

... was synthesized in a two-step process described by D. E. Chavez and co-workers in their Communication on page 12973 ff. Firstly, a double N-amination of the bis(tetraethylammonium) salt of 3,3'-dinitro-5,5'-bi-1,2,4-triazole provides a thermally stable, di-N-aminated energetic material that is insensitive to impact, spark, and friction. A subsequent azo coupling reaction produces a fused, tricyclic 1,2,3,4-tetrazine ring system with excellent density and explosive performance properties.

## Lithium–Sulfur Batteries

Hollow carbon nanofibers filled with  $\text{MnO}_2$  nanosheets were synthesized by X. W. Lou and co-workers in their Communication on page 12886 ff., and shown to be a suitable sulfur host for lithium–sulfur batteries.

## 2D Materials

In their Communication on page 13022 ff. B. I. Yakobson et al. show theoretically that pure boron is the first 2D material that varies its structure depending on the metal substrate it is deposited on.

## Photocatalysts

$\text{g-C}_3\text{N}_4$ -Photocatalysts can be modified for specific tasks by varying four parameters: electronic structure, nanostructure, crystal structure, and heterostructure. In their Review on page 12868 ff. X. Wang et al. discuss these and the uses of such catalysts.

### Thyroid Hormones

U. Schweizer,\*  
C. Steegborn \_\_\_\_\_ 12856–12858

Thyroid hormones—From Crystal Packing to Activity to Reactivity

**Form and substance:** Through observation and careful follow-up on polymorphic forms of thyroxine (Forms I and II; black C, gray H, violet I, blue N, red O), Mondal and Mugesh have provided a stunningly simple answer to the appar-

ent non-equivalence of thyroid hormone tablets. Their results further suggest control of deiodinase regioselectivity through the adjustment of torsional angles distant from the reactive bond.

## Minireviews

### Crystallization Matrices

W. M. Bloch, N. R. Champness,\*  
C. J. Doonan\* \_\_\_\_\_ 12860–12867

X-ray Crystallography in Open-Framework Materials

**Molecules made to order:** Open-framework materials are typically studied for their gas-sorption properties. However, recent work has demonstrated that the crystalline architectures of such materials

can be utilized to periodically order non-structural atoms and guest molecules. Recent examples where such framework materials have been utilized as a host matrix for crystallization are highlighted.

## Reviews

### Photocatalysts

Y. Zheng, L. Lin, B. Wang,  
X. Wang\* \_\_\_\_\_ 12868–12884

Graphitic Carbon Nitride Polymers toward Sustainable Photoredox Catalysis

**Metal-free photocatalysis:** Recent progress in g-C<sub>3</sub>N<sub>4</sub> photocatalysis is highlighted. The four fundamental approaches for modification of g-C<sub>3</sub>N<sub>4</sub> photocatalysts are discussed: electronic structure modulation, nanostructure design, crystal-structure engineering, and heterostructure construction. The application of g-C<sub>3</sub>N<sub>4</sub> photocatalysts are briefly summarized and the opportunities and challenges in this field are discussed.

**For the USA and Canada:**  
ANGEWANDTE CHEMIE International Edition (ISSN 1433-7851) is published weekly by Wiley-VCH, PO Box 191161, 69451 Weinheim, Germany. US mailing agent: SPP, PO Box 437, Emigsville, PA 17318. Periodicals postage

paid at Emigsville, PA. US POSTMASTER: send address changes to *Angewandte Chemie*, John Wiley & Sons Inc., C/O The Sheridan Press, PO Box 465, Hanover, PA 17331. Annual subscription price for institutions: US\$ 11.738/10.206 (valid for print and electronic / print or

electronic delivery); for individuals who are personal members of a national chemical society prices are available on request. Postage and handling charges included. All prices are subject to local VAT/sales tax.

## Communications

### Lithium–Sulfur Batteries

Z. Li, J. T. Zhang,  
X. W. Lou\* 12886 – 12890

Hollow Carbon Nanofibers Filled with  
MnO<sub>2</sub> Nanosheets as Efficient Sulfur  
Hosts for Lithium–Sulfur Batteries

Frontispiece

**Keep the sulfur:** Hollow carbon nano-fibers filled with MnO<sub>2</sub> nanosheets (MnO<sub>2</sub>@HCF) were synthesized and shown to be a suitable sulfur host for lithium–sulfur batteries. As the polysulfides are physically entrapped by the carbon shells and chemically bound by the MnO<sub>2</sub> nanosheets, this nanocomposite sulfur cathode displayed excellent specific/areal capacities and a good cycling stability.

**Caught in a trap:** Secondary phosphirane complexes isomerize above 100 °C to give the corresponding terminal phosphinidene complexes, which can be trapped by alkenes and alkynes. This example is a rare instance of the isomerization of a P<sup>III</sup> derivative into a P<sup>I</sup> derivative. It appears to mimic the reductive elimination of alkanes from transition-alkylmetal hydrides.

