## A gold(I)-catalyzed ...

... intermolecular annulation of *N*-allenamides at the proximal C=C bond has been achieved. In their Communication on page 14849 ff., J. Zhang et al. show that both enantiomers of the products are obtained with high regio-, diastereo-, and enantioselectivity by using either diastereomer of a chiral phosphoramidite as ligand. In the picture, the enantiomers of the products are easily controlled by the magician's hands with the aid of the gold rings on the fingers.
