Heavy-element corroles ...

... are of great interest as optical sensors, near-IR dyes, phosphors, organic light-emitting diodes, and anticancer compounds, but the insertion of 5d metals into corroles is difficult. In their Communication on page 14411 ff., A. Ghosh and co-workers present the oxidative metalation of meso triarylcorroles with $[\text{Os}_3(\text{CO})_{12}]/\text{NaN}_3$ as a route to nitridoosmium(VI) corroles. These complexes exhibit distinctive domed folded macrocycles and multiple Os–nitrido stretching frequencies.