### Phosphorous Compounds

J. Wong, Y. Li, Y. Hao, R. Tian,\*  
F. Mathey\* 12891 – 12893

Isomerization of Secondary Phosphirane  
into Terminal Phosphinidene Complexes:  
An Analogy between Monovalent  
Phosphorus and Transition Metals

**Nanolithography:** An on-tip photo-modulated molecular printing concept is introduced to chemically regulate the nano-scale ink flow on cantilever-free scanning probe arrays. A photopolymerization can be effected to regulate the ink viscosity and therefore transport, resulting in a deliberate control over feature size from the micrometer to sub-50 nm length scales.

### Molecular Printing

Z. Xie, Y. Zhou, J. L. Hedrick, P.-C. Chen,  
S. He, M. M. Shahjamali, S. Z. Wang,  
Z. J. Zheng,\*  
C. A. Mirkin\* 12894 – 12899

On-Tip Photo-Modulated Molecular  
Printing

**Getting around:** Modification of catalytic micromotors with carbonic anhydrase results in a scrubbing platform for accelerated “on-the-move” biomimetic sequestration of CO<sub>2</sub> (see figure). The ability of carbonic anhydrase to catalyze the hydration of CO<sub>2</sub> to form bicarbonate ions combined with the rapid movement of the micromotors as well as the corresponding fluid dynamics and mixing result in a highly efficient system.

### Self-Propelled Devices

M. Uygun, V. V. Singh, K. Kaufmann,  
D. A. Uygun, S. D. S. de Oliveira,  
J. Wang\* 12900 – 12904

Micromotor-Based Biomimetic Carbon  
Dioxide Sequestration: Towards Mobile  
Microscrubbers

## Heterocycles

X. Li, H. Li, W. Song, P.-S. Tseng, L.-y. Liu,\*  
I. A. Guzei, W. Tang\* — 12905–12908

Divergent Reactivity of Rhodium(I)  
Carbenes Derived from Indole  
Annulations

**Two possibilities:** An indole annulation can be coupled with stereoselective cyclopropanation or dimerization to form complex indole derivatives. The key intermediate is a putative rhodium(I) carbene

derived from cycloisomerization of *ortho*-aniline-substituted propargylic alcohols. Boc = *tert*-butoxycarbonyl, Ts = 4-toluenesulfonyl.

## Thermoelectrics

R. Ang,\* A. U. Khan, N. Tsujii, K. Takai,  
R. Nakamura,\* T. Mori\* — 12909–12913

Thermoelectricity Generation and  
Electron–Magnon Scattering in a Natural  
Chalcopyrite Mineral from a Deep-Sea  
Hydrothermal Vent

**It came from the deep:** A chalcopyrite mineral from a deep-sea hydrothermal vent has been found to have a large thermoelectric power and a high power factor, in which electron–magnon scattering and a large effective mass were detected. These findings highlight the feasibility of the generation of thermoelectric energy from natural materials that are abundant in the Earth's crust.

## Silylamide Complexes

M. Faust, A. M. Bryan, A. Mansikkamäki,  
P. Vasko, M. M. Olmstead,  
H. M. Tuononen,\* F. Grandjean,  
G. J. Long, P. P. Power\* — 12914–12917

The Instability of  $\text{Ni}\{\text{N}(\text{SiMe}_3)_2\}_2$ : A Fifty  
Year Old Transition Metal Silylamide  
Mystery

**The singular instability** of  $\text{Ni}\{\text{N}(\text{SiMe}_3)_2\}_2$ , one of the original transition metal silylamides of Bürger and Wannagat, was re-investigated: it likely results from its tendency to undergo autoreduction into the dispersion force stabilized  $\text{Ni}^{\text{I}}$  tetramer  $[\text{Ni}\{\text{N}(\text{SiMe}_3)_2\}_4]$  (see picture; Si light blue, N dark blue, Ni green), the first neutral homoleptic  $\text{Ni}^{\text{I}}$  amide.

## Kinetic Resolution

Y. Nian, J. Wang, S. Zhou, S. Wang,  
H. Moriwaki, A. Kawashima,  
V. A. Soloshonok,\*  
H. Liu\* — 12918–12922

Recyclable Ligands for the Non-Enzymatic  
Dynamic Kinetic Resolution of  
Challenging  $\alpha$ -Amino Acids

**The non-enzymatic** dynamic kinetic resolution of racemic  $\alpha$ -amino acids bearing tertiary alkyl chains and multiple unprotected functional groups is based on the enantioselective formation of nickel(II)

complexes and their hydrolysis under convenient conditions. The specially designed chiral ligands are inexpensive and can be quantitatively recycled.

