Reactions Involving Thiotropolone: A Comment

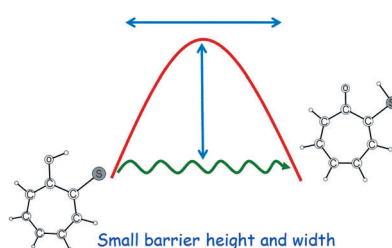

The correct interpretation is provided of how tunneling proceeds at low temperatures in the proton transfer Reactions (1) and (3) involving thiotropolone and tropolone (see the Arrhenius plots). It is also shown that the variational transition-state theory calculations carried out by Jose and Datta (*Angew. Chem.* **2012**, 124, 9523; *Angew. Chem. Int. Ed.* **2012**, 51, 9389), as well as their conclusions regarding these two processes are erroneous.

Quantum Mechanics (2)

A. Datta* — 8206–8207

Pronounced Tunneling Effect of Proton Transfer in Thiotropolone at Room Temperature: A Reply

Quantum mechanical calculations can provide insight into the role of tunneling in many reactions. At room temperature a pronounced tunneling effect of proton transfer is found for thiotropolone (see picture).

Highlights

Flexible Minerals

D. Gebauer* — 8208–8209

Bio-Inspired Materials Science at Its Best—Flexible Mesocrystals of Calcite

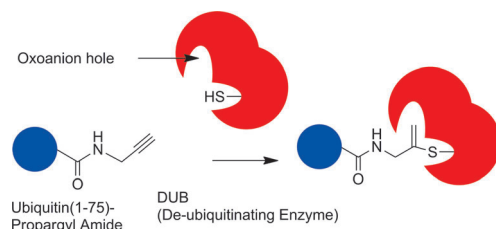

Minerals are the benchmark of hard and brittle materials. Self-assembled calcitic spicules were recently obtained utilizing a protein from silica biomineralization, silicatein- α . The synthetic spicules show remarkable material properties including extreme flexibility. Breakthroughs in bio-inspired materials science are highlighted. Will it be possible to obtain similar composites with truly artificial organic constituents?

Are aliphatic alkynes truly bioorthogonal?

In an attempt to prepare clickable ubiquitin derivatives bearing a C-terminal propargyl amide, two groups have now independently discovered propargyl-amides to be irreversible inhibitors of

cysteine proteases. The unexpected findings demonstrate the unexpected reactivity of alkynes in protein-templated reactions and introduce a novel class of activity-based protein probes.

Activity-Based Protein Probes

Propargyl Amides as Irreversible Inhibitors of Cysteine Proteases—A Lesson on the Biological Reactivity of Alkynes

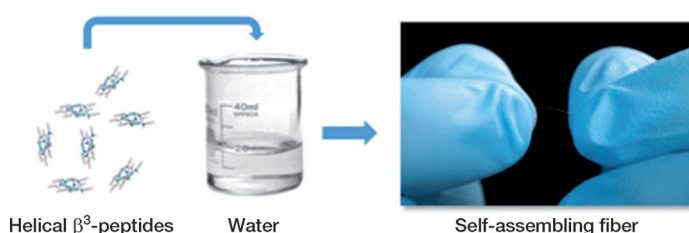

Although known for more than 100 years, fluorination still remains a challenge today. Recent advances, to a large extent enabled by catalysis, have resulted in more efficient methods to introduce fluorine and fluorine-containing functional groups into functionalized molecules. This Review focuses on new strategies for fluorination, with a brief introduction to conventional fluorination, so that the modern methods can be put into perspective.

Reviews

Fluorine

T. Liang, C. N. Neumann, T. Ritter* — 8214–8264

Introduction of Fluorine and Fluorine-Containing Functional Groups

From little things big things grow:

14-Helical *N*-acetyl β^3 -peptides spontaneously self-assemble in a unique head-to-tail fashion to form fibers from solution. The fiber size can be controlled from the

nano- to the macroscale. The inherent flexibility in design and ease of synthesis provide powerful new avenues for the development of novel bio- and nanomaterials by supramolecular self-assembly.

A Journal of Gesellschaft Deutscher Chemiker GDCh

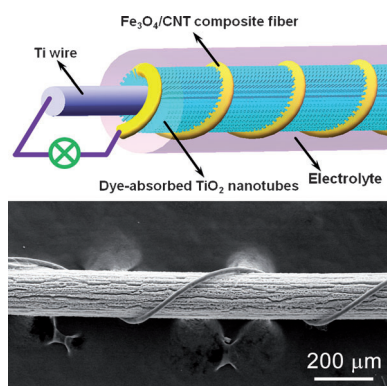

The elusive structure of malleobactin, a virulence factor of pathogens belonging to the *Burkholderia mallei* family, was finally unveiled by genetic and chemical analyses. The novel nitro-substituted siderophore is derived from an unusual, unprotected hydroxylamine, which undergoes spontaneous oxidation, as shown by in vitro assays and detection of analogues featuring hydroxylamino, nitroso, and azoxide groups.

