

PNSO Ligands as a Tool to Study Metal Bonding of Electron-Deficient Sulfinyl Groups

Marc Revés,^[a] Antoni Riera,^{*[a]} and Xavier Verdager^{*[a]}

Keywords: S ligands / Electron-deficient compounds / Cobalt / Cycloaddition

A family of *N*-phosphanylsulfinamide (PNSO) ligands with electron-deficient sulfinyl groups was synthesized. Reaction with Co₂-alkyne complexes yields P,S-bridged complexes. These complexes were used to study the metal bonding of different sulfinyl groups. IR spectroscopy, X-ray analysis, and Pauson–Khand reactivity studies indicated that electron-deficient sulfinyl groups provide enhanced S metal bonding.

The mean CO stretching frequencies ($\Delta\nu$) for these complexes closely correlates with the χ_i parameter computed by Tolman for phosphane ligands. Among the studied sulfinyl groups, the trifluoromethyl PNSO ligand afforded the strongest sulfur–metal bond.

Introduction

Sulfoxides and sulfinamides have recently emerged as a valuable class of ligands in metal catalysis.^[1] Compared to phosphanes, sulfinyl ligands offer a series of advantages: the chiral information is always adjacent to the bound metal, they can be easily synthesized in optically pure form, and they are stable to air.^[2] Depending on the metal and other structural factors, the sulfinyl ligand may bind the metal either through the oxygen or sulfur atom.^[3] Although there is extensive knowledge about the binding capacity of dmsO and the usual PhSO, *p*-TolSO, MeSO, and *tert*-BuSO fragments, there are virtually no examples of metal-bound, electron-deficient sulfoxides or sulfinamides.^[4]

We recently introduced *N*-phosphanyl sulfinamide ligands (PNSO) and studied their coordination behavior towards cobalt and rhodium complexes (Figure 1).^[5–7] Compounds **1** and **2** were shown to function invariably as P,S-bridging ligands towards alkyne–dicobaltcarbonyl complexes. In light of this observation, here we used PNSO ligands to study the π acidity and metal-binding capacity of electron-deficient sulfinyl groups. Here we report on the synthesis of PNSO ligands bearing electron-withdrawing groups (EWGs) on sulfur, the preparation of their corresponding dicobalt–alkyne complexes, and how the electronic nature of the ligand affects sulfur–metal bonding.

Figure 1. PNSO ligands and the corresponding Co₂-alkyne complexes.

Results and Discussion

Racemic PNSO ligands with EWGs on sulfur were prepared in a two-step synthesis starting from the corresponding sulfonyl chlorides (Table 1). Following the experimental procedure described by Harmata and co-workers, treatment of sulfonyl chloride with benzylamine, triethylamine, and PPh₃ produced a mixture of benzylsulfinyl amide and benzylsulfonyl amide, in which the former was the major product.^[8] A variety of sulfonyl chlorides are commercially available, thereby making these compounds an ideal starting material to prepare an array of sulfinamides with EWGs. Column chromatography provided pure sulfinamides **1** in moderate to good yields, except for perfluorobenzenesulfonyl chloride, which failed to produce the desired sulfinamide (Table 1, Entry 7). From the corresponding isolated sulfinamides **1**, deprotonation, reaction with Ph₂PCl, and protec-

tion with $\text{BH}_3\text{-SMe}_2$ afforded borane-protected PNSO ligands **10–16** in 31–70% yield. As described previously, borane protection stabilizes the functionalities contained in the PNSO ligands towards oxygen migration and hydrolysis.^[6] Protected ligands **II** are stable oils or solids that can be stored in the fridge for several months without decomposition.

