A high-pressure NMR probe head ...

... that can attain pressures up to 2.0 GPa is used for the study of an aqueous solution of LaCl_3 . In their Communication on page 15444 ff., W. H. Casey et al. show that a ruby sphere coupled to a fiber-optic cable allows pressure estimates with an improved electrical feedthrough design for an established high-pressure NMR probe. Spin–lattice relaxation rates are reported as a function of pressure and concentration.
