Keywords: Halides / Hydrogen bonding / Hypercoordination / Supramolecular chemistry / Tin

The hypercoordinated di- and triorganotin(IV) chlorides [{2-(Me₂NCH₂)C₆H₄}₂SnCl₂] (**1a**) and [{2-(Me₂NCH₂)C₆H₄}R₂SnCl] [R = Me (**2a**), Ph (**3a**)] were prepared by treating SnCl₄ or R₂SnCl₂ with [Li{2-(Me₂NCH₂)C₆H₄}]. Halide-exchange reactions between the organotin(IV) chlorides and the appropriate potassium halides gave [{2-(Me₂NCH₂)C₆H₄}₂SnX₂] [X = F (**1b**), I (**1d**)], [{2-(Me₂NCH₂)C₆H₄}Me₂SnX] [X = F (**2b**), Br (**2c**), I (**2d**)] and [{2-(Me₂NCH₂)C₆H₄}Ph₂SnX] [X = F (**3b**), I (**3d**)]. Their solution behaviour was investigated by multinuclear (¹H, ¹³C, ¹⁹F and ¹¹⁹Sn)

NMR spectroscopy, including variable-temperature studies. Single-crystal X-ray diffraction analyses revealed that the strong intramolecular coordination of the nitrogen atom from the pendant CH₂NMe₂ group to tin induces chirality. The influence of the identity and the number of the halogen atoms and the organic substituents at tin is discussed in relation with the hydrogen-bonding network, which results in different supramolecular architectures in the crystal.

Introduction

Several organotin(IV) halides containing the [2-(Me₂NCH₂)C₆H₄] group or related organic ligands have been investigated so far both in solution and the solid state. Single crystal X-ray diffraction studies have revealed, in all cases, hypercoordinated structures obtained as a result of strong intramolecular N→Sn interactions.^[1–27] On the basis of NMR spectroscopic data, octahedrally and trigonal bipyramidally configured tin atoms were suggested in solution for the intramolecularly coordinated diorganotin dihalides [{2-(Me₂NCH₂)C₆H₄}₂SnX₂] and triorganotin halides [{2-(Me₂NCH₂)C₆H₄}R₂SnX] (X = halogen), respectively. Single-crystal X-ray diffraction studies have confirmed the hypercoordinated nature of [{2-(Me₂NCH₂)C₆H₄}Me₂SnCl] (**2a**)^[17] and [{2-(Me₂NCH₂)C₆H₄}Ph₂SnX] [X = Cl (**3a'**),^[20] Br (**3c**)^[3]], but no crystallographic data are

available for the diorganotin(IV) derivatives [{2-(Me₂NCH₂)C₆H₄}₂SnX₂], and no studies on the influence of the identity and number of halogen atoms and organic substituents on the association through hydrogen bonds in the solid state have been reported. On the other hand, it has been shown previously that intramolecular coordination of the nitrogen atom to a metal atom in compounds containing a [2-(Me₂NCH₂)C₆H₄]M moiety induces chirality at the metal centre,^[27–31] and therefore the crystals usually contain 1:1 mixtures of (*R*) and (*S*) isomers [with the C(1)–C(6) aromatic ring and the N(1) atom as chiral plane and pilot atom, respectively].^[32] While this work was in progress the molecular structures of the fluorides [{2-(Me₂NCH₂)C₆H₄}R₂SnF] [R = Me (**2b'**), Ph (**3b'**)], which crystallise in different space groups,^[26] were reported, but no details concerning the planar chirality induced by the intramolecular N→Sn interaction and the hydrogen-bond network in the crystal were mentioned.

Here we report the synthesis and spectroscopic characterisation of some organotin(IV) halides, as well as the crystal and molecular structures of [{2-(Me₂NCH₂)C₆H₄}₂SnX₂] [X = Cl (**1a**), F (**1b**), I (**1d**)], [{2-(Me₂NCH₂)C₆H₄}Me₂SnX] [X = Cl (**2a**), F (**2b**), Br (**2c**), I (**2d**)] and [{2-(Me₂NCH₂)C₆H₄}Ph₂SnX] [X = F (**3b**), I (**3d**)]. The discussion of the solid-state structure is focused on the hydrogen-bonding-based network between the isomers, which results in different supramolecular architectures in the crystal.

Results and Discussion

The diorganotin(IV) dihalides were prepared according to Scheme 1. The ligand-redistribution reaction between $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_4\text{Sn}]$ and SnCl_4 in the absence of a solvent has proved to be an excellent alternative to the direct synthesis from $[\text{Li}\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}]$ and SnCl_4 for the preparation of **1a** as it allows a better control of the stoichiometry of the reagents. The halide-exchange reactions between the organotin(IV) chlorides and the appropriate potassium halides (Schemes 1 and 2) were performed according to a modified literature procedure^[33] in a two-layer solvent system ($\text{H}_2\text{O}/\text{MeOH}/\text{CH}_2\text{Cl}_2$).

Scheme 1. Synthesis of compounds **1a–1d**.

Scheme 2. Synthesis of compounds **2a–2d**, **3a**, **3b** and **3d**.

All compounds were isolated as air-stable, colourless, crystalline products. They are soluble in common organic solvents, such as chloroform, methylene dichloride or benzene.

Solution Behaviour

All compounds were investigated by multinuclear (^1H , ^{13}C , ^{119}Sn) NMR spectroscopy in solution at room temperature. For the organotin fluorides, the ^{19}F NMR spectra were also recorded.

The assignments of the ^1H and ^{13}C resonances according to the numbering scheme above were based on 2D experiments and tin–carbon coupling constants, and were con-

firmed for several compounds by simulation of the aromatic region of the ^1H NMR spectra using the gNMR program (see Supporting Information).

The low-temperature ^1H NMR spectra of the diorganotin derivatives $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnX}_2]$ [$\text{X} = \text{Cl}$ (**1a**), F (**1b**) and I (**1d**)] are very similar (see Supporting Information) to that reported for the dibromide analogue **1c**,^[6] i.e. an AB system and two singlet resonances in the aliphatic region for the diastereotopic CH_2 protons and the CH_3 groups at nitrogen, respectively. This is consistent with a *trans* arrangement of the organic ligands and a *cis* arrangement of the two coordinated nitrogen atoms and halogen atoms in solution,^[6] as subsequently proved by single-crystal X-ray diffraction for compounds **1a**, **1b** and **1d** (see below). When the temperature is raised, the diorganotin dichloride **1a** and the diorganotin diiodide **1d** exhibit a similar behaviour to the diorganotin dibromide **1c**.^[6,22] The two singlets for the methyl protons of the NMe_2 group coalesce at $20\text{ }^\circ\text{C}$ for **1a** ($\Delta G^\ddagger = 13.8\text{ kcal mol}^{-1}$) and $0\text{ }^\circ\text{C}$ for **1d** ($\Delta G^\ddagger = 12.6\text{ kcal mol}^{-1}$) in CDCl_3 . This coalescence indicates that the process involving $\text{N} \rightarrow \text{Sn}$ dissociation/recoordination, with inversion at a three-coordinate nitrogen atom and rotation of the $\text{C}_{\text{methylene}}-\text{N}$ bond, becomes fast on the NMR timescale. The AB pattern for the methylene protons is retained even at $60\text{ }^\circ\text{C}$, thus indicating configurational stability of the tin atom in the $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnX}_2]$ derivatives containing heavier halogens. In contrast, coalescence of both the two resonances of the NMe_2 group ($\Delta G^\ddagger = 14.2\text{ kcal mol}^{-1}$) and the AB pattern of the CH_2 group ($\Delta G^\ddagger = 14.3\text{ kcal mol}^{-1}$) is observed at $10\text{ }^\circ\text{C}$ for the diorganotin difluoride **1b** in CDCl_3 . This suggests that exchange of the chloride by fluoride results in a considerable decrease of the configurational stability of the tin atom in **1b** compared to **1a**. There is no indication for a *cis–trans* equilibrium in solution such as that observed for $[\{\text{Me}_2\text{N}(\text{CH}_2)_3\}_2\text{SnF}_2] \cdot 2\text{H}_2\text{O}$.^[34]

