

(www.interscience.com) DOI 10.1002/dta.54

The cover of this issue of *Drug Testing and Analysis* features an illustration of the article 'Interpretation of urinary concentrations of pseudoephedrine and its metabolite cathine in relation to doping control' by K. Deventer, P. Van Eenoo, G. Baele, O. J. Pozo, W. Van Thuyne and F. Delbecke. The image shows doping control samples, in front of an LC-MS interface (used in this study) and suggest a direct urine injection on the instrument (which is actually occurring as well, albeit via an autosampler and an HPLC).
