Organometallic Chemistry Reviews — Section B, Annual Surveys, vol. 10 No. 2, June 1974, Elsevier Sequoia, S.A., Lausanne 1974. Annual surveys covering the year 1972; edited by D. Seyferth and R.B. King.

This volume is the latest in a continuing series of annual surveys published within the format of organometallic chemistry reviews. There are three chapters. The first deals with transition metal organic chemistry, physical methods and results of general interest by P.S. Braterman (54 pages, 221 references). The second chapter deals with nickel palladium and platinum written by E. Singleton (74 pages, 435 references). The same author also deals with copper, silver and gold (29 pages, 157 references). There is an author index but no general subject index. Like its predecessors, this issue is invaluable in keeping one up to date with the ever burgeoning field of organometallic chemistry.
