(Received December 26, 2002)

Bis[tris(trimethylsilyl)germyl]zinc, [(Me₃Si)₃Ge]₂Zn, was prepared by the reaction of [tris(trimethylsilyl)germyl]lithium, (Me₃Si)₃GeLi(thf), with zinc chloride, ZnCl₂, and by the reaction of tris(trimethylsilyl)germane, (Me₃Si)₃GeH, with diethylzinc, Et₂Zn. The molecular structure of [(Me₃Si)₃Ge]₂Zn was determined by spectroscopic and X-ray diffraction methods. In [(Me₃Si)₃Ge]₂Zn, the two tris(trimethylsilyl)germyl ligands, (Me₃Si)₃Ge, are bonded in a linear fashion to the zinc atom and are staggered with respect to each other. The reactions of bis(germyl)zinc with substrates were also examined.

The chemistry of organozinc compounds has been a major research theme in organic synthesis and organometallic chemistry.¹ Despite the large number of reports on organozinc reagents, far less attention has been devoted to silyl- or germyl-substituted zinc compounds. Up to now, four bis(silyl)zinc derivatives {(*t*-Bu₃Si)₂Zn,^{2a} [(Me₃Si)₃Si]₂Zn,^{2b} (Me₃-Si)₂Zn,^{2c} and (Ph₃Si)₂Zn^{2d}} have been prepared, and only two X-ray crystal structures of (*t*-Bu₃Si)₂Zn and [(Me₃-Si)₃Si]₂Zn have been determined. Although a few examples of bis(germyl)zinc, (Ph₃Ge)₂Zn and (Et₃Ge)₂Zn, are known,^{3a-c} no solid state structure, or few reactivities, of bis(germyl)zinc derivatives have been reported.

In this report we describe the first successful isolation of bis[tris(trimethylsilyl)germyl]zinc, [(Me₃Si)₃Ge]₂Zn (**1**), prepared by several methods, and its structural characterization by X-ray diffraction analysis. Some reactions of the bis(germyl)zinc **1** with substrates are also examined.

Results and Discussion

Preparation of Bis[tris(trimethylsilyl)germyl]zinc, [(Me₃Si)₃Ge]₂Zn. Bis[tris(trimethylsilyl)germyl]zinc, [(Me₃Si)₃Ge]₂Zn, **1** was prepared by several methods. The treatment of zinc chloride (ZnCl₂) with two molar amounts of [tris(trimethylsilyl)germyl]lithium solvated by tetrahydrofuran (THF), (Me₃Si)₃GeLi(thf)₃,⁴ prepared by the reaction of tetrakis(trimethylsilyl)germane, (Me₃Si)₄Ge, with THF solution of MeLi, in diethyl ether at room temperature for 1 day afforded colorless crystals with a composition of [(Me₃Si)₃Ge]₂Zn (**1**) in 83% isolated yield. ¹H, ¹³C, and ²⁹Si NMR examinations of a C₆D₆ solution of the colorless crystals **1** revealed a single assigned to the trimethylsilyl group (Me₃Si). No coordinating THF in **1** was observed. The symmetrical bis(germyl)zinc **1** could be recrystallized from pentane at -20 °C as colorless needles that are very flammable in air. The bis(germyl)zinc **1** are thermally stable for prolonged periods in the absence of air at room temperature.

The treatment of [tris(trimethylsilyl)germyl]zinc chloride solvated by THF, (Me₃Si)₃GeZnCl(thf),⁵ which was prepared by the reaction of ZnCl₂ with one molar amount of (Me₃Si)₃GeLi(thf), with additional (Me₃Si)₃GeLi(thf)₃ in diethyl ether at room temperature for 1 h, also gave bis(germyl)zinc **1** in 93% isolated yield. This result suggests that (Me₃-Si)₃GeZnCl(thf) is an intermediate in the formation of the bis(germyl)zinc **1** by the reaction of ZnCl₂ with two molar amounts of (Me₃Si)₃GeLi(thf):

Two molar amounts of tris(trimethylsilyl)germane, (Me₃Si)₃GeH, reacted with diethylzinc, Et₂Zn, in diethyl ether (or THF) at room temperature for 1 day to give bis(germyl)zinc **1** quantitatively:

This method is experimentally easier and gives higher yields of **1** than the ZnCl₂–(Me₃Si)₃GeLi(thf) methods. Attempts to prepare ethyltris(trimethylsilyl)germylzinc, (Me₃Si)₃GeZn-Et, as an intermediate in the formation of the bis(germyl)zinc **1** have failed, probably due to its thermodynamically instability.

