

A New Route to (+)-2,3-(Isopropylidenedioxy)-4-cyclopentenone via
the Optically Active Dicyclopentadiene Intermediate

Seiichi TAKANO,* Kohei INOMATA, and Kunio OGASAWARA

Pharmaceutical Institute, Tohoku University, Aobayama, Sendai 980

Chiral synthesis of the dicyclopentadiene derivative and its stereoselective conversion into (+)-2,3-(isopropylidenedioxy)-4-cyclopentenone, a versatile building block for the synthesis of cyclopentanoid natural products, have been described.

Recently, we succeeded¹⁾ in resolving the racemic allylic alcohol²⁾ [(±)-1], obtainable in a large quantity from dicyclopentadiene, by employing kinetic hydrolysis of its acetate [(±)-2] using lipase. Since both the (+)-alcohol [(+)-1], obtained in 30% yield after recrystallization, and the (-)-alcohol [(-)-1], obtained in 22% overall yield after hydrolysis followed by recrystallization, could be interconverted one another in good yield (about 80%) via the corresponding dienone (3) by employing the Wharton reaction, synthesis of a single enantiomer of the alcohol (1) or the dienone (3) implies acquisition of both enantiomers (Scheme 1). We report herewith an alternative synthesis of the (+)-dienone [(+)-3]

i, AcCl, pyridine, benzene; ii, PCC, CH₂Cl₂; iii, KOH, aq. dioxane; iv, (a) 30% H₂O₂, aq. NaOH, (b) (NH₂)₂·H₂O, AcOH.

starting from (S)-5-hydroxymethylbuten-2-olide³⁾ (4) and conversion of (+)-3 thus obtained into (+)-2,3-(isopropylidenedioxy)-4-cyclopentenone (17) which is a versatile building block for the synthesis of cyclopentanoid natural products⁴⁾

especially for prostaglandins.^{4b)}

Heating **4** with an excess cyclopentadiene (6 equiv.) without solvent in a sealed tube gave a mixture of adducts which was purified by recrystallization to afford the pure endo-adduct³⁾ (**5**), mp 96-97 °C, $[\alpha]_D^{26} -49.77^\circ$ (c 1.01, CHCl₃), in 72% yield. Treatment of **5** with a mixture of triphenylphosphine, iodine, and imidazole⁵⁾ gave the crude iodide (**6**) which without purification was exposed to DBU in benzene to give the enol-lactone (**7**) in 68% overall yield. Reduction of **7** with diisobutylaluminum hydride, followed by exposing the reaction mixture to aqueous sodium hydroxide (0.5 M) initiated concomitant hydrolysis and aldolization of the lactol (**8**) to furnish the (+)-dienone [(+)-**3**] (43% from **7**), mp 59-60 °C, $[\alpha]_D^{25} +160.7^\circ$ (c 0.27, MeOH). Since physical and optical properties of (+)-**3** were identical in all respects with those of (+)-**3** [mp 59-60 °C, $[\alpha]_D^{25} +158.8^\circ$ (c 1.01, MeOH)] obtained from the enzymatically prepared (+)-alcohol¹⁾ [(+)-**1**], the present transformation confirmed the absolute configuration of the enzymatic products.

Scheme 2.

i, cyclopentadiene, 140 °C, 20 h, sealed tube; ii, (a) PPh₃, I₂, imidazole, Et₂O-CH₃CN (3:1), rt, (b) DBU, benzene, reflux; iii, DIBAL, THF, -78 °C; iv, 0.5 M NaOH, -78 °C - rt, 1 h.

We next carried out the conversion of the (+)-dienone [(+)-**3**] into (+)-2,3-(isopropylidenedioxy)-4-cyclopentenone (**17**). Reduction of (+)-**3** with sodium borohydride in the presence of cerium (III) chloride⁶⁾ yielded the endo-alcohol (**11**), $[\alpha]_D^{24} -215.1^\circ$ (c 0.49, CHCl₃) (83%), accompanied by a small amount of the exo-alcohol [(+)-**1**] (10%) which was readily separated (silica gel column) and recycled. Treatment of **11** with *N*-bromosuccinimide gave the bromo-ether (**12**) in 85% yield. Stirring **12** with a catalytic amount of osmium tetroxide (3% mol) and 1-methylmorpholine-1-oxide⁷⁾ (1.5 equiv.) furnished the exo-1,2-glycol (**13**) (95% yield), $[\alpha]_D^{22} -123.7^\circ$ (c 0.64, CHCl₃), selectively, which was transformed into the acetonide (**14**) (95% yield), $[\alpha]_D^{22} -95.4^\circ$ (c 0.66, CHCl₃), under standard conditions. Refluxing **14** with zinc powder in ethanol containing a catalytic amount of acetic acid gave the endo-alcohol (**15**) (88% yield), $[\alpha]_D^{23} +55.1^\circ$ (c 0.67, CHCl₃),

Scheme 3.

i, NaBH_4 , $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$, MeOH , 0°C ; ii, NBS , CH_2Cl_2 , 0°C -rt; iii, OsO_4 (3 mol%), 1-methylmorpholine-1-oxide, aq. THF (3:1), 0°C -rt; iv, 2,2-dimethoxypropane, *p*- TsOH (cat.), DMF , rt; v, Zn , AcOH (cat), EtOH , reflux; vi, PCC , CH_2Cl_2 , rt; vii, *o*-dichlorobenzene, reflux.

which was oxidized with pyridinium chlorochromate in methylene chloride to give the ketone (16), $[\alpha]_{\text{D}}^{24} +266.8^\circ$ (c 0.68, CHCl_3), in 78% yield. Finally, 16 was refluxed in *o*-dichlorobenzene to furnish (+)-2,3-(isopropylidenedioxy)-4-cyclopentenone (17), mp $36-37^\circ\text{C}$, $[\alpha]_{\text{D}}^{24} +71.57^\circ$ (c 1.01, CHCl_3) [lit.^{4b}): mp $37.5-38.5^\circ\text{C}$, $[\alpha]_{\text{D}}^{25} +71.8^\circ$ (c 0.90, CHCl_3)], in 65% yield, with removal of cyclopentadiene by retrograde Diels-Alder reaction.⁸⁾ Since inversion of the (+)-dienone [(+)-3] into its enantiomer [(-)-3] could be easily carried out, the present route formally constitutes a synthesis of (-)-2,3-(isopropylidenedioxy)-4-cyclopentenone [(-)-17].