With the novel PNSO ligands in hand, we proceeded to check their binding capacity to dicobalt–alkyne complexes. Deprotection with DABCO and a ligand exchange reaction with trimethylsilylacetylenedicobalt hexacarbonyl complex was conducted in a one-pot procedure by thermal activation at 65 °C in toluene (Table 2). TLC monitoring disclosed the formation of two novel complexes: the initial nonbridged P-coordinated intermediate and the final bridged P,S-coordinated complex. In most cases, heating for 2–5 h at 65 °C sufficed for full conversion to the final bridged complex. In other cases, a better yield was observed when the initial deprotection/P coordination sequence was

achieved at lower temperature (40 °C), whereas S coordination was promoted at 65 °C (Table 2, Entries 5 and 6). Thus, in general, good to excellent yields of the desired bridged complexes were obtained. Although sulfinyl groups containing *o*-fluoro- and *o*-chlorobenzene fragments provided efficient S coordination, the analogous ligand with an *o*-nitrobenzene moiety failed to yield the bridged compound (Table 2, Entry 3).^[9] Benzene groups with an EWG (CF_3 , NO_2) in either the *meta* or *para* positions allowed the formation of bridged complexes (Table 2, Entries 4–6). Finally, PNSO ligand **16** containing a trifluoromethyl sulfinyl group, provided the corresponding bridged complexes in good yield (Table 2, Entries 7 and 8). Resulting bridged complexes **10a–16b** were obtained as a 1:1 mixture of diastereomers and they could not be separated by chromatography. This result is in concordance with *p*-tolylsulfinamide ligand (**2**), which showed lower selectivity than its *tert*-butyl analog (**1**).

At this point, we observed that even the exceptionally electron-deficient CF_3SO group showed the capacity to bind to cobalt. To the best of our knowledge, there are virtually no examples of sulfoxides with EWGs bonded to transition-metal complexes.^[10] We propose that, in analogy to phosphane ligands, PNSO–cobalt carbonyl complexes **10a–16a** could allow the study of the S-binding properties of electron-deficient sulfinyl groups. The electronic properties of phosphane ligands can be conveniently analyzed by the stretching frequencies of the CO ligands in $\text{Ni}(\text{PR}_3)\text{CO}_3$ and $\text{Cr}(\text{PR}_3)\text{CO}_5$ complexes.^[11–13] σ -Donor phosphanes will increase metal electron density, which increases back-bonding to CO ligands, thus eventually resulting in lower IR frequencies. In contrast, strong π -acceptor ligands will compete for metal electron density with the CO ligands and the CO stretching frequencies will remain high. Thus, CO stretching frequencies allows the ranking of phosphanes from strongly σ basic (*t* Bu_3P) to strongly π acidic (F_3P).

Dicobalt–alkyne complexes with a bridging PNSO ligand have no symmetry, and the four carbonyl ligands originate an equal amount of CO stretching bands (A, B, C, D; Fig-

ure 2). The lower frequency band (D) is also the less intense and it usually overlaps partially with the C band. Conversely, the highest frequency band (A) corresponding to the symmetric stretching of the four carbonyl ligands is isolated from the other CO bands.^[14]

Figure 2. Representative metal carbonyl IR spectra for complexes **10a–16b**.

Complexes of trimethylsilylalkyne (**1a–16a**) were ranked on the basis of their CO stretching frequencies, as shown in Table 3. The same ranking resulted independently of whether band A or the mean stretching frequency (A, B, and C) was used. Taking the complex with a *tert*-butyl sulfinyl group as a reference, we calculated the $\Delta\nu$ parameter as the difference of the mean frequencies of the two complexes. The $\Delta\nu$ parameter is indicative of the π acidity of the ligand: High $\Delta\nu$ indicated increased π acidity. In agreement with this observation, the *p*-tolyl sulfinyl group provided lower $\Delta\nu$ than the corresponding phenyl sulfinyl groups with the EWG on the aryl ring. Phenyl groups with *o*-chloro and *o*-fluoro substitution provided similar $\Delta\nu$ values (Table 3, Entries 3 and 4). *p*-Nitrophenyl provided lower $\Delta\nu$ (8 cm⁻¹) than *p*-trifluoromethylphenyl (9 cm⁻¹) and 3,5-bis(trifluoromethyl)phenyl (12 cm⁻¹). Finally, the CF₃ group alone provided the highest $\Delta\nu$ value (17 cm⁻¹). The values of $\Delta\nu$ calculated for complexes **1a–16a** correlate well with the electronic parameter χ_i calculated by Tolman for the contribution of a single substituent R in a phosphane (PR₃).^[11] In phosphanes, for example, the *p*-tolyl and the CF₃ groups showed χ_i values of 3.5 and 19.6, respectively.