The formation and the mechanism of bis(triphenylgermyl)zinc, (Ph₃Ge)₂Zn, by a treatment of Et₂Zn with triphenylgermane, Ph₃GeH, in diglyme at 150 °C for 1.5 h were reported

Fig. 1. An ORTEP representation of bis[(tris(trimethylsilyl)germyl)zinc] **1** (hydrogen atoms are omitted for clarity).

by Bychkov and co-workers.^{3b}

Several studies on the preparation of a binary group 12-element germly derivatives by reactions of organogermanium hydrides with diorganometals have been reported.^{6–8} The easiness of the reaction is in the order Zn < Cd < Hg.

Crystal Structure. The molecular structure of **1** was unequivocally confirmed by an X-ray diffraction analysis. The molecular structure of **1** is shown in Fig. 1. The bis(germyl)zinc **1** has a crystallographic inversion center on the zinc atom. The two tris(trimethylsilyl)germyl, (Me₃Si)₃Ge, ligands are bonded in a linear fashion to the zinc atom, and are staggered with respect to each other, as shown in Fig. 1. The structural features are similar to that found in [(Me₃Si)₃Si]₂Zn.^{2b} The bond angle of Ge1–Zn–Ge1* is 180°. No solvent coordinating to the zinc metal of **1** was observed due to the steric hindrance of the (Me₃Si)₃Ge ligand. The Ge–Zn bond length of 2.3818(3) Å is somewhat longer than that found in (Me₃Si)₃Ge–ZnCl(thf).⁵ The average Si–Ge–Zn angle of 106.65(1)° is smaller than that found in Si–Ge–Si angles (av 112.13(2)°). The mean Ge–Si bond length of 2.3804 Å is quite normal.

The selected bond lengths and bond angles of **1** are summarized in Table 1. Crystallographic data of **1** are summarized in

Table 1. The Selected Bond Lengths (Å) and Bond Angles (°) of [(Me₃Si)₃Ge]₂Zn (**1**)

Ge1–Si1	2.3788(6)	Ge1–Si3	2.3761(7)

the experimental section.

The crystal structure of bis(germyl)zinc **1** is different from that of (Me₃Si)₃GeZnCl(thf). The germlyzinc chloride has dimeric structures consisting of two μ -chlorine atoms.⁵

Reactivity. The reactions of bis(germyl)zinc **1** with some electrophiles in diethyl ether under an argon atmosphere in a Schlenk tube were examined at room temperature. All of the products were identified by GC, GC-MS, and NMR spectra compared with those of authentic samples. The yields of the products were determined by GC with internal-standard methods.

The bis(germyl)zinc **1** could be preserved under an argon atmosphere at room temperature. The hydrolysis of bis(germyl)zinc **1** in diethyl ether with deoxygenated water proceeded extremely slowly to give tris(trimethylsilyl)germane, (Me₃Si)₃GeH, in only 38% yield after 7 days of stirring under an argon atmosphere at room temperature. Unreacted **1** still remained. The addition of hydrochloric acid of **1** under an argon atmosphere for 2 h completely promoted the hydrolysis reaction to give (Me₃Si)₃GeH. This reactivity contrasts with that of the analogous silyl derivatives, [(Me₃Si)₃Si]₂Zn,^{2b} which appear to be more reactive. The bis(germyl)zinc **1** did not react with an excess amount of Me₃SiCl at all for 2 days. Unreacted **1** was completely recovered. On the other hand, the bis(germyl)zinc **1** reacted easily with I₂ to afford iodotris(trimethylsilyl)germane, (Me₃Si)₃GeI in 91% yield after 3 h of stirring under an argon atmosphere at room temperature. In 4 h of stirring under an argon atmosphere, the reaction of bis(germyl)zinc **1** with MeI proceeded to form (Me₃Si)₃GeI in 93% yield. The reaction took place even in a dark condition. The presence of (Me₃Si)₃GeI suggests that Me₂Zn is simultaneously formed as a reactive species. Further stirring for 3 days led to the final formation of methyltris(trimethylsilyl)germane, (Me₃Si)₃GeMe (50% yield), with the precipitation of ZnI₂ salt:

Table 2. Reactions of Bis[tris(trimethylsilyl)germyl]zinc (1) with Substrates in Diethyl Ether

Substrate	Reaction conditions	Products (Yield/%)
H ₂ O	r.t., 7 d	(Me ₃ Si) ₃ GeH (38)
HCl	r.t., 2 h	(Me ₃ Si) ₃ GeH (100)
I ₂	r.t., 3 h	(Me ₃ Si) ₃ GeI (91)
Me ₃ SiCl	r.t., 2 d	No reaction
MeI	r.t., 1 h	(Me ₃ Si) ₃ GeI (93)
	r.t., 3 d	(Me ₃ Si) ₃ GeMe (50)

