Annulenoannulenes...

... consist of multi-annulated aromatic annulenes. In their Communication on page 13320 ff. N. Aratani, H. Shinokubo, A. Osuka, and J. Song report the efficient synthesis of *meso*-to-*meso* 2,5-pyrrolylene-bridged porphyrin nanorings. The trimer (the crystal structure is on the top left) holds a cyclic hexapyrrolic unit in its central part, to form the formal porphyrinohexaphyrin. The picture represents the Rokkakudo Temple located in central Kyoto (Japan). The main hall is composed of the fused hexagonal and quadrangular buildings (the name rokkaku refers to the hexagonal shape of the temple).
