Received October 25, 1995

**Key Words:** Dimetallations / Insertions / Rhenium / Isothiocyanates

Molecules containing dimetallated hydrocarbyl groupings are of great chemical interest<sup>[1–3]</sup>. These groupings often represent intermediates in important catalytic processes<sup>[4]</sup>. Recently, we have shown that substituted dimetallated olefins can be formed by alkyne insertion into the metal–metal bonds of certain dinuclear complexes<sup>[2,5]</sup>. Complexes having dimetallated hydrocarbyl groups combined with heteroatoms

are quite rare<sup>[6]</sup>. Herein is described the formation of a dimetallathioimide grouping by the insertion of an organic isothiocyanate into an unsupported metal–metal bond. Organic isothiocyanates are useful reagents in organic synthesis<sup>[7]</sup>, but the organometallic chemistry of these molecules is not yet well developed<sup>[8]</sup>.

The reaction of  $\text{EtO}_2\text{CN}=\text{C}=\text{S}$  with  $\text{Re}_2(\text{CO})_9(\text{NCMe})$  (**1**) yielded three products:  $\text{Re}(\text{CO})_4[\text{s-trans-}\mu\text{-C,S-EtO}_2\text{CN}=\text{CS}]\text{Re}(\text{CO})_5$  (**2**),  $\text{Re}(\text{CO})_4[\text{s-trans-}\mu\text{-C,S,N-EtO}_2\text{CN}=\text{CS}]\text{Re}(\text{CO})_4$  (**3**), and  $\text{Re}(\text{CO})_4[\mu\text{-C,N,S}_2\text{-(EtO}_2\text{C)}_2\text{N}=\text{CNCN}]\text{Re}(\text{CO})_4$  (**4**) as shown by a combination of IR,  $^1\text{H-NMR}$  and single crystal X-ray diffraction analyses (see Experimental and ref.<sup>[8]</sup>). The molecular structures of **2** and **3** were established by single crystal X-ray diffraction analyses (see Figures 1 and 2). Compound **2** can be viewed as a dirheniathioimide complex with an *s-trans* conformation at the C–S bond.

It was formed by the insertion of the isothiocyanate molecule into the rhenium–rhenium bond in **1**, although the mechanism of this insertion has not yet been established. An  $\text{Re}(\text{CO})_5$  group is bonded to the sulfur atom, and the carbon atom C(1) and the oxygen atom of the carbonyl group are coordinated to a  $\text{Re}(\text{CO})_4$  group to form a five membered ring. The nitrogen atom is not bonded to the  $\text{Re}(\text{CO})_5$  group [ $\text{Re}(2)\cdots\text{N} = 3.423(7)$ ]. Compound **3** was derived from **2** by the loss of CO from the  $\text{Re}(\text{CO})_5$  and coordination of the lone pair of electrons on the nitrogen atom to the rhenium atom. The  $\text{Re}(2)\text{--N}$  distance was reduced to 2.172(9) Å. Compound **3** was obtained independently in 81% yield by refluxing solutions of **2** in hexane for 2 h.

The molecular structure of compound **4** was also established crystallographically, and its structure is shown in Figure 3. Compound **4** was formed by the addition and coupling of two molecules of  $\text{EtO}_2\text{C-N}=\text{C}=\text{S}$  to **1**. Compound **4** contains a novel bridging  $\text{S}_2\text{CNCN}(\text{CO}_2\text{Et})_2$  grouping inserted between two  $\text{Re}(\text{CO})_4$  groups. The central carbon C(1) contains two sulfur atoms each of which

Figure 1. An ORTEP diagram of  $\text{Re}(\text{CO})_4[\text{s-trans-}\mu\text{-C,S-EtO}_2\text{CN}=\text{CS}]\text{Re}(\text{CO})_5$  (**2**) showing 50% probability thermal ellipsoids; selected interatomic distances [Å] and angles [°] are:  $\text{Re}(1)\text{--O}(1) = 2.148(6)$ ,  $\text{Re}(1)\text{--C}(1) = 2.146(9)$ ,  $\text{Re}(2)\text{--S} = 2.497(3)$ ,  $\text{Re}(2)\cdots\text{N} = 3.423(7)$ ,  $\text{C}(1)\text{--S} = 1.720(9)$ ,  $\text{C}(1)\text{--N} = 1.33(1)$ ,  $\text{C}(2)\text{--N} = 1.35(1)$ ;  $\text{N}\text{--C}(1)\text{--S} = 118.8(7)$ ,  $\text{Re}(2)\text{--S}\text{--C}(1) = 109.9(3)$ ,  $\text{Re}(1)\text{--C}(1)\text{--S} = 123.0(5)$