Inside Cover

**Four at once:** The regio- and stereoselective concomitant addition of trifluoromethyl and trifluoromethanesulfonate groups to alkynes is enabled by a photocatalyst. Combining this process with

palladium-catalyzed cross-couplings provides access to various tetrasubstituted trifluoromethylated alkenes from simple alkynes in a facile one-pot process.

### Trifluoromethylation

R. Tomita, T. Koike,\*  
M. Akita\* 12923 – 12927

Photoredox-Catalyzed Stereoselective Conversion of Alkynes into Tetrasubstituted Trifluoromethylated Alkenes

**Nanocomposite catalyst:** A novel Mo-based catalyst for the hydrogen-evolution reaction has been synthesized by directly carbonizing a composite obtained from polyoxometalate-based metal-organic frameworks and graphene oxide at a relatively low temperature. The Mo-based catalyst exhibits a positive onset potential, low Tafel slope, high exchange current density, and long-term stability for the hydrogen-evolution reaction in acidic media.

### Hydrogen-Evolution Reaction

Y.-J. Tang, M.-R. Gao, C.-H. Liu, S.-L. Li, H.-L. Jiang, Y.-Q. Lan,\* M. Han, S.-H. Yu\* 12928 – 12932

Porous Molybdenum-Based Hybrid Catalysts for Highly Efficient Hydrogen Evolution

**Pucker up:** 9,10-Bis(dimesitylboryl)anthracene (**1**), having a planar conjugated  $\pi$ -system, can be reduced stepwise to the radical anion  $1^{\bullet-}$  and dianion  $1^{2-}$ , accom-

panied by stepwise changes of the aromaticity of the anthracene moiety.  $1^{\bullet-}$  has a planar semiquinoidal structure, whereas  $1^{2-}$  has a puckered quinoidal structure.

### Aromaticity

Y. Zheng, J. Xiong, Y. Sun, X. Pan,\*  
J. Wu\* 12933 – 12936

Stepwise Reduction of 9,10-Bis(dimesitylboryl)anthracene

**Lending support:** Homogeneous positioning of Ir<sup>I</sup> complexes within the pore-channels of a silica framework stabilizes a low-valent Ir<sup>I</sup> species and leads to drastically improved catalyst efficiency.

Catalyst decomposition by formation of iridium-hydride clusters is prevented by the attachment to the support. Mes = 2,4,6-trimethylphenyl.

### Supported Catalysts

I. Romanenko, D. Gajan, R. Sayah, D. Crozet, E. Jeanneau, C. Lucas, L. Leroux, L. Veyre, A. Lesage, L. Emsley, E. Lacôte,\* C. Thieuleux\* 12937 – 12941

Iridium(I)/N-Heterocyclic Carbene Hybrid Materials: Surface Stabilization of Low-Valent Iridium Species for High Catalytic Hydrogenation Performance

## Carbenes

N. Su, J. A. Theorell, D. J. Wink,  
T. G. Driver\* 12942 – 12946

Copper-Catalyzed Formation of  
 $\alpha$ -Alkoxy cycloalkenones from  
*N*-Tosylhydrazones

**The combination** of 20 mol % of copper iodide and lithium *tert*-butoxide triggers the formation of a broad range of substituted, functionalized  $\alpha$ -alkoxy 2*H*-naphthalenones from readily available *N*-

tosylhydrazones. The reaction proceeds by the cycloaddition of a copper carbenoid with an ester, and a subsequent Lewis acid-catalyzed [1,2] alkyl shift of the in situ generated alkoxyepoxide intermediate.

## Radical Chemistry

G. N. Khairallah, A. T. Maccarone,  
H. T. Pham, T. M. Benton, T. Ly,  
G. da Silva, S. J. Blanksby,\*  
R. A. J. O'Hair\* 12947 – 12951

Radical Formation in the Gas-Phase  
Ozonolysis of Deprotonated Cysteine

**Gas-phase reactions:** Deprotonated cysteine reacted with ozone to give a rich set of products including sequential oxygen atom abstraction reactions to yield cysteine sulfenate, sulfonate, and sulfonate anions, and significantly sulfenate radical anions formed by ejection of a hydroperoxy radical (see picture). The free-radical pathway occurred only when both thiol and carboxylate moieties were available.

## Biocatalysis

C. Gally, B. M. Nestl,  
B. Hauer\* 12952 – 12956

Engineering Rieske Non-Heme Iron  
Oxygenases for the Asymmetric  
Dihydroxylation of Alkenes

**Modulation by mutation:** Rieske non-heme iron oxygenases can be used as efficient biocatalysts for the selective oxygen-functionalization of various olefins yielding vicinal *cis*-diols and allylic alcohols. Introduction of a single amino acid substitution in the active sites of two selected oxygenases resulted in variants with improved stereoselectivities and product formations.

