

Studies on Uricosuric Diuretics. I. Syntheses and Activities of Xanthonyloxyacetic Acids and Dihydrofuroxanthone-2-carboxylic Acids

Haruhiko SATO,* Takashi DAN, Etsuro ONUMA, Haruko TANAKA, and Hiroshi KOGA

Exploratory Research Laboratories, Chugai Pharmaceutical Co., Ltd., 135 Komakado 1-chome, Gotemba-shi, Shizuoka 412, Japan.

Received September 20, 1989

A series of substituted xanthonyloxyacetic acids (**5** and **6**), 1,2-dihydrofuro[2,3-*c*]xanthone-2-carboxylic acids (**7**) and 2,3-dihydrofuro[3,2-*b*]xanthone-2-carboxylic acids (**8**) were synthesized and tested for diuretic and uricosuric activities in rats. Most of the xanthon-3-yloxyacetic acids (**5**) and **7** showed potent diuretic activities, while **8** had lower activities. Uricosuric activities were found in **5c**, **5f**, **5k**, **5m**, **5o**, **5p**, **5r**, **7m**, **7p** and **8q**.

Keywords diuretic activity; uricosuric activity; xanthonyloxyacetic acid; 1,2-dihydrofuro[2,3-*c*]xanthone-2-carboxylic acid; 2,3-dihydrofuro[3,2-*b*]xanthone-2-carboxylic acid

Diuretic agents have been widely used as the drugs of first choice in the treatment of hypertension. However, they frequently cause hyperuricemia as a side effect. Furthermore, it is known that hypertension is often complicated by hyperuricemia. Many cases of hyperuricemia are believed to be due to disorders in the renal excretion of uric acid.¹⁾ Under these circumstances, there exists a strong need for the development of diuretics having uricosuric activity.

Tienilic acid (**1**)¹⁾ (Chart 1) is known to be a diuretic having uricosuric activity, but it has been withdrawn from the market in most countries because of the liver toxicity.

Attempts to develop uricosuric diuretics of a similar type led to the discovery of indacrinone (**2**),^{1,2)} a dihydrobenzofuran homolog (**3**),^{1,3)} and HP-522 (**4**)^{1,4)} (Chart 1). We noticed that these compounds had aryloxyacetic acid as a common structure and so aimed at discovering better uricosuric diuretics possessing the aryloxyacetic acid structure.

We selected tienilic acid (**1**) as the prototype. It is highly conceivable that the liver toxicity of **1** might be due to the metabolic change of the thienyl moiety in liver⁵⁾ and that the formation of metabolites might be reduced by changing the thienyl group to a phenyl group and constructing more hydrophilic ring systems. Under these conceptions, we designed aryloxyacetic acids having a variety of ring skeletons, but the substituents were generally limited to a halogen atom or methyl group from the reported results of structure-activity relationship studies of the aryloxyacetic acid diuretics.¹⁾

In this paper we describe the syntheses, and diuretic and uricosuric activities of xanthone derivatives (**5** and **6**) and furoxanthone derivatives (**7** and **8**) (Chart 2).

Chemistry

The xanthon-3-yloxyacetic acids (**5**) were synthesized by

the route shown in Chart 3.

Resorcinol dimethyl ethers (**10**) were treated with substituted 2-fluoro or 2-chlorobenzoyl chlorides (**9**) (1 eq) and aluminum chloride (1 eq) in 1,2-dichloroethane under the controlled conditions (see Experimental section) to afford 2-hydroxy-4-methoxybenzophenones (**11**), which were consecutively cyclized with ethanolic potassium hydroxide or sodium methoxide to the 3-methoxyxanthenes (**12**) in moderate to good overall yields (Table VI). Treatment of **12** with pyridine hydrochloride at 180–200 °C gave the corresponding 3-hydroxyxanthenes (**13**) (Table VII). Compounds **13** were converted into ethyl xanthon-3-yloxyacetates (**14**) by the reaction with ethyl bromoacetate in the presence of anhydrous potassium carbonate (Table VIII). The esters **14** were hydrolyzed with aqueous sodium hydroxide to give the desired carboxylic acids (**5**) (Table I). These last 2 steps could be improved by a one-pot procedure where **13** was treated with ethyl bromoacetate as described above, followed by treatment with hot aqueous sodium hydroxide, to give **5** (Table I).

In a similar way, the xanthon-2-yloxyacetic acids (**6**) were synthesized by the route starting from 2-substituted 1,4-dimethoxybenzenes (**16**) as shown in Chart 4 (Tables II, IX and X).