The magnitudes of the ^{119}Sn chemical shifts for the diorganotin halides **1a** (s, $\delta = -260.7\text{ ppm}$), **1b** (t, $\delta = -386.7\text{ ppm}$) and **1d** ($\delta = -346.9\text{ ppm}$) at room temperature are typical for six-coordinate diorganotin(IV) species in solution [cf. $[\{\text{Me}_2\text{N}(\text{CH}_2)_3\}_2\text{SnF}_2] \cdot 2\text{H}_2\text{O}$ ^[34] ($\delta = -292.0\text{ ppm}$ in CD_2Cl_2) and $[(8\text{-Me}_2\text{NC}_{10}\text{H}_6)_2\text{SnI}_2]$ ^[11] ($\delta = -361.9\text{ ppm}$ in $\text{C}_6\text{D}_5\text{CD}_3$)]. The equivalence of the fluoride atoms in **1b** is reflected in a singlet ^{19}F resonance surrounded by tin satellites ($\delta = -181.5\text{ ppm}$, $^1J_{\text{F,Sn}} = 2567/2683\text{ Hz}$) and a triplet ^{119}Sn resonance ($\delta = -386.7\text{ ppm}$, $^1J_{\text{F,Sn}} = 2663\text{ Hz}$).

The ^1H and ^{13}C NMR spectra for the triorganotin halides $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}\text{Me}_2\text{SnX}]$ [$\text{X} = \text{Cl}$ (**2a**), F (**2b**), Br (**2c**), I (**2d**)] and $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}\text{Ph}_2\text{SnX}]$ [$\text{X} = \text{F}$ (**3b**), I (**3d**)] are very similar to those of benzyldimethylamine, regardless of the nature of the halogen and the other organic groups attached to tin. Two singlet resonances are observed in the aliphatic region for the methylene and the methyl protons, respectively, which is compatible either with a tetrahedral or with a pentacoordinate structure (assuming a fast conformational change of the five-membered SnC_3N nonplanar chelate ring in solution, which gives averaged ^1H NMR signals). The ^{13}C NMR spectrum contains two sing-

[a] Spectra recorded in CDCl₃ at room temperature. [b] In CH₂Cl₂/D₆acetone. [c] Ref.^[26]: $\delta_{119\text{Sn}}$ = –53.8 ppm (¹*J*_{F,Sn} = 2023 Hz), $\delta_{19\text{F}}$ = –178.8 ppm. [d] In C₆D₅CD₃. [e] ¹¹⁹Sn MAS NMR spectroscopic data. [f] Ref.^[26]: $\delta_{119\text{Sn}}$ = –198.6 ppm (¹*J*_{F,Sn} = 2141 Hz), $\delta_{19\text{F}}$ = –182.3 ppm.

let signals for the methylene and the methyl carbon atoms, respectively, but the tin satellites are well resolved only for the former; the magnitude of the ²*J*_{C,Sn} (ca. 28–30 Hz) couplings is consistent with the presence of an intramolecular N→Sn coordination, i.e. a trigonal bipyramidal (C,N)-C₂SnX core. The major difference noted in the ¹H NMR spectra of the two series of compounds is the downfield shift of the resonance for the aromatic H-6 proton, which is a result of the intramolecular interaction of this proton with the halogen atom.

The increase in the H-6 chemical shift follows the order F < Cl < Br < I (δ = 7.97, 8.17, 8.26 and 8.31 ppm for the triaryltin halides **2b**, **2a**, **2c** and **2d**, respectively). In addition to the resonances assigned to the 2-(Me₂NCH₂)C₆H₄ ligand, the ¹H and ¹³C NMR spectra for the [{2-(Me₂NCH₂)C₆H₄]₂R₂SnX] derivatives also contain signals corresponding to equivalent methyl and phenyl groups, respectively.

A comparison of the ¹⁹F and ¹¹⁹Sn NMR parameters for the diorganotin dihalides [{2-(Me₂NCH₂)C₆H₄]₂SnX₂] and the triorganotin halides [{2-(Me₂NCH₂)C₆H₄]₂R₂SnX] described in this work and the related [Ph₂SnX₂], [Me₂PhSnX] and [Ph₃SnX] derivatives is given in Table 1. The increase of the coordination number at the metal atom in solution to six and five, respectively, is supported by the upfield shift of the ¹¹⁹Sn chemical shift in the 2-(Me₂NCH₂)C₆H₄-containing derivatives (X = Cl, Br, I) with respect to the corresponding monomeric, tetrahedral [Ph₂SnX₂], [Me₂PhSnX] and [Ph₃SnX] compounds.

In conclusion, the NMR spectroscopic data indicate that both [{2-(Me₂NCH₂)C₆H₄]₂SnX₂] and [{2-(Me₂NCH₂)C₆H₄]₂R₂SnX] compounds exhibit intramolecular N→Sn coordination in solution, which results in similar coordination geometries to those found in the solid state (see below).

Solid-State Structures

The crystal and molecular structures of **1a**, **1b**, **1b**·CH₂Cl₂, **1d**, **2a**, **2a'**, **2b–2d**, **3a**, **3b** and **3d** were determined by single-crystal X-ray diffraction. Crystals suitable for X-ray diffraction analysis were generally grown by solvent diffusion from dichloromethane and *n*-hexane. Crystals of the dichloromethane solvate of the diorganotin difluoride [{2-(Me₂NCH₂)C₆H₄]₂SnF₂], namely **1b**·CH₂Cl₂, were obtained from a CH₂Cl₂/*n*-hexane (approximately 1:3) mixture, and were measured immediately after removal from solution. The crystal was stable enough for a sufficiently good measurement, but they turned opaque within two days in the air due to loss of the crystallisation solvent, as proved by ¹H NMR spectroscopy. Crystals of [{2-(Me₂NCH₂)C₆H₄]₂SnF₂] (**1b**), free of crystallisation solvent, were also obtained by slow crystallisation from a CH₂Cl₂/*n*-hexane (approximately 1:5) mixture. The triorganotin chloride [{2-(Me₂NCH₂)C₆H₄]₂Me₂SnCl] crystallises in different forms from ethanol (**2a**; orthorhombic, space group *Pbca*) and *n*-hexane (**2a'**; orthorhombic, space group *Pna2*₁). This form has also been reported by Rippstein et al.^[17] for crystals grown from CHCl₃). Monoclinic crystals (space group *P2*₁/*n*) with different unit-cell parameters were obtained for [{2-(Me₂NCH₂)C₆H₄]₂Ph₂SnCl] when the compound was crystallised from toluene.

ene^[20] or CH₂Cl₂/*n*-hexane (**3a**); the first form contains one molecule in the unit cell^[20] while the second one contains two independent molecules. The crystals of [{2-(Me₂NCH₂)-C₆H₄}Ph₂SnF] (**3b**; monoclinic, space group *P*2₁/*n*, which is different from the reported space group *P*2₁/*c*^[26]) also contain two independent molecules in the unit cell.