## Cross-Coupling

W. Su, T.-J. Gong, X. Lu, M.-Y. Xu, C.-G. Yu,  
Z.-Y. Xu, H.-Z. Yu, B. Xiao,\*  
Y. Fu\* 12957 – 12961

Ligand-Controlled Regiodivergent Copper-  
Catalyzed Alkylboration of Alkenes

**One way or another:** The copper-catalyzed regiodivergent alkylboration of alkenes with bis(pinacolato)diboron and alkyl

halides is described. The regioselectivity of the carboboration can be controlled by fine-tuning the ligand structure.

**Different paths:** A stereodivergent synthesis of five-membered N-heterocycles has been developed and involves trapping of the in situ formed intermediates. The copper-catalyzed annulation proceeds by allenolate formation and subsequent

intramolecular hydroamination. The rhodium-catalyzed route features a carbenoid insertion into the N–H bond and subsequent Conia-ene cyclization. PG = protecting group.

## Heterocycles

K. Liu, C. Zhu, J. Min, S. Peng, G. Xu, J. Sun\* 12962–12967

Stereodivergent Synthesis of N-Heterocycles by Catalyst-Controlled, Activity-Directed Tandem Annulation of Diazo Compounds with Amino Alkynes

**Isoquinolines** are obtained by the C–H activation of O-acyl oximes with a Cp\*Co<sup>III</sup> catalyst. Whereas the reactions catalyzed by the Cp\*Co<sup>III</sup> system proceed with high site selectivity favoring C–H activation at

the sterically less hindered site, the use of the corresponding Cp\*Rh<sup>III</sup> catalyst leads to low selectivities and/or yields when unsymmetrical O-acyl oximes and terminal alkynes are used.

## C–H Activation

B. Sun, T. Yoshino, M. Kanai,\* S. Matsunaga\* 12968–12972

Cp\*Co<sup>III</sup> Catalyzed Site-Selective C–H Activation of Unsymmetrical O-Acyl Oximes: Synthesis of Multisubstituted Isoquinolines from Terminal and Internal Alkynes

**Ring of fire:** Double N-amination of the bis(tetraethylammonium) salt of 3,3'-dinitro-5,5'-bi-1,2,4-triazole results in a thermally stable di-N-aminated energetic material that is insensitive to impact, spark, and friction. Subsequent oxidation leads to a fused, tricyclic 1,2,3,4-tetrazine ring system (see figure) with excellent density and explosive performance properties.

## Energetic Materials

D. E. Chavez,\* J. C. Bottaro, M. Petrie, D. A. Parrish 12973–12975

Synthesis and Thermal Behavior of a Fused, Tricyclic 1,2,3,4-Tetrazine Ring System

Front Cover

**Make the cycle:** A photochromic organic moiety integrated into a bistable spin-crossover iron(II) complex underwent reversible cyclization in the solid state upon irradiation with light of different

wavelengths (see scheme). The ligand-based photoreaction triggered a reversible spin transition at the coordinated metal ion at room temperature.

## Molecular Switches

B. Rösner, M. Milek, A. Witt, B. Gobaut, P. Torelli, R. H. Fink,\* M. M. Khusniyarov\* 12976–12980

Reversible Photoswitching of a Spin-Crossover Molecular Complex in the Solid State at Room Temperature

## Surface Reactions

Q. Deng,\* V. Gopal,  
J. Weissmüller — 12981 – 12985

Less Noble or More Noble: How Strain Affects the Binding of Oxygen on Gold

**Less noble or more noble?:** The different oxygen electroadsorption processes, and specifically oxygen species adsorption on the bulk-terminated surface versus the formation of a mixed oxygen–gold surface

layer by the replacement–turnover process, exhibit fundamentally different coupling between the chemistry and the mechanics of the surface.

## Peptide Coupling

J. Li, M. J. Lear, Y. Kawamoto, S. Umeyama,  
A. R. Wong, E. Kwon, I. Sato,  
Y. Hayashi\* — 12986 – 12990

Oxidative Amidation of Nitroalkanes with Amine Nucleophiles using Molecular Oxygen and Iodine

cheap reagents

wide substrate scope

readily available

no epimerization

**An odd couple:** A mild oxidative entry into amide formation between readily available nitroalkanes and amines is disclosed involving iodine, molecular oxygen, and solid potassium carbonate. As well as

halogen bonding of amines by the iodonium source, amidation is shown to proceed via  $\alpha$ -iodo nitroalkanes with complete stereochemical integrity and high functional-group tolerance.