The synthetic pathways to the 1,2-dihydrofuro[2,3-*c*]xanthone-2-carboxylic acids (**7**) and the 2,3-dihydrofuro[3,2-*b*]xanthone-2-carboxylic acids (**8**) are illustrated in Chart 5.

The 3-hydroxyxanthenes (**13**) were smoothly alkylated with allyl bromide to give the 3-allyloxyxanthenes (**20**) (Table XI). Compounds **20** were heated in *N,N*-dimethylaniline or in *N,N*-diethylaniline to afford the rearrangement of products 4-allyl-3-hydroxyxanthenes (**21**) when the 4 position of **20** was not substituted, or 2-allyl isomers (**22**) when **20** had a methyl group at the 4 position, and both **21** and **22** when **20** had chlorine at the 4 position

Chart 1

(Table XII). Oxidation of **21** and **22** with *m*-chloroperbenzoic acid (*m*-CPBA) gave the corresponding epoxide intermediates, which immediately cyclized to the dihydrobenzofurans **23** and **24**, respectively (Tables XIII and

XIV). The Jones oxidation of **23** and **24** yielded the desired carboxylic acids **7** and **8**, respectively (Tables III and IV).

Physico-chemical properties of the carboxylic acids **5**–**8** synthesized are shown in Tables I–IV.

Biological Activities

Diuretic and Uricosuric Activities Diuretic and uricosuric activities in rats of the compounds **5**–**8** are shown in Table V. Tienilic acid and indacrinone were used as the reference agents. Tienilic acid showed moderate diuretic and uricosuric activities, and indacrinone showed potent diuretic and uricosuric activities.

The diuretic activities of most of the xanthon-3- and xanthon-2-yloxyacetic acids (**5** and **6**) were comparable to, or more potent than, that of tienilic acid. The uricosuric activities of compounds **5** having a substituent at the 2 position were comparatively potent. Among these compounds, **5k**, **5m**, **5p** and **5r** had relatively well-balanced diuretic and uricosuric activities.

The diuretic activities of compounds **7** were generally more potent than those of the corresponding compounds **5**. On the other hand, the diuretic activities of compounds **8**, except for **8q**, were comparable to, or less potent than, those of the corresponding compounds **5**. Compounds **7m**, **7p** and **8q** possessed uricosuric activity. Among compounds

a) Test compounds were administered at 100 mg/kg *p.o.* to Wistar-Imamichi rats and the activities are shown as relative activity (%) to the control (100%). Details of the test protocol are described in the experimental section. b) Student's *t*-test: c) $p < 0.05$, d) $p < 0.01$, e) $p < 0.001$ vs. control; values without marks are not statistically significant. f) Not tested.

7 and **8**, **7m**, **7p** and **8q** had both diuretic and uricosuric activities.

As a result, compound **5m** was found to possess diuretic and uricosuric activities more potent than those of tienilic acid and balanced diuretic and uricosuric activities better than those of indacrinone.

Experimental

Melting points were determined on a Yanagimoto micro melting point apparatus and are uncorrected. Infrared (IR) spectra were taken on a Hitachi 270-30 spectrophotometer. Nuclear magnetic resonance (NMR) spectra were recorded on a Hitachi R-24B spectrometer using tetramethylsilane as an internal standard. Chemical shifts are given in ppm and coupling constants are given in Hertz. The following abbreviations are used: s=singlet, d=doublet, t=triplet, q=quartet, dd=doublet of doublets, br=broad. For column chromatography, Wakogel C-200 (Wako, 0.074—0.149 mm) was used.

3-Methoxyxanthones (12) A typical example is given to illustrate the general procedure.

2-Chloro-3-methoxyxanthone (12m): 2-Fluorobenzoyl chloride (7.9 g, 0.05 mol) and 4-chlororesorcinol dimethyl ether (8.6 g, 0.05 mol) were dissolved in 1,2-dichloroethane (120 ml) and the solution was cooled to 0—5°C. AlCl₃ (6.7 g, 0.05 mol) was added portionwise to the solution, and the resulting mixture was warmed to room temperature over a 3 h period and then refluxed for 1 h. After cooling, ice-water and conc. HCl were added to the reaction mixture, and the whole mixture was stirred for 30 min. The slurry formed was extracted with Et₂O. The extract was washed with H₂O, dried over Na₂SO₄, and evaporated to give 14 g of 4-chloro-2-(2-fluorobenzoyl)-5-methoxyphenol (**11m**) as crystals (CH₂Cl₂-EtOH), mp 135—136°C. *Anal.* Calcd for C₁₄H₁₀ClFO₃: C, 59.91; H, 3.59. Found: C, 59.87; H, 3.57. MS *m/z*: 280 (M⁺), 279. IR (KBr) cm⁻¹: 3460 (OH), 1628 (C=O). NMR (CDCl₃) δ: 3.94 (3H, s, O-CH₃), 6.53 (1H, s, 6-H), 6.97—7.74 (5H, m, arom. H), 12.46 (1H, s, OH).