Selected molecular parameters are given in Tables 2, 3 and 4, and the molecular structures of representative compounds **1b** and **3d**, with the atom numbering schemes, are shown in Figures 1 and 2, respectively. The molecules of all compounds investigated in this work feature a metal atom strongly coordinated by two or one nitrogen atoms of the pendant arms *trans* to an Sn–halogen bond in diorganotin(IV) and triorganotin(IV) halides, respectively [the Sn–N distance exceeds the sum of the covalent radii for the corre-

sponding atoms, $\Sigma_{\text{cov}}(\text{Sn}, \text{N}) = 2.1 \text{ Å}^{[40]}$]. This results in different coordination environments of the metal atom, i.e. octahedral (*C,N*)₂SnX₂ for **1a**, **1b** and **1d**, and trigonal bipyramidal (*C,N*)C₂SnX configurations for **2a–2d**, **3b** and **3d**.

The (*C,N*)₂SnX₂ core in the [{2-(Me₂NCH₂)-C₆H₄}₂SnX₂] derivatives shows a *trans*-SnC₂ fragment, while the N and X atoms are *cis* (Figure 1). This contrasts with the molecular structure reported for the related [{Me₂N(CH₂)₃}₂SnF₂]₂·2H₂O,^[34] which exhibits an all-*trans* octahedral (*C,N*)₂SnX₂ configuration. The difference in the configuration of the octahedral environment of tin is reflected in the lengthening and shortening of the Sn–F and Sn–N bond lengths, respectively, in **2b** [Sn(1)–F(1) = 1.9726(14), Sn(1)–F(2) = 1.9774(13), Sn(1)–N(1) = 2.5083(19) and Sn(1)–N(2) = 2.6064(18) Å] in comparison

with $[\{Me_2N(CH_2)_3\}_2SnF_2] \cdot 2H_2O$ [$Sn(1)-F(1) = 2.084(6)$ and $Sn(1)-N(1) = 2.366(8)$ Å].^[34]

The molecular structures of the triorganotin halides [$\{2-(Me_2NCH_2)C_6H_4\}_2R_2SnX$] (**2a–2d**, **3b** and **3d**) are very similar. One representative is shown in Figure 2. The tin–nitrogen distances are not dramatically affected by the identity of the halogen atom *trans* to the nitrogen atom. The Sn(1) atom is displaced from the equatorial plane defined by C(1), C(10) and C(16) (Figure 2) in the direction of the X(1) atom, which means that the X–Sn–C angles are larger than the N–Sn–C angles.

As a result of the intramolecular coordination of the nitrogen to the tin atom a five-membered SnC_3N ring is formed. This ring is not planar but is folded along the $Sn(1) \cdots C_{methylene}$ axis, with the nitrogen atom lying above the best plane defined by Sn(1), C(1), C(2) and C(methylene). This induces planar chirality at the metal atom,^[27–31] and all compounds reported here crystallise as racemates. The crystals of the triorganotin(IV) derivatives (**2a**, **2a'**, **2b–2d**, **3a**, **3a'**, **3b**, **3b'** and **3d**) contain 1:1 mixtures of (*R*) and (*S*) isomers, with the C(1)–C(6) aromatic ring and the N(1) atom as chiral plane and pilot atom, respectively.^[32] The

crystals of the diorganotin(IV) derivatives contain either (S_{N1}, R_{N2}) and (R_{N1}, S_{N2}) isomers (for **1b**) or (S_{N1}, S_{N2}) and (R_{N1}, R_{N2}) isomers (for **1a** and **1d**) with respect to the two chelate rings in a molecular unit. The discrete monomeric molecular units are separated by normal van der Waals distances between heavy atoms.

However, a closer check of the crystal structures revealed several intermolecular hydrogen-bonding interactions shorter than the sum of the corresponding van der Waals radii [i.e. $\Sigma_{vdW}(F, H) \approx 2.55$, $\Sigma_{vdW}(Cl, H) \approx 3.0$, $\Sigma_{vdW}(Br, H) \approx 3.15$ and $\Sigma_{vdW}(I, H) \approx 3.35$ Å].^[40] This results in different supramolecular architectures that are presented in the subsequent discussion taking into account the increasing degree of association, with the common patterns summarised in Table 5 (further details are available in the Supporting Information). Thus, in the crystal of the fluoride **3b** (space group $P2_1/n$) pairs of isomers (*S,S* or *R,R*) of the two independent molecules are associated through $F(1) \cdots H(34)_{aryl}$ contacts (2.50 Å). The short interatomic distance (2.56 Å) between the F(2) atom and a methyl hydrogen of a neighbouring dinuclear unit of the same type is at the limit of a van der Waals contact. The crystal of **3b'** (space group $P2_1/c$)^[26] contains polymeric chains of (*S*) and (*R*) isomers, respectively, built through $F(1) \cdots H(17Ba)_{methylene}$ interactions (2.37 Å). Similar polymeric chains of (*S*) and (*R*) isomers, respectively, were also found in the crystals of the triorganotin chlorides **3a**, **3a'**^[20] and the triorganotin iodide **3d**. In contrast to the phenyl derivatives, the crystals of the methyl analogues **2a** (space group $Pbca$) and **2b** contain chains of alternating (*S*) and (*R*) isomers. There are no further halogen–hydrogen contacts between the parallel polymeric chains.

For compound **1b**·CH₂Cl₂, alternating (R_{N1}, S_{N2})- and (S_{N1}, R_{N2})-**1b** isomers are connected through $F(2) \cdots H(7Ab)_{methylene}$ interactions (2.52 Å) and further bridged by CH₂Cl₂ molecules [$F(1) \cdots H(19A)_{solvent} = 2.37$, $Cl(2a) \cdots H(8A)_{methyl} = 2.94$ Å], resulting in ribbon-like chains (Figure 3), with no further inter-chain halogen–hydrogen contacts.

Polymeric chains of (*S*) and (*R*) isomers, respectively, built through $I(1) \cdots H(7Ba)_{methylene}$ interactions (3.16 Å), are also found in the crystal of the triorganotin iodide **2d**, but in this case additional $I(1) \cdots H(10Ac)_{Sn-methyl}$ contacts (3.29 Å) between chains of the same isomers result in a 2D supramolecular architecture. The crystal consists of layers alternating in the sequence $-R-R-S-S-R-R-S-S-$, with no further inter-layer contacts. The triorganotin chloride **2a'** (space group $Pna2_1$) and the triorganotin bromide **2c** also form polymeric chains, but in this case they are built from alternating (*S*) and (*R*) isomers [$Cl(1) \cdots H(8Bb)_{N-methyl} = 2.81$ Å for **2a'**; $Br(1) \cdots H(9Bb)_{N-methyl} = 3.02$ Å for **2c**]. For **2a'**, weak inter-chain contacts [$Cl(1) \cdots H(8Cc)_{N-methyl} = 2.98$ Å] result in a 2D network with a honeycomb motif (Figure 4, a) in which each molecule is linked to four neighbouring molecules (two isomers of a different type for the polymeric chain and two isomers of the same type for the parallel chains). For **2c**, the weak inter-chain contacts between the halogen and an aromatic hydrogen atom [$Br(1) \cdots$

Table 5. Structural patterns of the hydrogen-bonding-based supramolecular architectures in the crystals of [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnX}_2$] and [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{R}_2\text{SnX}$].

