

Main Group Chemistry

Preface

Each year *Coordination Chemistry Reviews* presents a Main Group Chemistry Review. A topic based format was adopted in 1992 and was intended to focus on the more significant new developments in Main Group Chemistry. In the first three volumes of this type (volume numbers 112, 130 and 137) an international authorship provided a number of outstanding articles. Leading scientists in the field have contributed to the 1995 volume, which includes the chemistry of elements from groups 1, 2, 13, 14 and 15, with emphasis on new structure and bonding.

I would like to thank each of the authors for their first class contributions and the referees for their enormous efforts during the reviewing process.

Neil Burford
Associate Editor