The formation of Me₂Zn was confirmed by the ¹H NMR spectra ($\delta = -1.44$ in THF-*d*₈) and a chemical trapping experiment with chlorotriphenylgermane, Ph₃GeCl. The Me₂Zn was quenched with Ph₃GeCl to yield methyltriphenylgermane, Ph₃GeMe, in 59% yield. The formation of (Me₃Si)₃GeI and Me₂Zn may be explained by electron-transfer processes as one possible reaction mechanism. Since bis(germyl)zinc **1** with low ionization oxidative potentials is an excellent electron donor, electron-transfer from **1** to MeI with high reductive potentials generates geminate radical anions composed of the radical cation of **1** and the radical anion of MeI. The radical cation of **1** possibly reacts with the radical anion of MeI to afford (Me₃Si)₃GeI and Me₂Zn.⁹ The reaction mechanism for the formation of (Me₃Si)₃GeMe and ZnI₂ is unclear.

Taking these results of reaction of **1** with H₂O and Me₃SiCl into consideration, bis(germyl)zinc **1** is not only a very weak base, but also a weak nucleophile. These results are summarized in Table 2.

Experimental

General Methods. The NMR spectra were obtained on a Varian Unity Inova 400 MHz spectrometer. The GC-MS spectra were measured on a JEOL JMS-DX 303 mass spectrometer. Gas chromatography was performed on a Shimadzu GC 8A with a 1 m 20% SE30 column. X-ray crystallographic data and diffraction intensities were collected on a MacScience DIP2030 diffraction utilizing graphite-monochromated Mo K α ($\lambda = 0.71073$ Å) radiation. The structures were solved by direct methods using the program system SIR-92. A refinement was performed by a SILICON Graphics O₂ with maXus. THF, diethyl ether, and other solvents were purified and dried as reported in the literature.

Materials. (Me₃Si)₃GeLi(thf)₃,⁴ (Me₃Si)₃GeH,⁴ (Me₃Si)₃GeI,⁴ (Me₃Si)₃GeMe,⁴ Ph₃GeCl,¹⁰ and Ph₃GeMe¹¹ were prepared as reported in the literature. Me₂Zn, Et₂Zn, ZnCl₂, Me₃SiCl, and MeI were commercially available.

Structural Studies. Bis(germyl)zinc **1** could be obtained in the form of crystals suitable for X-ray diffraction studies. A single crystal was sealed in a capillary glass tube for collection. Diffraction data were collected at 293 K on a MacScience DIP2030 image plate diffraction employing graphite-monochromated Mo K α radiation ($\lambda = 0.71073$ Å). MF = C₁₈H₅₄Ge₂Si₆Zn, MW = 649.70, cryst size = 0.30 × 0.30 × 0.30 mm, triclinic, *P*1, *a* = 9.3840(7), *b* = 9.4960(6), *c* = 12.2610(6) Å, β = 70.174(5)°, γ = 62.489(4)°, *V* = 882.80(10) Å³, *Z* = 1, *D*_{calcd} = 1.222 g cm⁻³, Temp/K = 293. The final *R* factor and the good-

ness-of-fit indicator were 0.0399 (*R*_w = 0.1255 for all data, 3506 reflections) and 1.141, respectively, for 3357 reflection with *I* > 2σ(*I*).

Preparation of Bis[tris(trimethylsilyl)germyl]zinc (1) by Treatment of [Tris(trimethylsilyl)germyl]lithium with Zinc Chloride. Zinc chloride, ZnCl₂, (0.13 g, 0.95 mmol) reacted with two molar amounts of [tris(trimethylsilyl)germyl]lithium solvated by THF, (Me₃Si)₃GeLi(thf)₃ (0.88 g, 1.70 mmol) containing diethyl ether (10 mL) in a Schlenk tube at room temperature for 1 day under an argon atmosphere. The concentration of the reaction mixture by the removal of diethyl ether, followed by recrystallization from pentane at -20 °C, gave colorless crystals flammable in air with a composition of bis[tris(trimethylsilyl)germyl]zinc, [(Me₃Si)₃Ge]₂Zn (**1**) (0.52 g, 0.80 mmol) in 83% yield. ¹H NMR (C₆D₆) δ 0.39 (s, 54 H); ¹³C {¹H} NMR (C₆D₆) δ 5.2; ²⁹Si {¹H} NMR (C₆D₆) δ -2.3.