To a solution of the crude **11m** (14 g) in EtOH (200 ml), 28% NaOMe-MeOH (19.3 g, 0.1 mol) was added and the mixture was refluxed for 1 h. The product crystallized upon the addition of H₂O was collected by filtration and washed successively with H₂O and EtOH to give **12m** (11.9 g, overall 92%) as crystals (CH₂Cl₂-EtOH), mp 195—197°C. *Anal.* Calcd for C₁₄H₉ClO₃: C, 64.51; H, 3.48. Found: C, 64.52; H, 3.54. MS *m/z*: 260 (M⁺). IR (KBr) cm⁻¹: 1644 (C=O). NMR (CDCl₃) δ: 3.93 (3H, s, O-CH₃), 6.78 (1H, s, 4-H), 7.11—7.82 (3H, m, arom. H), 8.07—8.32 (1H, m, 8-H), 8.13 (1H, s, 1-H).

Other compounds **12** in Table VI were similarly prepared.

3-Hydroxyxanthones (13) A typical example is given to illustrate the general procedure.

2-Chloro-3-hydroxyxanthone (13m): Compound **12m** (10 g, 0.038 mol) was heated with pyridine hydrochloride (60 g) at 180—200°C for 2 h and

then cooled to 70 °C. The product crystallized upon the addition of H₂O was collected by filtration and washed with H₂O to give **13m** (9.3 g, 98%) as crystals (AcOEt-hexane), mp > 310 °C. *Anal.* Calcd for C₁₃H₇ClO₃: C, 63.31; H, 2.86. Found: C, 63.31; H, 2.85. MS *m/z*: 246 (M⁺). IR (KBr) cm⁻¹: 3160 (OH), 1644 (C=O). NMR (CDCl₃-DMSO-*d*₆) δ: 7.01 (1H, s, 4-H), 7.15—8.00 (3H, m, arom. H), 8.00—8.34 (1H, m, 8-H), 8.04 (1H, s, 1-H), 11.40 (1H, brs, OH).

Other compounds **13** in Table VII were similarly prepared.

Ethyl Xanthon-3-yloxyacetates (14) A typical example is given to illustrate the general procedure.

Ethyl 4-Chloro-8-fluoroxanthon-3-yloxyacetate (14c): A mixture of 4-chloro-8-fluoro-3-hydroxyxanthone (**13c**) (2.6 g, 9.8 mmol), ethyl bromoacetate (3.3 g, 20 mmol) and anhyd. K₂CO₃ (2.8 g, 20 mmol) in dimethylformamide (DMF) (40 ml) was heated at 60—70 °C for 4 h. After cooling, H₂O was added to the mixture and the resulting crystals were collected by filtration, washed with H₂O and dried. Recrystallization gave **14c** (3.4 g, 99%) as crystals (EtOH), mp 188—190 °C. *Anal.* Calcd for C₁₇H₁₂ClFO₅: C, 58.22; H, 3.45. Found: C, 58.11; H, 3.41. MS *m/z*: 350 (M⁺), 315. IR (KBr) cm⁻¹: 1738 (COOEt), 1668 (C=O). NMR (CDCl₃) δ: 1.28 (3H, t, *J*=7.0 Hz, CH₃), 4.23 (2H, q, *J*=7.0 Hz, O-CH₂-CH₃), 4.78 (2H, s, O-CH₂), 6.77 (1H, d, *J*=9.0 Hz, 2-H), 6.76—7.80 (3H, m, arom. H), 8.06 (1H, d, *J*=9.0 Hz, 1-H).

Other compounds **14** in Table VIII were similarly prepared.

Xanthon-3-yloxyacetic Acids (5) Typical examples are given to illustrate the general procedure.