is bound to a different rhenium atom [ $\text{C}(1)\text{--S}(1) = 1.68(1)$  Å,  $\text{C}(1)\text{--S}(2) = 1.67(1)$  Å,  $\text{Re}(1)\text{--S}(2) = 2.472(3)$  Å and  $\text{Re}(2)\text{--S}(1) = 2.516(3)$  Å]. Nitrogen N(1) is bonded to Re(2) to form a four membered  $\text{Re}\text{--N}\text{--C}\text{--S}$  ring. The bonding in **4** can be represented by the resonance structures **4a** or the zwitterion **4b**. On the basis of observed bond distances, the latter seems to be the more appropriate structure. N(1) is also bonded to the carbon C(2) that can be viewed as a carbene center (**4a** form) [ $\text{Re}(1)\text{--C}(2) = 2.13(1)$  Å], and there is a  $\text{N}(\text{CO}_2\text{Et})_2$  group bonded to N(2) [ $\text{C}(2)\text{--N}(2) = 1.47(1)$  Å].

The  $\text{S}_2\text{CNCN}(\text{CO}_2\text{Et})_2$  grouping appears to be derived from two molecules of  $\text{EtO}_2\text{C-N}=\text{C}=\text{S}$ . It seems that the sulfur atom from

An ORTEP diagram of  $\text{Re}(\text{CO})_4[\mu\text{-C,N,S}_2\text{-(EtO}_2\text{C)}_2\text{N=CNCS}_2]\text{Re}(\text{CO})_5$  (**4**) showing 50% probability thermal ellipsoids; selected interatomic distances [Å] and angles [°] are:  $\text{Re}(1)\text{--S}(2) = 2.472(3)$ ,  $\text{Re}(1)\text{--C}(2) = 2.13(1)$ ,  $\text{Re}(2)\text{--S}(1) = 2.516(3)$ ,  $\text{Re}(2)\text{--N}(1) = 2.201(8)$ ,  $\text{C}(1)\text{--S}(1) = 1.68(1)$ ,  $\text{C}(1)\text{--S}(2) = 1.67(1)$ ,  $\text{C}(1)\text{--N}(1) = 1.43(1)$ ,  $\text{C}(2)\text{--N}(1) = 1.28(1)$ ,  $\text{C}(2)\text{--N}(2) = 1.47(1)$ ;  $\text{S}(1)\text{--C}(1)\text{--S}(2) = 128.5(7)$ ,  $\text{N}(1)\text{--C}(1)\text{--S}(1) = 109.9(7)$ ,  $\text{N}(1)\text{--C}(1)\text{--S}(2) = 121.6(8)$ ,  $\text{Re}(2)\text{--N}(1)\text{--C}(2) = 140.7(8)$ ,  $\text{Re}(1)\text{--N}(1)\text{--C}(1) = 101.6(6)$

one isothiocyanate molecule was transferred to the carbon of the other isothiocyanate and that the  $\text{CO}_2\text{Et}$  grouping from the second

isothiocyanate was transferred back to the nitrogen atom of the first isothiocyanate. The coupling of isothiocyanates in the presence of metal atoms is well known<sup>[8,9]</sup>. Recently, Cowie has reported an example of a carboxylate shift in the addition of isothiocyanates,  $\text{R--N=C=S}$ , to a bridging  $\text{EtO}_2\text{C--N=C=S}$  ligand<sup>[6a]</sup>.

It can be anticipated that the dimetalated thioimides such as **2** and **3** can be further modified by coupling to other unsaturated organic molecules to yield new ligands and new organic molecules<sup>[2]</sup>. The insertion of heterocumulenes into metal–metal bonds may prove to be a general method for the activation of these molecules.

