Supramolecular octopus couples ...

... form when a positively quadrupolar cyclic Ag^{I} -triazolate trimer with fluorinated octopus arms electrostatically attracts a negatively quadrupolar free porphyrin or a Pt^{II} porphyrin with shorter alkyl octopus arms. In their Communication on page 4842 ff., C. Yang, M. A. Omary et al. show that in this system, the phosphorescence of the Pt^{II} porphyrin is enhanced under ambient conditions as O_2 and self-quenching processes are suppressed.
