Carbohydrate Research, 257 (1994) 249–268.

The last sentence on p 265 should read:

Since the $(\Delta G_6 + \Delta G_7)$ values are found essentially from $(\Delta G_6 + \Delta G_7) = \text{total binding energy for a substrate}$

$$-\sum_{0}^{5} \Delta G_i - \sum_{8}^{9} \Delta G_i$$

any errors in interaction energies for subsites 0 to 5, 8, and 9 will contribute to errors in $(\Delta G_6 + \Delta G_7)$.
