

... of ceria in heterogeneous reactions are revealed by J. Pérez-Ramírez, A. Trovarelli, et al. in their Communication on page 12069 ff. The (111) surface prevalent in conventional polyhedral CeO_2 particles outperforms in hydrogenation, while the (100) surface that is exposed in nanocubes dominates in oxidation.
Artwork: Amalia Gallardo (ArteLi) and Marcel Reich.

Proton-Coupled Electron Transfer

In their Communication on page 12046 ff., J. Cheng et al. propose the concept of protonic energy levels to visualize the thermodynamics of proton-coupled electron transfer. Their method helps to elucidate the electronic and protonic components of thermodynamic overpotentials in photocatalysis.

Triboelectrification

In their Communication on page 12101 ff., T. A. L. Burgo and A. Erdemir describe that friction force fluctuations and tribocurrent generation at metal–insulator interfaces show a strong correlation during sliding contacts.

Hydrogen Evolution Reaction

In their Communication on page 12120 ff., Y. Xiong and co-workers show how the surface polarization effect can be induced on Pt surfaces. As the thickness of the Pt layer decreases, the surface polarization boosts the hydrogen evolution reaction activity.

M. Sprik _____ 12046 – 12050

Aligning Electronic and Protonic Energy Levels of Proton-Coupled Electron Transfer in Water Oxidation on Aqueous TiO₂

Frontispiece

Scheming: A scheme for computing the thermochemistry of proton-coupled electron transfer (PCET) reactions at interfaces is described. In analogy with electronic energy levels, an appealing concept of protonic energy levels is proposed to

visualize the thermodynamics of PCET in a level diagram. This diagram helps to elucidate the electronic and protonic components of thermodynamic overpotentials in photocatalysis.

The spin calls the shots: Velocity slice imaging was used to study the dynamics of electron-induced dissociation of the potential plasma gas CF₃I (see picture). The changed spin state was found to switch the predominant diabatic path in the neutral CF₃I molecule to an adiabatic path in the CF₃[•] transient negative ion by opening a path through a conical intersection that is efficiently repressed by a required spin flip in the neutral molecule.

Polymer-Induced Surface Modifications of Pd-based Thin Films Leading to Improved Kinetics in Hydrogen Sensing and Energy Storage Applications

A multi-shell nanocrystal was synthesized and used as an effective probe for in vivo imaging. With emission in the short-wavelength infrared region at 1525 nm, the probe is detectable in tissues at depths of up to 18 mm with a low detection threshold.

Bioimaging

R. Wang, X. M. Li, L. Zhou, F. Zhang* ————— **12086 – 12090**

Epitaxial Seeded Growth of Rare-Earth Nanocrystals with Efficient 800 nm Near-Infrared to 1525 nm Short-Wavelength Infrared Downconversion Photoluminescence for In Vivo Bioimaging

Inside Cover

A handle on [O]: A variety of C–H oxidation methods were explored on the betulin skeleton to improve the solubility of this bioactive, yet poorly water-soluble, natural product. The innate reactivity of

the molecule, as well as the molecular handles present on the core, allowed oxidations at different positions. Solubility enhancement was observed for many of the synthesized compounds.

Terpenoids

Q. Michaudel, G. Journot, A. Regueiro-Ren, A. Goswami, Z. Guo, T. P. Tully, L. Zou, R. O. Ramabhadran, K. N. Houk, P. S. Baran* ————— **12091 – 12096**

Improving Physical Properties via C–H Oxidation: Chemical and Enzymatic Approaches

No longer elusive: The allylic gold(I) cation **2**, which has been proposed as an intermediate in the rearrangement of alkyne/cyclopropanes (**1**) into alkenylcyclohexadienes (**3**), has been detected and characterized by NMR spectroscopy.

Participation of **2** was supported experimentally and theoretically, and through these studies, a stable homo-antiaromatic carbocation was isolated and characterized.