Preparation of Bis[tris(trimethylsilyl)germyl]zinc (1) by the Treatment of [Tris(trimethylsilyl)germyl]zinc Chloride with [Tris(trimethylsilyl)germyl]lithium. To a THF solution (10 mL) of [tris(trimethylsilyl)germyl]zinc chloride, (Me₃Si)₃GeZnCl (0.10 g, 0.21 mmol), in a Schlenk tube (Me₃Si)₃GeLi(thf)₃ (0.11 g, 0.21 mmol) in diethyl ether (10 mL) was added under an argon atmosphere. The reaction mixture was stirred at room temperature for 1 h. After the removal of diethyl ether, [(Me₃Si)₃Ge]₂Zn (**1**) (0.13 g, 0.20 mmol) was formed quantitatively. [(Me₃Si)₃Ge]₂Zn: ¹H NMR (C₆D₆) δ 0.39 (s, 54 H); ¹³C {¹H} NMR (C₆D₆) δ 5.2; ²⁹Si {¹H} NMR δ -2.3.

Preparation of Bis[tris(trimethylsilyl)germyl]zinc (1) by Treatment of Tris(trimethylsilyl)germane with Diethylzinc. To a diethyl ether (3 mL) solution of (Me₃Si)₃GeH (0.30 g, 1.0 mmol) in a Schlenk tube, Et₂Zn in hexane (0.5 mL, 0.5 mmol) was added under an argon atmosphere. The reaction mixture was stirred at room temperature for 1 day. After removal of diethyl ether, [(Me₃Si)₃Ge]₂Zn (**1**) (0.32 g, 0.5 mmol) was formed quantitatively.

Hydrolysis of Bis[tris(trimethylsilyl)germyl]zinc (1) with Water. A diethyl ether solution (10 mL) of **1** (1.00 mmol), an excess amount of deoxygenated H₂O, and nonadecane as internal standard in a Schlenk tube was stirred under an argon atmosphere at room temperature for 7 days. Tris(trimethylsilyl)germane, (Me₃Si)₃GeH (0.38 mmol) was formed in 38% GC yield. (Me₃Si)₃GeH: ¹H NMR (C₆D₆) δ 0.28 (s, 27 H), 2.16 (s, 1 H); ¹³C {¹H} NMR (C₆D₆) δ 3.4. GC-MS *m/z* 294 (*M*⁺, 20), 278 (5), 220 (40), 146 (35), 131 (40), 73 (100).

Hydrolysis of Bis[tris(trimethylsilyl)germyl]zinc (1) with Hydrochloric Acid. A diethyl ether solution (10 mL) of **1** (1.00 mmol), an excess amount of conc. HCl, and nonadecane as internal standard in a Schlenk tube was stirred under argon atmosphere at room temperature for 2 h. Tris(trimethylsilyl)germane, (Me₃Si)₃GeH (2.00 mmol) was formed quantitatively.

Reaction of Bis[tris(trimethylsilyl)germyl]zinc (1) with Iodine. A diethyl ether solution of **1** (1.00 mmol), an excess amount of I₂, and nonadecane as an internal standard in a Schlenk tube was stirred under an argon atmosphere at room temperature for 3 h. Iodotris(trimethylsilyl)germane, (Me₃Si)₃GeI (1.82 mmol) was formed in 91% GC yield. (Me₃Si)₃GeI: ¹H NMR (C₆D₆) δ 0.29 (s, 27 H); ¹³C {¹H} NMR (C₆D₆) δ 0.81. GC-MS *m/z* 420 (*M*⁺, 5), 220 (10), 146 (10), 73 (100).

Reaction of Dimethylzinc with Chlorotriphenylgermane. To a diethyl ether solution (10 mL) of **1** (0.26 g, 0.40 mmol) in a Schlenk tube, MeI (0.62 g, 4.3 mmol) was added under an argon atmosphere. The reaction mixture was stirred at room temperature

for 4 h. Then, chlorotriphenylgermane, Ph_3GeCl (0.27 g, 0.80 mmol) was added to this solution. The reaction mixture was stirred at room temperature for 1 day. Methyltriphenylgermane, Ph_3GeMe , was formed in 59% yield.

X-ray Crystallographic Data. Crystallographic data have been deposited at the CCDC, 12 Union Road, Cambridge CB2 1EZ, UK and copies can be obtained on request, free of charge, by quoting the publication citation and the deposition number 205945.

This work was supported by a Grant-in-Aid for Scientific Research (No. 11740344) from the Ministry of Education, Culture, Sports, Science and Technology. We thank Mitsubishi Material Co., Ltd., for providing us with tetra-chlorogermane.