## Experimental

A solution containing 20.0 mg (0.030 mmol) of  $\text{Re}_2(\text{CO})_9\text{-(MeCN)}$ , and 10.6  $\mu\text{l}$  (0.09 mmol) of  $\text{EtO}_2\text{CNCS}$  in 40 ml of hexane was heated to reflux for 1 h, 50 min. The products were separated by TLC on silica gel using a hexane:  $\text{CH}_2\text{Cl}_2$ , 9:2, solvent mixture to yield in order of elution: 0.4 mg of  $\text{Re}_2(\text{CO})_{10}$ ; 8.8 mg of colorless **3**, 40% yield; 1.5 mg of **2**, 7% yield; 0.5 mg of  $\text{Re}_2(\text{CO})_9\text{-(MeCN)}$ ; and 4.3 mg of red-orange **4**, 17% yield. Spectral data for **2**: IR (hexane):  $\tilde{\nu}_{\text{CO}}$  ( $\text{cm}^{-1}$ ) = 2139 (w), 2097 (w), 2076 (w), 2037 (vs), 2034 (vs), 1995 (vs), 1991 (vs), 1953 (s), 1524 (w, br.).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  = 4.36 (q,  $^3J_{\text{H--H}} = 7.1$  Hz, 2H,  $\text{OCH}_2\text{Me}$ ), 1.36 (t,  $^3J_{\text{H--H}} = 7.1$  Hz, 3H,  $\text{CH}_3$ ); for **3**: IR (hexane):  $\tilde{\nu}_{\text{CO}}$  ( $\text{cm}^{-1}$ ) = 2099 (m), 2011 (vs), 1993 (s), 1964 (s), 1957 (s), 1554 (w, br.).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  = 4.34 (q,  $^3J_{\text{H--H}} = 7.2$  Hz, 2H,  $\text{OCH}_2\text{Me}$ ), 1.40 (t,  $^3J_{\text{H--H}} = 7.1$  Hz, 3H,  $\text{CH}_3$ ); for **4**: IR (hexane):  $\tilde{\nu}_{\text{CO}}$  ( $\text{cm}^{-1}$ ) = 2104 (m), 2028 (s), 2016 (s), 1998 (s), 1969 (s), 1964 (s), 1956 (sh, w), 1780 (w, br.).  $^1\text{H}$  NMR ( $\text{CDCl}_3$ ):  $\delta$  = 4.40 (q,  $^3J_{\text{H--H}} = 7.1$  Hz, 4H,  $\text{OCH}_2\text{Me}$ ), 1.37 (t,  $^3J_{\text{H--H}} = 7.1$  Hz, 6H,  $\text{CH}_3$ ). — Analytical data: **2**:  $\text{C}_{13}\text{H}_{15}\text{NO}_{11}\text{Re}_2\text{S}$  (755.7): calcd. C 20.66, H 0.67, N 1.85; found: C 20.79, H 0.57, N 1.85; **3**:  $\text{C}_{12}\text{H}_5\text{NO}_{10}\text{Re}_2\text{S}$  (727.7): calcd. C 19.81, H 0.69, N 1.92; found: C 19.70, H 0.89, N 1.91; **4**:  $\text{C}_{16}\text{H}_{10}\text{N}_2\text{O}_{12}\text{Re}_2\text{S}_2$  (858.8): calcd. C 22.38, H 1.17, N 3.26; found: C 22.24, H 1.00, N 3.19.

**X-ray Structure Analyses:** For **2**:  $\text{Re}_2\text{SO}_{11}\text{NC}_{13}\text{H}_5$ ,  $M_r = 755.66$ , triclinic, space group =  $P\bar{1}$ ,  $a = 10.476(2)$  Å,  $b = 14.386(2)$  Å,  $c = 6.865(1)$  Å,  $\alpha = 91.68(1)^\circ$ ,  $\beta = 92.19(1)^\circ$ ,  $\gamma = 109.30(1)^\circ$ ,  $Z = 2$ ,  $\mu(\text{MoK}\alpha) = 125.75$   $\text{cm}^{-1}$ ,  $T = 293$  K, 2252 independent reflections,  $R = 0.027$ ,  $R_w = 0.034$ ; for **3**:  $\text{Re}_2\text{SO}_{10}\text{NC}_{12}\text{H}_5$ ,  $M_r = 727.65$ , triclinic, space group =  $P\bar{1}$ ,  $a = 10.132(2)$  Å,  $b = 10.417(2)$  Å,  $c = 9.994(1)$  Å,  $\alpha = 98.06(1)^\circ$ ,  $\beta = 94.38(1)^\circ$ ,  $\gamma = 62.03(1)^\circ$ ,  $Z = 2$ ,  $\mu(\text{MoK}\alpha) = 132.80$   $\text{cm}^{-1}$ ,  $T = 293$  K, 2087 independent reflections,  $R = 0.035$ ,  $R_w = 0.042$ ; for **4**:  $\text{Re}_2\text{S}_2\text{O}_{12}\text{N}_2\text{C}_{16}\text{H}_{10}$ ,  $M_r = 858.80$ , triclinic, space group =  $P\bar{1}$ ,  $a = 10.703(3)$  Å,  $b = 12.365(4)$  Å,  $c = 10.271(3)$  Å,  $\alpha = 108.46(2)^\circ$ ,  $\beta = 109.44(2)^\circ$ ,  $\gamma = 89.84(3)^\circ$ ,  $Z = 2$ ,  $\mu(\text{MoK}\alpha) = 102.52$   $\text{cm}^{-1}$ ,  $T = 293$  K, 2825 independent reflections,  $R = 0.034$ ,  $R_w = 0.036$ . Empirical absorption corrections (psi scans). All structures were solved by direct methods (MITHRIL). Further details of the crystal structure analyses are available from the Fachinformationszentrum Karlsruhe, D-76344 Eggenstein-Leopoldshafen (Germany) on quoting the depository number CSD-59264.
