

SYNTHESIS OF 2-METHYLENETRICYCLO[4.3.2.0<sup>1,5</sup>]UNDECAN-3-ONES  
INVOLVING A SPIRO CYCLOPROPANE RING

Biologically active 2-methylenetricyclo[4.3.2.0<sup>1,5</sup>]undecan-3-ones involving a *spiro cyclopropane ring* related to quadron have been synthesized.

As part of study on the unique transformations of [m.n.2]propellanes, we have already reported the synthesis of various 7-alkylidene-5-oxadispiro[2.0.4.4]-dodecan-6-ones (1) containing a *spiro cyclopropane ring* by using the skeletal rearrangement of [4.4.2]propella- $\delta$ -lactone (2) and their interesting biological activities.<sup>1)</sup> Furthermore, we have recently synthesized biologically active

descarboxyquadrone (3)<sup>2,3)</sup> and its binor derivative 4<sup>2)</sup> related to quadrone (5)<sup>4)</sup> by utilizing the novel acid-catalyzed rearrangement<sup>5)</sup> of [4.3.2]propellانونe (6) to the quadrone framework. From the viewpoint of exploitation of a new type of biologically active substances, we wish to describe here the synthesis of 2-methylenetricyclo[4.3.2.0<sup>1,5</sup>]undecan-3-ones (9 and 10) having a *spiro cyclopropane ring* by application of the rearrangement to [4.3.2]propellانونe derivatives 7 and 8, and their biological activities.

At first, we prepared the key intermediate 11 from 7<sup>6)</sup> for the synthesis of 9 as described before.<sup>2)</sup> Condensation of the enolate of 11 [1.1 equiv. LDA, THF, -78 °C] with gaseous formaldehyde at -20 °C followed by hydrogenation of 12<sup>7)</sup> [Pd/C, AcOEt, rt] and acid-catalyzed dehydration [*p*-toluenesulfonic acid, C<sub>6</sub>H<sub>6</sub>, 40-50 °C] gave 9<sup>7)</sup> in 54% overall yield.

In a similar fashion, the key intermediate of 16<sup>7)</sup> for the synthesis of 10 was easily derived from 8<sup>6,7)</sup>: i) acid-catalyzed rearrangement of 8 [concd HCl, Et<sub>2</sub>O, reflux] followed by dehydration of the crude 13 [SOCl<sub>2</sub>, Py, CH<sub>2</sub>Cl<sub>2</sub>, rt, 79% overall yield]; ii) reduction of 14<sup>7)</sup> with tributyltin hydride [2,2'-azobis-isobutyronitrile, cyclohexane, reflux, 93%]; iii) allylic oxidation of 15<sup>7)</sup> with Collins reagent [CrO<sub>3</sub>-Py<sub>2</sub>, CH<sub>2</sub>Cl<sub>2</sub>, rt, 74%]. At the final stage, hydroxy-methylation of 16 and subsequent hydrogenation of 17<sup>7)</sup> as described for 11 followed by dehydration [i) MeSO<sub>2</sub>Cl, Py, rt; ii) 1,8-Diazabicyclo[5.4.0]undec-7-ene, C<sub>6</sub>H<sub>6</sub>, rt] afforded 10<sup>7)</sup> in 50% overall yield.

The bioassay of 9 and 10 was undertaken against tumor cells of mice in vitro and the results are summarized in Table 1 together with those of quadrone (5). As shown in Table 1, the cytotoxicity of 9 and 10 has been observed at almost the

same level as the antibiotic 5. Interestingly, 9 has exhibited antimicrobial activity against *Staphylococcus aureus*, *Candida albicans*, and *Trichomyhyton foetus* (minimum inhibitory concentration: MIC, 2.5-5  $\mu\text{g/ml}$ ) and the activity of 10 was somewhat lower than that of 9 (MIC, 20  $\mu\text{g/ml}$  or above), while quadron (5) has not been found to have antibacterial or antifungal activity at levels of 100  $\mu\text{g/ml}$  or below.<sup>8)</sup> These details of the assay will be reported shortly.

Table 1. Antitumor Activity of Quadron (5)  
and Related Compounds 9 and 10

Test cell	IC <sub>50</sub> (ng/ml)		
	<u>5</u>	<u>9</u>	<u>10</u>
P388	190	173	416
L1210	650	106	487
3LL	390	80	357
LY	>1000	263	>1000

We would like to thank Dr. N. Ida and Mr. H. Koike of Basic Laboratories, Toray Industries, Inc. for the screening.

- 6) The propellanonones 7 and 8 were prepared by photocycloaddition of allene to bicyclo[4.3.0]undec-1(6)-en-2-one [ $\text{CH}_2\text{Cl}_2$ ,  $-78^\circ\text{C}$ ] followed by cyclopropanation [i) LAH,  $\text{Et}_2\text{O}$ , rt; ii)  $\text{Me}_3\text{SiCl}$ ,  $\text{Et}_3\text{N}$ , THF, rt; iii)  $\text{Et}_2\text{Zn}$ ,  $\text{CH}_2\text{I}_2$ , hexane, rt; iv) 5% HCl, MeOH, rt; v)  $\text{CrO}_3\text{-Py}_2$ ,  $\text{CH}_2\text{Cl}_2$ , rt] in 26% and 53% overall yields. The stereochemistry of the two allene photoadducts were elucidated on the basis of LIS  $^1\text{H}$  NMR study.
- 7) All new compounds gave satisfactory spectral and analytical data. Selected data are as follows:
- 9:  $^1\text{H}$  NMR ( $\text{CCl}_4$ )  $\delta$  0.4-0.8 (m, 4H), 1.2-2.1 (m, 10H), 2.2-2.5 (m, 2H), 4.91 (s, 1H), 5.71 (s, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  207.4 (s), 153.2 (s), 112.3 (t), 53.4 (s), 52.4 (d), 47.1 (d), 45.7 (t), 39.8 (t), 34.3 (t), 31.3 (t), 23.1 (s), 20.0 (t), 17.9 (t), 6.8 (t).
- 10:  $^1\text{H}$  NMR ( $\text{CCl}_4$ )  $\delta$  0.2-0.8 (m, 4H), 1.2-2.4 (m, 12H), 4.64 (s, 1H), 5.68 (s, 1H);  $^{13}\text{C}$  NMR ( $\text{CDCl}_3$ )  $\delta$  207.8 (s), 150.8 (s), 112.8 (t), 53.2 (d), 53.1 (s), 39.8 (t), 39.7 (t), 37.5 (d), 33.2 (t), 32.9 (t), 24.9 (s), 19.1 (t), 16.1 (t), 7.2 (t).