Functional Antibody CDR3 Fusion
Proteins with Enhanced Pharmacological
Properties

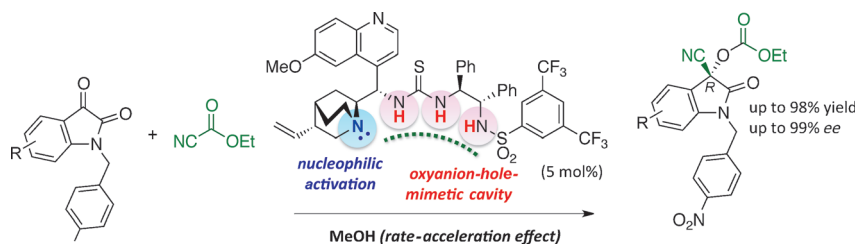

Real staying power: A subset of bovine antibodies (blue, see scheme) feature an ultralong CDR3 loop that forms an anti-parallel β -sheet stalk, terminating in a folded, disulfide cross-linked knob domain. Fusion of a polypeptide (red) into this unique CDR3 motif provides a novel strategy for generating polypeptide therapeutics with enhanced pharmacokinetics and pharmacodynamics.

Asymmetric Catalysis

Y. Ogura, M. Akakura, A. Sakakura,*
K. Ishihara* ————— **8299–8303**

Enantioselective
Cyanoethoxycarbonylation of Isatins
Promoted by a Lewis Base–Brønsted Acid
Cooperative Catalyst

Teaming up to make it happen: In the title reaction, the Lewis basic site of the catalyst activated ethyl cyanocarbonate, and the deep and flexible Brønsted acidic

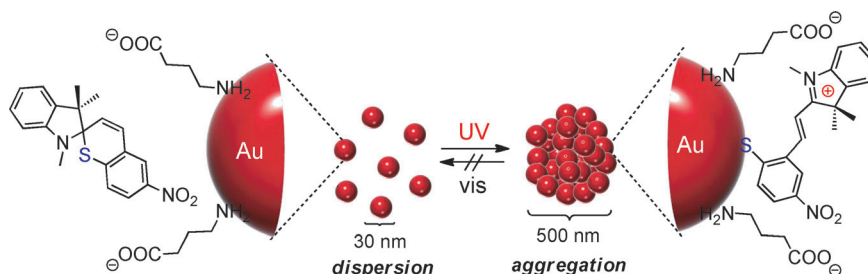

cavity stabilized and selectively recognized the key reaction intermediate to promote asymmetric acylation (see scheme).

Nanoparticles

Y. Shiraishi,* K. Tanaka, E. Shirakawa,
Y. Sugano, S. Ichikawa, S. Tanaka,
T. Hirai ————— **8304–8308**

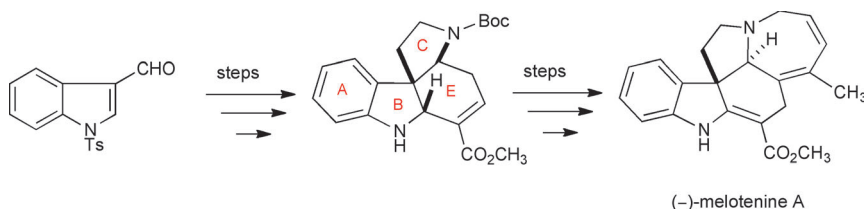

Light-Triggered Self-Assembly of Gold
Nanoparticles Based on
Photoisomerization of Spirothiopyran

Give it some stick: UV irradiation of spirothiopyran in an aqueous solution of gold nanoparticles (AuNPs) gives AuNP aggregates. The aggregate size is tuned by the photoirradiation time and the aggre-

gation is facilitated by the covalent binding of photoisomerized spirothiopyran to the surface of the AuNPs. This binding decreases the electrostatic repulsion between the AuNPs.

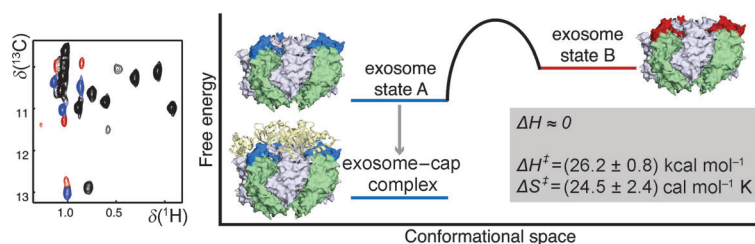

'Melo' out: A concise asymmetric synthesis of (-)-melotenine A has been accomplished in fourteen steps and 1% overall yield from commercial *N*-tosylindole-3-carboxaldehyde. Key steps

include a Piers annulation, an intermolecular vinylogous aldol reaction, and a novel one-pot sequence to prepare the ABCE tetracycle. Boc = *tert*-butoxycarbonyl, Ts = 4-toluenesulfonyl.

