(Received June 11, 1987)

α -Alkyl- α -[(phenoxypropylamino)propyl]benzeneacetonitrile derivatives containing various substituents on the ring of the benzeneacetonitrile moiety (A), the quaternary carbon atom and the ring of the phenoxy moiety (B) were prepared, and their Ca^{2+} -antagonistic activities were evaluated. Among these compounds, the *N*-Me derivatives with a 3,4,5-(OMe)₃ group on the A ring, an iso-Pr group on the quaternary carbon atom, and a *m*-OMe, 3,5-(OMe)₂, 3,5-Me₂ or 3,4,5-(OMe)₃ group on the B ring were found to possess Ca^{2+} -antagonistic activity higher than $\text{pA}_2=9$. The effects of substitutions at the A ring, the quaternary carbon atom and the B ring are discussed.

Keywords—phenoxyalkylamine; α -alkyl- α -[(phenoxypropylamino)propyl]benzeneacetonitrile; calcium ion-antagonistic activity; structure-activity relationship

Previously,¹⁾ we synthesized a series of novel phenoxyalkylamine derivatives (I) in which the phenethylamino moiety of verapamil was transformed to a phenoxyalkylamino moiety. We observed variations in their Ca^{2+} -antagonistic and α -blocking activities depending upon the structural modifications. The effects of the carbon chain length (*m*, *n*) and the R₁ substituent on the nitrogen atom on the activity were examined while the R₂ substituent on the A ring of the benzeneacetonitrile moiety was fixed as a 3,4,5-(OMe)₃ group, the R₃ substituent on the quaternary carbon atom as an iso-Pr group and the R₄ substituent on the B ring of the phenoxy moiety as an *o*-OMe group. We found that the compound (I'-2) with *m*=3, *n*=3 and R₁=Me exhibited a potent Ca^{2+} -antagonistic activity and that (I'-3) with *m*=3, *n*=2 and R₁=H exhibited a potent α -blocking activity.

The aim of the present study was to investigate the effect of further structural modification of I on the Ca^{2+} -antagonistic activity. We examined the activity of compounds in which various modifications had been made in the R₂ substituent on the A ring (II-1—6, III-1—6), the R₃ substituent on the quaternary carbon atom (II-7—15, III-7—15) and the R₄ substituent on the B ring (II-16—50, III-16—50) while the carbon chains were fixed at *m*=3 and *n*=3, which were previously shown to be favorable for potent activity.¹⁾

Synthesis

α -Alkyl- α -[(phenoxypropylamino)propyl]benzeneacetonitrile derivatives (II, III) were synthesized by the method shown in Chart 2.

The key intermediate aldehydes (IV) were obtained *via* α -alkylbenzeneacetonitriles (VIII) from benzeneacetonitriles (V) as shown in Chart 3. The physicochemical properties of VIII and IV are summarized in Tables IV and V in the experimental section.

The aldehydes (IV) thus obtained were reductively condensed with the corresponding

phenoxyalkylamines using sodium borohydride to yield the *N*-H derivatives (II), *N*-methylation of which was performed by two methods (A and B). Among them, *N*-methylation of the *m*-Me (II-24) and *m*-OMe (II-26) compounds by method A proceeded in low yields (19% and 0%, respectively). We considered that in the presence of an electron-releasing substituent such as a Me or OMe group at the *m*-position, hydroxymethylation with formalin occurred at the 2-, 4-, and 6-positions on the B ring. On the other hand, by method B, II-24 and 26 gave III-24 and 26 in relatively high yields (56% and 59%, respectively). Although

 6: $\text{R}_3=n\text{-Hex}$
 7: $\text{R}_3=n\text{-Oct}$
 8: $\text{R}_3=n\text{-dodecyl}$

formalin was also employed in method B, no hydroxymethylation seemed to occur, since the reaction temperature (*ca.* 60 °C) in method B was lower than that (90–100 °C) in method A.

On the basis of the above results, *N*-methylation of the compounds having an electron-releasing substituent at the *m*-position of the B ring, including di- and trisubstituted derivatives, was performed by using method B, to give III-25, 32, 43, 45, 47–50.