		inter-chain	Br(1)–H(4d) _{aryl}	3.15
3D architectures				
[R ₂ SnCl ₂] (1a)	alternating layers of (<i>S</i> _{N1} , <i>S</i> _{N2}) and (<i>R</i> _{N1} , <i>R</i> _{N2}) isomers, respectively; inter-layer contacts leading to a 3D supramolecular architecture	intra-layer	Cl(1)–H(4a') _{aryl}	2.81
		inter-layer	Cl(1)–H(6f') _{aryl}	2.94
[R ₂ SnI ₂] (1d)	chain of alternating (<i>S</i> _{N1} , <i>S</i> _{N2}) and (<i>R</i> _{N1} , <i>R</i> _{N2}) isomers; contacts between parallel chains, resulting in a layer network; inter-layer contacts leading to a 3D supramolecular architecture	intra-chain	I(2)–H(9Ca) _{methyl}	3.15
		inter-chain	I(2)–H(8Ac) _{methyl}	3.26
		inter-layer	I(1)–H(14f) _{aryl}	3.32

H(4d)_{aryl} = 3.15 Å, at the limit of a van der Waals contact] lead to a different two-dimensional motif, with rings built from two molecules [(*R*)- and (*S*)-**2c** isomers] and four molecules [(*R*)-(*R*)-(*S*)-(*S*)-**2c** isomers], respectively (Figure 4, b). In both cases there are no further contacts between the parallel layers.

In contrast to **1b**·CH₂Cl₂, the crystal structure of the diorganotin difluoride **1b** consists of layers in which alternating polymeric chains of (*R*_{N1},*S*_{N2})- and (*S*_{N1},*R*_{N2})-**1b** iso-

mers [F(2)–H(12a)_{aryl} = 2.38 Å] are connected through F(1)–H(7Ad)_{methylene} (2.47 Å) interactions. The overall layer network resembles that observed in the crystal of the triorganotin iodide **2d**, with both fluorine atoms being involved in weak hydrogen-bonding interactions.

Three-dimensional supramolecular architectures (Table 5) were found for the diorganotin dihalides **1a** and **1d**. Thus, in the crystal of the diorganotin diiodide **1d** there are parallel chains built from alternating (*S*_{N1},*S*_{N2}) and

Figure 3. Polymeric associations in the crystal of compound **1b**·CH₂Cl₂ based on halogen-hydrogen contacts (only hydrogens involved in such contacts are shown) [symmetry-equivalent atoms ($x, 2 - y, 0.5 + z$) and ($x, 2 - y, -0.5 + z$) are labelled as “a” and “b”].

Figure 4. View of the layer network based on intermolecular hydrogen bonds (only hydrogens involved in intermolecular interactions are shown) in the crystals of (a) **2a'** [symmetry-equivalent atoms ($1.5 - x, 0.5 + y, 0.5 + z$), ($1.5 - x, -0.5 + y, -0.5 + z$), ($1.5 - x, -0.5 + y, 0.5 + z$) and ($1.5 - x, 0.5 + y, -0.5 + z$) are labelled “a”, “b”, “c” and “d”, respectively] and (b) **2c** [symmetry-equivalent atoms ($-0.5 + x, y, 0.5 - z$), ($0.5 + x, y, 0.5 - z$), ($0.5 - x, -y, 0.5 + z$) and ($0.5 - x, -y, -0.5 + z$) are labelled “a”, “b”, “c” and “d”, respectively].

Figure 5. View of supramolecular architectures based on hydrogen bonding (only hydrogen atoms involved in intermolecular interactions are shown): (a) the layer network of (S_{N1}, S_{N2}) and (R_{N1}, R_{N2}) isomers in the crystal of **1d** [symmetry equivalent atoms ($-0.5 + x, 1.5 - y, 0.5 + z$), ($0.5 + x, 1.5 - y, -0.5 + z$), ($0.5 - x, -0.5 + y, 1.5 - z$) and ($0.5 - x, 0.5 + y, 1.5 - z$) are labelled as “a”, “b”, “c” and “d”, respectively]; (b) the layer network of (S_{N1}, S_{N2}) isomers in the crystal of **1a** [symmetry equivalent atoms ($0.5 + x, 0.5 + y, z$), ($0.5 + x, -0.5 + y, z$), ($-0.5 + x, -0.5 + y, z$) and ($-0.5 + x, 0.5 + y, z$) are labelled as “a”, “b”, “c” and “d”, respectively]; (c) 3D supramolecular structure in the crystal of **1a** [symmetry equivalent atoms ($-x, 1 - y, 1 - z$) and ($0.5 - x, 0.5 - y, -z$) are labelled as “e” and “f”, respectively].

(R_{N1}, R_{N2}) isomers through $I \cdots H_{\text{methyl}}$ contacts [$I(2) \cdots H(9\text{Ca})_{\text{methyl}} = 3.15 \text{ \AA}$]. Inter-chain contacts [$I(2) \cdots H(8\text{Ac})_{\text{methyl}} = 3.26 \text{ \AA}$] result in a similar layer network to that observed for **2a'** (Figure 5, a). Additional weak, inter-layer contacts between $I(1)$ and an aromatic proton [$I(1) \cdots H(14\text{f})_{\text{aryl}} = 3.32 \text{ \AA}$] lead to a 3D network. By contrast, in the crystal of the diorganotin dichloride **1a** only aromatic protons are involved in hydrogen bonding. The molecules are associated into layers built of the same type of isomer [$Cl(1) \cdots H(4\text{a}')_{\text{aryl}} = 2.81 \text{ \AA}$] (Figure 5, b) and alternating parallel layers of (S_{N1}, S_{N2}) or (R_{N1}, R_{N2}) isomers are bridged through weak $Cl(1) \cdots H(6\text{f}')_{\text{aryl}} (2.94 \text{ \AA})$ interactions (Figure 5, c).

Conclusion

The hypercoordinated di- and triorganotin(IV) halides [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnX}_2$], [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}-\text{Me}_2\text{SnX}$] and [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}\text{Ph}_2\text{SnX}$] ($X = \text{F}, \text{Cl}, \text{Br}, \text{I}$) have been prepared and their solutions investigated by multinuclear NMR spectroscopy, including variable-temperature studies. Single-crystal X-ray structure analyses have revealed that the strong intramolecular coordination of the nitrogen atom from the pendant CH_2NMe_2 group to tin induces planar chirality and the compounds crystallise as racemates. The influence of the identity and number of halogen atoms and organic substituents attached to the tin atoms is reflected in different supramolecular architectures based on hydrogen-bonding networks.

Experimental Section

General Remarks: All manipulations were carried out under argon using dried solvents freshly distilled prior to use. The ^1H and ^{13}C NMR spectra were recorded with Bruker Avance 300 and Bruker DPX 200 instruments. The ^{19}F NMR were recorded with Bruker Avance DRX 400 and Bruker DPX 300, and ^{119}Sn NMR were obtained using Bruker DPX 400 and Varian Unity 300 instruments. Variable-temperature ^1H NMR studies were performed with a Varian Unity 300 (compound **1a**) and a Varian Gemini 300S (compound **1b**). The chemical shifts are reported in ppm relative to the residual peak of solvent (CHCl_3 ; $\delta_{\text{H}} = 7.26$, $\delta_{\text{C}} = 77.0$ ppm for ^1H and ^{13}C , CFCl_3 for ^{19}F and neat SnMe_4 for ^{119}Sn). Starting materials such as SnCl_4 , BuSnCl_3 , Ph_2SnCl_2 , Me_2SnCl_2 KX ($X = \text{F}, \text{Br}, \text{I}$), N,N -dimethylbenzylamine and n -butyllithium were commercially available. The compounds [$\text{Li}\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}$],^[41] [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_4\text{Sn}\]$ ^[17] and [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}\text{Ph}_2\text{SnCl}\]$ (**3a**)^[20] were prepared according to the literature methods.

