

these findings do not clarify the correlation between the subunit structure of this enzyme and its catalytic activity. The results presented here represent a start on a study of the regulatory mechanism of AMP nucleosidase. Work now is proceeding on the experiments to elucidate the relationship between two forms of AMP nucleosidase and its catalytic activities. Further work will especially be necessary to clarify the role of ATP.

NEW VOLUME CODING FOR BBA-ENZYMOLGY

BBA is published according to a volume-numbering scheme that embraces all sections of the journal: for 1968 the scheme covering the volumes 150-170- is to be found on the inside cover of this issue. The seven individual sections are distinguished by a colour code, and a series number has hitherto been inserted on the spine.

The overall volume-numbering system and colour code are to be maintained; however, instead of the series number, each section is to be given its own sequential volume numbers, these being assigned in retrospect to the volumes already published in that section. This system will run parallel to the overall BBA scheme: for the ENZYMOLGY section the correspondence is indicated in the Table below. This issue is therefore BIOCHIMICA ET BIOPHYSICA ACTA, Vol. 167/1 or BBA-ENZYMOLGY E24/1.