Further confirmation of the binding properties of the CF₃–SO came through single-crystal X-ray studies. The original 1:1 diastereomeric mixture of complex **16a** was crystallized out from hexanes to obtain a single diastereomer as a racemate.^[15] One of the two enantiomers contained in the unit cell is shown in Figure 3. The X-ray structure confirmed that the PNSO ligand in complex **16a** adopts a bridging disposition. The P,S ligand is positioned *anti* with respect the alkyne substituent (TMS) to minimize steric interactions. Interestingly, the S–Co distance for **16a**

was 2.13 Å, a distance shorter than that of *p*-tolyl sulfinyl (2.17 Å) and the *tert*-butyl sulfinyl examples (2.19 Å).^[5,6] The preceding bond lengths further validate the IR spectroscopic data observed, and are indicative that, for sulfinyl ligands, the presence of EWGs leads to increased ligand–metal bond strength.

Figure 3. ORTEP plot for the crystal structure of complex **16a**. Thermal ellipsoids shown at 50% probability. Only one enantiomer of the racemate is shown. Bond length S–Co = 2.13 Å.

Finally, in a reactivity study we compared Co₂–PNSO complexes containing a CF₃SO group with the corresponding *p*TolSO and the *t*BuSO analogs in the stoichiometric intermolecular Pauson–Khand reaction (Table 4). Thus, for both TMS- and Ph-alkyne complexes, the shortest reaction times observed were for complexes **1a** and **1b** with a *tert*-butyl sulfinyl group (Table 4, Entries 1 and 4). Of the *p*-tolyl and CF₃ ligands, the latter were noticeably less reactive for the corresponding TMS complex (Table 4, Entries 2 and

3), whereas both groups of ligands showed similar reaction times for phenylacetylene-derived complexes (Table 4, Entries 5–8). In general, a higher strength of the S–Co bond resulted in longer reaction times. These observations can be rationalized on the basis of the hemilabile character of the PNSO ligands. Hemilabile ligands provide empty coordination sites for the incoming olefin and, as a result, accelerate the cycloaddition process. Accordingly, *tert*-butyl PNSO ligands showed the highest hemilabile character of the series, whereas the CF₃SO ligand showed the lowest and behaved more like a solid bridged ligand.

[a] Yield refers to product purified by flash chromatography. [b] Time for full conversion of starting complex (TLC). [c] Data from ref.^[5]

The bond length (or bond strength) is a physical property that depends ultimately on different parameters, one of them being the π acidity of the ligand. Other important parameters are the steric bulk of the ligand (Tolman's cone angle) and the σ -donor capacity. For phosphane ligands, quantitative analysis of ligand effects (QALE) has demonstrated that increasing π acidity and reducing the cone angle results in shortening the M–L bond length.^[16] QALE analysis has also shown that π acidity has a stronger influence in bond length than steric and σ -donor parameters. In that respect, the CF₃SO ligand shows both increased π acidity and reduced steric bulk, which leads to a stronger sulfur–metal bond.

Conclusions

In summary, here we synthesized a family of *N*-phosphanylsulfinamide (PNSO) ligands with electron-deficient sulfinyl groups from the corresponding sulfonyl chlorides in two steps. These ligands behaved like P,S-bidentate ligands in response to Co₂–alkyne complexes, thereby providing bridged tetracarbonyl complexes. The binding capacity of the different sulfinyl groups was examined on the basis of stretching frequencies of the CO ligands. This approach allowed the ranking of these groups on the basis of their π acidity. Finally, X-ray analysis and Pauson–Khand reactiv-

ity studies of complexes **16a** and **16b**, both bearing a CF₃SO group, confirmed that electron-deficient sulfinyl groups provide enhanced metal bonding. Given these interesting properties, electron-deficient sulfinyl groups should find further applications in metal catalysis and synthesis.