## Hollow Nanoparticles

L. Li, C. Yuan, D. Zhou, A. E. Ribbe,  
K. R. Kittilstved,  
S. Thayumanavan\* — 12991 – 12995

Utilizing Reversible Interactions in Polymeric Nanoparticles To Generate Hollow Metal–Organic Nanoparticles

**Hollow metal–organic particles (MOPs)** are prepared by simply adding metal ions into solutions of polymeric organic nanoparticles. The size and shell thickness of the MOPs can be easily tuned. Evidence

for the generality of the method is provided by its application to a variety of metal ions with different coordination geometries.

## Protein Synthesis

C. He, S. S. Kulkarni, F. Thuaud,  
J. W. Bode\* — 12996 – 13001

Chemical Synthesis of the 20 kDa Heme Protein Nitrophorin 4 by  $\alpha$ -Ketoacid-Hydroxylamine (KAHA) Ligation

**It's all coming together!** The 20 kDa heme protein nitrophorin 4 was synthesized by sequential KAHA ligations using a convergent strategy. The folded synthetic protein readily coordinates the heme

cofactor, and the holoprotein shows identical biological properties to the wild-type protein for NO binding and nitrite dismutase reactivity.

**Heat-induced radiolabeling** yields  $^{89}\text{Zr}$ -Feraheme nanoparticles, which are taken up by blood monocytes and carried to the lymph nodes (white circles), as shown in a PET/CT image of a normal mouse.

### In Vivo Nanoparticle Imaging

M. D. Normandin, H. Yuan, M. Q. Wilks, H. H. Chen, J. M. Kinsella, H. Cho, N. J. Guehl, N. Absi-Halabi, S. M. Hosseini, G. El Fakhri, D. E. Sosnovik, L. Josephson\* \_\_\_\_\_ **13002 – 13006**

Heat-Induced Radiolabeling of Nanoparticles for Monocyte Tracking by PET

**Chiral CB[n] catalysis:** A supramolecular CB[8]-based catalyst system forms a chiral nanoreactor in the presence of a single, natural L-amino acid as the chiral source for an asymmetric Lewis acid catalyzed Diels-Alder reaction. Both a substantial rate acceleration (up to 9.5 times) and high enantioselectivity up to 92 % ee were achieved. The nanoreactor assembly was also investigated through spectroscopic measurements and isothermal calorimetry.

### Host-Guest Catalysis

Turning Cucurbit[8]uril into a Supramolecular Nanoreactor for Asymmetric Catalysis

## Novartis Chemistry Lectureship

Novartis is pleased to announce the following Novartis Chemistry Lecturers for 2015 – 2016.

**Tehshik P. Yoon**  
University of Wisconsin  
Madison, USA

**Matthew J. Gaunt**  
University of Cambridge  
Cambridge, UK

**Neil K. Garg**  
University of California  
Los Angeles, USA

**Regan J. Thomson**  
Northwestern University  
Evanston, USA

**Jinbo Hu**  
Shanghai Institute of  
Organic Chemistry  
Shanghai, China

**Didier Rognan**  
CNRS / University of  
Strasbourg  
Illkirch, France

The Novartis Chemistry Lectureship is awarded to scientists in recognition of outstanding contributions to organic and computational chemistry, including applications to biology.

## Iron Heterocubanes

C. Lichtenberg,\* I. Garcia Rubio, L. Viciu,  
M. Adelhardt, K. Meyer, G. Jeschke,  
H. Grützmacher\* — 13012–13017

A Low-Valent Iron Imido Heterocubane Cluster: Reversible Electron Transfer and Catalysis of Selective C–C Couplings

**A iron heterocubane cluster**,  $[\text{Fe}_4(\text{Ntrop})_4]$ , with an unprecedented all-ferrous  $\text{Fe}_4\text{N}_4$  core was synthesized and fully characterized (trop = 5*H*-dibenzo[*a,d*]cyclo-hepten-5-yl). This compound can reversibly store up to four electrons at remarkably neg-

ative potentials. The  $[\text{Fe}_4(\text{Ntrop})_4]/[\text{Fe}_4(\text{Ntrop})_4]^\bullet$  system catalyzes the oxidative coupling of allyl anions and the reductive coupling of acridinium cations in a one-pot reaction.

## Bioinorganic Chemistry

L. M. Peschel, F. Belaj,  
N. C. Mösch-Zanetti\* — 13018–13021

Towards Structural-Functional Mimics of Acetylene Hydratase: Reversible Activation of Acetylene using a Biomimetic Tungsten Complex

**On and off relationship:** A structural-functional model has been designed to mimic the tungstoenzyme acetylene hydratase. The S-Phoz ligand (2-(4',4'-dimethyloxazolin-2'-yl)thiophenolate) is

used to generate a bioinspired environment around the W center, which can stabilize  $\text{W}-\text{C}_2\text{H}_2$  adducts and can also reversibly activate ethyne.