Synthesis of [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnCl}_2$] (1a**).** **Procedure 1:** A suspension of [$\text{Li}\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}$] [prepared as above from $n\text{BuLi}$ in n -hexane (24.6 mL, 1.6 M, 20% excess) and $\text{Me}_2\text{NCH}_2\text{C}_6\text{H}_5$ (4.43 g, 32.8 mmol) in 200 mL of anhydrous n -hexane] in anhydrous toluene (150 mL) was added dropwise, whilst stirring, to a cooled (-78°C) solution of SnCl_4 (4.27 g, 16.4 mmol) in 300 mL of toluene (300 mL). After all the suspension had been added, the reaction mixture was stirred for 1 h at -78°C , and then allowed to reach room temperature overnight. The reaction mixture was filtered under inert atmosphere and the solvent of the filtrate

was removed in vacuo. The solid residue was recrystallised from $\text{CH}_2\text{Cl}_2/n$ -hexane to give 6.1 g (81%) of the title compound as colourless crystals.

Procedure 2: SnCl_4 (0.437 g, 1.68 mmol) was added to [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_4\text{Sn}\]$ (1.1 g, 1.68 mmol) under inert atmosphere and the mixture was slowly heated whilst stirring until a homogeneous melt was obtained. The heating was maintained for 15 min and then the reaction mixture was cooled to room temperature. Recrystallisation from a $\text{CH}_2\text{Cl}_2/n$ -hexane mixture (approximately 1:4) provided 1.2 g (78%) of **1a** as colourless crystals (m.p. $257\text{--}259^\circ\text{C}$). ^1H NMR (CDCl_3 , 300 MHz, 20°C): $\delta = 2.22$ (br. s, 12 H, NCH_3), AB spin system with $\delta_{\text{A}} = 3.37$ and $\delta_{\text{B}} = 4.07$ ($^2J_{\text{H,H}} = 14.1$ Hz, 4 H, CH_2N), 7.18 (m, 2 H, 3-H), 7.41 (m, 4 H, 4, 4, 5-H), 8.22 (m, $^3J_{\text{H,Sn}} = 108$ Hz, 2 H, 6-H) ppm. ^1H NMR (CDCl_3 , 300 MHz, 60°C): $\delta = 2.21$ (br. s, 12 H, NCH_3), AB spin system with $\delta_{\text{A}} = 3.38$ and $\delta_{\text{B}} = 4.04$ (br. s, 4 H, CH_2N), 7.17 (d, $^3J_{\text{H,H}} = 6.9$ Hz, 2 H, 3-H), 7.52 (m, 4 H, 4, 4, 5-H), 8.25 (d, $^3J_{\text{H,H}} = 6.3$, $^3J_{\text{H,Sn}} = 108$ Hz, 2 H, 6-H) ppm. ^1H NMR (300 MHz, CDCl_3 , -60°C): $\delta = 2.05$ (s, $^3J_{\text{H,Sn}} = 39$ Hz, 6 H, NCH_3), 2.55 (s, $^3J_{\text{H,Sn}} = 39$ Hz, 6 H, NCH_3), AB spin system with $\delta_{\text{A}} = 3.39$ and $\delta_{\text{B}} = 4.14$ ($^2J_{\text{H,H}} = 14.2$, $^3J_{\text{H,Sn}} = 39$ Hz, 4 H, CH_2N), 7.19 (d, $^3J_{\text{H,H}} = 6.6$ Hz, 2 H, 3-H), 7.41 (m, 4 H, 4, 4, 5-H), 8.19 (d, $^3J_{\text{H,H}} = 6.8$, $^3J_{\text{H,Sn}} = 110$ Hz, 2 H, 6-H) ppm. ^{13}C NMR (CDCl_3 , 100.6 MHz, 20°C): $\delta = 46.78$ (br. s, NCH_3), 63.80 (s, $^2J_{\text{C,Sn}} = 42.8$ Hz, CH_2N), 127.85 (s, $^3J_{\text{C,Sn}} = 97.1/99.3$ Hz, C-3), 128.18 (s, $^3J_{\text{C,Sn}} = 104.8/107.6$ Hz, C-5), 130.16 (s, $^4J_{\text{C,Sn}} = 19.1$ Hz, C-4), 135.47 (s, $^2J_{\text{C,Sn}} = 61.3$ Hz, C-6), 140.79 (s, $^2J_{\text{C,Sn}} = 62.8$ Hz, C-2; $^1J_{\text{C,Sn}} = 1167.1/1221.3$ Hz, C-1) ppm. ^{119}Sn NMR ($\text{CH}_2\text{Cl}_2/[\text{D}_6]\text{acetone}$, 149.2 MHz, 20°C): $\delta = -260.7$ ppm (s). $\text{C}_{18}\text{H}_{24}\text{Cl}_2\text{N}_2\text{Sn}$ (458.00): calcd. C 47.21, H 5.28, N 6.12; found C 47.34, H 5.43, N 5.84.

Synthesis of [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnF}_2$] (1b**):** Dichloromethane was added to a suspension of **1a** (0.3 g, 0.65 mmol) in MeOH (20 mL) until the solid compound dissolved. An aqueous solution of KF (0.2 g, 3.44 mmol) was then added and the mixture was stirred for 3 h at room temperature. The organic layer was separated and the water solution was washed twice with 5 mL of CH_2Cl_2 . The combined organic layers were dried with anhydrous Na_2SO_4 . The latter was filtered, the solvent was removed in vacuo and the obtained white solid residue was recrystallised from a $\text{CH}_2\text{Cl}_2/n$ -hexane mixture to give **1b** (0.25 g, 90%; m.p. $213\text{--}215^\circ\text{C}$). Colourless crystals suitable for single-crystal X-ray diffraction were obtained by slow crystallisation from a $\text{CH}_2\text{Cl}_2/n$ -hexane (approximately 1:5) mixture. ^1H NMR (CDCl_3 , 400 MHz, 20°C): $\delta = 2.24$ (br. s, 12 H, NCH_3), 3.66 (br. s, 4 H, CH_2N), 7.16 (m, 2 H, 3-H), 7.38 (m, 4 H, 4, 4, 5-H), 8.08 (m, $^3J_{\text{H,Sn}} = 92.2$ Hz, 2 H, 6-H) ppm. ^1H NMR (CDCl_3 , 300 MHz, 55°C): $\delta = 2.24$ (s, 12 H, NCH_3), 3.66 (s, 4 H, CH_2N), 7.17 (m, 2 H, 3-H), 7.39 (m, 4 H, 4, 4, 5-H), 8.09 (m, $^3J_{\text{H,Sn}} = 91.5$ Hz, 2 H, 6-H) ppm. ^1H NMR (CDCl_3 , 300 MHz, -55°C): $\delta = 2.10$ (s, 6 H, NCH_3), 2.42 (s, 6 H, NCH_3), AB spin system with $\delta_{\text{A}} = 3.53$ and $\delta_{\text{B}} = 3.82$ ($^2J_{\text{H,H}} = 14.3$ Hz, 4 H, CH_2N), 7.17 (m, 2 H, 3-H), 7.38 (m, 4 H, 4, 4, 5-H), 8.05 (m, $^3J_{\text{H,Sn}} = 93.3$ Hz, 2 H, 6-H) ppm. ^{13}C NMR (CDCl_3 , 100.6 MHz, 20°C): $\delta = 46.09$ (br. s, NCH_3), 64.10 (s, $^2J_{\text{C,Sn}} = 48.4$ Hz, CH_2N), 127.31 (s, $^3J_{\text{C,Sn}} = 96.7$ Hz, C-3), 127.93 (s, $^3J_{\text{C,Sn}} = 99.3$ Hz, C-5), 129.97 (s, $^4J_{\text{C,Sn}} = 17.6$ Hz, C-4), 136.30 (s, $^2J_{\text{C,Sn}} = 49.5$ Hz, C-6), 139.23 (t, $^3J_{\text{C,F}} = 22.5$ Hz, C-1), 141.04 (s, $^2J_{\text{C,Sn}} = 66.7$ Hz, C-2) ppm. ^{19}F NMR (CDCl_3 , 282.38 MHz, 20°C): $\delta = -181.5$ ppm (s, $^1J_{\text{F,Sn}} = 2567/2683$ Hz). ^{119}Sn NMR ($\text{CH}_2\text{Cl}_2/[\text{D}_6]\text{acetone}$, 149.2 MHz, 20°C): $\delta = -386.7$ ppm (t, $^1J_{\text{F,Sn}} = 2663$ Hz). $\text{C}_{18}\text{H}_{24}\text{F}_2\text{N}_2\text{Sn}$ (425.09): calcd. C 50.86, H 5.69, N 6.59; found C 50.58, H 5.33, N 6.37.

