

Synthesis of (η^3 -Allyl)bromodicarbonylbis(pyrazole)molybdenum(II) and Reactivity towards $[\text{Au}(\text{acac})\text{PPh}_3]$: Structure and Dynamic Behavior of the Monometallic Pyrazole and Heterometallic Pyrazolate Complexes

Paloma Paredes, Daniel Miguel, and Fernando Villafañe*

Keywords: Molybdenum / Gold / Heterometallic complexes / N ligands / Fluxionality

In our original article,^[1] under the heading “Acac Complexes” (page 998) we inadvertently omitted that the use of acac complexes in synthesis has been reviewed.^[2] Likewise, $[\text{Au}(\text{acac})\text{PPh}_3]$ has been used previously to synthesise a heterometallic complex.^[3]