## Boron Monolayers

Z. Zhang, Y. Yang, G. Gao,  
B. I. Yakobson\* — 13022–13026

Two-Dimensional Boron Monolayers Mediated by Metal Substrates

**Concerto in B flat:** 2D materials usually have a specific lattice structure that is independent of external conditions. In contrast, the structure of 2D boron (red, see picture) depends on the metal sub-

strate. On weakly interacting metals, 2D boron shows significant off-plane buckling but on more reactive metals, it strongly favors a planar structure.

## Inside Back Cover

## Photocage Compounds

P. N. Basa, S. Antala, R. E. Dempsey,  
S. C. Burdette\* — 13027–13031

A Zinc(II) Photocage Based on a Decarboxylation Metal Ion Release Mechanism for Investigating Homeostasis and Biological Signaling

**Light-driven metal release:** A photodecarboxylation reaction has been exploited to design a photocaged complex for  $\text{Zn}^{2+}$  with superior properties compared to

other caged metal complexes. The photocage has been used to control the uptake of  $\text{Zn}^{2+}$  in frog oocytes expressing a human zinc transport protein.

**Al be back:** An in situ electrochemical ionothermal method allows highly oriented and defect-free  $\text{AlPO}_4\cdot 11$  molecular-sieve films to be synthesized using an Al electrode as the Al source. The  $\text{AlPO}_4\cdot 11$  film shows excellent corrosion resistance.

## Molecular-Sieve Films

T. Yu, W. Chu, R. Cai,\* Y. Liu,  
W. Yang\* 13032 – 13035

In Situ Electrochemical Synthesis of Oriented and Defect-Free AEL Molecular-Sieve Films Using Ionic Liquids

Concanavalin A hydrogel

*Candida albicans*

**A con trick:** Two-dimensional arrays of photonic crystals (PCs) embedded on Concanavalin A protein hydrogel surfaces can be used to selectively detect *Candida albicans* by multivalently and selectively binding to mannose on the cell surface.

The resulting crosslinking shrinks the protein hydrogel to reduce the 2D particle spacing, and blue-shift the light diffracted from the PC (see figure). The sensor can distinguish between *C. albicans* and *E. coli*.

## Sensors

Z. Cai, D. H. Kwak, D. Punihaole, Z. Hong,  
S. S. Velankar, X. Liu,\*  
S. A. Asher\* 13036 – 13040

A Photonic Crystal Protein Hydrogel Sensor for *Candida albicans*

**Make it catalytic:** A catalytic Mitsunobu reaction using innocuous reagents to recycle the stoichiometric phosphine oxide and hydrazine by-products was developed. The reported method is catalytic in 1-phenylphospholane and uses phenylsilane to recycle the catalyst. Integration of this phosphine catalytic cycle with Taniguchi's azocarboxylate catalytic system provided the first fully catalytic Mitsunobu reaction.

## Organocatalysis

J. A. Buonomo,  
C. C. Aldrich\* 13041 – 13044

Mitsunobu Reactions Catalytic in Phosphine and a Fully Catalytic System

**Green stuff:** A sustainable C–C bond formation is merged with the catalytic asymmetric generation of one or two stereocenters by combining asymmetric enolate chemistry with either autoxidation or visible-light photosensitized oxidation. The robustness of a chiral-at-metal rhodium(III) catalyst serves to facilitate the reaction. PMP = *para*-methoxyphenyl, TFA = trifluoroacetic acid.

## C–H Activation

S. Balasubramanian,  
S. J. George\* 13053–13057

Autoresolution of Segregated and Mixed p-n Stacks by Stereoselective Supramolecular Polymerization in Solution

**Chiral stacking:** A chirality-driven self-sorting strategy has been introduced for the construction of mixed and segregated

donor-acceptor supramolecular arrays in solution.

DOI: 10.1002/anie.201584414

# Flashback: 50 Years Ago ...

The preparation of new elements by bombarding samples with heavy ions was a field that had already taken off: neptunium (atomic number 93) was first reported in 1940, and elements with atomic numbers 102, 103, and 104 were reported in 1957, 1961, and 1964, respectively. In a Review, C. Keller discussed the synthesis of transcurium elements. He postulated “...the next few years may witness the discovery of isotopes of elements up to atomic number 109 ...”. He was certainly correct: element 109 (meitnerium) was first created in 1982.

Hellmut Brederick, Rolf Gleiter, and co-workers published two Communications. The first report was on the reactions of *N,N*-disubstituted formamides with alkali metals, which proceeded with the evolution of hydrogen to form the metal formamide. The salt then either decomposed with loss of carbon monoxide to form the metal dialkylamide, or reacted with the starting formamide to produce the salt of the substituted glyoxylamide. The second report described the reaction of *N,N*-dimethyl-3-dimethylaminoprop-1-enylideneammonium salts. Treatment with potassium methoxide resulted in the formation of *N,N,N',N'*-tetramethyl-1-propene-1,3-

diamine, and treatment with sodium dimethylamide resulted in the formation of *N,N,N',N',N'',N''*-hexamethyl-3-propene-1,1,3-triamine. Reaction of these products with CH-acidic compounds resulted in the formation of butadiene derivatives.