Synthesis of [$\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}_2\text{SnI}_2$] (1d**):** A saturated aqueous solution of NH_4I (20 mL) was added to a solution of **1a** (0.79 g,

1.73 mmol) in CH₂Cl₂ (20 mL)/EtOH (4 mL) and the reaction mixture was stirred for 10 h at room temperature. The organic layer was separated and the water solution was washed twice with 5 mL of CH₂Cl₂. The organic solution was separated and dried with anhydrous Na₂SO₄. The latter was filtered, the solvent was removed in vacuo and the solid residue was recrystallised from a CH₂Cl₂/*n*-hexane mixture to give **1d** as colourless crystals (0.66 g, 60%; m.p. 238 °C). ¹H NMR (CDCl₃, 300 MHz, 20 °C): δ = 2.23 (br. s, 12 H, NCH₃), AB spin system with δ_A = 3.19 and δ_B = 4.22 (²J_{H,H} = 12.7 Hz, 4 H, CH₂N), 7.13 (d, ³J_{H,H} = 6.9 Hz, 2 H, 3-H), 7.37 (dd, ³J_{H,H} = 7.4 Hz, 2 H, 4-H), 7.47 (dd, ³J_{H,H} = 7.5 Hz, 2 H, 5-H), 8.19 (d, ³J_{H,H} = 7.2, ³J_{H,Sn} = 111.9 Hz, 2 H, 6-H) ppm. ¹H NMR (CDCl₃, 300 MHz, 50 °C): δ = 2.21 (s, ³J_{H,Sn} = 39.1 Hz, 12 H, NCH₃), AB spin system with δ_A = 3.24 and δ_B = 4.16 (br. s, 4 H, CH₂N), 7.12 (d, ³J_{H,H} = 7.3 Hz, 2 H, 3-H), 7.37 (dd, ³J_{H,H} = 7.4 Hz, 2 H, 4-H), 7.47 (dd, ³J_{H,H} = 7.5 Hz, 2 H, 5-H), 8.21 (d, ³J_{H,H} = 7.3, ³J_{H,Sn} = 111.9 Hz, 2 H, 6-H) ppm. ¹H NMR (300 MHz, CDCl₃, -50 °C): δ = 1.96 (s, ³J_{H,Sn} = 39.2 Hz, 6 H, NCH₃), 2.63 (s, ³J_{H,Sn} = 38.8 Hz, 6 H, NCH₃), AB spin system with δ_A = 3.17 and δ_B = 4.30 (²J_{H,H} = 14.2 Hz, 4 H, CH₂N), 7.13 (d, ³J_{H,H} = 7.2 Hz, 2 H, 3-H), 7.37 (dd, ³J_{H,H} = 7.4 Hz, 2 H, 4-H), 7.46 (dd, ³J_{H,H} = 7.4 Hz, 2 H, 5-H), 8.15 (d, ³J_{H,H} = 7.4, ³J_{H,Sn} = 115.3 Hz, 2 H, 6-H) ppm. ¹³C NMR (CDCl₃, 100.6 MHz, 20 °C): δ = 46.90 (br. s, NCH₃), 62.80 (s, ²J_{C,Sn} = 35.6 Hz, CH₂N), 128.02 (s, ³J_{C,Sn} = 104.1 Hz, C-5), 128.22 (s, ³J_{C,Sn} = 90.8 Hz, C-3), 130.29 (s, ⁴J_{C,Sn} = 18.2 Hz, C-4), 135.73 (s, ²J_{C,Sn} = 67.1 Hz, C-6), 138.17 (s, C-1), 140.51 (s, C-2) ppm. ¹¹⁹Sn NMR (CDCl₃, 111.9 MHz, 20 °C): δ = -346.9 ppm (s). C₁₈H₂₄I₃N₂Sn (640.90): calcd. C 33.73, H 3.77, N 4.37; found C 33.42, H 3.53, N 4.12.

Synthesis of [{2-(Me₂NCH₂)C₆H₄}]Me₂SnCl] (2a**):** A suspension of [Li{2-(Me₂NCH₂)C₆H₄}] prepared as above from *n*BuLi in *n*-hexane (17.6 mL, 1.6 M, 20% excess) and Me₂NCH₂C₆H₅ (3.18 g, 23.5 mmol) in 50 mL of anhydrous *n*-hexane] in anhydrous toluene (50 mL) was added dropwise, whilst stirring, to a cooled (-78 °C) solution of Me₂SnCl₂ (5.17 g, 23.5 mmol) in 150 mL of toluene (300 mL). After all the suspension had been added the reaction mixture was stirred for 1 h at -78 °C, and then allowed to reach room temperature overnight. The reaction mixture was filtered under inert atmosphere and the solvent was removed in vacuo. The white solid residue was recrystallised from CH₂Cl₂/*n*-hexane to give **2a** (5.2 g, 69%) as colourless crystals (m.p. 119–121 °C; ref.^[12] 120–123 °C). ¹H NMR (CDCl₃, 200 MHz, 20 °C): δ = 0.73 (s, ²J_{H,Sn} = 64.1/67.0 Hz, 6 H, SnCH₃), 2.29 (s, 6 H, NCH₃), 3.62 (s, 2 H, CH₂N), 7.12 (m, 1 H, 3-H), 7.32 (m, 2 H, 4,5-H), 8.17 (m, ³J_{H,Sn} = 67.2 Hz, 1 H, 6-H) ppm. ¹³C NMR (CDCl₃, 50.3 MHz, 20 °C): δ = -0.28 (s, ¹J_{C,Sn} = 492.4/515.4 Hz, SnCH₃), 45.15 (s, NCH₃), 64.78 (s, ²J_{C,Sn} = 28.8 Hz, CH₂N), 126.46 (s, ³J_{C,Sn} = 59.1 Hz, C-3), 127.88 (s, ³J_{C,Sn} = 67.2 Hz, C-5), 129.32 (s, ⁴J_{C,Sn} = 13.2 Hz, C-4), 137.60 (s, ²J_{C,Sn} = 42.9 Hz, C-6), 140.28 (s, C-1), 141.78 (s, ²J_{C,Sn} = 38.6 Hz, C-2) ppm. ¹¹⁹Sn NMR (CH₂Cl₂/[D₆]acetone, 149.2 MHz, 20 °C): δ = -48.7 ppm (s). C₁₁H₁₈ClNSn (318.41): calcd. C 41.49, H 5.70, N 4.40; found C 41.23, H 5.61, N 4.53.