Natural Products

S. Zhao, G. Sirasani, S. Vaddypally,
M. J. Zdilla, R. B. Andrade* **8309–8311**

Total Synthesis of (-)-Melotenine A

Big and unexpectedly flexible: The 173 kDa exosome core is unexpectedly dynamic in solution. The kinetic and thermodynamic properties connected with the identified exchange process were

quantified. Both cap protein and RNA substrate binding significantly alter the identified motions, suggesting that these interactions occur through conformational selection.

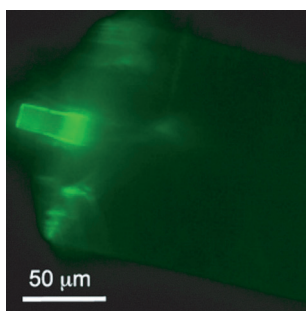

Molecular Machines

Domino Cycloaddition Organocascades of Dendralenes

Hooray Horeau! Highly enantioselective organocatalyzed Diels–Alder reaction cascades are disclosed for the first time. The reaction enables the efficient and

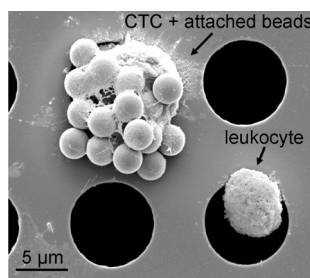

rapid construction of enantiopure polycycles from simple achiral, acyclic polyenes.

Cancer Cells

H. J. Lee, J. H. Oh, J. M. Oh, J. M. Park, J. G. Lee, M. S. Kim, Y. J. Kim, H. J. Kang, J. Jeong, S. I. Kim, S. S. Lee,* J. W. Choi,* N. Huh* — 8337–8340

Efficient Isolation and Accurate In Situ Analysis of Circulating Tumor Cells Using Detachable Beads and a High-Pore-Density Filter

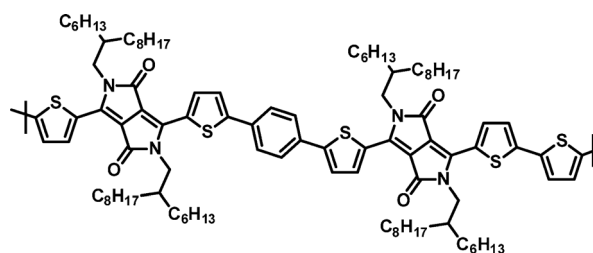

Analysis of cancer cells: A new technique isolates rare circulating tumor cells (CTCs) and analyzes their protein expression by the use of detachable beads and high-pore-density filters. This technique shows significantly improved efficiency in the isolation of rare CTCs from peripheral blood and enables accurate measurement of in situ protein-expression levels.

Organic Photovoltaics

K. H. Hendriks, G. H. L. Heintges, V. S. Gevaerts, M. M. Wienk, R. A. J. Janssen* — 8341–8344

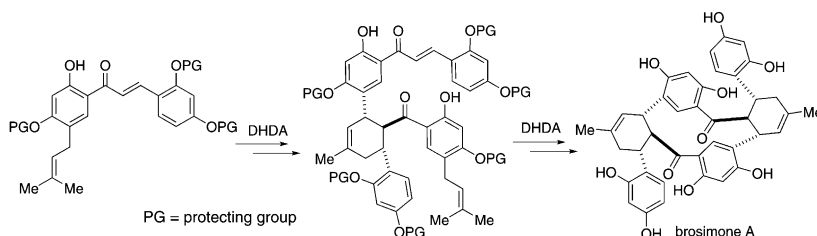

High-Molecular-Weight Regular Alternating Diketopyrrolopyrrole-based Terpolymers for Efficient Organic Solar Cells

A regular alternating terpolymer design strategy is used to create a semiconducting polymer with tailored energy levels and optical band gap. Combined with a modified synthetic procedure for the polymerization reaction, high-molecular-

weight polymers of the terpolymer as well as the parent co-polymers were obtained with high efficiencies (up to 8.0%) in organic solar cells when combined with [70]PCBM.