Experimental Section

Experimental Details: All reactions were carried out under a nitrogen atmosphere in dried solvents; thf was dried with sodium/benzophenone, toluene over sodium, and dichloromethane over CaH₂. Thin-layer chromatography was carried out by using TLC aluminum sheets with silica gel (Merck 60 F₂₅₄). Chromatography purifications were carried out by using flash-grade silica gel (SDS Chromatogel 60 ACC, 35–70 μ m). NMR spectra were recorded at 23 °C with a Varian Mercury 400 and a Varian Unity 300 spectrometer. ¹H NMR and ¹³C NMR spectra were referenced either to relative internal TMS or to residual solvent peaks. ³¹P NMR spectra were referenced to phosphoric acid. Signal multiplicities in the ¹³C NMR spectra were assigned by DEPT and HSQC experiments. Melting points were determined with a Büchi melting point apparatus and are not corrected. IR spectra were recorded with an FTIR apparatus. HRMS were recorded by using an electrospray ionization apparatus. Sulfinamides **3–5**, **7**, and **9** have been described previously in the literature.^[8]

General Procedure for the Preparation of Sulfinamides: To a solution of sulfonyl chloride (1.59 mmol) in CH₂Cl₂ (5 mL) at 0 °C was added a solution of triphenylphosphane (417 mg, 1.59 mmol), benzylamine (0.17 mL, 1.59 mmol), and triethylamine (0.44 mL, 3.19 mmol) in CH₂Cl₂ (5 mL) by using a syringe pump over a period of 1 h. After the addition, TLC showed that the sulfonyl chloride was consumed. The reaction mixture was concentrated under vacuum. The crude mixture was purified by column chromatography (hexanes/EtOAc, 90:10) to give the desired sulfinamide.

***N*-Benzyl-*p*-nitrophenylsulfinamide (6):** According to the general procedure, *p*-nitrophenylsulfonyl chloride (1.0 g, 4.51 mmol) in CH₂Cl₂ (13 mL), triphenylphosphane (1.18 g, 4.51 mmol), benzylamine (0.49 mL, 4.51 mmol), and triethylamine (1.25 mL, 9.02 mmol) in CH₂Cl₂ (13 mL). Flash chromatography (hexanes/EtOAc, 90:10) afforded **6** (511 mg, 42%) as a yellow solid. M.p. 135–136 °C. IR (KBr): $\tilde{\nu}$ = 3208, 2917, 2860, 1525, 1343 cm^{–1}. ¹H NMR (400 MHz, CDCl₃): δ = 3.87 (dd, ²J_{H,H} = 14 Hz, ³J_{H,H} = 7 Hz, 1 H, CH₂Ph), 4.27 (dd, ²J_{H,H} = 14 Hz, ³J_{H,H} = 5 Hz, 1 H, CH₂Ph), 4.47 (s, 1 H, NH), 7.23–7.34 (m, 5 H), 7.96 (d, *J* = 9 Hz, 2 H), 8.36 (d, *J* = 9 Hz, 2 H) ppm. ¹³C NMR (100 MHz, CDCl₃): δ = 44.9 (CH₂), 124.2 (CH), 127.7 (CH), 128.2 (CH), 128.5 (CH), 129.0 (CH), 137.1 (C), 149.8 (C), 151.1 (C) ppm. MS [ESI, H₂O/CH₃CN (1:1), 1% HCO₂H]: *m/z* (%) = 108 (100) [C₇H₉N + H]⁺, 277 (11) [M + H]⁺. HRMS (ESI): calcd. for C₁₃H₁₃N₂O₃S [M + H] 277.0644; found 277.0641. C₁₃H₁₂N₂O₃S (276.31): calcd. C 56.51, H 4.38, N 10.14, S 11.60; found C 56.28, H 4.31, N 10.03, S 11.41.