Both the *N*-H and *N*-Me derivatives with a nitro group (II-22, 29, 39, III-22, 29, 39) on the B ring were hydrogenated over PtO₂ to yield the corresponding derivatives with an amino group (II-23, 30, 40, III-23, 30, 40).

The physicochemical properties of II and III are summarized in Tables I–III.

Results and Discussion

Pharmacological data for the compounds obtained here are summarized in Tables I–III.

a) Yield of free base. b) pA_2 values in the KCl-depolarized guinea-pig taenia coli. c) High mass data. The upper values are calculated and the lower ones are those found. d) Ref. 1.

Ca^{2+} -Antagonistic activity was tested in KCl-depolarized guinea-pig taenia coli and the results are given as the pA_2 value.

First, we examined the effect of the R_2 substituent (Table I). As R_2 -substituted compounds, the non-substituted (II-1, III-1), mono-OMe (II-2—4, III-2—4), di-(OMe)₂ (II-5, III-5) and 2,3,4-(OMe)₃ (II-6, III-6) derivatives, in addition to the 3,4,5-(OMe)₃ derivatives (I'-1, 2) reported in the previous paper,¹⁾ were examined. The activity of the *N*-H derivatives (II-1—6, I'-1) was low and no marked difference was observed among them. On the other hand, the activities of the *N*-methylated derivatives (III-1—6, I'-2) were higher, but no compound was found to be superior to I'-2 having the 3,4,5-(OMe)₃ group.

Second, the effect of the R_3 substituent was examined (Table II). In the R_3 -substituted compounds, in addition to the iso-Pr derivatives (I'-1, 2), the non-substituted (II-7, III-7) and alkyl (II-8—15, III-8—15) derivatives from Me to *n*-dodecyl were included. The activity of the *N*-H derivatives (II-7—15, I'-1) was low, similar to the findings for the R_2 -substituted compounds. On the other hand, the activities of the *N*-methylated derivatives (III-7—15, I'-2)

a) Yield of free base. b) pA₂ values in the KCl-depolarized guinea-pig taenia coli. c) High mass data. The upper values are calculated and the lower ones are those found. d) Ref. 1. e) The yield by method A is 19%. f) The yield by method A is 0%. g) pA₂ values in the KCl-depolarized rabbit thoracic aorta.

N-H derivatives was also lower than that of the *N*-methylated derivatives. Of the *N*-Me derivatives, the non-substituted derivative (III-16) showed potent activity, $pA_2 = 8.19$. Among those in which a mono-substituent was introduced at the *o*-, *m*- or *p*-position on the B ring, the *o*-Me (III-17), *m*-Me (III-24), *m*-OMe (III-26), *m*-F (III-27) and *m*-Cl (III-28) derivatives were more potent than the non-substituted derivative. In particular, the activity of III-26 was $pA_2 = 9.00$, about ten times more potent than that of verapamil. Since the OMe and Me groups were thought to be favorable substituents for potent activity, di- or tri-substituted analogs (II-43—50, III-43—50) were synthesized. Among the *N*-H derivatives, the activities of II-48 and 50 were especially potent, being almost equal to that of verapamil. Furthermore, the activities of the corresponding *N*-methylated derivatives (III-43—50) were higher than those of the *N*-H derivatives. The derivatives having 3,5-(OMe)₂ (III-48), 3,5-Me₂ (III-49) and 3,4,5-(OMe)₃ (III-50) groups exhibited very high activities of more than $pA_2 = 9$ in the rabbit thoracic aorta, although their pA_2 values could not be calculated in the test using guinea-pig taenia coli owing to their non-competitive mode of action.

As a result of various conversions of the R₂, R₃ and R₄ substituents of I, especially the R₄ substituent, we found that III-26, 48, 49 and 50 showed potent Ca²⁺-antagonistic activities of more than $pA_2 = 9$.

Investigations of the pharmacological activities of these compounds are in progress. The effects of the R₃ and R₄ substituents on the Ca²⁺-antagonistic activity were quantitatively analyzed by using substituent parameters and regression analysis. The results will be reported in a later paper.

