

PREFACE

Denmark has a long history of vital contributions to the field of coordination chemistry. It has contributed to our understanding of the discipline to a degree quite out of proportion to its relative size in the scientific community. It is evident from the reviews in this volume that inorganic researchers in Denmark continue to have much to offer us. It is a pleasure therefore to devote this issue to Danish coordination chemistry.

I am indebted to Professor Claus E. Schäffer for his help in putting this monograph together.

A.B.P. Lever