4-Chloro-8-fluoroxanthon-3-yloxyacetic Acid (5c): A mixture of **14c** (3.3 g, 9.4 mmol) and NaOH (1.9 g, 47.5 mmol) in EtOH (10 ml) and H₂O (100 ml) was refluxed for 30 min. After cooling, the mixture was acidified with HCl and the deposited crystals were collected by filtration, washed with H₂O and dried. Recrystallization gave **5c** (2.5 g, 82%) as crystals (DMF-EtOH), mp 301—303 °C. *Anal.* Calcd for C₁₅H₈ClFO₅: C, 55.83; H, 2.50. Found: C, 55.76; H, 2.45. MS *m/z*: 322 (M⁺). IR (KBr) cm⁻¹: 1736 (COOH), 1666 (C=O). NMR (CDCl₃-DMSO-*d*₆) δ: 4.85 (2H, s, O-CH₂), 6.98 (1H, d, *J*=9.0 Hz, 2-H), 6.96—7.85 (3H, m, arom. H), 8.02 (1H, d, *J*=9.0 Hz, 1-H).

2-Chloroxanthon-3-yloxyacetic Acid (5m): A mixture of **13m** (1.5 g, 6.1 mmol), ethyl bromoacetate (3.1 g, 18.6 mmol) and anhyd. K₂CO₃ (2.5 g, 18.3 mmol) in DMF (40 ml) was stirred at 65—75 °C for 2 h. After cooling the mixture, 1 N NaOH (100 ml) was added, and the mixture was stirred at 80—90 °C for 30 min. After cooling, the mixture was acidified with HCl and the deposited crystals were collected by filtration, washed with H₂O and dried to give **5m** (1.5 g, 81%) as crystals (DMF-EtOH-H₂O), mp 248—249 °C. *Anal.* Calcd for C₁₅H₈ClO₅: C, 59.13; H, 2.98. Found: C, 59.00; H, 3.00. MS *m/z*: 304 (M⁺). IR (KBr) cm⁻¹: 1724

(COOH), 1664 (C=O). NMR (CDCl₃–DMSO-*d*₆) δ : 4.86 (2H, s, O–CH₂), 7.02 (1H, s, 4-H), 7.18–7.91 (3H, m, arom. H), 8.00–8.26 (1H, m, 8-H), 8.10 (1H, s, 1-H).

Other compounds 5 in Table I were similarly prepared.

2-Methoxyxanthenes (18) A typical example is given to illustrate the general procedure.

3-Chloro-2-methoxyxanthone (18b): 2-Fluorobenzoyl chloride (7.9 g, 0.05 mol) and 2-chloro-1,4-dimethoxybenzene (8.6 g, 0.05 mol) were dissolved in 1,2-dichloroethane (120 ml) and cooled to 0–5 °C. AlCl₃ (6.7 g, 0.05 mol) was added portionwise to the solution, and the resulting mixture was warmed to room temperature over a 3 h period and then refluxed for 1 h. Ice-water and conc. HCl were added to the reaction mixture and the whole mixture was stirred for 30 min. The slurry formed was extracted with Et₂O, and the extract was washed with H₂O, dried over Na₂SO₄, and evaporated to give 14 g of 3-chloro-6-(2-fluorobenzoyl)-4-methoxyphenol (17b). To a solution of crude 17b (14 g) in EtOH (200 ml), 28% NaOMe–MeOH (19.3 g, 0.1 mol) was added and the mixture was refluxed for 1 h. The product crystallized upon the addition of H₂O was collected by filtration and washed successively with H₂O and EtOH to give 18b (8.4 g, 65%) as crystals (CH₂Cl₂–EtOH), mp 176–177 °C. Anal. Calcd for C₁₄H₉ClO₃: C, 64.51; H, 3.48. Found: C, 64.21; H, 3.44. MS *m/z*: 260 (M⁺), 245. IR (KBr)

cm^{−1}: 1656 (C=O). NMR (CDCl₃) δ : 3.93 (3H, s, O–CH₃), 7.08–7.78 (3H, m, arom. H), 7.41 (1H, s, 4-H), 7.58 (1H, s, 1-H), 8.07–8.33 (1H, m, 8-H).

Other compounds 18 in Table IX were similarly prepared.

2-Hydroxyxanthenes (19) A typical example is given to illustrate the general procedure.