***N*-Benzyl-3,5-bis(trifluoromethyl)phenylsulfinamide (8):** According to the general procedure, 3,5-bis(trifluoromethyl)phenylsulfonyl chloride (500 mg, 1.59 mmol) in CH₂Cl₂ (5 mL), triphenylphosphane (417 mg, 1.59 mmol), benzylamine (0.17 mL, 1.59 mmol), and triethylamine (0.44 mL, 3.19 mmol) in CH₂Cl₂ (15 mL). Flash chromatography (hexanes/EtOAc, 95:5) afforded **8** (244 mg, 42%) as a colorless oil. IR (KBr): $\tilde{\nu}$ = 3213, 1357, 1279, 1139 cm^{–1}. ¹H NMR (400 MHz, CDCl₃): δ = 3.90 (dd, ²J_{H,H} = 13 Hz, ³J_{H,H} = 6 Hz, 1 H, CH₂Ph), 4.24 (dd, ²J_{H,H} = 13 Hz, ³J_{H,H} = 5 Hz, 1 H,

CH_2Ph), 4.58 (t, $J = 5$ Hz, 1 H, NH), 7.21 (m, 2 H), 7.26–7.30 (m, 3 H), 7.97 (s, 1 H), 8.21 (s, 2 H) ppm. ^{13}C NMR (100 MHz, CDCl_3): $\delta = 44.5$ (CH_2), 122.8 (q, $J_{\text{C,F}} = 272$ Hz, 1 C), 124.9 (m, CH), 126.9 (d, $J_{\text{C,F}} = 3$ Hz, CH), 128.1 (CH), 128.3 (CH), 128.6 (CH), 132.6 (q, $J_{\text{C,F}} = 33$ Hz, 1 C), 136.8 (C), 147.5 (C) ppm. ^{19}F NMR (376 MHz, CDCl_3): $\delta = -63.3$ ppm. MS [ESI, $\text{H}_2\text{O}/\text{CH}_3\text{CN}$ (1:1), 1% HCO_2H]: m/z (%) = 368 (40) $[\text{M} + \text{H}]^+$, 390 (21) $[\text{M} + \text{Na}]^+$. HRMS (ESI): calcd. for $\text{C}_{15}\text{H}_{12}\text{F}_6\text{NOS}$ $[\text{M} + \text{H}]$ 368.0538; found 368.0540.

General Procedure for the Synthesis of the Borane Complexes of (S)-N-Phosphanyl-p-Tolylsulfonamides: An oven-dried, one-necked, round-bottomed flask (100 mL) equipped with magnetic stirring bar was charged with the corresponding sulfonamide (1.89 mmol) under an atmosphere of nitrogen. Anhydrous thf (20 mL) was added, and the solution was cooled to -78°C . To this solution was added dropwise by syringe BuLi (2.5 M in hexanes, 0.83 mL, 2.08 mmol). After stirring for 15 min, Ph_2PCl (2.08 mmol) was added by syringe; the mixture turned yellow. The solution was stirred for 1 h, during this time the temperature was raised to -30°C . Immediately, $\text{BH}_3\text{-SMe}_2$ (0.27 mL, 2.83 mmol) was added and the mixture was stirred for 20 min. The mixture was warmed to 0°C ; H_2O (10 mL) and Et_2O (10 mL) were added carefully (H_2 evolves). The aqueous layer was washed with Et_2O (10 mL), and the combined organic layer was dried with anhydrous magnesium sulfate, filtered, and concentrated in vacuo. The resulting crude mixture was purified on silica gel (hexane/ EtOAc , 90:10) to obtain the desired N-phosphanylsulfonamides protected with borane.