Reactive Intermediates

E. Tudela, J. González, R. Vicente, J. Santamaría, M. A. Rodríguez, A. Ballesteros* ————— **12097 – 12100**

Mechanistic Studies on the Rearrangement of 1-Alkenyl-2-alkynylcyclopropanes: From Allylic Gold(I) Cations to Stable Carbocations

Triboelectrification

T. A. L. Burgo,*

A. Erdemir — 12101–12105

Bipolar Tribocharging Signal During Friction Force Fluctuations at Metal–Insulator Interfaces

Friction force fluctuation and tribocurrent generation at metal–insulator interfaces show a strong correlation during sliding contacts. The reported results suggest that these two phenomena have a common origin that must be associated with the occurrence of strong electrostatic interactions at the interface.

Inside Back Cover

Template Synthesis

C. J. Bueno-Alejo, L. A. Villaescusa,*

A. E. Garcia-Bennett* — 12106–12110

Supramolecular Transcription of Guanosine Monophosphate into Mesostructured Silica

Templates with a twist: Chiral guanosine monophosphate (GMP) has been used as a supramolecular template for the synthesis of highly ordered silica mesoporous materials with trigonal symmetry and anisotropic channels. Electron microscopy studies revealed diffuse scattering patterns (see picture) corresponding to silica modulations associated with the chiral twisting of the GMP tetramers.

Target Identification

C. Li, T. Dong, Q. Li,

X. Lei* — 12111–12115

Probing the Anticancer Mechanism of (–)-Ainsliatrimers A through Diverted Total Synthesis and Bioorthogonal Ligation

The target of the structurally complex natural product (–)-ainsliatrimers A has been identified by a systematic and efficient approach enabled by diverted total synthesis and bioorthogonal ligation. This

approach enabled visualization of the subcellular localization of the natural product in live cells and identified activation of PPAR γ as leading to the anticancer activity of ainsliatrimers A.

Porous Polymer Films

W. Wang, C. Du, X. Wang, X. He,* J. Lin,

L. Li,* S. Lin* — 12116–12119

Directional Photomanipulation of Breath Figure Arrays

Directional photofluidization of azobenzene groups manipulates the shape transformation of the round pores in an ordered breath figure array. Depending on

the irradiation time and polarization direction of the incident polarized light, rectangular, rhombic, or parallelogram-shaped pores can be obtained.

Less is more: Pt–Pd–graphene stack structures (see picture) are prepared by a new method that allows control of the thickness of the Pt shell. This thickness correlates with performance in the hydro-

gen evolution reaction (HER). As a result of surface polarization, the HER activity actually increases with decreasing Pt thickness, opening possibilities of using less Pt.

Nanostructures

S. Bai, C. Wang, M. Deng, M. Gong, Y. Bai, J. Jiang, Y. Xiong* — 12120–12124

Surface Polarization Matters: Enhancing the Hydrogen-Evolution Reaction by Shrinking Pt Shells in Pt–Pd–Graphene Stack Structures

Back Cover

The sequence matters: The human cytokine interleukin 6 (IL-6) was synthesized in two glycoforms by sequential native chemical ligation from two recombinant fragments (A, C) and a synthetic glyco-

peptide (B). Only one of the possible sequences of ligations efficiently led to the IL variants because of the susceptibility of the peptide chain and the folded glycoprotein to nonphysiological conditions.

Native Chemical Ligation

A. Reif, S. Siebenhaar, A. Tröster, M. Schmälzlein, C. Lechner, P. Velisetty, K. Gottwald, C. Pöhner, I. Boos, V. Schubert, S. Rose-John, C. Unverzagt* — 12125–12131

Semisynthesis of Biologically Active Glycoforms of the Human Cytokine Interleukin 6

Terrace versus step sites: Atomic layer deposition (ALD) overcoating was applied to cover the step sites of Pd nanoparticles with alumina, whereas the terrace sites remained as the active component for

furfural hydrogenation. The modified catalyst exhibited an increased selectivity to furan, showing that this technique can be used to tune the catalytic properties of Pd nanoparticles.