Synthesis of [{2-(Me₂NCH₂)C₆H₄}]Me₂SnF] (2b**):** Same procedure as for **1b**, using **2a** (0.25 g, 0.78 mmol) and KF (0.228 g, 3.92 mmol). Recrystallisation from CH₂Cl₂/*n*-hexane (approximately 1:3) mixture gave **2b** (0.21 g, 89%) as colourless crystals (m.p. 92–94 °C). ¹H NMR (CDCl₃, 400 MHz, 20 °C): δ = 0.56 (d, ³J_{H,F} = 3.7, ²J_{H,Sn} = 64.8/67.2 Hz, 6 H, SnCH₃), 2.28 (s, 6 H, NCH₃), 3.59 (s, 2 H, CH₂N), 7.12 (m, 1 H, 3-H), 7.32 (m, 2 H, 4,5-H), 7.97 (m, ³J_{H,Sn} = 60.4 Hz, 1 H, 6-H) ppm. ¹³C NMR (CDCl₃, 100.6 MHz, 20 °C): δ = -3.67 (d, ²J_{C,F} = 16.7, ¹J_{C,Sn} = 507.7/531.3 Hz, SnCH₃), 45.16 (s, NCH₃), 64.91 (s, ²J_{C,Sn} = 30.3 Hz, CH₂N), 126.47 (s, ³J_{C,Sn} = 58.3 Hz, C-3), 127.83 (s, ³J_{C,Sn} =

64.6 Hz, C-5), 129.24 (s, ⁴J_{C,Sn} = 12.8 Hz, C-4), 137.19 (s, ²J_{C,Sn} = 38.2 Hz, C-6), 141.32 (d, ³J_{C,F} = 21.7 Hz, C-1), 142.04 (s, ²J_{C,Sn} = 39.4 Hz, C-2) ppm. ¹⁹F NMR (CDCl₃, 376.5 MHz, 20 °C): δ = -178.4 ppm (s, ¹J_{F,Sn} = 1944.2/2034.6 Hz). ¹¹⁹Sn NMR (CDCl₃, 111.9 MHz, 20 °C): δ = -52.7 ppm (d, ¹J_{F,Sn} = 2039.3 Hz). C₁₁H₁₈FNSn (301.96): calcd. C 43.75, H 6.01, N 4.64; found C 43.41, H 5.79, N 4.41.

Synthesis of [{2-(Me₂NCH₂)C₆H₄}]Me₂SnBr] (2c**):** An aqueous solution of KBr (0.93 g, 7.85 mmol) was added to a solution of **2a** (0.5 g, 1.57 mmol) in CH₂Cl₂ (30 mL) and the reaction mixture was stirred for 3 h at room temperature. The organic layer was separated and the water solution was washed twice with 10 mL of CH₂Cl₂. The organic solution was dried with anhydrous Na₂SO₄. The solvent was removed in vacuo and the obtained pale brown-red residue was recrystallised from a CH₂Cl₂/*n*-hexane mixture to give **2c** (0.52 g, 91%) [m.p. 136–138 °C (dec); ref.^[2] white solid, 136–137 °C]. Colourless crystals suitable for single-crystal X-ray diffraction were obtained from a CH₂Cl₂/*n*-hexane (approximately 1:4) solution. ¹H NMR (CDCl₃, 200 MHz, 20 °C): δ = 0.87 (s, ²J_{H,Sn} = 63.5/66.4 Hz, 6 H, SnCH₃), 2.32 (s, 6 H, NCH₃), 3.64 (s, 2 H, CH₂N), 7.12 (m, 1 H, 3-H), 7.35 (m, 2 H, 4,5-H), 8.26 (m, ³J_{H,Sn} = 68.5 Hz, 1 H, 6-H) ppm. ¹³C NMR (CDCl₃, 50.3 MHz, 20 °C): δ = 1.02 (s, ¹J_{C,Sn} = 483.1/505.1 Hz, SnCH₃), 45.22 (s, NCH₃), 64.74 (s, ²J_{C,Sn} = 28.1 Hz, CH₂N), 126.46 (s, ³J_{C,Sn} = 58.9 Hz, C-3), 127.89 (s, ³J_{C,Sn} = 67.6 Hz, C-5), 129.39 (s, C-4), 138.22 (s, ²J_{C,Sn} = 44.7 Hz, C-6), 139.54 (s, C-1), 141.58 (s, ²J_{C,Sn} = 37 Hz, C-2). ¹¹⁹Sn NMR (CDCl₃, 149.2 MHz, 20 °C): δ = -55.5 ppm (s). C₁₁H₁₈BrNSn (362.86): calcd. C 36.41, H 5.00, N 3.86; found C 36.11, H 5.21, N 3.67.

Synthesis of [{2-(Me₂NCH₂)C₆H₄}]Me₂SnI] (2d**):** Same procedure as for **1b**, using **2a** (0.2 g, 0.63 mmol) and KI (0.52 g, 3.14 mmol). Recrystallisation from a CH₂Cl₂/*n*-hexane (approximately 1:3) mixture gave **2d** (0.21 g, 82%) as pale-yellow crystals (m.p. 105–107 °C). ¹H NMR (CDCl₃, 300 MHz, 20 °C): δ = 1.05 (s, ²J_{H,Sn} = 63.2/65.0 Hz, 6 H, SnCH₃), 2.34 (s, 6 H, NCH₃), 3.65 (s, 2 H, CH₂N), 7.11 (d, ³J_{H,H} = 7.0 Hz, 1 H, 3-H), 7.35 (m, 2 H, 4,5-H), 8.30 (d, ³J_{H,H} = 6.6, ³J_{H,Sn} = 71.2 Hz, 1 H, 6-H) ppm. ¹³C NMR (CDCl₃, 75.5 MHz, 20 °C): δ = 3.18 (s, ¹J_{C,Sn} = 470.1/492.0 Hz, SnCH₃), 45.42 (s, NCH₃), 64.84 (s, ²J_{C,Sn} = 26.9 Hz, CH₂N), 126.54 (s, ³J_{C,Sn} = 58.9 Hz, C-3), 128.03 (s, ³J_{C,Sn} = 69.4 Hz, C-5), 129.58 (s, ³J_{C,Sn} = 13.7 Hz, C-4), 138.26 (s, ¹J_{C,Sn} = 664.0/694.8 Hz, C-1), 139.62 (s, ²J_{C,Sn} = 46.2 Hz, C-6), 141.40 (s, ²J_{C,Sn} = 35.8 Hz, C-2) ppm. ¹¹⁹Sn NMR (CDCl₃, 111.9 MHz, 20 °C): δ = -72.8 ppm (s). C₁₁H₁₈INSn (409.87): calcd. C 32.24, H 4.43, N 3.42; found C 32.11, H 4.25, N 3.33.