N-Benzyl-N-diphenylphosphanyl-o-chlorophenylsulfonamide Borane Complex (10): According to the general procedure, **3** (166 mg, 0.62 mmol), BuLi (0.28 mL, 0.69 mmol), Ph_2PCl (0.13 mL, 0.69 mmol), and $\text{BH}_3\text{-SMe}_2$ (0.08 mL, 0.81 mmol). Flash chromatography (hexane/ EtOAc , 95:5) afforded **10** (144 mg, 50%) as a white foam. IR (KBr): $\tilde{\nu} = 3058, 2388, 1450, 1437, 1105\text{ cm}^{-1}$. ^1H NMR (400 MHz, CDCl_3): $\delta = 0.85\text{--}1.79$ (br., 3 H, BH_3), 4.28 (dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 12$ Hz, 1 H, CH_2Ph), 4.77 (dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 7$ Hz, 1 H, CH_2Ph), 6.68 (m, 2 H), 6.80 (m, 2 H), 6.91 (dd, $J = 8$ Hz, $J = 1$ Hz, 1 H), 7.05 (t, $J = 8$ Hz, 1 H), 7.17 (t, $J = 7$ Hz, 1 H), 7.43–7.60 (m, 6 H), 7.75 (m, 1 H), 7.88 (m, 3 H), 7.97 (m, 2 H) ppm. ^{13}C NMR (100 MHz, CDCl_3): $\delta = 45.7$ (CH_2), 126.5 (CH), 127.07 (CH), 127.11 (CH), 127.4 (CH), 127.7 (CH), 127.8 (d, $J_{\text{C,P}} = 64$ Hz, 1 C), 128.5 (d, $J_{\text{C,P}} = 59$ Hz, 1 C), 128.8 (d, $J_{\text{C,P}} = 11$ Hz, CH), 129.0 (d, $J_{\text{C,P}} = 10$ Hz, CH), 129.9 (CH), 131.1 (d, $J_{\text{C,P}} = 12$ Hz, 1 C), 132.3 (CH), 132.4 (CH), 133.0 (CH), 133.6 (d, $J_{\text{C,P}} = 11$ Hz, CH), 133.7 (d, $J_{\text{C,P}} = 11$ Hz, CH), 136.0 (C), 139.5 (d, $J_{\text{C,P}} = 9$ Hz, 1 C) ppm. ^{31}P NMR (121 MHz, CDCl_3): $\delta = 82.5$ ppm. MS [ESI, $\text{H}_2\text{O}/\text{CH}_3\text{CN}$ (1:1), 1% HCO_2H]: m/z (%) = 462 (100) $[\text{M} - \text{H}]^+$, 949 (31) $[\text{2M} + \text{Na}]^+$. HRMS (ESI): calcd. for $\text{C}_{25}\text{H}_{23}\text{BClNOPS}$ $[\text{M} - \text{H}]$ 462.1013; found 462.1014.

N-Benzyl-N-diphenylphosphanyl-o-fluorophenylsulfonamide Borane Complex (11): According to the general procedure, **4** (424 mg, 1.70 mmol), BuLi (0.75 mL, 1.87 mmol), Ph_2PCl (0.38 mL, 2.04 mmol), $\text{BH}_3\text{-SMe}_2$ (0.19 mL, 2.04 mmol). Flash chromatography (hexane/ EtOAc , 95:5) afforded **11** (400 mg, 56%) as a white foam. IR (KBr): $\tilde{\nu} = 3060, 2388, 1470, 1437\text{ cm}^{-1}$. ^1H NMR (400 MHz, CDCl_3): $\delta = 0.82\text{--}1.86$ (br., 3 H, BH_3), 4.40 (dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 13$ Hz, 1 H, CH_2Ph), 4.74 (dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 8$ Hz, 1 H, CH_2Ph), 6.66 (t, $J = 9$ Hz, 1 H), 6.87 (s.a., 4 H), 7.07 (t, $J = 8$ Hz, 1 H), 7.17–7.19 (m, 1 H), 7.46–7.57 (m, 6 H), 7.69–7.77 (m, 2 H), 7.82–7.87 (m, 2 H), 7.92–7.97 (m, 2 H) ppm. ^{13}C NMR (100 MHz, CDCl_3): $\delta = 46.1$ (d, $J_{\text{C,P}} = 4$ Hz, CH_2), 115.8 (d, $J_{\text{C,F}} = 20$ Hz, CH), 124.6 (d, $J_{\text{C,F}} = 4$ Hz, CH), 126.8 (CH), 127.6 (CH), 127.7 (CH), 127.9 (CH), 128.0 (d, $J_{\text{C,P}} = 47$ Hz, 1 C),