Experimental

Melting points were measured with a Yanagimoto melting point apparatus and are uncorrected. Infrared (IR) spectra were recorded using a JASCO A-202 or Hitachi 270-30 spectrophotometer. Mass spectra (MS) were obtained on a Hitachi RMU-6M or JEOL DX-300 mass spectrometer. High-resolution MS were measured using a JEOL DX-300 mass spectrometer. Proton nuclear magnetic resonance (¹H-NMR) spectra were measured with a JEOL FX-90Q spectrometer using tetramethylsilane as an internal standard.

Preparation of *N*-Unsubstituted α -[3-[(3-Phenoxypropyl)amino]propyl]benzeneacetonitriles (II). α -Isopropyl- α -[3-[[3-(2-methoxyphenoxy)propyl]amino]propyl]benzeneacetonitrile (II-1)—A solution of α -(2-formylethyl)- α -isopropylbenzeneacetonitrile (IV-2, 2.85 g) and 3-(2-methoxyphenoxy)propylamine (2.00 g) in EtOH (100 ml) was refluxed for 1.5 h, then cooled with ice water, and NaBH₄ (0.51 g) was added. The mixture was stirred at room temperature for 1 h, and then concentrated. The residue was acidified with 10% HCl and washed with Et₂O. The aqueous layer and the insoluble oily layer were combined, made alkaline with K₂CO₃ and extracted with AcOEt. The AcOEt layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was purified on a column of silica gel using CHCl₃ and CHCl₃-MeOH (95:5) as eluents to give II-1 (3.80 g, 90%) as a colorless oil. IR $\nu_{\max}^{\text{liq}}$ cm⁻¹: 2230 (CN). ¹H-NMR (CDCl₃) δ : 0.77, 1.19 (each 3H, d, $J = 6.5$ Hz, CH(CH₃)₂), 3.79 (3H, s, OCH₃), 4.07 (2H, t, $J = 6.0$ Hz, NCH₂CH₂CH₂O), 6.88 (4H, s, aromatic protons). High MS m/z : 380.2435 (M⁺) (Calcd for C₂₄H₃₂N₂O₂ 380.2464).

Compounds II-2—22, 24—29, 31—39 and 41—50 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Tables I—III.

α -[3-[[3-(2-Aminophenoxy)propyl]amino]propyl]- α -isopropyl-3,4,5-trimethoxybenzeneacetonitrile (II-23)—A solution of α -isopropyl-3,4,5-trimethoxy- α -[3-[[3-(2-nitrophenoxy)propyl]amino]propyl]benzeneacetonitrile (II-22, 4.78 g) in MeOH (100 ml) was hydrogenated over PtO₂ (50 mg) under atmospheric pressure at room temperature. After H₂ absorption had ceased, the catalyst was removed by filtration. The filtrate was concentrated under reduced pressure to give II-23 (4.36 g, 97%) as a pale yellow oil. The free base thus obtained was converted into the oxalate in a usual manner and the resulting salt was recrystallized from EtOH-Et₂O to give colorless crystals, mp 118—122 °C. IR $\nu_{\max}^{\text{KBr}}$ cm⁻¹: 2210 (CN). ¹H-NMR (DMSO-*d*₆) δ : 0.71, 1.13 (each 3H, d, $J = 6.5$ Hz, CH(CH₃)₂), 3.67 (3H, s, OCH₃), 3.80 (6H, s, 2 × OCH₃), 3.96 (2H, t, $J = 6.0$ Hz, NCH₂CH₂CH₂O), 6.67 (2H, s, aromatic protons). Anal. Calcd for C₂₆H₃₇N₃O₄·C₂H₂O₄·H₂O: C, 59.67; H, 7.33; N, 7.46. Found: C, 59.39; H, 7.11; N, 7.16.

Compounds II-30 and 40 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Table III.