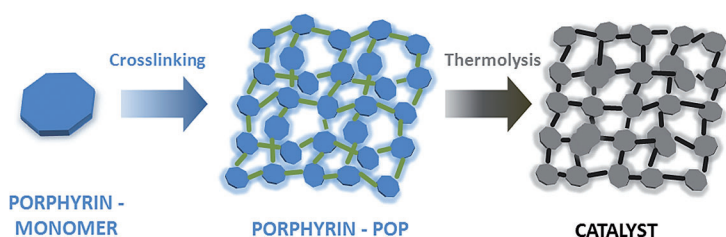

Passing (H_2) gas: Concise syntheses of the natural products brosimones A and B have been achieved using sequential dehydrogenative Diels–Alder (DHDA) cycloadditions. The syntheses employ

either Pt/C-cyclopentene or DDQ to effect dehydrogenation of prenylchalcone substrates in combination with silver nanoparticles to promote subsequent Diels–Alder cycloadditions.

Natural Product Synthesis

C. Qi, H. Cong, K. J. Cahill, P. Müller, R. P. Johnson, J. A. Porco, Jr.* **8345–8348**

Biomimetic Dehydrogenative Diels–Alder Cycloadditions: Total Syntheses of Brosimones A and B

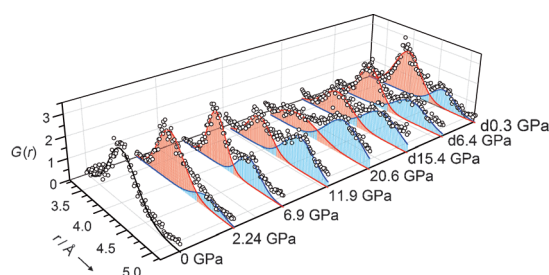

An electrocatalyst for the oxygen reduction reaction that is free of precious metals was prepared by thermal activation of an ultrahigh-surface-area porous poly-

porphyrin. The PEM fuel cells made with such catalyst demonstrated excellent current and power densities.

Fuel-Cell Catalysts

S. Yuan, J. Shui, L. Grabstanowicz, C. Chen, S. Commet, B. Repogle, T. Xu, L. Yu,* D.-J. Liu* **8349–8353**

A Highly Active and Support-Free Oxygen Reduction Catalyst Prepared from Ultrahigh-Surface-Area Porous Polyporphyrin

Pressed for time: Amorphous calcium carbonate (ACC) undergoes a reversible amorphous–amorphous phase transition at 10 GPa, adopting an aragonite-like local order. This result suggests a mechanism

by which Mg^{2+} —a cation with smaller ionic radius than Ca^{2+} —modifies the local order of ACC to an aragonite-like order by helping to decrease the molar volume of the amorphous phase.

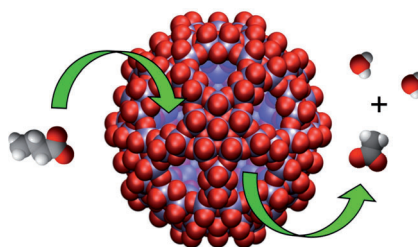

Polyamorphism

A. Fernandez-Martinez,* B. Kalkan, S. M. Clark, G. A. Waychunas **8354–8357**

Pressure-Induced Polyamorphism and Formation of ‘Aragonitic’ Amorphous Calcium Carbonate

Unprecedented information concerning how the relative roles of different hydrophobic effects evolve during multistep hydrophobic assembly processes is provided by using a unique type of experiment to resolve the underlying energetics of individual growth steps in the formation of a structurally well-defined micelle-like organic aggregate of *n*-butyrate ions within a porous inorganic-oxide nanocapsule.

Supramolecular Chemistry

A. Grego, A. Müller,* I. A. Weinstock* **8358–8362**

Stepwise-Resolved Thermodynamics of Hydrophobic Self-Assembly

Li–Se Batteries

C.-P. Yang, S. Xin, Y.-X. Yin, H. Ye,
J. Zhang, Y.-G. Guo* — 8363–8367

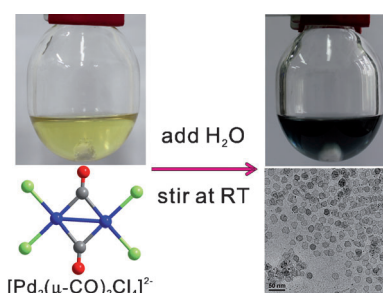

An Advanced Selenium–Carbon Cathode for Rechargeable Lithium–Selenium Batteries

Selenium has been confined in the form of cyclic Se₈ molecules within ordered mesoporous carbon for use as a cathode material in Li–Se batteries. An ex situ study of the Se cathode reveals conversion from cyclic Se₈ molecules into chain-like

Se_n molecules upon cycling. This effectively eliminates the shuttle effect of Se, resulting in superior electrochemical performance in terms of volumetric capacity density and cycling stability.