128.3 (d, $J_{\text{C,P}} = 41$ Hz, 1 C), 128.9 (d, $J_{\text{C,P}} = 11$ Hz, CH), 129.0 (d, $J_{\text{C,P}} = 10$ Hz, CH), 131.1 (d, $J = 12$ Hz, 1 C), 132.3 (d, $J_{\text{C,P}} = 2$ Hz, CH), 132.4 (d, $J_{\text{C,P}} = 2$ Hz, CH), 133.5 (CH), 133.6 (CH), 134.1 (d, $J_{\text{C,F}} = 8$ Hz, CH), 136.3 (C), 158.8 (d, $J_{\text{C,F}} = 250$ Hz, 1 C) ppm. ^{31}P NMR (121 MHz, CDCl_3): $\delta = 81.4$ ppm. ^{19}F NMR (376 MHz, CDCl_3): $\delta = -110.67$ ppm. General Procedure for the Synthesis of PNSO Dicobalttetracarbonyl Complexes: A Schlenk flask equipped with a magnetic stirring bar was charged with the corresponding PNSO ligand protected with borane (0.15 mmol), DABCO (0.23 mmol), and trimethylsilylacetylene dicobalt complex (0.16 mmol). The Schlenk flask was purged with N_2 and toluene (2 mL) was added. The reaction was heated at 65 °C and was monitored by TLC. The reaction was stopped upon disappearance of the intermediate pentacarbonyl complex (which can be observed by TLC). The reaction mixture was concentrated in vacuo and purified on silica gel (hexanes/EtOAc, 95:5) to obtain the PNSO dicobalttetracarbonyl complexes as a red solids.

$\text{Co}_2(\mu\text{-TMSC}_2\text{H})(\text{CO})_4(\mu\text{-C}_{25}\text{H}_{21}\text{CINOPS})$ (10a): According to the general procedure, **10** (70 mg, 0.15 mmol), DABCO (26 mg, 0.23 mmol), and trimethylsilylacetylene dicobalt complex (63 mg, 0.165 mmol). The mixture was kept at 65 °C for 4 h. Flash chromatography (hexanes/EtOAc, 95:5) afforded a mixture of diastereomers **10a** (1:1, 95 mg, 82%) as a red solid. IR (film): $\tilde{\nu} = 2961, 2956, 2037, 2003, 1981\text{ cm}^{-1}$. ^1H NMR (400 MHz, C_6D_6): $\delta = 0.32/0.41$ (2 s, 9 H, SiMe_3), 4.10 (dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 5$ Hz, 2 H, CH_2Ph), 4.65/4.88 (2 d, $J = 16/17$ Hz, 1 H, CH_2Ph), 5.69/6.00 (2 d, $^3J_{\text{H,P}} = 7\text{ Hz}/^3J_{\text{H,H}} = 12$ Hz, 1 H, $\text{HC}\equiv\text{CTMS}$), 5.81 (d, $J = 7$ Hz, 1 H), 6.35–6.58 (m, 13 H), 6.75(m, 3 H), 7.04–7.21 (m, with solvent peak, 9 H), 7.79–7.90 (m, 7 H), 8.08–8.28 (m, 5 H) ppm. ^{31}P NMR (121 MHz, C_6D_6): $\delta = 118.5/122.5$ ppm. MS [ESI, $\text{H}_2\text{O}/\text{CH}_3\text{CN}$ (1:1), 1% HCO_2H]: m/z (%) = 722 (21) $[\text{M} + \text{H} - 2\text{CO}]^+$, 750 (16) $[\text{M} + \text{H} - \text{CO}]^+$, 778 (13) $[\text{M} + \text{H}]^+$. HRMS (ESI): calcd. for $\text{C}_{34}\text{H}_{32}\text{ClCo}_2\text{NO}_3\text{PSSi}$ $[\text{M} + \text{H}]$ 777.9855; found 777.9826.

