Sliding down the enzymatic cascade ...

... Unprotected phenols were selectively *para*-vinylated using pyruvate as the reagent by W. Kroutil, E. Busto, and Robert C. Simon in their Communication on page 10899 ff. The cover illustrates the overall transformation starting from a substituted phenol, which passes the three involved enzymes on its way down, leading to the expulsion of water and CO₂ (Cover image: Verena A. Resch).