Pd Nanosheets

H. Li, G. X. Chen, H. Y. Yang, X. L. Wang,
J. H. Liang, P. X. Liu, M. Chen,
N. F. Zheng* — 8368–8372

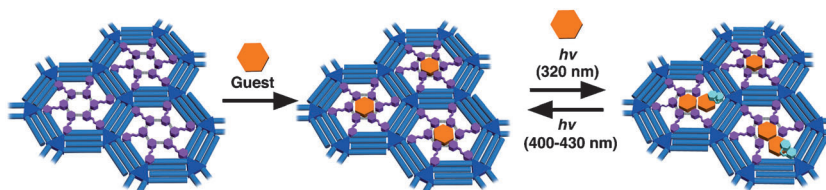

Shape-Controlled Synthesis of Surface-Clean Ultrathin Palladium Nanosheets by Simply Mixing a Dinuclear Pd^I Carbonyl Chloride Complex with H₂O

Simple shape control: Ultrathin Pd nanosheets are readily fabricated by simply mixing [Pd₂(μ-CO)₂Cl₄]²⁻ with H₂O at ambient temperature. The as-prepared Pd nanosheets are surface clean and serve as an excellent platform to evaluate the effect of organic capping agents on the catalytic and electrocatalytic properties of Pd nanocrystals.

Tailored 2D Pores

K. Tahara,* K. Inukai, J. Adisojoso,
H. Yamaga, T. Balandina, M. O. Blunt,
S. De Feyter,* Y. Tobe* — 8373–8376

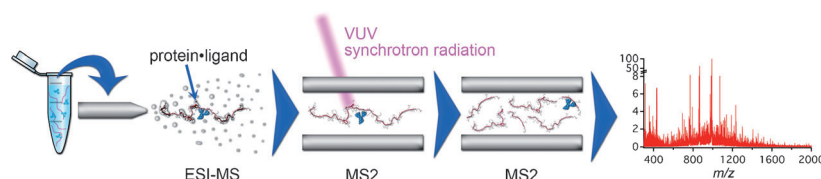

Tailoring Surface-Confined Nanopores with Photoresponsive Groups

Opening light: Two-dimensional pores are formed by the self-assembly of azobenzene-functionalized triangular building blocks on graphite at the liquid–solid interface. These pores can selectively host

a guest molecule. The pore size can be reversibly changed by irradiation at different wavelength which changes the number of guest molecules that are adsorbed (see scheme).

Mass Spectrometry of Proteins

F. Canon, A. R. Milosavljević,
G. van der Rest, M. Réfrégiers, L. Nahon,
P. Sarni-Manchado, V. Cheynier,
A. Giuliani* — 8377–8381

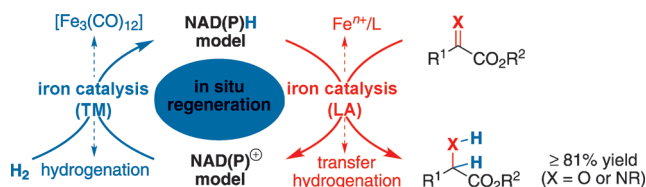

Photodissociation and Dissociative Photoionization Mass Spectrometry of Proteins and Noncovalent Protein–Ligand Complexes

Weight of evidence: Using synchrotron radiation, photo-fragmentation of an intrinsically disordered protein is probed and compared with classical tandem

mass-spectrometry activation techniques. It provides excellent sequence coverage allowing the identification of the protein noncovalent binding sites.

Inside Cover

Two irons for a smoother finish: An NAD(P)H model was regenerated readily in situ by iron-catalyzed reduction with molecular hydrogen. The subsequent biomimetic reduction of α -keto-/ α -iminoesters proceeded smoothly in the

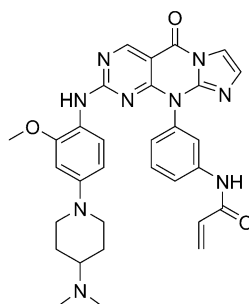

presence of an iron-based Lewis acid (LA) to provide α -hydroxyesters and amino acid esters in good to excellent yields (see scheme; NAD(P)⁺ = nicotinamide adenine dinucleotide (phosphate), TM = transition metal).