Selective Hydrogenation

H. Zhang, X.-K. Gu, C. Canlas, A. J. Kropf, P. Aich, J. P. Greeley, J. W. Elam, R. J. Meyers, J. A. Dumesic, P. C. Stair, C. L. Marshall* — 12132–12136

Atomic Layer Deposition Overcoating: Tuning Catalyst Selectivity for Biomass Conversion

Kill Two Birds with One Stone: Two iridium(III) complexes can specifically image lysosomes and induce an autophagic response in live cells. The combination of these two intriguing properties makes them ideal theranostic agents to track lysosomal changes during autophagic processes. Additionally, these complexes display strong two-photon excited fluorescence, which is favorable for live cell imaging and in vivo applications.

Theranostic Iridium Complexes

L. He, C.-P. Tan,* R.-R. Ye, Y.-Z. Zhao, Y.-H. Liu, Q. Zhao, L.-N. Ji, Z.-W. Mao* — 12137–12141

Theranostic Iridium(III) Complexes as One- and Two-Photon Phosphorescent Trackers to Monitor Autophagic Lysosomes

Self-Repairing Materials

Y. Yang, M. W. Urban* — 12142–12147

Self-Repairable Polyurethane Networks by Atmospheric Carbon Dioxide and Water

Self-repairing materials were obtained by reacting sugar moieties with hexamethylene diisocyanate trimer and polyethylene glycol to form cross-linked MGP-polyurethane networks. The repair process requires atmospheric amounts of CO₂ and H₂O, thus resembling plant behavior of carbon fixation during photosynthesis.

Oxidation Catalysis

W. Tu, Y.-H. Chin* — 12148–12152

Catalytic Consequences of the Thermodynamic Activities at Metal Cluster Surfaces and Their Periodic Reactivity Trend for Methanol Oxidation

Oxidative dehydrogenation: The first-order rate coefficients for methanol oxidative dehydrogenation on metal clusters are a single-valued function of the O₂/CH₃OH ratio (see picture). The reactive collision frequency for CH₃OH activation on O*-covered surfaces varies with the oxygen-binding strength in a classical volcano-type relation.

Asymmetric Catalysis

X. Zeng,* J. J. Gao, J. J. Song, S. Ma, J.-N. Desrosiers, J. A. Mulder, S. Rodriguez, M. A. Herbage, N. Haddad, B. Qu, K. R. Fandrick, N. Grinberg, H. Lee, X. Wei, N. K. Yee, C. H. Senanayake — 12153–12157

Remarkable Enhancement of Enantioselectivity in the Asymmetric Conjugate Addition of Dimethylzinc to (Z)-Nitroalkenes with a Catalytic [(MeCN)₄Cu]PF₆-Hoveyda Ligand Complex

Don't forget Me! Challenging methyl-substituted all-carbon quaternary stereogenic centers were formed with high stereoselectivity by a copper-catalyzed asymmetric conjugate addition of Me₂Zn to (Z)-nitroalkenes (see scheme; Bn =

benzyl). The key feature is the unprecedented use of [(MeCN)₄Cu]PF₆ in conjunction with ligand **L1** so that the undesired nitroalkene isomerization was minimized.

C–H Activation

Y. Huang, D. Wu, J. Huang, Q. Guo, J. Li, J. You* — 12158–12162

Use of the Wilkinson Catalyst for the *ortho*-C–H Heteroarylation of Aromatic Amines: Facile Access to Highly Extended π -Conjugated Heteroacenes for Organic Semiconductors

An old favorite that can't be beat: An innovative system composed of the Wilkinson catalyst [Rh(PPh₃)₃Cl] and CF₃COOH enabled the highly regioselective oxidative C–H/C–H cross-coupling of aromatic amines with heteroarenes (see

scheme). The products could be conveniently transformed into highly extended π -conjugated heteroacenes with large HOMO–LUMO energy gaps and low-lying HOMO levels as promising organic semiconductors.

Centered on N: A visible-light-induced photocatalytic generation of N-centered hydrazone radicals has been accomplished for the first time. This approach allows efficient intramolecular addition of hydrazone radical to terminal alkenes,

thus providing hydroamination and oxyamination products in good yields. Importantly, the protocol involves direct N–H oxidation under mild reaction conditions. Ts = 4-toluenesulfonyl.

