

## ERRATUM

Volume 182, Number 2, January 31, 1992

In the article "An Amino Acid Exchange in Exon I of the Human Lecithin: Cholesterol Acyltransferase (LCAT) Gene Is Associated with Fish Eye Disease," by Grethe Skretting and Hans Prydz, pages 583-587:

On page 585, the legend to Fig. 1 is incorrect. For the reader's convenience, the correct legend is given below.

Fig. 1. Schematic representation of the LCAT gene.

The exons are boxed and arrows above the exons show the orientation and length of the sequence readings. Oligonucleotides numbered 1-11 were used for PCR amplification and/or sequencing. The exons are 182, 157, 116, 96, 225, and 597 nucleotides, respectively. The amplified fragments were 204 (exon 1, primers 1 and 2), 2000 (exon 1-exon 2, primers 1 and 4), 552 (exon 2-exon 4, primers 3 and 6), 620 (exon 3-exon 5, primers 5 and 7), and 608 (exon 6, primers 8 and 11).