Preparation of *N*-Methylated α -[3-[(3-Phenoxypropyl)amino]propyl]benzeneacetonitriles (III) (Method A). α -Isopropyl- α -[3-[*N*-[3-(2-methoxyphenoxy)propyl]-*N*-methylamino]propyl]benzeneacetonitrile (III-1)—A mixture of

II-1 (2.50 g), 37% formalin (6 ml) and HCOOH (6 ml) was stirred at 90–100 °C for 1 h. After cooling, the mixture was made alkaline with aqueous K₂CO₃ and extracted with AcOEt. The AcOEt layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was purified on a column of silica gel using CHCl₃ as the eluent to give III-1 (1.80 g, 69%) as a pale yellow oil. IR $\nu_{\text{max}}^{\text{liq}}$ cm⁻¹: 2240 (CN). ¹H-NMR (CDCl₃) δ : 0.76, 1.17 (each 3H, d, *J* = 6.5 Hz, CH(CH₃)₂), 2.09 (3H, s, NCH₃), 3.85 (3H, s, OCH₃), 4.03 (2H, t, *J* = 6.5 Hz, NCH₂CH₂CH₂O), 6.89 (4H, s, aromatic protons). High MS *m/z*: 394.2615 (M⁺) (Calcd for C₂₅H₃₄N₂O₂ 394.2620).

Compounds III-2–22, 27–29, 31, 33–39, 41–42, 44, and 46 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Tables I–III.

(Méthod B). α -Isopropyl-3,4,5-trimethoxy- α -[3-[*N*-[3-(3-methoxyphenoxy)propyl]-*N*-methylamino]propyl]benzeneacetonitrile (III-26)—Formalin (37%, 3.54 ml) was added to a solution of α -isopropyl-3,4,5-trimethoxy- α -[3-[3-(3-methoxyphenoxy)propyl]amino]propyl]benzeneacetonitrile (II-26, 1.90 g) in MeOH (40 ml) and the mixture was refluxed for 2 h, then cooled with ice water, and NaBH₄ (1.50 g) was added. The mixture was stirred at room temperature for 1 h, and then concentrated. The residue was acidified with aqueous HCl and extracted with AcOEt. The AcOEt layer was washed with aqueous NaOH and then water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was purified on a column of silica gel using CHCl₃ and CHCl₃–MeOH (97:3) as eluents to give III-26 (1.16 g, 59%) as a yellow oil. IR $\nu_{\text{max}}^{\text{liq}}$ cm⁻¹: 2230 (CN). ¹H-NMR (CDCl₃) δ : 0.79, 1.17 (each 3H, d, *J* = 6.5 Hz, CH(CH₃)₂), 2.13 (3H, s, NCH₃), 3.78 (3H, s, OCH₃), 3.85 (3H, s, OCH₃), 3.86 (6H, s, 2 × OCH₃), 3.97 (2H, t, *J* = 6.5 Hz, NCH₂CH₂CH₂O), 6.57 (2H, s, aromatic protons). High MS *m/z*: 484.2934 (M⁺) (Calcd for C₂₈H₄₀N₂O₅ 484.2937).

Compounds III-24, 25, 32, 43, 45, and 47–50 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Table III.

α -[3-[*N*-[3-(2-Aminophenoxy)propyl]-*N*-methylamino]propyl]- α -isopropyl-3,4,5-trimethoxybenzeneacetonitrile (III-23)—A solution of α -isopropyl-3,4,5-trimethoxy- α -[3-[*N*-[3-(2-nitrophenoxy)propyl]-*N*-methylamino]propyl]benzeneacetonitrile (III-22, 0.92 g) in MeOH (20 ml) was hydrogenated over PtO₂ (10 mg) under atmospheric pressure at room temperature. After H₂ absorption had ceased, the catalyst was removed by filtration. The filtrate was concentrated under reduced pressure to give III-23 (0.86 g, 99%) as a pale yellow oil. The free base thus obtained was converted into the oxalate in a usual manner and the resulting salt was recrystallized from CH₃CN–Et₂O to give colorless crystals, mp 108–110 °C. IR $\nu_{\text{max}}^{\text{KBr}}$ cm⁻¹: 2240 (CN). ¹H-NMR (CD₃OD) δ : 0.79, 1.21 (each 3H, d, *J* = 6.5 Hz, CH(CH₃)₂), 2.80 (3H, s, NCH₃), 3.76 (3H, s, OCH₃), 3.85 (6H, s, 2 × OCH₃), 4.11 (2H, t, *J* = 5.5 Hz, NCH₂CH₂CH₂O), 6.72 (2H, s, aromatic protons). Anal. Calcd for C₂₇H₃₉N₃O₄ · 2C₂H₂O₄: C, 57.31; H, 6.67; N, 6.47. Found: C, 57.15; H, 6.87; N, 6.41.