Synthesis of [{2-(Me₂NCH₂)C₆H₄}]Ph₂SnF] (3b**):** Same procedure as for **1b**, using **3a** (0.25 g, 0.56 mmol) and KF (0.164 g, 2.82 mmol). Recrystallisation from a CH₂Cl₂/*n*-hexane (approximately 1:3) mixture gave **3b** (0.21 g, 87%) as colourless crystals (m.p. 161–163 °C). ¹H NMR (CDCl₃, 400 MHz, 20 °C): δ = 1.97 (s, 6 H, NCH₃), 3.56 (s, 2 H, CH₂N), 7.20 (d, ³J_{H,H} = 7.2 Hz, 1 H, 3-H), 7.44 (m, 8 H, 4,5-H + C₆H₅-*meta,para*), 7.72 (m, ³J_{H,Sn} = 61.1 Hz, 4 H, C₆H₅-*ortho*), 8.31 (d, ³J_{H,H} = 7.0, ³J_{H,Sn} = 64.4 Hz, 1 H, 6-H) ppm. ¹³C NMR (CDCl₃, 100.6 MHz, 20 °C): δ = 45.76 (s, NCH₃), 64.82 (s, ²J_{C,Sn} = 31.2 Hz, CH₂N), 127.03 (s, ³J_{C,Sn} = 64.6 Hz, C-3), 128.05 (s, ³J_{C,Sn} = 68.7 Hz, C-5), 128.75 (s, ³J_{C,Sn} = 67.5 Hz, C₆H₅-*meta*), 129.53 (s, ⁴J_{C,Sn} = 13.5 Hz, C₆H₅-*para*), 129.93 (s, ⁴J_{C,Sn} = 13.1 Hz, C-4), 136.03 (s, ²J_{C,Sn} = 44.8 Hz, C₆H₅-*ortho*), 138.34 (s, ²J_{C,Sn} = 39.1 Hz, C-6), 140.29 (d, ³J_{C,F} = 15.5 Hz, C₆H₅-*ipso*), 142.88 (s, ²J_{C,Sn} = 44.3 Hz, C-2) ppm; the resonance for C-1 is overlapped by the resonance of C-6. ¹⁹F NMR (CDCl₃, 376.5 MHz, 20 °C): δ = -182.4 ppm (s, ¹J_{F,Sn} = 2058.3/2154.0 Hz). ¹¹⁹Sn NMR (CDCl₃,

111.9 MHz, 20 °C): $\delta = -197.6$ ppm (d, $^1J_{\text{F,Sn}} = 2157$ Hz). $\text{C}_{21}\text{H}_{22}\text{FNSn}$ (426.10): calcd. C 59.20, H 5.20, N 3.29; found C 58.96, H 5.05, N 3.07.

Synthesis of $[\{2-(\text{Me}_2\text{NCH}_2)\text{C}_6\text{H}_4\}\text{Ph}_2\text{Sn}]\text{I}$ (3d**):** Same procedure as for **1b**, using **3a** (0.2 g, 0.45 mmol) and KI (0.375 g, 2.26 mmol). Recrystallisation from a $\text{CH}_2\text{Cl}_2/n$ -hexane (approximately 1:4) mixture gave **3d** (0.22 g, 91%) as pale-yellow crystals (m.p. 235–

236 °C). ^1H NMR (CDCl_3 , 300 MHz, 20 °C): $\delta = 1.87$ (s, 6 H, NCH_3), 3.56 (s, 2 H, CH_2N), 7.18 (d, $^3J_{\text{H,H}} = 7.3$ Hz, 1 H, 3-H), 7.40 (m, 7 H, 4-H + C_6H_5 -*meta,para*), 7.53 (dd, $^3J_{\text{H,H}} = 7.5$ Hz, 1 H, 5-H), 7.72 (m, $^3J_{\text{H,Sn}} = 65.3$ Hz, 4 H, C_6H_5 -*ortho*), 8.60 (d, $^3J_{\text{H,H}} = 7.1$, $^3J_{\text{H,Sn}} = 75.1$ Hz, 1 H, 6-H) ppm. ^{13}C NMR (CDCl_3 , 75.4 MHz, 20 °C): $\delta = 45.84$ (s, NCH_3), 64.64 (s, $^2J_{\text{C,Sn}} = 25.8$ Hz, CH_2N), 127.19 (s, $^3J_{\text{C,Sn}} = 62.1$ Hz, C-3), 128.29 (s, $^3J_{\text{C,Sn}} = 74.2$ Hz, C-5), 128.85 (s, $^3J_{\text{C,Sn}} = 69.3$ Hz, C_6H_5 -*meta*), 129.35 (s,

⁴*J*_{C,Sn} = 13.7 Hz, C₆H₅-*para*), 130.20 (s, ⁴*J*_{C,Sn} = 14.2 Hz, C-4), 135.18 (s, ²*J*_{C,Sn} = 45.8 Hz, C₆H₅-*ortho*), 135.23 (s, C-1), 140.80 (s, ²*J*_{C,Sn} = 50.3 Hz, C-6), 142.32 (s, ²*J*_{C,Sn} = 38.4 Hz, C-2), 142.36 (s, ¹*J*_{C,Sn} = 705.1/737.9 Hz, C₆H₅-*ipso*). ¹¹⁹Sn NMR (CDCl₃, 111.9 MHz, 20 °C): δ = –199.5 ppm (s). C₂₁H₂₂INSn (534.01): calcd. C 47.23, H 4.15, N 2.62; found C 47.01, H 3.88, N 2.45.

X-ray Crystallographic Study: The crystal structure measurement and refinement data for **1a**, **1b**, **1b**·CH₂Cl₂, **1d**, **2a**, **2a'**, **2b–2d**, **3a**, **3b** and **3d** are given in Tables 6, 7 and 8. Data for **1a** were collected with a Nonius KappaCCD diffractometer (University of Dortmund) at 291 K. For all the other compounds the data were collected using a SMART APEX diffractometer (“Babes-Boyai” University) at 297 K. In both cases a graphite monochromator was used to produce a wavelength (Mo-*K*_α) of 0.71073 Å. The structures were solved by direct methods (full-matrix least-squares on *F*²). All non-hydrogen atoms were refined with anisotropic thermal parameters. For structure solving and refinement the SHELX-97 software package was used.^[42] The drawings were created with the Diamond program by Crystal Impact GbR.^[43]

CCDC-231308 (for **1a**), -230620 (for **1b**), -230621 (for **1b**·CH₂Cl₂), -285103 (for **1d**), -215229 (for **2a**), -215230 (for **2a'**), -215224 (for **2b**), -230622 (for **2c**), -215380 (for **2d**), -215228 (for **3a**), -215226 (for **3b**) and -215227 (for **3d**) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.

Supporting Information Available (for details see the footnote on the first page of this article): Figure S1 (variable-temperature ¹H NMR spectra for **1a** and **1b**, in CDCl₃ solution), Figures S2–S8 (simulation of the aromatic region of the ¹H NMR spectra for **1a**, **1b**, **2a–2d** and **4b**, respectively) and Figures S9–S43 (details of the different supramolecular architectures based on hydrogen-bonding networks in the crystals of investigated compounds).

Acknowledgments

This work was supported by the National University Research Council of Romania [a CNCSIS grant (A-T-23/552/2004)] and a CERES Project (contract no. 32/12.11.2004). We thank the National Center for X-ray Diffraction (“Babes-Bolyai” University, Cluj-Napoca) for performing the single-crystal X-ray diffraction studies.