Heterocycle Synthesis

X.-Q. Hu, J.-R. Chen,* Q. Wei, F.-L. Liu, Q.-H. Deng, A. M. Beauchemin, W.-J. Xiao* **12163–12167**

Photocatalytic Generation of N-Centered Hydrazone Radicals: A Strategy for Hydroamination of β,γ -Unsaturated Hydrazones

Vinyl phosphanes (ene–phosphanes) undergo $B(C_6F_5)_3$ -induced phospho-Stork reactions with organic carbonyl com-

pounds under frustrated Lewis pair conditions. The reactions proceed via methylene phosphonium intermediates.

Frustrated Lewis Pairs

Y. Hasegawa, C. G. Daniliuc, G. Kehr, G. Erker* **12168–12171**

Developing Phospha-Stork Chemistry Induced by a Borane Lewis Acid

Keep on ‘Troc’ing: The reported title reaction leads to the asymmetric allylation of a variety of allylic trichloroethyl carbonates with silyl dienolates. The

γ -allylated products are produced selectively in 60–84% yield and with 90–98% *ee*. cod = 1,5-cyclooctadiene, THF = tetrahydrofuran, TMS = trimethylsilyl.

Asymmetric Catalysis

M. Chen, J. F. Hartwig* **12172–12176**

Iridium-Catalyzed Regio- and Enantioselective Allylic Substitution of Silyl Dienolates Derived from Dioxinones

Molecular crossroads: Associative routes prevail at low temperatures and high pressures for the reaction of methanol to dimethyl ether on zeolitic acids because they are mediated by larger transition states of lower enthalpy and entropy. A plausible sequence of elementary steps was established by rate and IR data during catalysis and confirmed by theoretical analysis using density functional theory with van der Waals interactions and transition-state theory formalisms.

Reaction Mechanisms

A. J. Jones, E. Iglesia* **12177–12181**

Kinetic, Spectroscopic, and Theoretical Assessment of Associative and Dissociative Methanol Dehydration Routes in Zeolites

Sierpiński Triangles

R. Sarkar, K. Guo, C. N. Moorefield,

G. R. Newkome* — 12182–12185

One-Step Multicomponent Self-Assembly
of a First-Generation Sierpiński Triangle:
From Fractal Design to Chemical Reality

Mathematical mimicry leads to the synthesis of a Sierpiński triangle, which was obtained by multicomponent assembly and features terpyridine–Cd^{II}–terpyridine connectivity. Complementary ligand architecture and metal complex lability act in synergy to achieve the desired outcome.

Carbon Dioxide Reduction

E. Blondiaux, J. Pouessel,
T. Cantat* — 12186–12190

Carbon Dioxide Reduction to
Methylamines under Metal-Free
Conditions

Organocatalysis: Proazaphosphatrane superbases prove to be highly active catalysts in the reductive functionalization of CO₂, in the presence of hydroboranes. The new method makes possible the

methylation of N–H bonds in a wide variety of amines, including secondary amines (see picture), with increased chemoselectivity.

Cluster Compounds

J. Poater, M. Solà,* C. Viñas,
F. Teixidor* — 12191–12195

π Aromaticity and Three-Dimensional
Aromaticity: Two sides of the Same Coin?

Making the rules: The Wade–Mingos $4n+2$ rule for three-dimensional *closo* boranes is equivalent to the Hückel $(4n+2)\pi$ rule for two-dimensional polycyclic aromatic hydrocarbons.

Nanocluster Self-Assembly

Z. N. Wu, Y. C. Li, J. L. Liu, Z. Y. Lu,
H. Zhang,* B. Yang — 12196–12200

Colloidal Self-Assembly of Catalytic
Copper Nanoclusters into Ultrathin
Ribbons

Cooperative forces: Ligand-capped copper nanoclusters are self-assembled into ribbons with single-cluster thickness in colloidal solution, a process controlled by tuning the cooperation between the dipolar interaction between nanoclusters and the van der Waals attraction between ligands. The self-assembled structures exhibit excellent catalytic activity and durability in oxygen reduction reactions.