Compounds III-30 and 40 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Table III.

Preparation of α -Alkylbenzeneacetonitriles (VIII). α -Isopropyl-3,4,5-trimethoxybenzeneacetonitrile (VIII-1)²⁾—NaNH₂ (10.00 g) was added to a solution of 3,4,5-trimethoxybenzeneacetonitrile (V-1, 50.00 g) in anhydrous tetrahydrofuran (THF, 500 ml). The mixture was stirred at room temperature for 0.5 h, then iso-PrBr (30.80 g) was added. The whole was stirred at room temperature for 4 h, poured into ice water and extracted with Et₂O. The Et₂O layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was distilled to give VIII-1 (54.44 g, 90%) as a colorless oil, bp 170–173 °C (8 mmHg). IR $\nu_{\text{max}}^{\text{liq}}$ cm⁻¹: 2240 (CN). ¹H-NMR (CDCl₃) δ : 1.06 (6H, d, *J* = 6.5 Hz, CH(CH₃)₂), 3.58 (1H, d, *J* = 6.5 Hz, CHCN), 3.85 (3H, s, OCH₃), 3.87 (6H, s, 2 × OCH₃), 6.50 (2H, s, aromatic protons). High MS *m/z*: 249.1367 (M⁺) (Calcd for C₁₄H₁₉NO₃ 249.1365).

Compounds VIII-2,³⁾ 3, 4,⁴⁾ 5,⁵⁾ 6⁶⁾ and 7 were also prepared in the same manner as described above. The yields and characteristics of the products are listed in Table IV.

α -Methyl-3,4,5-trimethoxybenzeneacetonitrile (VIII-8)—NaOEt in absolute EtOH (prepared from Na (6.90 g) and absolute EtOH (150 ml)) was added to a mixture of 3,4,5-trimethoxybenzeneacetonitrile (V-1, 62.10 g) and CO(OEt)₂ (354.40 g) and the solvent was distilled away at 120–140 °C. After cooling, the residue was taken up in Et₂O and the precipitate was filtered off to give ethyl α -cyano-3,4,5-trimethoxybenzeneacetate sodium salt (VI, 105.00 g) as pale brown crystals.

MeI (128.00 g) was added to a solution of the above crystals in EtOH (1 l) and the mixture was refluxed for 1 h. The solvent was evaporated off under reduced pressure. The residue was diluted with water and extracted with Et₂O. The Et₂O layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure to give ethyl α -cyano-3,4,5-trimethoxy- α -methylbenzeneacetate (VII-1, 84.00 g) as a brown oil.

A solution of NaOH (8.20 g) in water (35 ml) was added to a solution of VII-1 (46.14 g) in MeOH (400 ml) and then the mixture was refluxed for 2 h. The solvent was evaporated off under reduced pressure. The residue was diluted with water and extracted with Et₂O. The Et₂O layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was distilled to give VIII-8 (31.50 g, 86% (from V-1)) as a pale yellow oil, bp 141–143 °C (5 mmHg). IR $\nu_{\text{max}}^{\text{liq}}$ cm⁻¹: 2240 (CN). ¹H-NMR (CDCl₃) δ : 1.64 (3H, d, *J* = 7.0 Hz, CH₃), 3.84 (3H, s, OCH₃), 3.88 (6H, s, 2 × OCH₃), 6.55 (2H, s, aromatic protons). High MS *m/z*: 221.1056 (M⁺) (Calcd for C₁₂H₁₅NO₃ 221.1052).

