

OXIDATIVE ADDITION OF ORGANIC ACIDS TO DIOXYGEN COMPLEXES  
AND FORMATION OF HYDROGEN PEROXIDE

Shigeaki MUTO, Hajime OGATA, and Yoshio KAMIYA

Oxidative addition reactions of organic acids to dioxygen complexes are investigated. In the case of  $\text{Pt}(\text{PPh}_3)_2\text{O}_2$ , hydrogen peroxide is obtained in as much as 70% yield with a platinum carboxylato complex,  $\text{Pt}(\text{PPh}_3)_2(\text{OCOCH}_2\text{Cl})_2$ . The effect of  $\text{pK}_a$  of the substrates on the oxidative addition of the dioxygen complexes is also examined.

Although the coordinated dioxygen to a metal complex is reported to be peroxidic on the basis of increased O-O bond length,<sup>1,2)</sup> and Vaska<sup>3)</sup> and Wilke<sup>4)</sup> have briefly mentioned the formation of  $\text{H}_2\text{O}_2$  upon protonation of  $\text{IrCl}(\text{CO})(\text{PPh}_3)_2\text{O}_2$  and  $\text{Ni}(\text{PPh}_3)_2\text{O}_2$  ( $\text{PPh}_3$ =triphenylphosphine), respectively, the determination of reaction products and the elucidation of protonation mechanism still remain unclarified. We wish to report that the oxidative addition of organic acids to dioxygen complexes results in the selective formation of  $\text{H}_2\text{O}_2$  and a platinum carboxylato complex.

All the dioxygen complexes used were prepared according to the literatures.<sup>5)</sup> The reactions were carried out in  $\text{CH}_2\text{Cl}_2$  solution of  $\text{CH}_3\text{COOH}$  (4.37M.) or  $\text{CH}_2\text{ClCOOH}$  (1.00M.) at  $0^\circ\text{C}$ .  $\text{H}_2\text{O}_2$  formed during the reactions was transferred under vacuum prior to iodometric titration, which was employed to raise the precision of the iodometry.

As shown in Table 1, both  $\text{CH}_3\text{COOH}$  and  $\text{CH}_2\text{ClCOOH}$  react with  $\text{Pt}(\text{PPh}_3)_2\text{O}_2$  and  $\text{Pd}(\text{PPh}_3)_2\text{O}_2$  under air or nitrogen to give  $\text{H}_2\text{O}_2$  in 52-70% yield (based on the dioxygen complexes used). The formation of  $\text{H}_2\text{O}_2$  in high yield under  $\text{N}_2$  atmosphere strongly suggests that the peroxide titrated is derived from the coordinated oxygen molecule of  $\text{M}(\text{PPh}_3)_2\text{O}_2$ . In the case of  $\text{IrCl}(\text{CO})(\text{PPh}_3)_2\text{O}_2$  or  $\text{Ru}(\text{OH})(\text{NO})(\text{PPh}_3)_2\text{O}_2$ , the formation of  $\text{H}_2\text{O}_2$  could scarcely be recognized.

Table 1. The formation of  $\text{H}_2\text{O}_2$  by oxidative addition of organic acids to dioxygen complexes in  $\text{CH}_2\text{Cl}_2$  at  $0^\circ\text{C}$

Run	Dioxygen complex	$\times 10^5$ mole.	Acid <sup>a</sup>	Atmosphere	$\text{H}_2\text{O}_2$ ( $\times 10^5$ mole.) <sup>b</sup>	Yield(%)
2	$\text{Pt}(\text{PPh}_3)_2\text{O}_2$	1.69	$\text{CH}_3\text{COOH}$	Air	1.18	70.9
3	$\text{Pt}(\text{PPh}_3)_2\text{O}_2$	1.69	$\text{CH}_3\text{COOH}$	$\text{N}_2$	1.30	76.9
6	$\text{Pt}(\text{PPh}_3)_2\text{O}_2$	8.40	$\text{CH}_2\text{ClCOOH}$	Air	5.58	66.4
7	$\text{IrCl}(\text{CO})(\text{PPh}_3)_2\text{O}_2$	3.71	$\text{CH}_2\text{ClCOOH}$	Air	trace	-
8	$\text{Ru}(\text{OH})(\text{NO})(\text{PPh}_3)_2(\text{CO})$	4.48	$\text{CH}_2\text{ClCOOH}$	$\text{O}_2$	0.18	3.65
9	$\text{Ru}(\text{OH})(\text{NO})(\text{PPh}_3)_2\text{O}_2$	4.44	$\text{CH}_2\text{ClCOOH}$	Air	0.10	2.16
11	$\text{Pt}(\text{PPh}_3)_2\text{O}_2$	5.74	$\text{CH}_2\text{ClCOOH}$	Air	3.01	52.4
12	$\text{Pt}(\text{PPh}_3)_2\text{O}_2$	5.74	$\text{CH}_2\text{ClCOOH}$	Air	0.99 <sup>c</sup>	17.2
19	$\text{Pd}(\text{PPh}_3)_2\text{O}_2^{\text{d}}$	11.28	$\text{CH}_3\text{COOH}$	$\text{N}_2$	7.57	67.1
20	$\text{Pd}(\text{PPh}_3)_2\text{O}_2^{\text{d}}$	11.12	$\text{CH}_2\text{ClCOOH}$	$\text{N}_2$	8.37	75.3
21	$\text{Pd}(\text{PPh}_3)_2\text{O}_2^{\text{d}}$	17.66	$\text{CH}_2\text{ClCOOH}$	$\text{N}_2$	13.11	74.2