Iron Catalysis

L.-Q. Lu, Y. Li, K. Junge, M. Beller* **8382–8386**

Iron-Catalyzed Hydrogenation for the In Situ Regeneration of an NAD(P)H Model: Biomimetic Reduction of α -Keto-/ α -Iminoesters

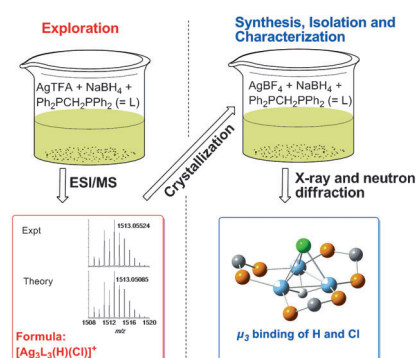

Catching the mutants: Pyrimido[4,5-*d*]pyrimidin-4(1*H*)-one derivatives (see example) were identified as specific inhibitors of EGFR^{T790M} mutants. The compounds bound with T790M or L858R/T790M mutants with significantly lower K_d values than that with EGFR^{WT}. They also selectively inhibited EGFR signal transduction and proliferation of NSCLC cells harboring EGFR^{L858R/T790M} mutation, but were significantly less potent to cells with EGFR^{WT}.

Drug Design

T. Xu, L. Zhang, S. Xu, C.-Y. Yang, J. Luo, F. Ding, X. Lu,* Y. Liu, Z. Tu, S. Li, D. Pei, Q. Cai, H. Li, X. Ren, S. Wang, K. Ding* **8387–8390**

Pyrimido[4,5-*d*]pyrimidin-4(1*H*)-one Derivatives as Selective Inhibitors of EGFR Threonine⁷⁹⁰ to Methionine⁷⁹⁰ (T790M) Mutants

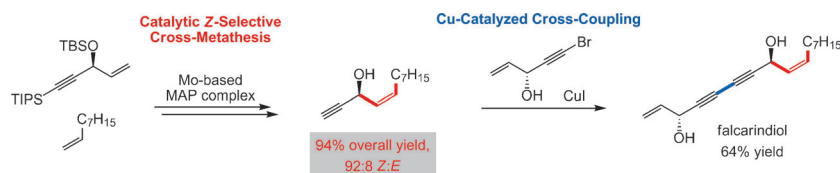

Mass spectrometry shows the way! MS analysis of silver salts treated with sodium borohydride in the presence of a bis(phosphino) ligand revealed the formation of novel silver hydride nanocluster cations instead of all silver nanocluster cations. This serendipitous discovery prompted the condensed-phase synthesis, isolation, and characterization of $[\text{Ag}_3\{(\text{PPh}_2)_2\text{CH}_2\}_3(\mu_3\text{-H})(\mu_3\text{-Cl})]\text{BF}_4 \cdot 0.5 \text{CHCl}_3$.

M. Greenblatt* 8406–8410

Polar and Magnetic Mn₂FeMO₆ (M = Nb, Ta) with LiNbO₃-type Structure: High-Pressure Synthesis

Polar LiNbO₃-type magnetic oxides have been extended, for the first time, to the A₂BB'O₆ family. Mn²⁺₂Fe³⁺M⁵⁺O₆ (M = Nb, Ta), synthesized at high pressure,

adopt a polar structure, as demonstrated by electron diffraction and the second harmonic generation effect, and they have interesting magnetic properties.

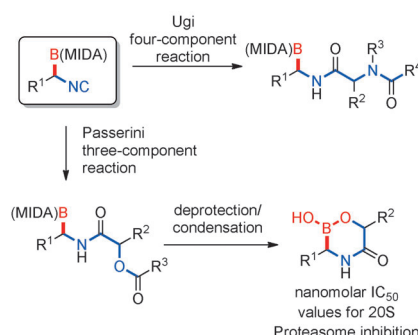

Multicomponent Reactions

A. Zajdlik, Z. Wang, J. L. Hickey, A. Aman,
A. D. Schimmer,
A. K. Yudin* 8411–8415

α-Boryl Isocyanides Enable Facile Preparation of Bioactive Boro-peptides

Entry to bioactive boro-peptides: MIDA-containing α-boryl isocyanides are isolable molecules which allow one-step access to boroalkyl-functionalized heterocycles as well as biologically active boro-peptides through a multicomponent approach. Among these derivatives are 6-boromorpholinones, novel borocycles with nanomolar IC₅₀ values for 20S proteasome inhibition. MIDA = N-methyliminodiacetyl.

Asymmetric Hydrogenation

T.-L. Liu, C.-J. Wang,*
X. Zhang* 8416–8419

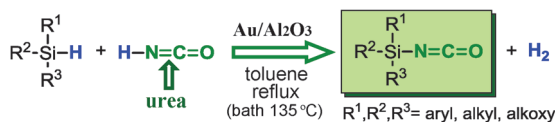

Synthesis of Chiral Aliphatic Amines through Asymmetric Hydrogenation

The direct route: A Rhodium-catalyzed asymmetric hydrogenation method for the efficient synthesis of a broad range of chiral allylic amines and aliphatic amines from readily available materials was developed. A chiral Z-allylic amine was

obtained for the first time through a Rhodium–DuanPhos-catalyzed asymmetric hydrogenation. TMS = Trimethylsilyl, cod = cyclooctadiene, TON = turnover number.