Compounds VIII-9–15 were also prepared in the same manner as described above. The yields and

a) Yield from benzeneacetonitriles (V). b) Ref. 2. c) High mass data. The upper values are calculated and the lower ones are those found. d) Ref. 3. e) Ref. 4. f) Ref. 5. g) Ref. 6. h) KBr disc.

characteristics of the products are listed in Table IV.

Preparation of α -(2-Formylethyl)benzeneacetonitriles (IV). α -(2-Formylethyl)- α -isopropyl-3,4,5-trimethoxybenzeneacetonitrile (IV-1)—IV-1 was prepared via α -(3,3-diethoxypropyl)- α -isopropyl-3,4,5-trimethoxybenzeneacetonitrile (IX-1) from VIII-1 by the method previously described.¹⁾

Compounds IV-2—5, 6²⁾ and 7—15 were also prepared in the same manner. The yields and characteristics of the products are listed in Table V.

α -(2-Formylethyl)-3,4,5-trimethoxybenzeneacetonitrile (IV-16)—NaNH₂ (1.69 g) was added to a solution of 3,4,5-trimethoxybenzeneacetonitrile (V-1, 10.00 g) in anhydrous THF (100 ml). The mixture was stirred at room temperature for 0.5 h, then 3-chloropropionaldehyde diethylacetal (7.27 ml) was added and the whole was refluxed for 1.5 h. The reaction mixture was then poured into ice water and extracted with Et₂O. The Et₂O layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure. The residue was purified on a column of Al₂O₃ using benzene as the eluent to give α -(3,3-diethoxypropyl)-3,4,5-trimethoxybenzeneacetonitrile (IX-16, 10.50 g) as a pale yellow oil.

A mixture of IX-16 (7.50 g), (COOH)₂·2H₂O (3.36 g), acetone (50 ml) and water (24 ml) was refluxed for 1.5 h.

a) Yield from α -alkylbenzeneacetonitriles (VIII). b) Ref. 1. c) Ref. 2. d) Yield from 3,4,5-trimethoxybenzeneacetonitrile (V-1).

The mixture was neutralized with aqueous K₂CO₃ and concentrated. The residue was diluted with water and extracted with Et₂O. The Et₂O layer was washed with water, dried over Na₂SO₄ and evaporated under reduced pressure to give IV-16 (5.40 g, 60% (from V-1)) as a yellow oil. IR $\nu_{\max}^{\text{liq}}$ cm⁻¹: 2230 (CN), 1725 (CO). ¹H-NMR (CDCl₃) δ : 3.84 (3H, s, OCH₃), 3.87 (6H, s, 2 $\times$ OCH₃), 6.53 (2H, s, aromatic protons), 9.80 (1H, s, CHO). High MS m/z : 263.1163 (M⁺) (Calcd for C₁₄H₁₇NO₄ 263.1158).

Pharmacology

Ca²⁺-Antagonistic Activity in Isolated Guinea-Pig Taenia Coli—The procedure was carried out in the manner previously described.¹⁾

Ca²⁺-Antagonistic Activity in Isolated Rabbit Thoracic Aorta—The procedure was performed according to the method of Campbell *et al.*⁷⁾ Briefly, the rabbit thoracic aorta was suspended under a resting tension of 3.0 g in an organ bath maintained at 37 $\pm$ 1 $^{\circ}$ C. After depolarization, the contraction induced by cumulative application of CaCl₂ was recorded isometrically. Compounds were applied 30 min before CaCl₂ application and their pA₂ values were calculated from dose ratios estimated graphically from the parallel shifts of concentration-response curves to CaCl₂.

Acknowledgement We wish to express our gratitude to Professor Toshio Fujita, Department of Agricultural Chemistry, Kyoto University, for encouragement and valuable suggestions. Thanks are also due to Mr. S. Kurata, Mr. H. Nishino and Miss Y. Shoken, Central Research Laboratory, Hokuriku Seiyaku Co., Ltd., for technical assistance.