$\text{Co}_2(\mu\text{-TMSC}_2\text{H})(\text{CO})_4(\mu\text{-C}_{25}\text{H}_{21}\text{FNOPS})$ (11a): According to the general procedure, **11** (75 mg, 0.17 mmol), DABCO (28 mg, 0.25 mmol), and trimethylsilylacetylene dicobalt complex (70 mg, 0.18 mmol). The mixture was kept at 65 °C for 5 h. Flash chromatography (hexanes/EtOAc, 95:5) afforded a mixture of diastereomers **11a** (1:1, 91 mg, 75%) as a red solid. IR (film): $\tilde{\nu} = 2960, 2953, 2037, 2004, 1981\text{ cm}^{-1}$. ^1H NMR (400 MHz, C_6D_6): $\delta = 0.33/0.39$ (2 s, 9 H, SiMe_3), 4.12 (m, 2 H), 4.77/4.89 (2 dd, $^2J_{\text{H,H}} = 17$ Hz, $^3J_{\text{H,P}} = 2\text{ Hz}/^2J_{\text{H,H}} = 16$ Hz, $^3J_{\text{H,P}} = 2$ Hz, 1 H, CH_2Ph), 5.92 (m, 5 H), 6.05/6.19 (2 m, 1 H), 6.41–6.56 (m, 10 H), 6.70 (dd, $J = 11, 2$ Hz, 1 H), 7.02–7.22 (m, with solvent peak, 12 H), 7.74–7.94 (m, 8 H), 8.10 (m, 2 H) ppm. ^{31}P NMR (121 MHz, C_6D_6): $\delta = 121.2/116.6$ ppm. ^{19}F NMR (376 MHz, C_6D_6): $\delta = -104.64/-104.99$ ppm. HRMS (ESI): calcd. for $\text{C}_{32}\text{H}_{24}\text{Co}_2\text{F}_3\text{NO}_5\text{PS}$ $[\text{M} + \text{H}]$ 739.9729; found 739.9732.

Synthesis of 4-(Trimethylsilyl)tricyclo[5.2.1.0^{2,6}]deca-4,8-dien-3-one^[6]

From 2a: Tetracarbonyl complex **2a** (130 mg, 0.17 mmol), norbornadiene (0.19 mL, 1.7 mmol), and toluene (4 mL) were charged in a Schlenk flask under a nitrogen atmosphere and heated to 70 °C with stirring. The reaction was monitored by TLC until disappearance of the tetracarbonyl complex. The reaction was complete after 48 h. Purification by flash chromatography on SiO_2 (hexane/EtOAc, 95:5) yielded the desired product (30 mg, 72%).

From 16a: Tetracarbonyl complex **16a** (60 mg, 0.08 mmol), norbornadiene (0.08 mL, 0.81 mmol), and toluene (2 mL) were charged in a Schlenk flask under a nitrogen atmosphere and heated to 70 °C with stirring. The reaction was monitored by TLC until disappearance of the tetracarbonyl complex. The reaction was complete after 65 h. Purification by flash chromatography on SiO_2 (hexane/EtOAc, 95:5) yielded the desired product (16 mg, 94%).

Synthesis of 4-Phenyltricyclo[5.2.1.0^{2,6}]deca-4,8-dien-3-one^[6]

From 2b: Tetracarbonyl complex **2b** (50 mg, 0.06 mmol), norbornadiene (0.07 mL, 0.66 mmol), and toluene (2 mL) were charged in a Schlenk flask under a nitrogen atmosphere and heated to 70 °C with stirring. The reaction was monitored by TLC until disappearance of the tetracarbonyl complex. The reaction was complete after 1 h. Purification by flash chromatography on SiO_2 (hexane/EtOAc, 95:5) yielded the desired product (14 mg 95%).

From 16b: Tetracarbonyl complex **16b** (35 mg, 0.05 mmol), norbornadiene (0.05 mL, 0.47 mmol), and toluene (2 mL) were charged in a Schlenk flask under a nitrogen atmosphere and heated to 70 °C with stirring. The reaction was monitored by TLC until disappearance of the tetracarbonyl complex. The reaction was complete after 1 h. Purification by flash chromatography on SiO_2 (hexane/EtOAc, 95:5) yielded the desired product (9 mg, 89%).

Supporting Information (see footnote on the first page of this article): ^1H and ^{13}C NMR spectra for all new sulfinamides, PNSO ligands, and cobalt complexes.