3-Chloro-2-hydroxyxanthone (19b): Compound 18b (8.0 g, 0.031 mol) was heated with pyridine hydrochloride (50 g) at 180–190 °C for 2 h and then cooled to 70 °C. The product crystallized upon the addition of H₂O was collected by filtration and washed with H₂O to give 19b (6.9 g, 91%) as crystals (AcOEt–hexane), mp 285–286 °C. Anal. Calcd for C₁₃H₇ClO₃: C, 63.31; H, 2.86. Found: C, 63.40; H, 2.85. MS *m/z*: 246 (M⁺). IR (KBr) cm^{−1}: 3304 (OH), 1656 (C=O). NMR (CDCl₃–DMSO-*d*₆) δ : 3.14 (1H, brs, OH), 7.21–7.85 (3H, m, arom. H), 7.21 (1H, brs, OH), 8.00 (1H, s, 1-H).

2-Allyl-3-hydroxy-4-methylxanthone (22q): A solution of 3-allyloxy-4-methylxanthone (20q) (8.0 g, 0.03 mol) in *N,N*-dimethylaniline (100 ml) was refluxed for 29 h. After cooling, the mixture was acidified with conc. HCl and the deposited crystals were collected by filtration, washed with H₂O and dried. Recrystallization gave 22q (5.6 g, 70%) as crystals (EtOH), mp 199—201 °C. *Anal.* Calcd for C₁₇H₁₄O₃: C, 76.67; H, 5.30. Found: C, 76.89; H, 5.34. MS *m/z*: 266 (M⁺), 265, 251. IR (KBr) cm⁻¹: 3388 (OH), 1640, 1606. NMR (CDCl₃-DMSO-*d*₆) δ: 2.41 (3H, s, CH₃), 3.48 (2H, brd, *J*=6.0 Hz, Ph-CH₂), 4.85—5.35 (2H, m, -CH=CH₂), 5.70—6.42 (1H, m, -CH=CH₂), 7.10—7.80 (3H, m, arom. Other compounds 21, 22 in Table XII were similarly prepared.

1,2-Dihydro-2-hydroxymethylfuro[2,3-*c*]xanthenes (23) A typical example is given to illustrate the general procedure.

4-Chloro-1,2-dihydro-2-hydroxymethylfuro[2,3-*c*]xanthone (23m): To a stirred solution of 21m (2.87 g, 0.01 mol) in CHCl₃ (300 ml), *m*-CPBA (3.45 g, 0.02 mol) was added in small portions at room temperature. The solution was stirred for 8 h and left to stand overnight. After addition of an aq. solution of NaOH to the solution, the mixture was extracted with CHCl₃. The CHCl₃ layer was dried over Na₂SO₄ and evaporated to give 23m (2.5 g, 83%) as crystals (EtOH), mp 184—185 °C. *Anal.* Calcd for C₁₆H₁₁ClO₄: C, 63.48; H, 3.66. Found: C, 63.50; H, 3.76. Other compounds 23 in Table XIII were similarly prepared.

2,3-Dihydro-2-hydroxymethylfuro[3,2-*b*]xanthenes (24) A typical example is given to illustrate the general procedure.

2,3-Dihydro-2-hydroxymethyl-11-methylfuro[3,2-*b*]xanthone (24q): To a stirred solution of 22q (1.1 g, 4.1 mmol) in CH₂Cl₂ (150 ml), *m*-CPBA (0.95 g, 5.5 mmol) was added in small portions at room temperature. The solution was stirred for 13 h and then refluxed for 7 h. After addition of an aq. solution of NaOH to the solution, the mixture was extracted with CH₂Cl₂. The CH₂Cl₂ layer was dried over Na₂SO₄ and evaporated to give 24q (1.0 g, 85%) as crystals (EtOH), mp 242—243 °C (EtOH). *Anal.* Calcd for C₁₇H₁₄O₄: C, 72.33; H, 5.00. Found: C, 72.47; H, 5.10. MS m/z : 282 (M⁺), 251. IR (KBr) cm⁻¹: 3392 (OH), 1640 (C=O), 1614. NMR (CDCl₃-DMSO-*d*₆) δ : 2.31 (3H, s, CH₃), 3.20 (2H, brd, $J=8.0$ Hz, Ph-CH₂), 3.53—3.85 (2H, m, CH₂OH), 4.67—5.17 (1H, m, Ph-CH₂-CH), 4.81 (1H, brs, OH), 7.07—7.93 (3H, m, arom. H), 7.77 (1H, s, 4-H), 8.00—8.22 (1H, m, 6-H).

Other compounds 24 in Table XIV were similarly prepared.

1,2-Dihydrofuro[2,3-*c*]xanthone-2-carboxylic Acids (7) A typical example is given to illustrate the general procedure.