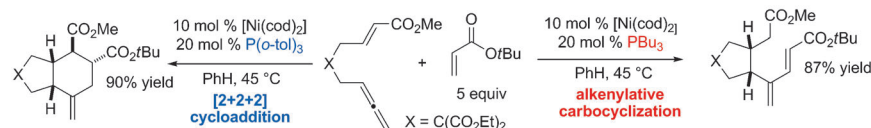

Support structure: In the presence of gold nanoparticles supported on alumina (Au/Al_2O_3), various hydrosilanes can be converted into the corresponding silyl isocyanates using urea as an isocyanate

source. The observed catalysis is truly heterogeneous, and the retrieved Au/Al_2O_3 catalyst can be reused several times without any loss of its high catalytic performance.

Cross-Coupling

K. Taniguchi, S. Itagaki, K. Yamaguchi, N. Mizuno* 8420–8423

Heterogeneous-Gold-Catalyzed Acceptorless Cross-Dehydrogenative Coupling of Hydrosilanes and Isocyanic Acid Generated in situ from Urea

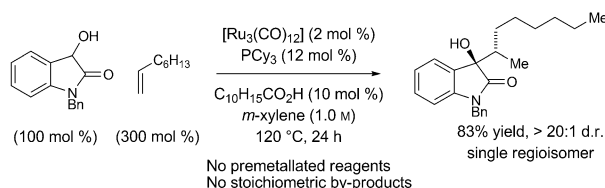

[2+2+2]=4 (stereocenters)? Nickel-catalyzed multicomponent cycloadditions and alkenylative cyclizations involving two alkenes and one allene are described. The [2+2+2] cycloaddition provides rapid

access to stereochemically complex, *cis*-fused hydrindanes. By exchanging $P(o-tol)_3$ for PBU_3 as ligand, the reaction pathway can be diverted to an alkenylative cyclization process.

Multicomponent Cycloadditions

N. N. Noucti, E. J. Alexanian* 8424–8427

Stereoselective Nickel-Catalyzed [2+2+2] Cycloadditions and Alkenylative Cyclizations of Ene-Allenes and Alkenes

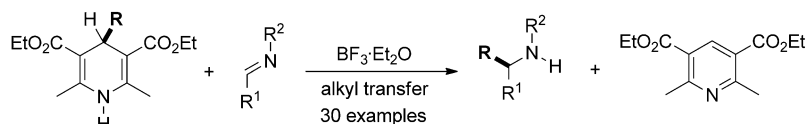

The direct approach: Ruthenium(0)-catalyzed hydrohydroxyalkylation of α -olefins and styrenes with 3-hydroxy-2-oxindoles forms branched products of C–C coupling with high levels of diastereocontrol. A

mechanism involving diene-olefin oxidative coupling and a subsequent carboxylic acid co-catalyzed transfer hydrogenolysis of the resulting oxaruthenacycle intermediate is postulated.

Transfer Hydrogenation

Regio- and Diastereoselective C–C Coupling of α -Olefins and Styrenes to 3-Hydroxy-2-oxindoles by Ru-Catalyzed Hydrohydroxyalkylation

Hydrogenation was only the beginning: Hantzsch esters have now been used to transfer alkyl groups to imines under mild catalytic conditions to provide a variety of amines (see scheme). Benzyl, secondary alkyl, and tertiary alkyl groups containing

ether, ester, and hydroxy functionalities were transferred successfully. The use of Hantzsch esters as alkylation reagents offers a practical and complementary alternative to organometallic processes.

Alkylation

T. Kato* **8437–8440**

Reversible Insertion of Unactivated
Alkenes into Silicon(II)–Tin Bonds

Insertion without assertion: Alkenes reacted reversibly under mild conditions (25–85 °C) with phosphine–silylene complexes containing a Si^{II}–Sn bond to give alkyl silylene complexes (see scheme). Theoretical studies indicated that the insertion reaction proceeds through oxidative addition and migratory insertion in a two-step process and thus revealed that silicon(II)–phosphine complexes can behave like transition-metal complexes.

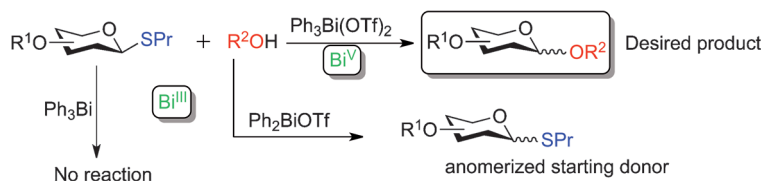

Glycosylation

Bismuth(V)-Mediated Thioglycoside
Activation

A straightforward method utilizing a bis-bismuth(V) compound was developed for the activation of thiopropylglycosides for coupling to various acceptors; good to excellent yields were obtained without applying additional additives/co-promot-

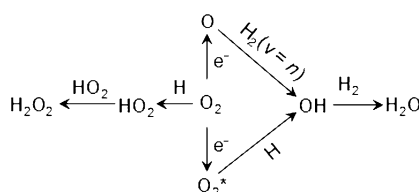

ers. The method does not require low temperatures, is applicable to a wide variety of carbohydrates, and tolerates different functional groups including alkenes.

