

Editorial Note: Short Crystallization Papers

The field of structural biochemistry, including protein crystallographic and NMR investigation on the three-dimensional structure of proteins has had a tremendous burst of growth over the last years. BBA strongly wants to encourage submission of manuscripts dealing with structural studies on proteins to the *Protein Structure and Molecular Enzymology* section of the journal. BBA will also consider short papers on crystallization and preliminary crystallographic data on proteins. To be eligible for publication, these 'Short Crystallization Papers' should offer novel information on the protein studied, the protein should be of biochemical–biological importance and not highly homologous to proteins of known structures, unless there is a particular reason why this might be interesting. Unit cell dimensions and spacegroup determination and an estimate of the resolution that can be obtained should be provided. These papers will adhere to the format used for Rapid Reports and Short Sequence/Promoter Papers (see Information for Contributors in each issue).
