In vivo tumor imaging ...

... by positron emission tomography (PET) is possible following the functionalization of $\alpha 5 \beta 1$ or $\alpha v \beta 3$ subtype-selective integrin antagonists with NODAGA. H. Kessler and co-workers also show in their Communication on page 11656 ff. that these peptidomimetics are able to block bFGF- and VEGF-stimulated angiogenesis in a rat aortic ring (RAR) assay, and exert anti-tumor effects in a fibrosarcoma model in mice. (Picture designed by Philipp Ganthaler.)