Hydrogen Peroxide Synthesis

Safe Direct Synthesis of High Purity H₂O₂
through a H₂/O₂ Plasma Reaction

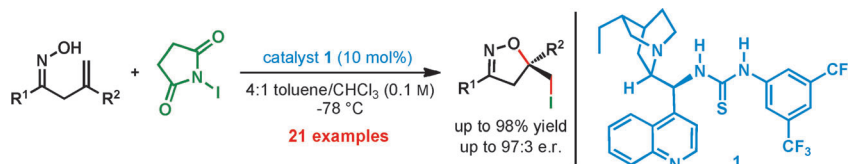

Plasma makes it safer: A gaseous H₂/O₂ plasma reaction has been developed for the safe direct synthesis of H₂O₂. Low electron density favors the generation of H₂O₂ by a chain termination path. This plasma method is promising for the direct synthesis of neutral, high concentration (ca. 60 wt %), and high purity (electronic grade) H₂O₂.

Asymmetric Catalysis

Catalytic Enantioselective
Iodoetherification of Oximes

Organocatalysis: The first catalytic enantioselective iodoetherification of oximes is developed using commercially available *N*-iodosuccinimide. In the presence of a dihydrocinchonidine-derived thiourea (10 mol %), β,γ-unsaturated oximes

undergo facile iodoetherification to produce Δ²-isoxazolines containing a quaternary stereogenic center generally in high yield with good to excellent enantioselectivity.

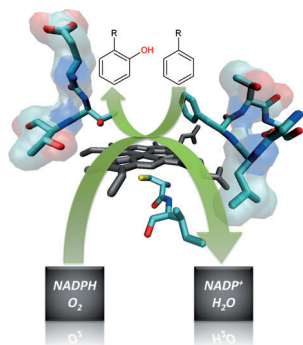

Two to four! Readily available flavones and chromones were efficiently converted into four valuable chiral classes of O-heterocycles—flavanones, chromanones, flavanols, and chromanols—by means of an

enantioselective Ru/NHC-catalyzed hydrogenation process (see scheme; NHC = N-heterocyclic carbene, PCC = pyridinium chlorochromate).

Ruthenium–NHC-Catalyzed Asymmetric Hydrogenation of Flavones and Chromones: General Access to Enantiomerically Enriched Flavanones, Flavanols, Chromanones, and Chromanols

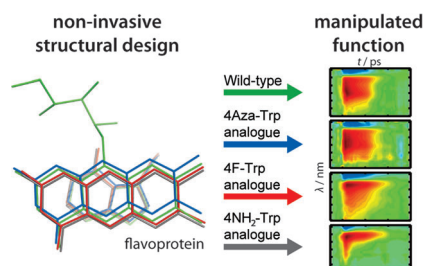

Dream come true: A new monooxygenase catalyst shows excellent activity for the hydroxylation of halogenated benzenes, anisole, and toluene with almost complete *ortho* regioselectivity (see scheme; R = F, Cl, Br, I, CH₃, OCH₃). The substrates were hydroxylated at room temperature in water without cosolvent using molecular oxygen as oxidant.

Aromatic Hydroxylation

Regioselective *o*-Hydroxylation of Monosubstituted Benzenes by P450 BM3

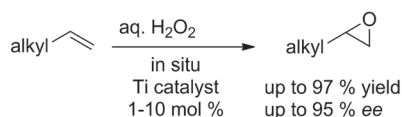

Tamed electrons: To manipulate a protein photocycle in a directed manner, the flavoprotein dodecin was endoscopically modified at its key amino acid tryptophan with substituents carefully selected by their structural and electronic influence. The approach is ideal in the precision of rational protein engineering, and allows correlating tryptophan ionization potentials and electron transfer rates in a Marcus model.

Reaction Control in Proteins

Directed Manipulation of a Flavoprotein Photocycle

Help for the neglected: Terminal, non-conjugated olefins, such as 1-octene, are difficult to epoxidize asymmetrically. Ti salalen complexes based on *cis*-1,2-diaminocyclohexane catalyze this demanding reaction giving high yields and enan-

tioselectivities (up to 95 % *ee*), with H₂O₂ as the oxidant. The X-ray structures of the μ -oxo and peroxo complexes shed light on the coordination behavior of this novel class of ligands.