a Total volumes are 4 ml. for  $\text{CH}_3\text{COOH}$  (1:1 by volume) and 2 ml. for  $\text{CH}_2\text{ClCOOH}$ . Concentrations of  $\text{CH}_3\text{COOH}$  and  $\text{CH}_2\text{ClCOOH}$  are 4.37 and 1.00 M., respectively.

b Titrated by iodometry after 1 hr. c Treated with catalase prior to titration. d Reaction temperature is  $2^\circ\text{C}$ .

Analytical data for the colorless metal complex, which is obtained in the reaction of  $\text{Pt}(\text{PPh}_3)_2\text{O}_2$  with  $\text{CH}_2\text{ClCOOH}$  and recrystallized from ethanol, are given in Table 2. The complex exhibits intense i.r. absorption at 1604 and  $1098\text{cm}^{-1}$  characteristic of platinum-carboxylate and coordinated triphenylphosphine, respectively. Elemental analysis and n.m.r. data also indicate that the structural formula of the complex can be determined to be  $\text{Pt}(\text{PPh}_3)_2(\text{OCOCH}_2\text{Cl})_2$ . Although the reaction of the platinum dioxygen complex with  $\text{CH}_3\text{COOH}$  was examined in a similar manner, the isolation of the acetate complex from the reaction residue was unsuccessful. However, it was confirmed that i.r. spectrum of the residue had characteristic stretching bands at 1565 and  $1098\text{cm}^{-1}$ . The yellow carboxylato complex which is obtained in

Table 2. Analytical data of  $\text{Pt}(\text{PPh}_3)_2(\text{OCOCH}_2\text{Cl})_2$

the reaction of  $\text{Pd}(\text{PPh}_3)_2\text{O}_2$  with  $\text{CH}_2\text{ClCOOH}$  similarly exhibits intense i.r. absorption at 1605 (C=O) and 1098 $\text{cm}^{-1}$  (P- $\text{Ph}_3$ ).

Furthermore, the effect of pKa of the substrates on the yield of  $\text{H}_2\text{O}_2$  was also investigated. As shown in Table 3, the yield of  $\text{H}_2\text{O}_2$  can be roughly correlated with pKa value of the substrates. While the yield of  $\text{H}_2\text{O}_2$  in the presence of benzoic acid (pKa=4.21) is much less than that in  $\text{CH}_3\text{COOH}$  (pKa=4.76). This result seems to

Table 3. The effect of pKa on the oxidative addition of  $\text{Pt}(\text{PPh}_3)_2\text{O}_2$  and  $\text{Pd}(\text{PPh}_3)_2\text{O}_2$  in  $\text{CH}_2\text{Cl}_2$  at 0°C<sup>a</sup>

Substrate (1.00M.)	pKa (at 25°C)	$\text{H}_2\text{O}_2$ (%)

Phenol	10	-	8.9
Indene	21	- <sup>d</sup>	- <sup>d</sup>

a Reactions were carried out under  $\text{N}_2$  for 1 hr. b Reaction temperature was 2°C. c Concentration of  $\text{CH}_3\text{COOH}$  was 4.73M. d No peroxide was detected by iodometry.

suggest that the oxidative addition is influenced by steric factor. Also phenols react with the dioxygen complexes to give  $\text{H}_2\text{O}_2$  in 7.1-8.9% yield.

From these results, the following mechanism for the oxidative addition can be depicted,

The reaction may proceed by stepwise mechanism through an intermediate in which the  $\text{H}_2\text{O}_2$  formation and the oxidative addition are concerted processes.

We would like to thank Dr.E.Niki of The University of Tokyo for his helpful discussions regarding this work.