Singled out: Secondary enaminones were oxidized by photochemically generated singlet oxygen, and subsequent nucleophilic addition of an alcohol and with an 1,2-acyl migration afforded quaternary

amino acid derivatives. An ene-type reaction pathway is proposed. It is distinctively different from the typical [2+2] addition of singlet oxygen to a C=C bond.

Synthetic Methods

W. Fan, P. Li* 12201 – 12204

Visible-Light-Mediated 1,2-Acyl Migration: The Reaction of Secondary Enamino Ketones with Singlet Oxygen

Glyceraldehyde acetonide serves as a chiral glyoxal equivalent and a linchpin for the enantioselective synthesis of several acyclic polyhalogenated monoterpenes from the red algae *Plocamium*. Several of these compounds demonstrate

selective toxicity towards solid-tumor cell lines over leukemia cell lines, as well as low-micromolar cytotoxicity towards the HCT-116 human colon carcinoma cell line.

Chiral Counteranion Strategy for
Asymmetric Oxidative C(sp³)–H/C(sp³)–
H Coupling: Enantioselective α-Allylation
of Aldehydes with Terminal Alkenes

Go with the combo: The title reaction is realized by combining asymmetric counteranion catalysis and palladium-catalyzed allylic C–H activation. This method tolerates a wide scope of α-branched

aromatic aldehydes and terminal alkenes, thus affording allylation products in high yields and with good to excellent levels of enantioselectivity.

Metallacarboranes

W. Y. Man, S. Zlatogorsky, H. Tricas,
D. Ellis, G. M. Rosair,
A. J. Welch* ————— 12222 – 12225

How to Make 8,1,2-*closo*-MC₂B₉
Metallacarboranes

The crystallographic characterization of three new examples of metallacarboranes with 8,1,2-*closo*-MC₂B₉ structure is reported. Consideration of the reactions in which they were formed as well as their coproducts led to a suggested mechanism. This mechanism was tested in the synthesis of 8-(η-C₅H₅)-8,1,2-*closo*-CoC₂B₉H₁₁ and found to be successful.

Electrocatalysis

M. K. Coggins, M.-T. Zhang, Z. Chen,
N. Song, T. J. Meyer* — 12226 – 12230

Single-Site Copper(II) Water Oxidation
Electrocatalysis: Rate Enhancements with
HPO₄²⁻ as a Proton Acceptor at pH 8

Metal-catalyzed water oxidation: Cu^{II}-(Py₃P) (**1**) is a water oxidation electrocatalyst in H₂PO₄⁻/HPO₄²⁻ buffered aqueous solutions (see picture). Electrolysis experiments with **1** at pH 8.0 and at a potential of 1.40 V versus the normal hydrogen electrode resulted in the formation of dioxygen (84 % Faradaic yield) through multiple catalyst turnovers with minimal catalyst deactivation.

Carbon-Rich Porphyrins

D. Lungerich, J. F. Hitzengerger,
M. Marcia, F. Hampel, T. Drewello,*
N. Jux* ————— 12231 – 12235

Superbenzene–Porphyrin Conjugates

Super size me! The first porphyrin conjugate with two superbenzene units shows properties induced by the superbenzene and porphyrin moieties, but also behavior that differs distinctly from that of

the individual building blocks. The molecule is characterized by standard spectroscopic methods and modern mass spectrometry, and the first X-ray structure of such a conjugate is presented.

Lost in translation: Proline-rich antimicrobial peptides (PrAMPs) inhibit bacterial protein translation by binding to the 70S ribosome of Gram-negative bacteria. This represents a novel killing mechanism for gene-encoded antimicrobial peptides. Alanine substitutions in the peptides additionally identified specific basic and hydrophobic residues as major interaction sites, which will enable the design of optimized compounds.

Antimicrobial Peptides

Insect-Derived Proline-Rich Antimicrobial Peptides Kill Bacteria by Inhibiting Bacterial Protein Translation at the 70S Ribosome

Low-energy electrons (LEEs) with energies of less than 2 eV effectively decompose the 4-nitroimidazole molecule by electron attachment. Thereby a variety of decomposition channels are observed involving simple bond cleavages but also complex reactions involving multiple bond cleavages and formation of new molecules. This rich chemistry induced by LEE is completely suppressed in the energy domain below 2 eV for the molecule in its methylated form.

