

A Convenient Synthesis of Unsymmetrical Tellurides by a Sequential  
Reductive Cleavage of Bis(N,N-dimethylcarbamoyl) Ditelluride

Bis(N,N-dimethylcarbamoyl) ditelluride was converted to unsymmetrical tellurides possessing various substituents by a convenient stepwise reduction-alkylation or reduction-addition sequence.

Recently in the field of organic heteroatom chemistry, interest in the structure and synthesis of organotellurium compounds has been growing rapidly.<sup>1-7)</sup> However, in spite of the considerable needs for the preparation of unsymmetrical tellurides related to novel tellurocarbonyl compounds,<sup>8-11)</sup> the low stability of the precursors and reagents has impeded development of a variety of methods of unsymmetrical alkenyl tellurides. It has been assumed that formal unsymmetrical alkylation of  $\text{Te}^{2-}$  would be realized by the regioselective Te-Te bond cleavage of polytellurides possessing non-metallic protecting groups on both terminals. In respect of air-stability and solubility in organic solvents, bis(N,N-dialkylcarbamoyl) ditelluride 1 is expected to behave as a new synthetic equivalent of unsymmetrical  $\text{Te}^{2-}$  anion and vinyl tellurolate anions by the selective conversion in which reductive cleavage of the Te-Te bond and removal of the carbamoyl groups are combined. In this paper we would like to describe a convenient preparation of tellurides possessing various substituents by applying a novel stepwise reduction-alkylation or reduction-addition sequence to bis(N,N-dimethylcarbamoyl) ditelluride 1.<sup>12)</sup>

Bis(N,N-dimethylcarbamoyl) ditelluride 1 was prepared in 58% yield by treating DMF with sodium metal and elemental tellurium under Ar atmosphere according to Suzuki's method.<sup>12)</sup> Reductive Te-Te bond cleavage of 1 was carried out by treating 1 with 2 equiv. of  $\text{NaBH}_4$  in EtOH-DMF at  $-50^\circ\text{C}$  to generate anion 2, and subsequent addition of various alkyl halides to the reaction mixture afforded tellurocarbmates 3 in good yields. A telluroacetal 4 and alkenyl tellurocarbmates 5 were also obtained in high yields by treating anion 2 with  $\text{CH}_2\text{Br}_2$  and substituted acetylenes in a similar manner. However,

phenylacetylene was not reactive to the nucleophilic addition of anion 2. Physical properties of the products including MS, IR, and  $^1\text{H}$  NMR were fully consistent with the structure of the products.<sup>13)</sup> Z-Geometry of the alkenyl groups was also assigned by the coupling constants of olefinic vicinal protons revealed in  $^1\text{H}$  NMR spectra. Table 1 shows all results of the reactions.

Table 1. Synthesis of tellurocarbamates 3, 4, and 5 by the stepwise treatment of ditelluride 1 with  $\text{NaBH}_4$  and electrophilic reagents

$\text{R}^1\text{-X}$	Product	Yield <sup>a)</sup> %	Acetylene		Product	Yield %
			$\text{R}^2$	$\text{R}^3$		
$\text{CH}_3\text{I}$	<u>3a</u>	87	H	$\text{CO}_2\text{CH}_3$	<u>5a</u>	88
$\text{C}_6\text{H}_{13}\text{I}$	<u>3b</u>	92	$\text{CH}_3$	$\text{CO}_2\text{CH}_3$	<u>5b</u>	61

a) Refluxing in EtOH for 3 hours.

Compounds 3 were treated with  $\text{NaBH}_4$  in EtOH at refluxing temperature or  $\text{LiAlH}_4$  in  $\text{Et}_2\text{O}$  at room temperature followed by the treatment of various electrophilic reagents such as alkyl halides and substituted acetylenes to give unsymmetrical tellurides 6, 7, and 8 in high to modest yields. Physical properties of products 6, 7, and 8 were also fully consistent with their structure including MS, IR, and  $^1\text{H}$  NMR.<sup>14)</sup> All results are shown in Table 2 and Table 3. In all cases, the geometry of the double bonds in 7 was Z, as was reported in nucleophilic addition of thiols and thiolate anions to acetylenes.<sup>15)</sup> Furthermore, it was noteworthy that stepwise reduction-alkylation of alkenyl tellurocarbamates was effective for the synthesis of unsymmetrical dialkenyl tellurides. Interestingly, the geometry of the double bonds in the starting alkenyl tellurocarbamates was completely retained in the alkenyltelluroate anions under these reaction conditions.

Conclusively, a convenient synthesis of unsymmetrical tellurides was achieved by the use of repeated stepwise reduction-alkylation sequence starting from bis(N,N-dimethylcarbamoyl) ditelluride 1. This procedure is substantially based on the different reactivities of Te-Te and C-Te bonds on compound 1 toward the attack of hydrides. Alkenyl tellurides, dialkenyl tellurides, and a telluroacetal related to tellurocarbonyl compounds

were also synthesized by using this sequence. Further conversion of these products to the novel tellurocarbonyl compounds is now in progress in our laboratory.