4-Chloro-1,2-dihydrofuro[2,3-*c*]xanthone-2-carboxylic Acid (7m): To a stirred solution of 23m (2.0 g, 6.6 mmol) in acetone (250 ml), a mixture of CrO₃ (3.3 g, 33 mmol), H₂O (17 ml) and conc. H₂SO₄ (5.0 g) was added at room temperature. The resulting mixture was stirred for 10 h and left to stand overnight. Iso-PrOH (20 ml) was added and the mixture was stirred for 1 h, and then filtered. The filtrate was evaporated to dryness *in vacuo*.

After addition of H₂O to the residue, the crystals formed were collected by filtration, washed with H₂O and dried. Recrystallization from DMF-EtOH gave 7m (1.4 g, 67%) as crystals (DMF-H₂O), mp 300—302 °C. *Anal.* Calcd for C₁₆H₉ClO₅: C, 60.68; H, 2.86. Found: C, 60.51; H, 2.92. MS m/z : 316 (M⁺). IR (KBr) cm⁻¹: 3460 (OH), 1756 (COOH). NMR (CDCl₃-DMSO-*d*₆) δ : 3.75 (1H, d, $J=7.8$ Hz, Ph-CH₂), 3.80 (1H, d, $J=9.6$ Hz, Ph-CH₂), 4.80 (1H, brs, COOH), 5.50 (1H, dd, $J=9.6, 7.8$ Hz, Ph-CH₂-CH), 7.16—7.88 (3H, m, arom. H), 8.04 (1H, s, 5-H), 8.08—8.38 (1H, m, 7-H).

Other compounds 7 in Table III were similarly prepared.

2,3-Dihydrofuro[3,2-*b*]xanthone-2-carboxylic Acids (8) A typical example is given to illustrate the general procedure.

2,3-Dihydro-11-methylfuro[3,2-*b*]xanthone-2-carboxylic Acid (8q): To a stirred solution of 24q (4.45 g, 15.8 mmol) in acetone (1.5 l), a mixture of CrO₃ (7.9 g, 79 mmol), H₂O (40 ml) and conc. H₂SO₄ (12.0 g) was added at room temperature. The resulting mixture was stirred for 9 h and left to stand overnight. Iso-PrOH (20 ml) was added and the mixture was stirred for 1 h, and then filtered. The filtrate was evaporated to dryness *in vacuo*. After addition of H₂O to the residue, the crystals formed were collected by filtration, washed with H₂O and dried. Recrystallization gave 8q (3.1 g, 66%) as crystals (DMF-H₂O), mp 296—299 °C. *Anal.* Calcd for C₁₇H₁₂O₅: C, 68.92; H, 4.08. Found: C, 68.79; H, 4.15. MS m/z : 296 (M⁺). IR (KBr) cm⁻¹: 3460 (OH), 1730 (COOH), 1614. NMR (CDCl₃-DMSO-*d*₆) δ : 2.36 (3H, s, CH₃), 3.45 (1H, d, $J=7.8$ Hz, Ph-CH₂), 3.53 (1H, d, $J=9.6$ Hz, Ph-CH₂), 5.23 (1H, dd, $J=9.6, 7.8$ Hz, Ph-CH₂-CH), 7.01—7.90 (3H, m, arom. H), 7.44 (1H, brs, COOH), 7.79 (1H, s, 4-H), 8.00—8.22 (1H, m, 6-H).

Other compounds 8 in Table IV were similarly prepared.

Diuretic and Uricosuric Effects on Rats¹⁶⁾ Seven-week-old Wistar-Imamichi rats that had been fasted for 24 h were divided in groups of five heads so that the animals in each group would excrete almost the same amount of urine. After forced urination, the rats were orally administered the test compounds that were suspended in physiological saline containing 3% gum arabic in a dose volume of 25 ml per kg of body weight. The suspensions were administered typically in an amount of 100 mg/kg. The control rats were given only physiological saline containing 3% gum arabic. The animals were housed in separate metabolic cages and the urine excreted from each animal was collected over a period of 6 h following the administration of the test compounds or physiological saline after complete starvation. The urine volume was directly read on a measuring cylinder after forced urination therinto, and the amount of urine per kg of body weight was calculated. The amount of uric acid excreted in the urine was determined by the uricase-catalase method.

Acknowledgement The authors are indebted to Drs. S. Hata, B. Aoki, I. Matsunaga, T. Mori, and M. Akima for valuable suggestions throughout this work. We are also grateful to Dr. M. Hamana, Professor emeritus of Kyushu University, for helpful discussions.
