 $\alpha$ ,  $\beta$ -Epoxy esters were reduced to  $\beta$ -hydroxy esters with an organoselenium reagent, Na<sup>+</sup>[PhSeB(OEt)<sub>3</sub>]<sup>-</sup>, via  $\alpha$ -substitution process.

β-Hydroxy esters are useful synthetic intermediates and frequently utilized as construction units in important class of natural products. Potential precursors for these compounds may be  $\alpha$ ,  $\beta$ -epoxy esters (glycidic esters) since a variety of glycidic esters are readily available by the Darzens reaction  $^{1}$ ) or epoxidation of  $\alpha$ ,  $\beta$ -unsaturated esters (acids). Although a number of efficient methods have been developed for the regional reduction of  $\alpha$ ,  $\beta$ -epoxy ketones to  $\beta$ -hydroxy ketones,  $^{3}$ ) only few precedents for the reductive cleavage of  $\alpha$ ,  $\beta$ -epoxy esters to give  $\beta$ -hydroxy esters are known in literature. Recently SmI<sub>2</sub> has been employed as an effective reagent for this particular transformation.

We have recently reported that an organoselenium reagent, sodium phenylseleno-(triethoxy)borate  $\underline{1}$ , which is easily prepared by reducing (PhSe) $_2$  with NaBH $_4$  in ethanol $^6$ ) (Eq. 1), serves as an efficient reagent for the reduction of  $\alpha,\beta$ -epoxy ketones to  $\beta$ -hydroxy ketones. $^3$ ) In this communication we describe the use of this selenium reagent  $\underline{1}$  in the reduction of  $\alpha,\beta$ -epoxy esters.

$$(PhSe)_2 + 2 NaBH_4 + 6 EtOH \longrightarrow 2 Na^+[PhSeB(OEt)_3]^- + 7 H_2$$
 (1)

The results are listed in Table 1. As in the reduction of epoxy ketones,  $^3$ ) brief treatment of diethyl cis- or trans-epoxy succinate with the reagent  $\underline{1}$  (3 equiv.) in ethanol produced the desired hydroxy succinate in high yield (entries 1 and 2). Similarly, epoxy ester  $\underline{2}$  was reduced at 50 °C to give  $\beta$ -hydroxy ester  $\underline{3}$  as the sole product in 91% yield (entry 3). Thus a variety of  $\alpha$ -unsubstituted epoxy esters were efficiently and regional reduced to  $\beta$ -hydroxy esters (entries 1-5). On the other hand, substrates bearing an  $\alpha$ -alkyl substituent reacted sluggishly to give a mixture of  $\beta$ -hydroxy esters and a  $\beta$ -phenylseleno substitution product (entry 6), and an  $\alpha$ -alkyl- $\beta$ -unsubstituted epoxy ester produced only a  $\beta$ -substitution product (entry 7).

Since the present reduction proceeds via  $\alpha$ -substitution process (Eq. 2) in contrast with the reductive cleavage by electron transfer reagents, 5) the intermediate  $\beta$ -hydroxy- $\alpha$ -phenylseleno esters  $\underline{\mathbf{5}}$  are also obtainable in high yields by using 1 equiv. of the reagent  $\underline{\mathbf{1}}.^{7}$ ) These compounds as well as  $\beta$ -hydroxy esters will serve as useful synthetic intermediates.

Table 1. Reduction of  $\alpha$ ,  $\beta$ -Epoxy Esters with Na<sup>+</sup>[PhSeB(OEt)<sub>3</sub>] - a)

Entry	Substrate	Temp/°C	Time/min	Product(s)	Yield/%
1	$Eto_2C \xrightarrow{Q} R^2$ $R^1 = Co_2Et, R^2 = H$	0	10	EtO <sub>2</sub> C OH CO <sub>2</sub> Et	86
2	$R = CO_2Et$ , $R = H$ $R^1 = H$ , $R^2 = CO_2Et$	0	10	EtO2C CO2Et	83
3	$\bigcirc$	50	20	OH CO <sub>2</sub> R	91
	<u>2</u> R = Et			<u>3</u> R = Et	
4 <sup>b)</sup>	R = Me	50	45	R = Me	80
5	CO <sub>2</sub> Et	50	45	OH CO <sub>2</sub> Et	97
6	° CO <sub>2</sub> Et	50	90	OH CO <sub>2</sub> Et SePh CO <sub>2</sub> E OH	St 90
7	CO <sub>2</sub> Et	20	35	PhSe CO <sub>2</sub> Et	82

- a) The reaction was carried out by using 3 equiv. of the reagent  $\underline{1}$  in EtOH.
- b) The reaction was performed using 3 equiv. of Na<sup>+</sup>[PhSeB(OMe)<sub>3</sub>] in MeOH.<sup>8)</sup>
- c) A mixture of the stereoisomers (5:3).
