

BOOK REVIEW

TRANSDERMAL AND RELATED DRUG DELIVERY SYSTEMS

Chemical Technology Review No. 228

Edited by D. A. Jones

Noyes Data Corporation  
Park Ridge  
New Jersey 1984

This most useful book contains a quite comprehensive account of the relevant U.S. patent literature during the period January 1977 to September 1984. Not only are patent data included but also indexes, by company, inventor and patent. This book does not provide a critical review of the value (or lack of value) of the various patents. However, it is strongly recommended as a reference text for all those seriously interested in the development, production or regulatory approval of transdermal delivery systems.