Adolf Krebs outlined the occurrence of 1,2-didehydrocyclooctatetraene as an intermediate in the reaction of bromocyclooctatetraene with potassium *tert*-butoxide. The presence of the intermediate was confirmed by identifying the products of trapping experiments.

**Lithium-rich** layered oxides,  $\text{Li}_{1.2}\text{Mn}_{0.54}\text{Ni}_{0.13}\text{Co}_{0.13}\text{O}_2$  (LLMO), were modified with a nanoscale  $\text{LiFePO}_4$  (LFP) surface according to a facile sol-gel method. This surface modification combines the advantages of bulk doping and

surface coating as the LLMO crystal structure is stabilized by cationic doping and the LLMO cathode is protected from corrosion processes induced by organic electrolytes.

## Cathode Materials

F. Zheng, C. Yang,\* X. Xiong, J. Xiong, R. Hu, Y. Chen, M. Liu\* — **13058–13062**

Nanoscale Surface Modification of Lithium-Rich Layered-Oxide Composite Cathodes for Suppressing Voltage Fade

The **depolymerization** of < 1 mol% of a macro-cross-linker gives rise to an amplified response in stimuli-responsive cross-linked adhesives. This amplified response enables rapid and sensitive debonding in response to specific stimuli, as well as pre-programmed debonding of layers in composite materials. The use of depolymerizable macro-cross-linkers transforms an inexpensive monomer into a highly stimuli-responsive adhesive.

## Stimuli-Responsive Materials

H. Kim, H. Mohapatra, S. T. Phillips\* — **13063–13067**

Rapid, On-Command Debonding of Stimuli-Responsive Cross-Linked Adhesives by Continuous, Sequential Quinone Methide Elimination Reactions

**Seeing red:** A V-shaped molecule (TPA-DCPP), which undergoes thermally activated delayed fluorescence (TADF) to emit in the near-IR region, has been synthesized. The molecule incorporates triphenylamine (TPA) as the donor (D) and 2,3-dicyanopyrazino phenanthrene (DCPP) as the acceptor (A). A nondoped OLED prepared using TPA-DCPP exhibited a maximum external quantum efficiency (EQE) of 2.1%, whereas the doped device had an EQE of almost 10%.

## Organic Light-Emitting Diodes

Highly Efficient Near-Infrared Delayed Fluorescence Organic Light Emitting Diodes Using a Phenanthrene-Based Charge-Transfer Compound

**Two-in-one:** A novel triethylaluminum-modified Phillips  $\text{Cr/Ti/SiO}_2$  ethylene polymerization catalyst with two distinct active regions has been developed. STXM was used as a micro-spectroscopy method to discriminate between the active sites producing low molecular weight linear chain and high molecular weight short-chain branched polyethylene within a single catalyst particle.

## Phillips Catalyst

D. Cicmil, J. Meeuwissen, A. Vantomme, J. Wang, I. K. van Ravenhorst, H. E. van der Bij, A. Muñoz-Murillo, B. M. Weckhuysen\* — **13073–13079**

Polyethylene with Reverse Co-monomer Incorporation: From an Industrial Serendipitous Discovery to Fundamental Understanding

## Zeolites

H. Lee, Y. N. Choi,\* D.-W. Lim,  
M. M. Rahman, Y.-I. Kim, I. H. Cho,  
H. W. Kang, J.-H. Seo, C. Jeon,  
K. B. Yoon\* 13080 – 13084

Formation of Frustrated Lewis Pairs in  
Pt<sub>x</sub>-Loaded Zeolite NaY

**Poring over zeolites:** Frustrated Lewis pairs (FLPs), consisting of sodium hydride (Na<sup>+</sup>H<sup>-</sup>) and a framework-bound hydroxy proton O(H<sup>+</sup>), form inside the nanopores of zeolite NaY loaded with platinum nanoparticles after treatment of the material with H<sub>2</sub> at circa 400 K. FLP-containing zeolites may be applicable to size- and shape-selective ionic hydrogenation reactions.

## Leukemia Therapy

M. B. Minus, W. Liu, F. Vohidov,  
M. M. Kasembeli, X. Long, M. J. Krueger,  
A. Stevens, M. I. Kolosov, D. J. Tweardy,\*  
E. A. R. Sison,\* M. S. Redell,\*  
Z. T. Ball\* 13085 – 13089

Rhodium(II) Proximity-Labeling Identifies  
a Novel Target Site on STAT3 for  
Inhibitors with Potent Anti-Leukemia  
Activity

**Touching from a distance:** Small molecules block STAT3 SH2 phosphotyrosine recognition by binding to the distal coiled-coil domain (CCD). Inhibition of this new CCD target site, which was identified by catalytic rhodium labeling, blocks tumor progression in a leukemia mouse model.

