Abstract — Reduction of N-alkoxycarbonyllactams with NaBH_4/H^+ in ethanol (Speckamp's condition) afforded α -ethoxyurethanes (Shono's compounds) in good yields.

New methods for the carbon-carbon bond formation at the α -position of amines via acyliminium ion (2) have been developed in recent years.¹ Among these, α -alkoxyamides² (1; $\text{R}^2 = \text{alkyl}$) and α -alkoxyurethanes³ (1; $\text{R}^2 = \text{alkoxy}$), precursors for 2, are conveniently available from the reduction of imides with $\text{NaBH}_4/\text{EtOH-H}^+$ or from the anodic oxidation of urethanes, respectively. In this paper, a convenient alternative method for the synthesis of cyclic N-alkoxycarbonyl-2-ethoxyamines (7 - 9) is described.

Although the reduction of N-acyllactams (e. g. 4a, 4b, 5a) with NaBH_4 did not afford α -ethoxyamides (e. g. 7a, 7b, 8a), the reduction of N-alkoxycarbonyllactams (4c-g - 6c-g) in a similar condition gave the desired α -ethoxyurethanes (7 - 9) in good yields. The results are shown in Table 1. The reaction was carried out by the modification of Speckamp's procedure²: A small amount of bromocresol green (pH 3.8 yellow - 5.4 blue) was used as an internal indicator and the optimum reaction temperature was between -6° and 0° .

The investigation of the carbon-sulfur, carbon-nitrogen and carbon-carbon bonds formation at the α -position of amines using these α -ethoxyurethane are now in progress.

Table 1. Reduction of N-Alkoxycarbonyllactams^a to α-Ethoxyurethanes^b

Yield (%)^c and bp (°C/mmHg) of Products (7, 8, 9)

R	<u>7</u>	<u>8</u>	<u>9</u>
a : Me	0 ^d	0 ^d	-
b : Ph	0 ^d	-	-
c : OMe	80 (120°/3)	79 (85°/4)	-
d : OEt	83 (83°/2)	-	64 (83°/2)
e : OCH ₂ Ph	83 (110°/2)	80 (- ^e)	88 (- ^e)
f : O ^t Bu	88 (75°/2)	70 (70°/2)	65 (78°/2)
g : OCH ₂ CH=CH ₂	88 (105°/2)	-	-

a) N-Alkoxycarbonyllactams (4 - 6) were prepared by the alkoxy-carbonylation of lactams with chloroformates (or di-tert-butyl dicarbonate for tert-butoxy-carbonylation) and sodium hydride in 60-80% yields. b) All the products gave satisfactory ir, ¹H-nmr and ms spectra. c) Isolated yield. d) In the case of N-acyllactams, the cleavage of N-acyl groups and the reduction of the ring-opened compounds were observed. e) Purified by chromatography.