Electron-Induced Decomposition

K. Tanzer, L. Feketeová,* B. Puschmann, P. Scheier, E. Illenberger, S. Denifl* 12240–12243

Reactions in Nitroimidazole Triggered by Low-Energy (0–2 eV) Electrons: Methylation at N1-H Completely Blocks Reactivity

The primary products of the chemical ligations of α -ketoacids and 5-oxaproline peptides are esters, rather than the previously reported amides (see scheme). The depsipeptide products rapidly rearrange to the amides in basic buffers. The formation of esters sheds light on possible mechanisms for the type II KAHA ligations and opens a new avenue for the chemical synthesis of deproteins.

Ester Ligation

T. G. Wucherpfennig, F. Rohrbacher, V. R. Pattabiraman, J. W. Bode* 12244–12247

Formation and Rearrangement of Homoserine Depsipeptides and Depsipeptides in the α -Ketoacid-Hydroxylamine Ligation with 5-Oxaproline

SUMO match! A protected α -ketoacid resin delivers C-terminal peptide α -ketoacids directly and accommodates the inclusion of all canonical amino acids, including cysteine and methionine. By using this approach, SUMO2 and SUMO3

proteins were prepared by KAHA ligation with 5-oxaproline. The synthetic SUMO proteins were recognized by and conjugated to RanGAP1 by SUMOylation enzymes in vitro.

Protein Ligation

M. Sattler, K. Richter,*
J. Buchner* ————— 12257 – 12262

Effective intervention: Novel small-mole-
cule modulators of the molecular chaper-
one Hsp90 have been identified and
characterized which mimic the effects of
protein cofactors in accelerating changes
in the conformation of Hsp90. This opens
new perspectives for targeting Hsp90 to
treat diseases such as cancer and viral
infections.

Artificial Accelerators of the Molecular
Chaperone Hsp90 Facilitate Rate-Limiting
Conformational Transitions

The Very Important Papers, marked
VIP, have been rated unanimously as
very important by the referees.

The Hot Papers are articles that the Editors
have chosen on the basis of the referee
reports to be of particular importance for
an intensely studied area of research.

Angewandte Corrigendum

Nucleophilic Reactivity of a Copper(II)–
Superoxide Complex

P. Pirovano, A. M. Magherusan,
C. McGlynn, A. Ure, A. Lynes,
A. R. McDonald* ————— 5946–5950

Angew. Chem. Int. Ed. **2014**, *53*

DOI: 10.1002/anie.201311152

In this Communication, two sentences need to be corrected.

The sentence on page 5946, column 2, line 4 should read: “An Fe^{III}–superoxide intermediate in a mutated form of homoprotocatechuate 2,3-dioxygenase was recently trapped and spectroscopically characterized,^[9] however, rather than display electrophilic HAA or nucleophilic reactivity, this species decayed through electron transfer.”

And the sentence on page 5948, column 1, line 18 should begin as follows: “The only model complex that displayed higher deformation rates than **1** is [Fe^{III}(η¹-OO⁻)-(TMCS)] (TMCS = 1-(2-mercaptoethyl)-4,8,11-trimethyl-1,4,8,11-tetraazacyclotetradecane), ...”

Angewandte Corrigendum

In this Communication, the structure of salinosporamide A in Figure 1 has been incorrect. The correct structure is as follows.

Figure 1. Biologically active β -lactones.

Asymmetric Synthesis of Highly Substituted β -Lactones through Oxidative Carbene Catalysis with LiCl as Cooperative Lewis Acid

S. Bera, R. C. Samanta, C. G. Daniliuc, A. Studer* **9622–9626**

Angew. Chem. Int. Ed. **2014**, 53

DOI: 10.1002/anie.201405200

Angewandte Corrigendum

Upon further investigations of the KAHA ligations with 5-oxaproline the authors of this Communication have found that esters, rather than amides are the major products. The esters easily rearrange to the amide products in basic buffers. For further details and updated characterization data for the ligation products described in this paper, please see the Communication in Ref. [1].