## Cation- $\pi$ Interactions

R. Bertermann, H. Braunschweig,\*  
P. Constantinidis, T. Dellermann,  
R. D. Dewhurst, W. C. Ewing, I. Fischer,  
T. Kramer, J. Mies, A. K. Phukan,  
A. Vargas 13090 – 13094

Exclusive  $\pi$  Encapsulation of Light Alkali  
Metal Cations by a Neutral Molecule

**No help required:** Cation- $\pi$  interactions are one of the most important classes of noncovalent bonding; however, examples of exclusive cation- $\pi$  bonding are exceedingly rare. A neutral diboryne molecule has been found to encapsulate Li<sup>+</sup>

and Na<sup>+</sup> in the absence of a net charge, covalent bonds, or lone-pair donor groups. In the resulting encapsulation complexes, a neutral molecule binds the light alkali metals exclusively through cation- $\pi$  interactions.

## Amyloid Inhibitors

E. Andreetto, E. Malideli, L.-M. Yan,  
M. Kracklauer, K. Farbiarz,  
M. Tatarek-Nossol, G. Rammes, E. Prade,  
T. Neumüller, A. Caporale,  
A. Spanopoulou, M. Bakou, B. Reif,  
A. Kapurniotu\* 13095 – 13100

A Hot-Segment-Based Approach for the  
Design of Cross-Amyloid Interaction  
Surface Mimics as Inhibitors of Amyloid  
Self-Assembly

**Inhibitors of amyloid self-assembly** are difficult to design because of the dynamic nature of the structures involved. A hot-segment-linking approach has led to highly potent inhibitors of the cytotoxic self-assembly of the A $\beta$  peptide (Alzheimer's disease), the islet amyloid polypeptide in type 2 diabetes, or both polypeptides. This strategy should be applicable to inhibiting pathogenic interactions of other proteins as well.

**Function follows form:** Aerogel electrocatalysts consisting of alloyed PdNi hollow nanospheres (HNS) were prepared. Their chemical composition and shell thickness can be controlled based on

the ratio of the Ni/Pd precursors. The mass activity of the Pd<sub>83</sub>Ni<sub>17</sub> HNS aerogel is 5.6 times higher than that of the commercial Pd/C catalyst.

### Electrocatalysis

E<sub>4</sub> Butterfly Complexes (E = P, As) as Chelating Ligands

## Main-Group Chemistry

C. Marquardt, O. Hegen, M. Hautmann,  
G. Balázs, M. Bodensteiner, A. V. Virovets,  
A. Y. Timoshkin,  
M. Scheer\* 13122–13125

Isolation and Characterization of Lewis  
Base Stabilized Monomeric Parent  
Stibanylboranes

**Getting heavier!** The monomeric parent  
compound of the stibanylboranes, “H<sub>2</sub>Sb-  
BH<sub>2</sub>”, which is only stabilized by a Lewis  
base, was isolated and completely char-

acterized. DFT calculations give further  
insight into the stability of these unique  
compounds.

## Rewritable Materials

O. Roling, K. De Bruycker, B. Vonhören,  
L. Stricker, M. Körsen, H. F. Arlinghaus,  
B. J. Ravoo,\*  
F. E. Du Prez\* 13126–13129

Rewritable Polymer Brush Micropatterns  
Grafted by Triazolinodione Click  
Chemistry

**Write and erase:** The click reaction  
between a triazolinodione (TAD)-conju-  
gated ATRP initiator and indole was used  
for the patterning of glass and silicon  
wafers employing microcontact chem-  
istry. The reversibility of the click reaction  
enabled the writing, erasing, and rewriting  
of surfaces with polymer brush micro-  
patterns for the first time.

## Decarboxylative Cross-Coupling

J. Tang, A. Biafora,  
L. J. Goossen\* 13130–13133

Catalytic Decarboxylative Cross-Coupling  
of Aryl Chlorides and Benzoates without  
Activating *ortho* Substituents

**Lifting the restriction:** A combination of  
a CuI/Me<sub>2</sub>phen decarboxylation catalyst  
and a [(MeCN)<sub>4</sub>Pd](OTf)<sub>2</sub>/XPhos cross-  
coupling catalyst enables the synthesis of  
biaryls from inexpensive aryl chlorides and  
potassium benzoates regardless of their

substitution pattern (see scheme; FG =  
functional group). This approach lifts the  
restriction of decarboxylative cross-cou-  
pling reactions to *ortho*-substituted or  
heterocyclic carboxylate substrates.
